An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR Part 9 and 48 CFR Chapter 15. The Federal Register notice required under 5 CFR 1320.8(d), soliciting comments on this collection of information was published on June 13, 1996 (61 FR 30061); no comments were received.

**Burden Statement:** There are an estimated 25,547 sources subject to the operating permits program. The annual public reporting and recordkeeping burden for this collection of information is estimated to average 211 hours per source. This reflects all the information reporting activities associated with this collection. Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

**Respondents/Affected Entities:** Sources subject to the operating permits program.

**Estimated Number of Respondents:** 25,547.

**Frequency of Response:** One-time and semiannual.

**Estimated Total Annual Hour Burden:** 5.3 million hours.

**Estimated Total Annualized Cost Burden:** $0.

Send comments on the Agency's need for this information, the accuracy of the provided burden estimates, and any suggestions for minimizing respondent burden, including through the use of automated collection techniques to the following addresses. Please refer to EPA ICR Number 1587.05 and OMB Control Number 2060–0243 in any correspondence.

Ms. Sandy Farmer, U.S. Environmental Protection Agency, OPPE Regulatory Information Division (2137), 401 M Street, SW., Washington, DC 20460 and Office of Information and Regulatory Affairs, Office of Management and Budget; Attention: Desk Officer for EPA, 725 17th Street, NW., Washington, DC 20503.

Dated: August 22, 1996.

Richard Westlund,
Acting Director, Regulatory Information Division.

**Control Techniques Guidelines for Shipbuilding and Ship Repair Operations (Surface Coating)**

**AGENCY:** Environmental Protection Agency (EPA).

**ACTION:** Notice of release of control techniques guidelines (CTG).

**SUMMARY:** The CTG for control of volatile organic compound (VOC) emissions from surface coating operations in the shipbuilding and ship repair industry is available to assist States in analyzing and determining reasonably available control technology (RACT) for shipbuilding and ship repair operations located within ozone national ambient air quality standards (NAAQS) nonattainment areas. The CTG also sets forth the adoption and implementation dates for RACT. The CTG for Shipbuilding and Ship Repair Operations (Surface Coating) is not being issued as a stand-alone document. Rather, it is a combination of the information contained in this notice and the EPA's previously published alternative control techniques (ACT) document for this emission source category.

**EFFECTIVE DATE:** Any State that has not adopted an approvable RACT regulation for the source category addressed by this CTG must submit a RACT regulation for these sources within one year from the date of publication of this action in the Federal Register. For any State that has adopted an approvable RACT regulation for the source category addressed by this CTG, Section 182(b)(2) of the Clean Air Act (CAA) requires these States to submit a revision to the applicable implementation plan, to include provisions that require the implementation of RACT. This revision shall be submitted to the EPA not later than August 27, 1997. Furthermore, all States must require sources to implement the required limitations and work practices under these adopted RACT regulations not later than August 27, 1998.

**ADDRESSES:** Alternative Control Techniques (ACT) Document. The EPA published the ACT document for surface coating operations at shipbuilding and ship repair facilities in April 1994. A copy of the ACT document may be obtained from the National Technical Information Services (NTIS), 5285 Port Royal Road, Springfield, Virginia 22161, telephone number (800) 553–NTIS. Specify the following title when ordering: “Alternative Control Techniques Document: Surface Coating Operations at Shipbuilding and Ship Repair Facilities” (EPA 453/R–94–032).

**Docket:** Following publication of the ACT document, the recommended RACT was developed concurrently with maximum achievable control technology (MACT), on which standards issued under Section 112 of the CAA were based. The rulemaking docket, No. A–92–11, is available for inspection and copying from 8 a.m. to 5:30 p.m. Monday through Friday, at the EPA’s Air and Radiation Docket and Information Center, Waterside Mall, Room M–1500, Ground Floor, 401 M Street, SW, Washington, DC 20460; telephone number (202) 260–7548, FAX (202) 260–4400. A reasonable fee may be charged for copying.

**FOR FURTHER INFORMATION CONTACT:** Dr. Mohamed Serageldin at (919) 541–2379, Coatings and Consumer Products Group, Emission Standards Division (MD–13), U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711.

**SUPPLEMENTARY INFORMATION:** Potentially Affected Entities. Entities potentially affected by this action are those shipbuilding and ship repair operations which are (or have the potential to become) “major” sources of VOC emissions and are located in nonattainment areas of ozone.

<table>

<tbody>
<tr>
<td>Industry</td>
<td>Any building or repairing, repainting, converting, or alteration of ships. The term ship means any marine or fresh-water vessel, including self-propelled by other craft (barges), and navigational aids (buoys). Note: Offshore oil and gas drilling platforms and vessels used by individuals for noncommercial, non-military, and recreational purposes that are less than 20 meters in length are not considered ships.</td>
</tr>
</tbody>
</table>
I. Background and Purpose

Section 183(b)(4) of the CAA specifically requires the EPA to issue a CTG for the shipbuilding and ship repair industry, to reduce air emissions of VOC and particulate matter from coatings (paints) and solvents used at new and existing shipbuilding and ship repair facilities. However, unlike the more general CTG requirements which require the EPA to establish a RACT level of control, Section 183(b)(4) requires the EPA to establish a CTG based on best available control measures (BACM) for emissions of VOC and particles with an aerodynamic diameter less than or equal to a nominal 10 micrometers (PM–10) from the removal or application of coatings and solvents at shipbuilding and ship repair facilities. The BACM is a broadly defined term referring to "best" technologies and other "best" available measures that can be used to control pollution. A discussion of the analogy between BACM and reasonable available control measures is presented in State Implementation Plans for Serious PM–10 Nonattainment Areas, and Attainment Date Waivers for PM–10 Nonattainment Areas Generally; Addendum to the General Preamble for Implementation of Title I of the Clean Air Act Amendments of 1990 (59 FR 41998, August 16, 1994).

Pursuant to Section 183 of the CAA, the EPA is required to issue CTG for the purpose of assisting States in developing RACT levels of controls for sources of VOC emissions. In turn, each State is required to submit a revision to its State implementation plan (SIP) providing RACT regulations for sources of VOC that are located in moderate or above ozone nonattainment areas. Specifically, Section 182(b)(2) of the CAA requires States to submit RACT regulations for sources of VOC that are covered by a CTG issued after enactment of the Clean Air Act of 1990, but prior to the time of attainment. The CTG also applies to those facilities in nonattainment areas located in States which already have existing shipbuilding and ship repair (or marine) coating regulations; the State limits must be at least as stringent as the CTG limits or otherwise must be determined to meet RACT (and in this case, BACM).

The CTG review current knowledge and data concerning the technology and costs of various emissions control techniques. The CTG are intended to provide State and local air pollution authorities with an information base for proceeding with their own analyses of RACT to meet statutory requirements. States may choose to develop their own RACT requirements on a case-by-case basis, considering the emission reductions needed to attain achievement of the NAAQS and the economic and technical circumstances of the individual source.

The application of RACT and resulting VOC emissions reduction is to "enhance the quality of the Nation's air resources so as to promote the public health and welfare and productive capacity of its population." The intent of this action is to protect the public health by requiring the highest degree of reduction in VOC emissions in ozone nonattainment areas, taking into consideration the cost of achieving such emission reduction, any nonair quality, health and environmental impacts, and energy requirements.

The VOC that are emitted by shipbuilding and ship repair facilities include xylene, toluene, ethyl benzene, isopropyl alcohol, butyl alcohol, ethyl alcohol, methanol, methyl ethyl ketone, methyl isobutyl ketone, ethylene glycol, and glycol ethers. All of these VOC contribute significantly to the formation of ground level ozone which can damage lung tissue and cause serious respiratory illness. Additionally, VOC can cause reversible or irreversible toxic effects following exposure. The potential toxic effects include eye, nose, throat, and skin irritation and blood cell, heart, liver, and kidney damage. The adverse health effects are associated with a wide range of ambient concentration and exposure time and are influenced by source-specific characteristics such as emission rates and local meteorological conditions. Health impacts are also dependent on the multiple factors that affect human variability such as genetics, age, health status (e.g., the presence of pre-existing disease), and lifestyle. Implementation of BACM described in the CTG will reduce VOC emissions from shipbuilding and ship repair surface coating operations by 1.250 megagrams Mg (1,370 tons per year).

II. BACM and "Presumptive RACT"

In developing the CTG for this industry, the EPA reviewed current knowledge and data concerning the
technology and costs of various emission control techniques. The type and level of VOC control identified as BACM is based on the marine coating VOC limits being used in California (with some exceptions and modifications). Table 1 presents the various paint categories with the maximum as-applied VOC content allowed for each under BACM. These same limits were similarly used in the development of national emission standards for hazardous air pollutants (NESHAP) for this same industry and serve as the basis for MACT. The VOC coating limits have not changed from what was proposed and promulgated in the NESHAP. Also included in BACM are work practice guidelines that state: (1) all handling and transfers of VOC-containing materials to and from containers, tanks, vats, drums, and piping systems are conducted in a manner that minimizes spills, and (2) all coating tanks, vats, drums, and piping systems are free of cracks, holes, and other defects and remain closed unless materials are being added to or removed from them.

With regard to PM–10 emissions, the EPA determined BACM to be no control. At proposal, the EPA found no sufficiently demonstrated technology to recommend for quantitatively controlling PM–10 emissions. The technologies in use and under development were discussed in the ACT document. There has been no new information received since the proposal that would lead the EPA to change that position.

Based on the EPA's work on the MACT standard and the ACT, the EPA has determined that the use of lower-VOC paints is the only technologically and economically feasible level of control for these sources that the EPA can establish in a category-wide basis. The EPA is recommending BACM, which was published for comment along with the NESHAP (59 FR 62681, December 6, 1994), be selected. Final BACM was identified in this action and was considered the "presumptive norm" or presumptive RACT for the source category. However, BACM, the presumptive norm, is only a recommendation. Individual sources may have alternative BACM requirements imposed by making an adequate infeasibility demonstration (44 FR 53761, September 17, 1979). States and sources may elect to establish alternative types of control for submittal to the EPA in a SIP revision. The EPA would make a final determination of whether such controls meet the RACT requirements of Section 182(b)(2) and BACM requirement of Section 183(b)(4), through notice-and-comment rulemaking action on the SIP submittal.

The EPA believes that RACT, BACM, and MACT are identical in this instance on a category-wide basis; while typically MACT ("maximum") implies more stringent control than BACM ("best"), which in turn implies more stringent control than RACT ("reasonable"). The EPA recognizes that there may be isolated instances when there is such a limited range of controls for a specified industry or industry process that two or all three of these levels of control may be identical. For a general discussion of these terms, refer to "State Implementation Plans for Serious PM–10 Nonattainment Areas, and Attainment Date Waivers for PM–10 Nonattainment Areas Generally; Addendum to the General Preamble for the Implementation of Title I of the Clean Air Act Amendments of 1990" (59 FR 41998, August 16, 1994).

The cost-effectiveness of add-on controls of VOC emissions for spray booth painting and tank painting operations was determined to be low. However, the variability and size of tanks inside a ship that may be painted, at any one time, in a shipyard makes evaluation of add-on controls on a category-wide basis difficult. Controls have to be evaluated on a case-by-case basis. It should be noted that automated, high-use paint operations may be feasibly controlled and would have to be evaluated on a case-by-case basis.

III. Modifications to the ACT Document

There have been some substantive technical changes since the ACT document for this industry was published in April 1994. Most notable of those changes is the inclusion of cold weather coating limits and the incorporation of both mass VOC per volume (g VOC/L) of coating less water and exempt solvents emission limits and the equivalent mass VOC per volume of solids (nonvolatile) emission limits (see Table 1 in this notice). The solids based units should be used to determine compliance whenever thinning solvent is added to a coating. This change was made to provide a uniform basis for all calculations related to emission reductions (i.e., associated with thinning additions or add-on control devices). The procedure for calculating the VOC content of a given coating to which thinning solvent is added is provided in Appendix A to this notice. Information in Appendix C and Appendix D may also be used to calculate VOC content.

The promulgated NESHAP for this industry (60 FR 64330, December 15, 1995) also reflects technical changes made as a result of public comments and provides information for air quality management agencies to consider in the development of an enforceable regulation limiting VOC emissions from shipbuilding and ship repair surface coating operations. Additional information related to the promulgated NESHAP is presented in the "Background Information for Final Standards" (EPA/453–R–96–003B).

IV. Model Rule

In effect, the NESHAP can be used as a model rule providing an organizational framework and regulatory language specifically tailored for surface coating operations at shipyards. Information is provided on applicability, definitions, format of standards, compliance determinations (calculations), and reporting and recordkeeping. Many of the definitions used in the ACT were modified/clarified for the NESHAP; therefore, Appendix B to this notice has been included to provide the updated terminology and definitions, including technical amendments to the NESHAP.

The various compliance options are described and illustrated (in a flow diagram) in the NESHAP as well. The State or other implementing agency can exercise its prerogative to consider other options provided they meet the objectives prescribed in this action. This guidance is for instructional purposes only and, as such, is not binding. The State or other enforcement agency should consider all information presented in the ACT document, the promulgated NESHAP, and this final action along with additional information about specific sources to which the regulation will apply.

V. Summary of Impacts

The EPA estimates the State and local regulations developed pursuant to this CTG could affect about 100 facilities, reduce emissions of VOCs by approximately 1,250 Mg per year, and result in nationwide costs of approximately $1.1 million. These costs are in addition to the $2.0 million assigned to the NESHAP for controlling volatile organic hazardous air pollutants (VOHAP) (and VOC) emissions from the 35 major source shipyards. Further information on costs and controls is presented in the Shipbuilding and Ship Repair ACT guideline document (EPA 453/R–94–032; NTIS PB94–181694) published in April 1994.

VI. Administrative Designation and Regulatory Analysis

Under Executive Order 12866 (58 FR 51735, October 4, 1993), the EPA must
determine whether the regulatory action is "significant" and therefore subject to Office of Management and Budget review and the requirements of the Executive Order. The Order defines "significant regulatory action" as one that is likely to result in a rule that may:

(1) Have an annual effect on the economy of $100 million or more, or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities.

(2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency.

(3) Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs, or the rights and obligations of recipients thereof.

(4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

It has been determined that this CTG document is not a "significant regulatory action" under the terms of Executive Order 12866 and is therefore not subject to OMB review. This CTG document is not a "rulemaking," rather it provides information to States to aid in developing rules.

a The limits are expressed in two sets of equivalent units. Either set of limits may be used to demonstrate compliance.

b To convert from g/L to lb/gal, multiply by (3.785 L/gal)/(1/453.6 lb/gal) or 1/293.7. For compliance purposes, metric units define the standards.

c VOC limits expressed in units of mass of VOC per volume of solids were derived from the VOC limits expressed in units of mass of VOC per volume of coating assuming the coatings contain no water or exempt compounds and that the volumes of all components within a coating are additive.

d These limits apply during cold-weather time periods (i.e., temperatures below 4.5°C). Cold-weather allowances are not given to coatings in categories that permit less than 40 percent solids (nonvolatiles) content by volume. Such coatings are subject to the same limits regardless of weather conditions.

Appendix A. Procedure to Determine VOC Contents of Coatings to Which Thinning Solvent Will Be Added

For a coating to which thinning solvent is routinely or sometimes added, the owner or operator shall determine the VOC content as follows:

(1) Prior to the first application of each batch, designate a single thinner for the coating and calculate the maximum allowable thinning ratio (or ratios), if the affected source complies with the cold-weather limits in addition to the other limits specified in Table 1 for each batch as follows:

\[ R = \frac{V_v(VOC \text{ limit}) - \text{m}_{\text{VOC}}}{D_{th}} \]

Where:

\[ R = \text{Maximum allowable thinning ratio for a given batch (L thinner/L coating as supplied)} \]

\[ V_v = \text{Volume fraction of solids in the batch as supplied (L solids/L coating as supplied)} \]

\[ \text{VOC limit} = \text{Maximum allowable as-applied VOC content of the coating (g VOC/L solids)} \]

m_{\text{VOC}} = \text{VOC content of the batch as supplied (g VOC/L coating as supplied)};

D_{th} = \text{Density of the thinner (g/L)}.

If \( V_v \) is not supplied directly by the coating manufacturer, the owner or operator shall determine \( V_v \) as follows:

\[ V_v = 1 - \frac{\text{m}_{\text{volatiles}}}{D_{avg}} \]

Where:

Volatiles = Total volatiles in the batch,
including VOC, water, and exempt
compounds (g/L coating); and
D_{avg} = Average density of volatiles in
the batch (g/L).

In addition, the owner or operator
may choose to construct nomographs,
based on Equation 1, similar or identical
to the one provided in Appendix C
(Figure 1) as a means of easily
estimating the maximum allowable
thinning ratio. The VOC Data Sheet
included as Appendix D also provides
useful information in determining
compliance with the applicable VOC
coating limit.

Appendix B. Definitions

Terms used in this CTF are defined in
the CAA or in this section as follows:

Add-on control system means an air
pollution control device such as a
carbon absorber or incinerator that
reduces pollution in an air stream by
destruction or removal prior to

discharge to the atmosphere.

Affected source means any
shipbuilding or ship repair facility
having surface coating operations with a
minimum 1,000 liters (L) (264 gallons
(gal)) annual marine coating usage.

Air flask specialty coating means any
special composition coating applied to
interior surfaces of high pressure
breathing air tanks to provide corrosion
resistance and that is certified safe
for use with breathing air supplies.

Antenna specialty coating means any
coating applied to equipment through
which electromagnetic signals must
pass for reception or transmission.

Antifoulant specialty coating means any
coating that is applied to the
underwater portion of a vessel to
prevent or reduce the attachment of
biological organisms and that is
registered with the EPA as a pesticide
under Federal Insecticide,
Fungicide, and Rodenticide Act.

As applied means the condition of a
coating at the time of application to the
substrate, including any thinning
solvent.

As supplied means the condition of a
coating before any thinning, as sold
and delivered by the coating manufacturer
to the user.

Batch means the product of an
individual production run of a coating
manufacturer's process. (A batch may
vary in composition from other batches
of the same product.)

Bitumens mean black or brown
materials that are soluble in carbon
disulfide, which consist mainly of
hydrocarbons.

Bituminous resin coating means any
coating that incorporates bitumens as a
principal component and is formulated
primarily to be applied to a substrate or
surface to resist ultraviolet radiation
and/or water.

Certify means, in reference to the VOC
content of a coating, to attest to the VOC
content as determined through analysis
by Method 24 of Appendix A to Part 60
of Title 40 of the Code of Federal
Regulations (CFR) or to attest to the
VOC content as determined through an
EPA-approved test method. In the case of
confllicting results, the EPA Method 24
shall take precedence.

Coating means any material that can
be applied as a thin layer to a substrate
and which cures to form a continuous
solid film.

Cold-weather time period means any
time during which the ambient
temperature is below 4.5°C (40°F) and
coating is to be applied.

Container of coating means the
container from which the coating is
applied, including but not limited to a
bucket or pail.

Cure volatiles means reaction
products which are emitted during the
chemical reaction which takes place in
some coating films at the cure
temperature. These emissions are other
than those from the solvents in the
coating and may, in some cases,
comprise a significant portion of total
VOC and/or VORAP emissions.

Epoxy means any thermoset coating
formed by reaction of an epoxy resin
(i.e., a resin containing a reactive
epoxide with a curing agent).

Exempt compounds means specified
organic compounds that are not
considered VOC due to negligible
photochemical reactivity. Exempt
compounds are specified in 40 CFR
§ 1.100(s).

Facility means all contiguous or
adjoining property that is under
common ownership or control,
including properties that are separated
only by a road or other public right-of-

way.

General use coating means any
coating that is not a specialty coating.

Heat resistant specialty coating means
any coating that during normal use must
withstand a temperature of at least
204°C (400°F).

High-gloss specialty coating means any
coating that achieves at least 85
percent reflectance on a 60 degree meter
when tested by the American Society for
Testing and Materials (ASTM) Method
D-523.

High-temperature specialty coating
means any coating that during normal
use must withstand a temperature of at
least 426°C (800°F).

Inorganic zinc (high-build) specialty
coating means a coating that contains
960 grams per liter (eight pounds per
gallon) or more elemental zinc
incorporated into an inorganic silicate
binder that is applied to steel to provide
galvanic corrosion resistance. (These
coatings are typically applied at more
than two mil dry film thickness.)

Maximum allowable thinning ratio
means the maximum volume of thinner
that can be added per volume of coating
without violating the applicable VOC
limit (see Table 1).

Military exterior specialty coating or
Chemical Agent Resistant Coatings
means any exterior topcoat applied to
military or U.S. Coast Guard vessels that
are subject to specific chemical,
biological, and radiological washdown
requirements.

Mist specialty coating means any low
viscosity, thin film, epoxy coating
applied to an inorganic zinc primer that
penetrates the porous zinc primer and
allows the occluded air to escape
through the paint film prior to curing.

Navigational aids specialty coating
means any coating applied to Coast
Guard buoys or other Coast Guard
waterway markers when they are
recoated aboard ship at their usage site
and immediately returned to the water.

Nonskid specialty coating means any
coating applied to the horizontal
surfaces of a marine vessel for the
specific purpose of providing slip
resistance for personnel, vehicles, or

aircraft.

Nonvolatiles (or volume solids) means
substances that do not evaporate
readily. This term refers to the film-
forming material of a coating.

Normal or closed means a container or
piping system is closed unless an
operator is actively engaged in adding or
removing material.

Nuclear specialty coating means any
protective coating used to seal porous
surfaces such as steel (or concrete) that
otherwise would be subject to intrusion
by radioactive materials. These coatings
must be resistant to long-term (service
life) cumulative radiation exposure
(7ASTM D4082—83), relatively easy to
decontaminate (7ASTM D4256—83),
and resistant to various chemicals to which
the coatings are likely to be exposed
(7ASTM 3912—80). (For nuclear coatings,
see the general protective requirements
outlined by the U.S. Atomic Energy
Commission in a report entitled "U.S.
Atomic Energy Commission Regulatory
Guide 1.54" dated June 1973, available
through the Government Printing Office
at (202) 512—2249 as document number
A74062—00001.)

Operating parameter value means a
minimum or maximum value
established for a control device or
process parameter that, if achieved by
itself or in combination with one or
more other operating parameter values, determines that an owner or operator has complied with an applicable emission limitation or standard.

**Organic zinc specialty coating** means any coating derived from zinc dust incorporated into an organic binder that contains more than 960 grams of elemental zinc per liter (eight pounds per gallon) of coating, as applied, and that is used for the expressed purpose of corrosion protection.

**Pleasure craft** means any marine or fresh-water vessel used by individuals for noncommercial, nonmilitary, and recreational purposes that is less than 20 meters in length. A vessel rented exclusively to, or chartered for, individuals for such purposes shall be considered a pleasure craft.

**Pretreatment wash primer specialty coating** means any coating that contains a minimum of 0.5 percent acid, by mass, and is applied only to bare metal to etch the surface and enhance adhesion of subsequent coatings.

**Repair and maintenance of thermoplastic coating of commercial vessels (specialty coating)** means any vinyl, chlorinated rubber, or bituminous resin coating that is applied over the same type of existing coating to perform the partial recoating of any in-use commercial vessel. (This definition does not include coal tar epoxy coatings, which are considered "general use" coatings.)

**Rubber camouflage specialty coating** means any specially formulated epoxy coating used as a camouflage topcoat for exterior submarine hulls and sonar domes.

**Sealant for thermal spray aluminum** means any epoxy coating applied to thermal spray aluminum surfaces at a maximum thickness of one dry mil.

**Ship** means any marine or fresh-water vessel used for military or commercial operations, including self-propelled vessels, those propelled by other craft (barges), and navigational aids (buoys). This definition includes, but is not limited to, all military and Coast Guard vessels, commercial cargo and passenger (cruise) ships, ferries, barges, tankers, container ships, patrol and pilot boats, and dredges. Pleasure craft and offshore oil and gas drilling platforms are not considered ships.

**Shipbuilding and ship repair operations** means any building, repair, repainting, converting, or alteration of ships.

**Special marking specialty coating** means any coating that is used for safety or identification applications, such as ship numbers and markings on flight decks.

**Specialty coating** means any coating that is manufactured and used for one of the specialized applications described within this list of definitions. **Specialty interior coating** means any coating used on interior surfaces aboard U.S. military vessels pursuant to a coating specification that requires the coating to meet specified fire retardant and low toxicity requirements, in addition to the other applicable military physical and performance requirements. **Tack specialty coating** means any thin film epoxy coating applied at a maximum thickness of two dry mils to prepare an epoxy coating that has dried beyond the time limit specified by the manufacturer for the application of the next coat. **Thinner** means a liquid that is used to reduce the viscosity of a coating and that evaporates before or during the cure of a film. **Thinning ratio** means the volumetric ratio of thinner to coating, as supplied. **Thinning solvent:** see Thinner. **Undersea weapons systems specialty coating** means any coating applied to any component of a weapons system intended to be launched or fired from under the sea. **Volatile organic compounds (VOC)** means any organic compound that participates in atmospheric photochemical reactions; that is, any organic compound other than those that the Administrator designates as having negligible photochemical reactivity. The VOC is measured by a reference method, an equivalent method, an alternative method, or by procedures specified under any rule. A reference method, an equivalent method, or an alternative method, however, may also measure nonreactive organic compounds. In such cases, any owner or operator may exclude the nonreactive organic compounds when determining compliance with a standard. For a list of compounds that the Administrator has designated as having negligible photochemical reactivity, refer to 40 CFR § 51.60.

**Volatile organic hazardous air pollutant (VOHAP)** means any compound listed in or pursuant to Section 112(b) of the CAA that contains carbon, excluding metallic carbides and carbonates. This definition includes VOC listed as hazardous air pollutant (HAP) and exempt compounds listed as HAP.

**Weld-through preconstruction primer (specialty coating)** means a coating that provides corrosion protection for steel during inventory, is typically applied at less than one mil dry film thickness, does not require removal prior to welding, is temperature resistant (burn back from a weld is less than 1.25 centimeters (0.5 inches)), and does not normally require removal before applying film-building coatings, including inorganic zinc high-build coatings. When constructing new vessels, there may be a need to remove areas of weld-through preconstruction primer due to surface damage or contamination prior to application of film-building coatings.
Maximum allowable thinning rates as a function of as-supplied VOC content and thinner density.\textsuperscript{a,b}

\textsuperscript{a} These graphs represent maximum allowable thinning ratios for general use coatings without water or exempt compounds.

\textsuperscript{b} The average density of the volatiles in the coating was assumed = 840 g solvent/L solvent.
Appendix D

VOC Data Sheet: Properties of the Coating "As Supplied" by the Manufacturer

Coating Manufacturer:

Coating Identification:

Batch Identification:

Supplied To:

Properties of the coating as supplied to the customer:
A. Coating Density: \( D_{w} \) g/L
   [ ] ASTM D1475-90* [ ] Other
B. Total Volatiles: \( m_{v} \) Mass Percent
   [ ] ASTM D2369-93* [ ] Other
C. Water Content: 1. (m,w) Mass Percent
   [ ] ASTM D3792-91* [ ] ASTM D4017-90* [ ] Other
2. \( v_{w} \) Volume Percent
   [ ] Calculated [ ] Other
D. Organic Volatiles: \( m_{o} \) Mass Percent
   [ ] Calculated [ ] Other
E. Nonvolatiles: \( v_{n} \) Volume Percent
   [ ] Calculated [ ] Other
F. VOC Content (VOC):
1. _____ g/L solids (nonvolatiles)
2. _____ g/L coating (less water and exempt compounds)

G. Thinner Density: \( D_{t} \) g/L

ASTM [ ] Other

Air Quality Criteria for Ozone and Related Photochemical Oxidants

AGENCY: Environmental Protection Agency.

ACTION: Notice of availability.

SUMMARY: This notice announces the availability of a final report titled, Air Quality Criteria for Ozone and Related Photochemical Oxidants, Volumes I, II, and III (EPA/600/P-93/004A, b, c, e, f), prepared by the U.S. Environmental Protection Agency's (EPA) Office of Research and Development (ORD). This document evaluates the latest scientific information pertaining to health and environmental effects associated with ozone and related photochemical oxidants.

DATES: On June 12, 1996, ORD transmitted the final document to the EPA Office of Air and Radiation. ORD thereby completed a criteria document preparation, comment, revision, and approval cycle beginning with the call for information of August 27, 1992 (57 FR 38832).

ADDRESSSES: Interested parties can obtain a single bound copy of the final Air Quality Criteria Document for Ozone and Related Photochemical Oxidants by contacting the ORD Publications Office, Technology Transfer and Support Division, National Risk Management Research Laboratory, U.S. Environmental Protection Agency, 26 W. Martin Luther King Drive, Cincinnati, OH 45268; telephone: (513) 569-7562; facsimile: (513) 569-7566. Please provide your name and mailing address, and request the three-volume document by the title and EPA document number (EPA/600/P-93/004A-cf). A limited number of paper copies will be available from the above source. After the supply is exhausted, copies of the Ozone document can be purchased from the National Technical Information Service (NTIS) by calling (703) 487-4650 or sending a facsimile to (703) 321-8547. The NTIS order numbers for the Air Quality Criteria for Ozone and Related Photochemical Oxidants are: Vol. I of III (PB96-185582), Vol. II of III (PB96-185590), Vol. III of III (PB96-185608), and for the three-volume set (PB96-185574).

The Executive Summary of the Air Quality Criteria Document for Ozone will be available via the Internet on the ORD Home Page (http://www.epa.gov/ORD). Interested parties also can access the Executive Summary of the Ozone Air Quality Criteria Document electronically on the Agency's Office of Air Quality Planning and Standards' (OAPQS) Technology Transfer Network (TTN) Bulletin Board System (BBS). The telephone number for the TTN BBS is (919) 541-5742. To access the bulletin board, a modem and communications software are necessary. The following parameters on the communications software are required: Data Bits—8; Parity—None; and Stop Bits—1. The Executive Summary will be located on the Clean Air Act Amendments BBS, under Title I, Policy/Guidance documents. If assistance is needed in accessing the system, call the help desk at (919) 541-5384 in Research Triangle Park, NC. A copy of the complete report is also available for public inspection at the EPA Air Docket and at the EPA Library, both at EPA Headquarters, Waterside Mall, 401 M Street, SW, Washington, D.C. EPA Air Docket hours, in Room M1500 of Waterside Mall, are 8:00 a.m. to 5:30 p.m., Monday through Friday, excluding Federal holidays. EPA Library hours are from 10:00 a.m. until 2:00 p.m., Monday through Friday, excluding Federal holidays.

FOR FURTHER INFORMATION CONTACT:
James Raub, National Center for Environmental Assessment (MD-52), U.S. Environmental Protection Agency, Research Triangle Park, NC 27711; telephone: (919) 541-4157; facsimile: (919) 541-1818; e-mail: raub.james@epamail.epa.gov.

SUPPLEMENTARY INFORMATION: Sections 108 and 109 of the Clean Air Act (CAA) govern the establishment, review, and revision of National Ambient Air Quality Standards (NAAQS). Section 108 directs the Administrator of the U.S. Environmental Protection Agency (EPA) to list pollutants that may reasonably be anticipated to endanger public health or welfare and to issue air quality criteria for them. The air quality criteria are to reflect the latest scientific information useful in indicating the kind and extent of all effects on public health and welfare that may be expected from the presence of the pollutant in ambient air. In keeping with these CAA mandates, this document evaluates the latest scientific information useful in deriving criteria to form scientific bases for decisions regarding possible revision of current Ozone NAAQS.

Dated: August 7, 1996.

Joseph K. Alexander,
Acting Assistant Administrator for Research and Development.

FEDERAL EMERGENCY MANAGEMENT AGENCY

Agency Information Collection Activities: Submission for OMB Review; Comment Request

SUMMARY: The Federal Emergency Management Agency has submitted the following proposed information collection to the Office of Management and Budget for review and clearance in accordance with the requirements of the Paperwork Reduction Act of 1995 (44 U.S.C. 3507(a)(1)).

Title: Community Rating System (CRS) Program—Application Worksheets and Commentary and NFIP Repetitive Loss Correction Worksheet.

FEMA Form: 81-83, NFIP Repetitive Loss Correction Worksheet.
