

DEPARTMENT OF ENVIRONMENTAL PROTECTION
Office of Oil and Gas Management

DOCUMENT NUMBER: 800-0810-001

TITLE: Guidelines for Implementing Area of Review (AOR) Regulatory Requirement for Unconventional Wells

EFFECTIVE DATE: October 8, 2016

AUTHORITY: 2012 Oil and Gas Act (58 Pa. C.S. § 3201 *et seq.*), Clean Streams Law (35 P.S. § 691.1 *et seq.*), 25 Pa. Code §§ 78a.52a and 78a.73

POLICY: *Unconventional well operators* conducting *hydraulic fracturing* activities should follow this policy to minimize the likelihood of *communication incidents* and to ensure protection of public health, public safety and the environment.

PURPOSE: The purpose of this guidance is to inform those engaged in *hydraulic fracturing* activities how to comply with the requirements of The Clean Streams Law, the 2012 Oil and Gas Act, 25 Pa. Code Chapter 78a, and other applicable laws. This policy is developed to facilitate appropriate risk mitigation for *unconventional well operators* and includes a risk-based classification scheme for *offset well* locations and commensurate levels of monitoring; sections addressing *communication incident* management, reporting, and resolution; and operational alternatives and technical considerations for different anticipated scenarios. This policy also provides an outline of the Department of Environment Protection's (Department or DEP) well adoption permitting process.

APPLICABILITY: This Policy applies to *operators* conducting *hydraulic fracturing* activities at *unconventional wells* in the Commonwealth of Pennsylvania.

DISCLAIMER: The policies and procedures outlined in this guidance document are intended to supplement existing requirements. Nothing in the policies or procedures will affect regulatory requirements.

The policies and procedures herein are not an adjudication or a regulation. There is no intent on the part of the Department to give these rules that weight or deference. This document establishes the framework, within which DEP will exercise its administrative discretion in the future. DEP reserves the discretion to deviate from this policy statement if circumstances warrant.

PAGE LENGTH: 48

I. INTRODUCTION

Hydraulic fracturing is a technical procedure utilized by the oil and gas industry to break down rock and extend and prop open fractures in hydrocarbon reservoirs in order to increase oil and gas recovery. It involves the application of surface and hydrostatic pressures that combine to generate bottom hole pressures in excess of rock strength and, thus, fracture the rock. Subsequent to this, emplacement of materials known as proppants occurs to prevent fracture closure after treatment pressure is reduced. Due to the character of the oil and gas reservoirs in Pennsylvania, *hydraulic fracturing* is necessary at most wells to produce commercial quantities of hydrocarbons.

When oil- or gas-bearing reservoirs are vertically isolated from shallower, freshwater aquifers serving as sources of drinking water by adequate intervening rock layers, *hydraulic fracturing* can be utilized with negligible risk to waters of the Commonwealth. However, when other wells penetrate the *zone of hydraulic fracturing influence*, they increase risk by serving as potential conduits to the surface and shallow subsurface. Properly plugged or equipped operating wells notably lessen this risk.

The Area of Review (AOR) regulations of Chapter 78a, found in sections 78a.52a and 78a.73, provide the assessment, reporting, monitoring and incident resolution requirements established to appropriately address risks associated with *hydraulic fracturing* communications. This document provides further clarification related to those sections of the regulations. Wherever possible, materials are sequenced chronologically from an operational perspective.

II. DEFINITIONS

This section of the document provides the Department of Environmental Protection's (DEP) interpretations of terms used in sections 78a.52a and 78a.73 and utilized throughout the document. Many of these terms have context-specific meanings and the definitions are, therefore, provided for clarity related to specific regulatory requirements. This section also includes definitions from the 2012 Oil and Gas Act and 25 Pa. Code Chapter 78a for reference. Note that the terms defined in this section are italicized throughout the document.

Abandoned well – As defined in Section 3203 of the 2012 Oil and Gas Act (58 Pa.C.S. § 3203).

Active well – For the purposes of this policy, a well:

- (1) That is designed to be capable of flowing or producing hydrocarbons into a metered gathering system, for commercial purposes; or one which is designed to provide natural gas for the purposes of supplying a domestic or commercial property. Both uses defined may apply at a single well.
- (2) That has been assigned a permit or registration number by the state of Pennsylvania and has not been designated a status of *Inactive*, *Orphan*, *Abandoned*, or *Plugged and Abandoned*.
- (3) That for the purposes of notification of adjacent *operators*, is being drilled or stimulated if it is determined that it penetrates or is likely to penetrate the zone of influence of the *hydraulic fracturing* activity.
- (4) That penetrates below the typically recognized freshwater zone, including gas storage wells, injection wells used for secondary recovery and disposal wells.

- (5) That meet criteria (1), (2) or (3) and has not been permitted or registered by the state of Pennsylvania.

Bottom hole location – GPS coordinates of the deepest penetration of the well (decimal degrees) for a vertical well, i.e., *GPS coordinates* of surface hole location; and depth below the last measured *GPS coordinate* pair equivalent surface location for an intentionally deviated or horizontal well. All coordinate data should reference the NAD 83 geodetic reference system.

Closest approach – The point or points along the length of a lateral (horizontal) well bore that potentially fall within the AOR radius (1,000 feet) of an *offset well*.

Communication incident – A transfer of measurable pressure or fluid flow from a well undergoing *hydraulic fracturing* to an *offset well* that is reportable in accordance with this policy. In certain cases, the referenced transfer of pressure or fluid may be evidenced at the well undergoing *hydraulic fracturing*.

GPS (global positioning system) coordinates – A satellite-based positioning system that provides detailed coordinate data, i.e., latitude and longitude. It is composed of user, control, and satellite segments, and allows precise position location quickly and with high accuracy (adapted from Bolstad, 2008). GPS utilizes a worldwide common grid that is easily converted to any local grid, is passive in all-weather operations, gives continuous real-time information, and is capable of supporting an unlimited number of users and areas (adapted from U.S. Air Force, 2016). The accuracy of coordinates provided by any GPS should be compliant with DEP’s “Oil and Gas Locational Guidance” (Document Number: 550-2100-009) (+/- 10m) for wells that require *visual monitoring* at the *offset well* location as part of the AOR regulation. It is acceptable to collect locational information using standard surveying techniques. For wells in the area of review depicted on the submitted plat, *GPS coordinates* may be derived from a separate source such as on-file permits or available databases and do not need to be field-verified or compliant with DEP’s “Oil and Gas Locational Guidance”. All coordinate data should reference the NAD 83 geodetic reference system. Note that older locational references relying on the NAD 27 geodetic reference system may result in locational discrepancies.

Hydraulic fracturing/hydraulically fractured – Injecting fracturing fluids into the target formation at a force exceeding the parting pressure of the rock, thus inducing fractures through which oil or gas can flow to the well bore (adapted from API Guidance Document HF3, 2011).

Inactive well – A well granted Inactive Status by DEP pursuant to Section 3214 of the 2012 Oil and Gas Act (58 Pa.C.S. § 3214).

Landowner – For the purposes of this policy, any owner that has a right or interest in a surface estate. In certain cases, this owner may also have rights or interests in the mineral estate or oil and gas rights.

Offset well – Any *Active, Inactive, Orphan, Abandoned* or *Plugged and Abandoned* well surrounding a well that is undergoing *hydraulic fracturing*.

Orphan well – As defined in Section 3203 of the 2012 Oil and Gas Act (58 Pa.C.S. § 3203).

Owner (of a well) – As defined in Section 3203 of the 2012 Oil and Gas Act (58 Pa.C.S. § 32031 et seq.). *Owner* does not include owners or possessors of surface real estate property on which an *abandoned well* is located who did not participate or incur costs in the drilling/extraction operation of the *abandoned well* and has no right of control over the drilling/extraction operation of the *abandoned well*. An *owner* is not necessarily the same individual as the *Responsible Party/Operator* (see definition that follows), but is understood to be the person who has legal access to the well, and legal rights to any economic benefit, i.e. production, from the well.

Remote Terminal Unit (RTU) – In SCADA (Supervisory Control And Data Acquisition) systems, a device installed at a remote location that collects data, codes the data into a format that is transmittable and transmits the data back to a central station, or master. A *RTU* also collects information from the master device and implements processes that are directed by the master. *RTUs* are equipped with input channels for sensing or metering; output channels for control, indication or alarms; and a communications port.

Responsible Party/Operator – The person designated as the well *operator* or *operator* (as defined by Section 3203 the 2012 Oil and Gas Act (58 Pa.C.S. § 3203)) on the permit application or well registration, *i.e.*, the permit holder. Where a permit or registration was not issued, the term means any person who locates, drills, operates, alters or plugs any well or reconditions any well with the purpose of production therefrom. In cases where a well is used in connection with the underground storage of gas, the term also means a “storage *operator*.” Simply “locating” a well without the purpose of producing it does not assign *responsible party* status to an *operator* developing an area. The *responsible party* for the condition and maintenance of a well is assumed to be equivalent to the *operator*, but could also be the *owner* in the case where the two are not the same.

True vertical depth/True bottom hole depth – For the purposes of the AOR regulations, these terms should be considered to be equivalent. *True bottom hole depth* is defined to be the best available estimate of the depth in feet below the surface hole location for the deepest penetration point of the well, either as reported in available records, or representing a best technical estimate provided by the *operator* in consideration of development history in the state in the area of activity. For an intentionally deviated well, this is the depth below the x-y equivalent surface location of the deepest penetration point.

Unconventional formation – As defined in Section 3203 of the 2012 Oil and Gas Act (58 Pa.C.S. § 3203).

Unconventional well – A bore hole drilled or being drilled for the purpose of or to be used for the production of natural gas from an *unconventional formation* (as defined by Section 3203 of the 2012 Oil and Gas Act(58 Pa.C.S. § 3203).

Visual monitoring – Verification at the location on the ground that is the identified site of a well bore requiring monitoring or some other feature that would require such monitoring. Eye contact or instrumentation are both suitable mechanisms for completing *visual monitoring* and “visual” inspections may be completed at a time interval that is respective of how well the site requiring monitoring is secured and the risk the monitored site poses.

Well control incident/loss of well control – A scenario where the treatment pressure, producing pressure, and/or annular pressure of the well being treated or any *offset well* deviates from

anticipated pressures in a manner that indicates mechanical integrity has been compromised and continued operations pose a risk to personnel safety, equipment integrity, or the environment (adapted from API RP 100-1, 9.4.5, 2015). This definition also includes any situations where a *communication incident* requires mobilization of specialized equipment to enter an *offset well* under pressure in order to circulate out a kick.

Zone of hydraulic fracturing influence – A vertical buffer distance referencing upward or downward offsets from notch or perforation elevations in order to define what *offset wells* falling in the AOR have the highest potential to be communicated with during *hydraulic fracturing* activities. For this evaluation the *zone of hydraulic fracturing influence* is a function of perforation elevation and is set at +/- 1,500 feet for all *unconventional wells*.

III. AOR GEOMETRY

Sections 78a.52a. and 78a.73 require an *operator* of *unconventional wells* to identify wells within a specific area, execute monitoring at a subset of those wells having certain penetration depths, and submit a report and accompanying plat to DEP containing the information required by section 78a.52a(c) 30 days prior to drilling the well, or at the time the permit application is submitted if drilling is planned less than 30 days after permit issuance. These areas and penetration depths are a function of the well attributes that is the subject of the area of review, *i.e.*, the well that will be stimulated using *hydraulic fracturing*.

For horizontal and vertical *unconventional wells*, survey distances reference the plan view projection of the well bore path and are set at 1,000 feet in all directions surrounding it. The well bore path in plan view for vertical wells is the surface hole location. See 25 Pa. Code § 78a.52a(a).

True vertical depths of *offset wells* determine notification responsibilities and whether or not wells located within the AOR must be visually monitored during *hydraulic fracturing* activities. Vertical buffer distances, referencing perforation elevations for cased hole completions are established at +/- 1,500 feet for all *unconventional wells*. See 25 Pa. Code § 78a.73(c).

Schematics depicting AOR geometries are included in Appendix A.

IV. REFERENCE MATERIAL REVIEW

Section 78a.52a(b)(1)–(2) provides that *operators* must identify *offset wells* within the AOR by (1) conducting a review of DEP’s well databases and other available well databases and (2) conduct a review of historical sources of information, such as applicable farmlines maps, where accessible. Numerous sources of information are available for determining the locations of *offset wells* falling within the AOR.

DEP has identified several well databases and historical sources of information to ensure compliance with the identification requirements in section 78a.52a(b)(1)-(2). In some cases, a thorough field survey may represent better way to identify *offset wells* than a database review, though it is not a requirement. As *operators* locate *offset wells* included in the AOR report

deliverables package in the field, DEP will review and verify this information, as resources allow; make necessary corrections; and add previously unidentified wells to its own databases.

Table 1 lists sources for reference when completing the AOR survey. With the exception of the required sources shaded in red, discretion may be applied by the *operator* to arrive at a final conclusion regarding which reference sources may be most useful for assessing their site.

Table 2 provides additional pay-for-service sources that may be useful when completing the AOR survey. Note that accessing these additional reference materials is not a regulatory requirement and that the compilation is provided for informational purposes only.

A. Reference Material Requirements Checklist

- Review list of reference materials in Table 1 and the associated Map Indices in Appendix B. Apply professional discretion to determine which reference materials should be used to locate *offset wells* at your site, keeping in mind that the DEP Oil and Gas Map (or associated databases) and DCNR Open File Report OFOG 15 01.2 (Map 10) ~~must~~ *should* always be consulted for any portions of the AOR not surveyed on foot – these sources are shaded in red.
- Construct a table of well locations by status and list the reference material source used to identify each well.
- Determine which wells will require monitoring, i.e., which wells penetrate the *zone of hydraulic fracturing influence*?
- Indicate which wells in the AOR will require notification of adjacent *operators*.

Table 1. List of Publicly Available Reference Materials

Note that not all sources provide statewide coverage and professional judgment should be applied to determine which sources are appropriate for the site being assessed. A thorough field survey is recommended in certain cases.

Source	Geographic Area of Applicability	Location	Comments	Instructions for Use
County/Local Historical Societies	Statewide	Establish local contacts through various mechanisms	These organizations often archive historical maps which may be inclusive of oil and gas well locations	Find contact information and call organization to determine if any sources are available for review.
DCNR BTGS Reports and Publications	Limited Geographic Extent	http://www.gis.dcnr.state.pa.us/geology/index.html Also see Map Index in Appendix B and Pennsylvania Geological Survey Publications (ZIP) at this location: http://www.dcnr.pa.gov/Geology/PublicationsAndData/Pages/default.aspx	Reports and other publications with maps depicting oil and gas well locations associated with different fields throughout the commonwealth	Navigate to PaGEODE website and search for reports by quadrangle. Compare to Appendix B to determine which reports cover oil and gas topics and download applicable reports for review or visit BTGS in Pittsburgh to review report. The “Stratigraphic Units” table included in OFOG 07-01.3 may also be a useful reference.
DCNR BTGS Farmline Maps	Limited Geographic Extent	See Map Index in Appendix B	Farmline map collection willed to Bureau of Topographic and Geologic Survey by Equitable	Reference Appendix B to determine if maps are available that cover drilling site and consult BTGS to review maps.
DEP Oil and Gas Map ¹	Statewide	http://www.depgis.state.pa.us/PaOilAndGasMapping/	Web-based GIS for mapping wells throughout the state; note that this source of locational information does not cover the commonwealth’s entire development history and locational discrepancies may exist	Navigate to area of operation and select well by status to view locations. Note that this information can also be downloaded in tabular format from DEP’s website: http://www.dep.pa.gov/DataandTools/Reports/Oil%20and%20Gas%20Reports/Pages/default.aspx

Source	Geographic Area of Applicability	Location	Comments	Instructions for Use
DEP Production Reporting	Statewide	https://www.paoilandgasreporting.state.pa.us/publicreports/Modules/Welcome/Agreement.aspx	Most useful in situations where adjacent <i>operator</i> cannot be successfully contacted using available DEP address, as sometimes other companies report production on behalf of the <i>operator</i> and may be able to provide updated contact information	Search for well using API #. Contact DEP (717.772.2199) to determine who reported production for the well in question.
DEP Spud Report ¹	Statewide	http://www.depreportingservices.state.pa.us/ReportServer/Pages/ReportViewer.aspx?/Oil_Gas/Spud_External_Data	For wells in process of being drilled that have not yet been input in eFACTS or EDWIN	Use option for querying by location, i.e., query by municipality to determine what wells may be in process of being drilled or what wells have been drilled but not entered into eFACTS.
PASDA Historic Wells and Mine Map Atlas	Limited Geographic Extent	http://www.pasda.psu.edu/	This currently includes wells that were digitized from analog source maps (WPA and K-sheet/H-sheet mine map series) by DEP and wells located in the footprint of historic coal mines (Mine Map Atlas); this is not a comprehensive compilation and is subject to updates	In the “Data Search” box in the upper right corner of the main website, search for “historic wells.” Click on the title and then click preview data to see locations in map form or to download a scanned map. The mine Map Atlas link is on main PASDA Page.
Penn Pilot	Statewide	http://www.pennpilot.psu.edu/	Archive of historical aerial imagery	Input address or coordinates to download associated aerial images. Options include filtering on location and image era. Images from the 1930s to 1970s are available.
The National Map	Statewide	http://viewer.nationalmap.gov/viewer/	Archive of current USGS topographic maps	Input address or coordinates and select “Other Featured Data” to view available topographic maps.

Source	Geographic Area of Applicability	Location	Comments	Instructions for Use
USGS Historical Topographic Map Explorer	Statewide	http://historicalmaps.arcgis.com/usgs/	Archive of current and historic USGS topographic maps	Input address or coordinates to review available historical topographic maps for the site. Maps from late 1800s to 1980s are available.
Google Earth Pro	Statewide	https://www.google.com/earth/	Aerial imagery dating back 1990s	After downloading free software, input address or coordinates to review available historical aerial imagery for the site.
USGS Reports and Publications	Limited Geographic Extent	http://energy.usgs.gov/RegionalStudies/AppalachianBasin.aspx	Archive of open-file reports discussing development histories in various portions of Appalachian basin	Compare to Appendix B to determine which reports cover oil and gas topics and visit BTGS in Pittsburgh to review report.
Industry Historic Map Inventory	Limited Geographic Extent	Various	Any maps in the possession of the <i>operator</i> completing <i>hydraulic fracturing</i>	Review available maps.
DCNR Open File Report OFOG 15-01.2 (Map 10) ¹	Statewide	http://dcnr.state.pa.us/topogeo/publications/pgspub/openfile/index.htm	GIS layer that provides compilation of oil and gas well depths in Pennsylvania	Download Open File Report files from DCNR website and import shapefiles into GIS

¹Indicates required reference source ~~recommended~~ for every AOR analysis (also shaded red).

V. LANDOWNER COORDINATION/SURFACE ACCESS

In addition to reviewing databases and historical sources to identify *offset wells* in section 78a.52a(b)(1)–(2), section 78a.52a(b)(3) requires the *operator* to submit a questionnaire by certified mail on forms provided by DEP to *landowners* whose property is within the AOR. The intent of this questionnaire is to solicit information regarding the precise location of *offset wells* on their property. Section 78a.52a(c) requires the *operator* to provide proof that the *operator* submitted questionnaires to those applicable landowners. This regulatory process is also critical for coordinating surface access to locate any wells in the field that the *operator* is responsible for monitoring. Note also that section 3213(a.1) of the 2012 Oil and Gas Act (58 Pa.C.S. § 3213(a.1)) requires *operators* to identify *abandoned wells* on leased or purchased properties to DEP within 60 days of discovery.

All information gathered as part of *landowner* surveys conducted in accordance with section 78a.52a(b)(3) may be cataloged for reuse by the *operator* for up to three (3) years from the date surveying of the parcel was completed. With approval from DEP, information gathered using the development plan option described below may be referenced for an additional two (2) years for a total of five (5) years from the date of collection. Information collected is transferrable to other *operators* who may acquire a lease in situations when the original, documented survey results are provided to the new *operator*. Finally, there is nothing preventing an *operator* from surveying an area larger than the AOR prescribed in the section 78a.52a(a).

A. Use of DEP Landowner Survey Form

In accordance with section 78a.52a(b)(3), DEP developed a form for completing the required *landowner* surveys: 8000-PM-OOGM0148U. This form must be sent via certified mail, as defined in section 78a.1, to all *landowners* whose property is within the established AOR. DEP recommends that operators include a reference map with the form to best assist the *landowner* in determining whether or not wells they are aware of fall within the AOR. The form should be mailed to the person identified in courthouse records of the county who is designated to receive tax notices for the surface tax parcel, although this person may appoint a local designee. If more than one tax parcel within the prescribed AOR radius is registered to the same individual, multiple tax parcels can be included on a single form. Multiple proposed *unconventional* drilling locations may also be referenced on a single form. This is most relevant in situations when a *landowner* owns a large parcel or when a single parcel contains all wellbores for a multi-well pad.

The instructions accompanying the form request that a *landowner* or the landowner's designee should complete and return the form to the *operator* within ten (10) business days of receipt. It is not required that certified mail receipts or completed forms be sent to DEP along with the AOR deliverables package, but the process must be verified by the *operator* completing the AOR report form. DEP recommends that all certified mail receipts and completed questionnaires be retained by the *operator* for five (5) years following the completion of *hydraulic fracturing* activities as documentation that the regulatory requirements were satisfied. This may also facilitate the transfer of *landowner* survey information to other *operators*.

As part of the survey, *landowners* are asked to provide documentation of any wells they are aware of on their property. Documentation may be in the form of pictures (physical

evidence) or records (historic maps, well records, etc.). *Landowners* are also asked if they would be willing to share documentation concerning any wells with *operators* and allow the *operator* access to their property to evaluate any identified wells, including those known by the *landowner* and any wells the *operator* may have become aware of through analysis of available reference materials.

DEP does not expect *operators* to access wells under any of the following scenarios:

- (1) The *landowner* does not complete the questionnaire within a reasonable timeframe or at all.
- (2) The *landowner* does not acknowledge that any physical evidence of a well's presence exists nor do they indicate that they have any official records documenting the presence of a well.
- (3) The *landowner* claims they have physical evidence or official records documenting the presence of wells on their property but is unwilling to share such information with the *operator*.
- (4) The *landowner* will not grant access to the *operator*.
- (5) Research completed by the *operator* and documented along with the AOR report deliverables indicates that any wells that may be present on the *landowner's* property are not likely to penetrate within the *zone of hydraulic fracturing influence* and the *landowner* has not provided any information that would call into question the validity of this determination.

B. Use of Development Plan Form

Under the following scenarios, operators may want to use the [Development Plan form](#) to help fulfill requirements of section 78a.52a(b)(3):

- (1) An *operator* has a lease agreement with a state or federal agency or a working access agreement with the agency in cases where oil and gas rights are severed from surface rights, e.g., DCNR, USFS, PGC, etc.).
- (2) An *operator* is dealing with one or several large *landowners*.
- (3) An *operator* is looking to evaluate large tracts of land (possibly with numerous surface *landowners*) in preparation for significant exploration efforts and to complete due-diligence assessments prior to finalizing site construction, drilling, and *hydraulic fracturing*.

The [Development Plan form](#) and accompanying instructions (8000-PM-OOGM0147U) are accessible from DEP's website and may be utilized for coordinating with *landowners* and identifying *offset wells* under the development plan option. The form allows the *operator* to maintain an electronic tabular summary of parcels associated with multiple well locations. Because this process potentially covers much larger areas of development, it necessarily requires more lead time/earlier coordination with *landowners*. The standard form (8000-PM-OOGM0148U) must be used to facilitate the collection of information under the development plan option per the regulatory requirements of section 78a.52a(b)(3), unless an alternative is approved by DEP. *Operators* choosing the development plan option should allow for up to 30 business days for receipt of responses

and may request approval from DEP to extend the reference period up to a maximum of five (5) years for any single well location.

DEP recommends that information used to complete the *landowner* survey (questionnaires, certified mail receipts, etc.) be retained by the *operator* for five (5) years following the completion of *hydraulic fracturing* activities as documentation that the regulatory requirements of section 78a.52a(b)(3) were satisfied. Retaining the questionnaire and certified mail receipts may also facilitate the transfer of survey information to other *operators*.

C. Land Management Agency/Commission Contacts

In situations where a government agency or commission serves as the *landowner*, *operators* should use the following contact information to best coordinate *landowner* surveying activities.

- (1) PA Fish & Boat Commission
Property Services Chief/Real Estate Chief
~~595 Rolling Ridge Drive~~~~450 Robinson Lane~~
Bellefonte, PA 1682327
814-359-5221, ~~or~~ 814-359-5108, or 814-359-5149
RA-fbpropertyservice@pa.gov

D. Landowner Coordination Requirements Checklist

- Have all parcels in the AOR been identified and have addresses been determined for each *landowner*?
- Have *landowner* questionnaires been submitted to each property owner in the AOR?
- Were *landowner* questionnaires submitted via certified mail?
- Is it necessary to schedule site visits to inspect any alleged wells or wells identified by the *operator* through the database or historic source review?
 - The *landowner* has completed and returned the questionnaire within a reasonable time.
 - The *landowner* has acknowledged that physical evidence of a well's presence exists or indicated that they have official records documenting the presence of a well and is willing to share this information.
 - The *landowner* has agreed to grant access to the *operator*.
 - Research completed by the *operator* and documented along with the AOR report deliverables indicates that at least one well present on the *landowner's* property is likely to penetrate within the *zone of hydraulic fracturing influence* or the *landowner* has provided information that at least one well on their property is likely to penetrate the *zone of hydraulic fracturing influence*

E. Other Possible Considerations

- Were site maps included with each *landowner* questionnaire?
- Have returned questionnaires, certified mailing receipts, and other forms of documentation been placed in a file that has a retention schedule of five (5) years following the completion of *hydraulic fracturing* activities?
- Has the *operator* determined that it will be important to document conditions at wells on a *landowner's* property prior to *hydraulic fracturing* activities even in a situation where communication risks are low, i.e., is there concern that a false claim regarding a *communication incident* may be filed?
- Is a plan in place for attempting to re-contact unresponsive *landowners* in areas where communication risks are elevated?
- Have risk mitigation strategies been fully evaluated in situations where a *landowner* has not been cooperative? Such strategies may include revising/eliminating *hydraulic fracturing* stages or redirecting the targeted well bore path for horizontal *unconventional wells*, moving the well location an appropriate distance from the *offset well*, and/or completing visual observations from a distance.

VI. ADJACENT OPERATOR COORDINATION

Section 78a.73(c) requires *operators* completing *hydraulic fracturing* activities to notify adjacent *operators* with *offset wells* that penetrate the *zone of hydraulic fracturing influence*. This section

explains the level of coordination that should take place between *operators* to mitigate risk and ensure the integrity, safety, and continued viability of assets.

A. Wells Within the AOR

After defining the AOR and prior to drilling, the *operator* should contact all adjacent *operators* who are responsible for *active, inactive, abandoned, and plugged and abandoned wells* in situations when the intended zone of completion (proposed perforation elevations) for the planned well is within +/-1,500 feet of any portion of any *offset well* bore path intersecting the AOR.

In accordance with section 78a.73(c), adjacent *operators* whose wells fall within the AOR shall be notified of intended operations at least 30 days in advance of the anticipated spud date, or at the time the well drilling permit is submitted if it is expected that the well will be spud within 30 days of permit issuance. Wells in the process of being drilled or stimulated are classified as *active* if the definition in this policy is satisfied and must be considered during the analysis. *Operators* are also expected to coordinate notification and monitoring activities within different business units of their own companies.

DEP's Well Inventory Report serves as the resource identifying the most up-to-date contact information for *operators* in the state and can be accessed from the agency's reporting page. *Operators* intending to complete *hydraulic fracturing* activities should maintain documentation of attempts to contact adjacent *operators* for up to five (5) years following well completion.

B. Adjacent Operator Coordination Requirements Checklist

- Has notification been provided to *operators* with *offset wells* within the AOR at least 30 days prior to anticipated well spud?
- Has notification to different business units, e.g., drilling, completions, operations been provided within the company intending to conduct *hydraulic fracturing* activities?
- Has the *hydraulic fracturing* operations team been briefed about actions that should be taken when notified by an adjacent *operator* about a confirmed *communication incident*?

C. Other Possible Considerations

- Are coordinated monitoring efforts with the adjacent *operator* needed in consideration of the communication risk at the location?
- Have communication protocols for implementation during *hydraulic fracturing* activities, including timely notification in the event of an unintended communication, been established with the adjacent *operator*?
- Has the subject of workover procedures been discussed with the adjacent *operator*, including scenarios where well work may be necessary to ensure mechanical integrity and/or environmental protection standards? Has it been determined who may assume financial responsibility for such work and the legal mechanisms for moving forward with adequate liability protection?

- Have risk mitigation strategies been fully evaluated in situations where an adjacent *operator* has not been cooperative? Such strategies may include revising/eliminating *hydraulic fracturing* stages or redirecting the targeted well bore path for horizontal *unconventional wells*, moving the well location an appropriate distance from the *offset well*, and/or completing visual observations from a distance.
- Have all correspondence or attempts to communicate with the adjacent *operator* been adequately documented and archived in a file with a retention schedule of five (5) years?

VII. WELL MONITORING

A. Hydraulic Fracturing Communication Risks and Monitoring Levels

Section 78a.73(c) requires *operators* to visually monitor *offset wells* during stimulation activities that penetrate within 1,500 feet measured vertically from the stimulation perforations or have an unknown true vertical depth. Not all *offset wells* penetrating the *zone of hydraulic fracturing influence* pose the same level of risk. An assessment of historical data and *communication incidents* supports the concept that communication risks are a function of several different variables including *offset well* location, depth, construction details, age, and status. Several of these variables are interrelated, making it possible to further simplify the risk-characterization model. For this reason, there are several options available for the *operator* to meet the monitoring requirements in section 78a.73(c) based on the risk-classification criteria described below.

Key risk-classification criteria are:

- (1) Character of the *hydraulic fracturing* activity.
- (2) Character and location of wells in the AOR.

A generalized risk-classification scheme is presented in the figures that follow. Figure 1 categorizes the potential for impact as a function of reservoir thickness and offset distance between the stimulated wells and surrounding wells falling within the AOR.

TableFigure 32 considers the character of the wells within the AOR.

Figure 1: Conceptual Model of Impact Potential

Conceptual model characterizing impact potential based on treatment volume (reservoir thickness) and offset distance for wells within the AOR.

Table 3Figure 2: Risk Characterization at Offset Wells

Description	General Risk Level
Wells within AOR which do not penetrate the <i>zone of hydraulic fracturing influence</i>	NEGLIGIBLE
Wells inside AOR which penetrate the <i>zone of hydraulic fracturing influence</i>	
<i>Active wells</i> being drilled	LOWER
<i>Active wells</i> in production/ <i>inactive wells</i>	
<i>Zone of hydraulic fracturing influence/pressure isolation is verified</i>	LOWER
Lack of <i>zone of hydraulic fracturing influence/pressure isolation</i>	HIGHER
Plugged and/or <i>abandoned wells</i>	
Well plugged in accordance with current regulations and laws	LOWER
Well plugged prior to passage of Act 223 (1984 Oil and Gas Act)	MODERATE
Well plugged prior to permitting era (1956)	HIGHER
Well on DEP's orphan and abandoned list	HIGHER
<i>Abandoned well</i> for which plugging status is unknown	HIGHER

Characterization of risk associated with *offset wells* within the AOR that penetrate the *zone of hydraulic fracturing influence* and *offset wells* within the AOR which do not penetrate the *zone of hydraulic fracturing influence*. Note that site-specific well plugging methodologies may have significant influence on the portion of the classification scheme related to plugged and/or *abandoned wells*. Specifically, the general risk level may be significantly different for wells plugged to attainable bottom or to 200 feet below a local, workable coal seam as opposed to total depth.

Suggested levels of monitoring are established in [TableFigure 43](#). Scenarios requiring adjacent *operator* notification, as specified in section 78a.73(c), are also summarized for reference. Finally, general monitoring/risk mitigation options are described. It is important to note that no accurate historical records of *hydraulic fracturing communication incidents* have been kept. Because of this, the suggested monitoring levels are not quantitative and instead represent relative levels of perceived risk.

Table 4Figure 3: Suggested Monitoring Levels, Notification Responsibilities, and Monitoring/Risk Mitigation Options

Description	General Risk Level or Suggested Monitoring Level	Monitoring/Risk Mitigation Options
Wells within AOR which do not penetrate the <i>zone of hydraulic fracturing influence</i>	(NEGLIGIBLE)	NONE
Wells inside AOR which penetrate the <i>zone of hydraulic fracturing influence</i>		
<i>Active wells</i> being drilled	(LOW)	NOTIFICATION ONLY
<i>Active wells</i> in production/ <i>inactive wells</i>		
<i>Zone of hydraulic fracturing influence</i> /pressure isolation is verified	(LOW)	NOTIFICATION ONLY
Lack of <i>zone of hydraulic fracturing influence</i> /pressure isolation	(HIGH)	NOTIFICATION ONLY
<i>Active wells</i> in production or being drilled/ <i>inactive wells</i> (adjacent operator)	(LOW)	NOTIFICATION ONLY
Plugged and/or abandoned wells		
<i>Abandoned well</i> (adjacent operator)	(LOW)	NOTIFICATION ONLY
Well plugged in accordance with current regulations and laws	LOW	CHECK DURING AND POST-HYDRAULIC FRACTURING
Well plugged prior to passage of Act 223 (1984 Oil and Gas Act)	MEDIUM	CHECK PRE-, DURING, AND POST-HYDRAULIC FRACTURING
Well plugged prior to well permitting era (1956)	HIGH	CONTINUOUS MONITORING OR ENSURE CONTAINMENT
Well on DEP's orphan and abandoned list	HIGH	CONTINUOUS MONITORING OR ENSURE CONTAINMENT
<i>Abandoned well</i> for which plugging status is unknown	HIGH	CONTINUOUS MONITORING OR ENSURE CONTAINMENT

Summary table of *offset well* characteristics, general risk level (in parentheses for wells requiring notification only) or suggested monitoring levels, notification responsibilities, and monitoring/risk mitigation alternatives. Note that time intervals over which continuous monitoring is required is dependent upon the character of the *hydraulic fracturing* operation and is further refined in [Table 5Figure 4](#).

B. Standard Monitoring Plans

After locating all wells known to fall within the AOR, the *operator* must identify the subset of those wells that require monitoring in accordance with section 78a.73(c): intended zone of completion (proposed perforation elevations) for the planned well is within +/-1,500 feet of any portion of any *offset well* bore path intersecting the AOR.

Suggested options for both *visual monitoring* and ensuring containment are provided below. For wells at which continuous monitoring is recommended in accordance with DEP's interpretation of section 78a.73(c), the *operator* conducting the monitoring should do so in real time during the *closest approach* and using acceptable techniques for *visual monitoring*. The operator may employ one or more of the listed techniques based on the operator's evaluation of the AOR. This list may not be comprehensive, i.e., there may be other techniques that satisfy the regulatory requirements related to monitoring. In all cases, it is essential that the *operator* coordinate with DEP prior to connecting any equipment to an *offset well* with no *responsible party*, as repercussions related to ownership responsibilities are at stake.

Monitoring/Containment techniques:

- (1) Employ *RTU*/continuous monitoring/automatic shut-in devices at producing wells (monitoring/containment)
- (2) Empty tanks at producing wells for optimum capacity (containment)
- (3) With prior DEP authorization, equip *abandoned wells* with pressure gauges (monitoring)
- (4) With prior DEP authorization, equip *abandoned wells* with tanks (containment)
- (5) Plug or re-plug *abandoned wells* – note that provisions of Good Samaritan Act (27 Pa. C.S. § 8101-8114) or section 13(c) of the Coal and Gas Resource Coordination Act (58 P.S. §§ 501—518) may be relevant.
- (6) Install continuous gas meters/flow meters or employ hand-held gas meters at *abandoned wells* (monitoring)
- (7) Appoint field personnel with radio contact to observe adjacent wells (monitoring)
- (8) Install chart gauge(s) at producing wells for a permanent pressure record (monitoring)
- (9) Use flagging tape and maintain clear observation pathways for *abandoned wells* that can be viewed from the rig operations area (monitoring)

Section 78a.52a requires the operator to submit a monitoring plan for wells that must be monitored under section 78a.73(c), including the methods the operator will use to monitor these wells. A standard monitoring plan is provided for *unconventional wells* in the table that follows ([TableFigure 54](#)). The plan does not cover incident response, as that subject is covered in Section X (Incident Reporting and Resolution). Monitoring protocols are based on relative, perceived risk levels. *Operators* also have the option of developing site-specific monitoring protocols that consider *communication incident* risks identified in this policy. Such an approach may rely on well-field geometries/preferred fracture propagation orientations and the character of the *hydraulic fracturing* activity e.g., treatment volumes and pressures used. In such situations, the site-specific assessment must be submitted as part of the AOR summary report. It is strongly recommended that the details of site-specific monitoring plans also be discussed with

DEP prior to implementation. Under no circumstances may a monitoring plan be proposed that does not involve the *operator* confirming whether or not a *communication incident* has taken place through *visual monitoring*.

Table 5 Figure 4: Standard Monitoring Plan for Unconventional Well

Well Type	Orientation	Depth (ft)	Pre-Hydraulic Fracturing/During Hydraulic Fracturing Actions Based on Established Monitoring Level			Post-Hydraulic Fracturing Actions Based on Established Monitoring Level		
			Low	Medium	High	Low	Medium	High
<i>Unconventional</i>	<i>Any</i>	<i>Any</i>	<i>No pre-hydraulic fracturing monitoring; visually monitor at least once during closest approach</i>	<i>Visually monitor pre-hydraulic fracturing and at least once during closest approach</i>	<i>Ensure containment</i>	<i>At conclusion of hydraulic fracturing, check all accessible identified offset wells requiring monitoring within AOR</i>		
					<i>Visually monitor continuously during closest approach</i>			

Note: The plan does not cover incident response, as that subject is covered in Section X (Incident Reporting and Resolution).

C. Well Monitoring Requirements Checklist

- Have the construction characteristics, age, and status of the *offset wells* in the AOR been determined and used to assign the appropriate monitoring level ([Table Figure 43](#))?
- For *offset wells* in the AOR requiring monitoring, has well integrity been assessed based on surface observations and a review of available records?
- Has a risk-based monitoring plan been developed for *offset wells* within the AOR?

D. Other Possible Considerations

- Has the character of the *hydraulic fracturing* activity been defined in terms of anticipated treatment pressures, volumes, and pump durations and compared to the information in Appendix C?
- Has the expected type of fracture plane orientation, e.g., vertical or horizontal, been determined for the interval(s) being targeted for production?
- Does the risk change as a function of what activity is being completed at the well undergoing *hydraulic fracturing*, i.e., multi-zone or multi-stage completions?
- Have the standard monitoring protocols been considered (Figures 4 through 8)?
- Has a plan for securing high-risk *offset wells* in the AOR been executed to minimize the potential for environmental impacts?

VIII. AOR REPORT DELIVERABLES

Section 78a.52a(c) requires the *operator* to submit a report summarizing the AOR review, including (1) a plat, (2) proof of submitting questionnaires to landowners, (3) a monitoring plan, and (4) the true vertical depth of offset wells in the AOR, if known. The [AOR report](#) consists of standard components that will be useful for creating a database detailing *operator* activities associated with the regulation. This section of the guidance provides a tabular summary of the standard AOR deliverables. Note that an electronic plat must also be filed in conjunction with each [AOR report](#). The [AOR report](#) must be submitted electronically to DEP at least 30 days in advance of well spud, or in cases where a well will be spud within 30 days of permit issuance, along with the well permit package in accordance with section 78a.52a(d). A supplemental, site-specific narrative report may also be submitted along with the [AOR report in instances when information compiled is not readily transferable to the summary table, but is nonetheless important for recognizing and addressing variability throughout different oil and gas producing areas of the state.](#)

A. Standard AOR Report Electronic Summary Table

In accordance with section 78a.52a(d), each [AOR report](#) must be submitted electronically using the standard form available on DEP's website. Instructions have been developed for completion of the report (8000-FM-OOGM146U). [Table 6 Figure 5](#) is a **tabular** summary of the standard components that should accompany each submittal. Note that not all parameters listed apply for each report developed. Those that are not relevant should be left blank. Each tabular report should cross-reference a plat using the designated well ID. A plat consists of an electronically rendered map, drawing, or print that is accurately drawn to scale and depicts all wells listed in the [AOR report](#) along with other relevant features.

Additional information concerning the well that is the subject of the AOR should also be provided. This information should be inclusive of anticipated surface and *bottom hole GPS coordinates* for the well that will be stimulated by way of *hydraulic fracturing* and the API number, or the farm name and number for a well that has not yet been permitted. Finally, *operators* must indicate if all *landowners* within the AOR have been notified and whether or not proof of notification is on file.

B. Site-specific AOR Report

In certain cases, the *operator* completing the AOR survey may develop a site-specific narrative report to accompany the electronic summary table. Information in the report may consist of the following:

- (1) The specifics of the risk assessment completed to determine appropriate levels of monitoring at applicable wells and details related to the type of monitoring activities that will be implemented
- (2) Any historical well drilling analysis completed to estimate well *true vertical depths*
- (3) Any geologic evaluation used to modify the AOR geometry beyond the dimensions prescribed in the regulations
- (4) Coordination/monitoring agreements between adjacent *operators*
- (5) Documentation of identified well ownership and access issues
- (6) Bibliography of reference materials used to compile information on wells falling within the AOR

Whenever ~~DEP requires a written accompanying report~~, the *operator* deems an accompanying report is necessary, it shall be submitted ~~it~~ to DEP electronically in pdf format. Written reports are recommended by DEP in cases where significant supplemental analyses were used to arrive at conclusions related to assigning risk and implementing monitoring activities, as they will be critical in determining what may have gone wrong when unanticipated *communication incidents* occur and also useful for resolving compliance matters in such cases.

C. AOR Report Deliverables Requirements Checklist

- Has the Standard [AOR Summary Table Report](#) been downloaded and completed for the well that is the subject of the AOR?
- Has an accompanying AOR well plat that references all wells in the AOR Report Electronic Summary Table been prepared and submitted along with the AOR Report Electronic Summary Table?
- Do submitted *GPS coordinates* for all field-verified wells within the AOR meet DEP accuracy requirements, i.e., +/-10 m?

D. Other Possible Considerations

- Has the need for an accompanying narrative report been evaluated in consideration of information that is most likely to be included in such a report (see items (1)-(6) in subsection B above)?

Table 6Figure 5: AOR Summary Table Report Parameters

Field Heading	Description of Report Parameter
Operator ID/OG Number	DEP ID or OGO number for the <i>operator</i> planning to conduct hydraulic fracturing.
<i>Landowner</i> Notification Documentation	"Y" to certify that all <i>landowners</i> with parcels in the area of review were notified per the regulatory requirements, otherwise enter "N."
Were Any Wells Identified Within the AOR?	"Y" if offset wells were identified within the AOR, otherwise enter "N."
US Well No. (API No.)/Authorization ID for Well that is Subject of Area of Review	If the well has been permitted, provide the US Well No. (API No.) using the following format: CCC-XXXXX. CCC represents the three-digit county code and XXXXX represents the unique, 5-digit county ID. The sections of the US Well No. (API No.) should be separated by a dash (-). If the well has not been permitted, the GreenPort authorization ID should be provided along with the county and municipality in the appropriate fields.
Municipality	Municipality that well will be drilled in if no US Well No./API No. has been assigned.
County	County that well will be drilled in if no US Well No./API No. has been assigned.
Surface Hole Latitude for Well that is Subject of Area of Review (decimal degrees)	The anticipated surface location latitude and longitude, in decimal degrees, for the well that is the subject of the area of review. This should reference NAD 83 datum.
Surface Hole Longitude for Well that is Subject of Area of Review (decimal degrees)	
<i>Bottom Hole</i> Latitude for Well that is Subject of Area of Review (decimal degrees)	For horizontal wells, the anticipated <i>bottom hole</i> location latitude and longitude in decimal degrees for the well that is the subject of the area of review. This should reference NAD 83 datum.
<i>Bottom Hole</i> Longitude for Well that is Subject of Area of Review (decimal degrees)	

Note: Information for [AOR Report](#) pertaining to well that will be hydraulically fractured.

Table 6Figure 5 Continued

Field Heading	Description of Report Parameter
US Well No. (API No.)/Alternate Well ID	The US Well (API No.) assigned to the well using the following format: CCC-XXXXX. CCC represents the three-digit county code and XXXXX represents the unique, 5-digit county ID. The sections of the US Well No. (API No.) should be separated by a dash (-). If a US Well No. (API No.) has not been assigned, use the following numbering system: "U1", "U2", "U3", etc. The identifiers used in the report should be identical to those used on the site plat for cross-referencing purposes.
Reference Material/Source	The source that used to identify the <i>offset well</i> from the list of available options: "DEP Database", "Other Database", "Historical Source", "Operator Map", "Landowner Survey", "Aerial Image", or "Field Inspection."
Well Status	The status used to classify the <i>offset well</i> from the list of available options: "Active", "Inactive", "Orphan", "Abandoned", "Plugged & Abandoned", or "Undetermined." If the offset well has been field verified, the status should reflect what was observed during the inspection.
Adjacent <i>Operator</i> ID/OGO Number	If the <i>offset well</i> included in the summary report is the responsibility of an adjacent <i>operator</i> , please provide the DEP ID or OGO number for that <i>operator</i> . Leave this space blank if neither notification nor monitoring at the offset well is required. Indicate "No RP" if well does not have an <i>operator</i> associated with it.
Adjacent <i>Operator</i> Notification	"Y" if the adjacent <i>operator</i> was notified or "N" if the delivery service failed. This space should be left blank if the well is the responsibility of the <i>operator</i> intending to conduct hydraulic fracturing activities at the well indicated in the first section of TableFigure 65 or if the well does not require notification in advance of well spud.

Field Heading	Description of Report Parameter
Surface Location Latitude (decimal degrees)	The true latitude and longitude in decimal degrees of the surface location of the well. This should be North American Datum of 1983 (NAD 83) and should meet or exceed the current DEP policy regarding locational accuracy (+/- 10 m) for any wells surveyed in the field by the operator.
Surface Location Longitude (decimal degrees)	
<i>Bottom Hole</i> Latitude (decimal degrees)	The true latitude and longitude in decimal degrees of the <i>bottom hole</i> location of all intentionally deviated wells based on a review of available records. This should be North American Datum of 1983 (NAD 83).
<i>Bottom Hole</i> Longitude (decimal degrees)	
Survey Accuracy (+/- meters)	For any well coordinates referenced in DEP/Department of Conservation and Natural Resources (DCNR) databases, or anything digitized from a historical map or a map from a published report that has not been field verified, leave this column blank. If the offset well has been field verified and surveyed with a hand-held GPS or other surveying equipment, accuracy should be reported as a numerical value in meters in the space provided and meet the current DEP accuracy policy: +/- 10 meters or better.
Access	"Y" if <i>landowner</i> consent for access has been granted or "N" if <i>landowner</i> consent for access has not been granted.
Property Tax ID #	The tax parcel ID for the tract of land where the <i>offset well</i> is located.
TVD (feet)	The <i>true vertical depth</i> (TVD) in feet for the <i>offset well</i> . This should either be as reported in available records, or represent a best technical estimate provided by the <i>operator</i> in consideration of development history in the state in the area of activity. For an intentionally deviated well, this is the depth below the latitude-longitude equivalent surface location of the deepest penetration point.
Information Source for TVD	Information regarding how the <i>offset well</i> TVD was determined from a list of available options: "DEP Well Record", "Publication Well Depth", "Private Source Well Record", "Study of Regional Drilling History", or "Other". A separate written report may be necessary to explain measures undertaken by the <i>operator</i> to investigate drilling history in an area.
Well Integrity Assessment	For <i>offset wells</i> in the monitoring plan that are observed in the field, the <i>operator</i> should assess the well's ability to contain fluids based on a surface visual inspection. Please choose from the following codes for each <i>offset well</i> inspected in the field: "1" if the well appears to have integrity based on field observation and any well construction details gleaned from a file review; "2" if the well appears to have compromised integrity or may experience compromised integrity during <i>hydraulic fracturing</i> based on any well construction details gleaned from a file review; and "3" if the integrity status cannot be determined with reasonable confidence. For wells not observed in the field, this parameter should be left blank.
Monitored Site	If the <i>offset well</i> is included in monitoring plan, indicate "Y", otherwise indicate "N."
Monitoring Level	Indicate the monitoring level from the list of available options: "High", "Medium", and "Low." Leave this field blank if the well does not require monitoring.
Monitoring Plan Notes	This field is optional and is designed to contain specific notes explaining monitoring or mitigation plans for each well. Entries are limited to 255 characters or less.
Engineered Communication	The engineered communications field is for use if an operator has planned a controlled communication event in association with well efficiency testing. If such an event is planned, indicate "Y," otherwise indicate "N." This space should be left blank if the well does not require notification in advance of spud.
Text Comment	This field is optional and intended for use in cases when further clarification may be necessary. Entries are limited to 255 characters or less.

Standard report parameters for tabular component of [AOR Report](#) and accompanying Monitoring Plan

IX. WELL ADOPTION

Section 78a.73(d) provides the opportunity for operators to adopt *offset wells* with which their wells have communicated. Although a discussion of the details of the well adoption permit (Permit Application to Adopt an Oil or Gas Well) is beyond the scope of this document, DEP provides several recommendations and general guidelines here for reference.

If an *operator* identifies an *abandoned* or *orphan well* within the AOR that they are interested in adopting, DEP recommends that this activity be pursued prior to commencement of *hydraulic fracturing*, as it may be one way to effectively mitigate risk ahead of stimulation. DEP recommends that due diligence for establishing well ownership and identifying whether or not there is some operating interest in an *abandoned well* be conducted ahead of well adoption to manage liability in such situations.

In all cases, it is essential to establish an updated lease agreement addressing operating/royalty-disbursement conditions, and to secure ongoing access to rehabilitate and operate the well. DEP does not regulate the details of lease agreements and does not intend to evaluate any processes that were undertaken by the *operator* to bring the well back in to legal production aside from those aimed at assuring that necessary environmental protection standards are in place.

For any wells that were communicated with during *hydraulic fracturing* activities, a site-specific integrity assessment protocol or workover plan, potentially involving downhole analysis procedures, should be submitted to DEP along with the adoption permit.

A. Other Possible Considerations

- Have the well adoption permit and accompanying instructions been reviewed?
- Have *abandoned* and *orphan wells* in the AOR been considered for adoption prior to *hydraulic fracturing* activities?
- For any wells on the adoption permit, have all potential *responsible parties* been considered and has a thorough assessment of potential operating interests been completed?
- Has a lease agreement been established that provides ongoing access and the ability to operate the well that is being considered for adoption?

X. INCIDENT REPORTING AND RESOLUTION

Section 78a.73(c)-(d) provides notification and incident response requirements for certain *communication incidents*. Accordingly, to clearly define a protocol for incident resolution, it is first essential to indicate what constitutes a reportable *communication incident*. Reportable *communication incidents* include, in accordance with section 78a.73(c): (1) any change in a well required to be monitored, (2) any treatment pressure or volume changes indicative of abnormal fracture propagation at the well being stimulated, or (3) confirmed well *communication incidents* associated with the well's stimulation activities. Inter-well communication intentionally executed by the *operator* and communication incidents below the reporting thresholds defined in this policy are not reportable *communication incidents* under section 78a.73(c). Please note, operators are required to maintain a safe operating environment. See 58 Pa.C.S. § 3259(2); 25 Pa. Code § 78a.81. When a reportable *communication incident* occurs, the operator must notify DEP within the appropriate timeframe, cease stimulation activities and prevent any

pollution to waters of the Commonwealth or discharges to the surface. In some instances, ceasing hydraulic fracturing activities may be required. This section of this document outlines the operator's obligations under different circumstances.

Please note that the notification and reporting requirements included in this regulation do not necessarily satisfy other regulatory obligations under sections 78.73/78a.73 pertaining to the over-pressuring of the surface casing seat, sections 78.86/78a.86 pertaining to defective casing and cement, sections 78.88/78a.88 pertaining the mechanical integrity of operating wells, or sections 78.89/78a.89 pertaining to the investigation of stray gas migration incidents; or any other statutory or regulatory investigative and reporting requirements. Further, all environmental releases of regulated substances must be reported and remediated in accordance with the Clean Streams Law, section 91.33, section 78a.66, and/or applicable law.

A. Incidents Requiring 2-Hour Notification and 3-Day Follow-up Incident Report

In cases where certain reportable incidents are identified, the *operator* must immediately cease *hydraulic fracturing* and notify DEP via the electronic reporting notification service on the DEP website. This notice should be filed within two (2) hours of when the *operator* first becomes aware of the incident. Note that established standards and timelines must be followed for any *communication incidents* that also violate section 91.33 or the provisions of section 78a.66. If, and only if, an emergency develops, the operator should contact DEP Emergency Response by telephone immediately (see Appendix D). *Hydraulic fracturing* may not commence again until DEP is satisfied that the situation is under control and measures have been developed to prevent any further anticipated risk. Part of this process includes submission of the standard electronic follow-up [incident report](#) available for download on DEP's website and described in ~~Table 7~~[Figure 6](#) and the accompanying instructions for the incident report (8000-PM-OOGM0145U). Note that in situations where an operator is stimulating multiple wells (zipper fracturing) and it is not possible to discern which well communicated with the offset well, the incident report should include a US Well No. (API No.) for each well undergoing hydraulic fracturing at the time of the communication incident.—Note that in situations where an operator is stimulating multiple wells (zipper fracturing) and it is not possible to discern which well communicated with the offset well, an incident report should be filed for each well undergoing hydraulic fracturing at the time of the communication incident.

Immediate activity cessation and notification is essential to begin the process of risk mitigation and reduce the potential for compounding environmental impacts as soon as possible. It is also critical for initiating conversations between the *operator* and DEP; and coordination with the public, as necessary. A *communication* [incident report](#) should be filed with the agency within three (3) days of when the *operator* first becomes aware of the incident.

Communication incidents that should be reported to DEP within two (2) hours and followed up with a standard [incident report](#) within three (3) days, including

communication incidents with wells which the *operator* completing *hydraulic fracturing* also operates, are as follows:

- (1) Any *communication incident* evidenced by downhole pressure or volume changes during *hydraulic fracturing* in the well being completed when the specific event observed indicates a loss of mechanical integrity, i.e., containment, and that could pose a specific risk to the environment (surface or subsurface fluid release), safety or is indicative of *loss of well control*. This would amount to a sudden loss of pressure or a volume change that is clearly, statistically beyond the normal variability that a job has.
- (2) Any *communication incident* with an *abandoned, orphan* or plugged well; as the ability for containment and pressure control at such wells is significantly limited. Immediate reporting applies even in the case where an *operator* has established temporary containment measures at the surface that appear to have been implemented with success. A plan for permanently plugging the affected well must be developed and executed by the *operator* as soon as practicable, unless the *operator* plans to adopt the well and place it into production. The plan may be implemented without filing a notice of intent to plug the well, provided DEP approval is received.
- (3) Any *communication incident* with any other well that the *operator* completing the stimulation has been made aware of and that threatens or jeopardizes the integrity of the surface or near surface environment as a result of a breach/loss of containment, a release of pollution-causing substances to the environment, or some other occurrence that has the potential to impact the waters of the Commonwealth.
- (4) Any *communication incident* that results in a *well control incident/loss of well control* as defined in this guidance.
- (5) Any *communication incident* that results in site safety risks as a result of equipment malfunction or other events within the AOR.

B. Incidents Requiring 24-Hour Notification and 30-Day Follow-up Incident Report

A subset of *communication incidents* may occur that were either anticipated and coupled with measures introduced by the *operator* to maintain control of the situation, but were not intentionally implemented or engineered; or that do not otherwise result in any environmental, safety, or *well control incidents* by virtue of the *offset well's* construction and operating characteristics. The *operator* conducting *hydraulic fracturing* is not required to cease *hydraulic fracturing* if: (1) any releases to the environment are prevented, (2) safe site conditions are maintained at all times, (3) it is ensured that *offset well* construction components and all appurtenances are adequately rated to contain fluid pressure and volume, (4) DEP is notified within 24 hours of when the *operator* first became aware of the incident via the electronic reporting notification service on the DEP website, and (5) an [incident report](#) is filed with DEP within 30 days of when the *operator* first becomes aware of the incident. Note that in situations where an *operator* is stimulating multiple wells (zipper fracturing) and it is not possible to discern which well communicated with the *offset well*, ~~the an~~ incident report should include a US Well No. (API No.) ~~be filed~~ for each well undergoing *hydraulic fracturing* at the time of the *communication incident*.

Information associated with these *communication incidents* will help determine what risk-mitigation measures are appropriate in the future, e.g., size of tank that should be installed, allow DEP to complete follow-up work as needed with regard to any potential well integrity problem(s), and enable DEP and the industry to continue to evaluate the geometry of the AOR in a more comprehensive sense and update this guidance from a risk-mitigation standpoint, as needed.

Communication incidents that should be reported to DEP within 24 hours and followed up with a standard [incident report](#) within 30 days, including *communication incidents* with wells which the *operator* completing *hydraulic fracturing* also operates, are as follows:

- (1) Any *communication incident* with any *active* or *inactive well* that the *operator* conducting the stimulation has become aware of that does not result in an environmental, safety, or *well control incident*, but does result in a breach/loss of containment that is not coupled to a release, e.g., release to a tank. A breach/loss of containment includes the observation of any flowing fluids in sections of the well where they were previously not noted, provided these observations are not in association with the outer annular spaces of surface or coal casing. The reporting threshold is characterized by a significant increase in the volume of such fluids or annular pressures respective of baseline conditions, as judged by the *operator* completing *hydraulic fracturing* and/or responsible for the *offset well*.
- (2) Any *communication incident* that results in significant production pressure deviations at any *active* or *inactive well* that the operator conducting the stimulation has become aware of. For wells that produce gas inside of surface or coal casing strings, reportable conditions include any surface-measured production pressures in excess of 80% but less than 100% of the hydrostatic pressure at the casing seat depth (assume 0.433 psi/ft gradient). For all wells, any pressure increases that are within 10% of the containment rating for the lowest rated barrier element subjected to production pressure should be reported. For example, if a well head valve is rated for 5,000 psi and production pressures increase to 4,500 psi as a result of a *communication incident*, this constitutes a reportable incident.

C. Incidents Involving Adjacent Operators

Due to the existence of operational areas where adjacent leases may be in various stages of development, it is anticipated that *hydraulic fracturing* being executed at one location will occasionally be detected at *offset wells* under the control of an adjacent *operator*. In certain cases, these events may will be below the thresholds described in sSubsections A and B, above; but the adjacent *operator* may report these to the *operator* conducting *hydraulic fracturing* as a standard practice.

In cases where an adjacent *operator* makes the *operator* conducting *hydraulic fracturing* aware of a *communication incident* below the reporting thresholds specified earlier in this section, the *operator* conducting *hydraulic fracturing* is not required to cease *hydraulic fracturing* if: (1) the ~~y-adjacent operator~~ documents ~~in writing~~ that none of the applicable thresholds for reporting in subsections A and B of this section have been

exceeded, (2) DEP is notified within 24 hours of when the *operator* first became aware of the incident via the electronic reporting notification service on the DEP website, and (3) an incident report is filed with DEP within 30 days of when the *operator* first becomes aware of the incident. In this case, the follow-up incident report is the aforementioned ~~written~~ documentation provided ~~by the adjacent operator~~ in (1) above. This documentation may also be submitted electronically through DEP's electronic reporting service, providing it can be verified at the time that the thresholds in subsections A and B have not been exceeded. Notification and follow-up reporting is required one time only if subsequent *communication incidents* occur at the *offset well* during later *hydraulic fracturing* stages provided the incidents remain below the thresholds described in subsections A and B, requiring a 30-day follow-up incident report.

Note, there is no expectation or regulation that requires an adjacent *operator* to notify an *operator* conducting *hydraulic fracturing* when a communication between wells below the thresholds noted in this policy occur at an *offset well* that is the responsibility of the adjacent *operator*.

ED. Incident Resolution

For reportable *communication incidents* under subsection A of this section, *hydraulic fracturing* may only recommence after DEP has provided authorization in accordance with § 78a.73(c). In instances where a *communication incident* alters a nearby *abandoned* or *orphan well* that is on DEP's list, or any previously plugged well for which no further regulatory obligations exist for another *operator/responsible party*, plugging/re-plugging or well adoption (Permit Application to Adopt an Oil or Gas Well) is required. Provided the *operator* is able to stabilize conditions at the affected well, plugging does not necessarily need to be completed prior to recommencement of *hydraulic fracturing*.

The *operator* may choose to file a Good Samaritan Act (27 Pa. C.S. § 8101- 8114) proposal for plugging the well or may proceed with the project outside of the liability protection afforded under that law. All Good Samaritan Act filings will be reviewed and judged on individual merit and the circumstances which led to the *communication incident*. Because the regulation requires plugging if the well is not going to be adopted, DEP may decide that the protections afforded under the Good Samaritan Act are not appropriate. Note that it is not necessary to first adopt the well in instances where plugging will be implemented.

When plugging is necessary to resolve an issue at a well that is not covered under the previous paragraph, i.e., a well for which some other *operator/responsible party* exists, environmental and safety issues should be mitigated as soon as possible, even if under an Order from DEP. After resolution of these matters, it is up to both *operators/responsible parties* involved to make the necessary arrangements for plugging of the well in accordance with all applicable laws and regulations. Some of these matters are discussed in more detail under Section V of the guidance addressing coordination between adjacent *operators*.

Plugging may not always be necessary to resolve *communication incidents*, and in certain cases there may be disputes between adjacent *operators*. Resolution of such matters is

beyond the scope of this document or regulatory program. In all cases, the *operators/responsible parties* should demonstrate that all environmental and safety matters are mitigated with diligence and that the plan to move forward with *hydraulic fracturing* activities can be implemented in a manner that appropriately mitigates previously revealed or reasonably anticipated risks.

DE. **Other Possible Considerations**

- Prior to commencement of *hydraulic fracturing* activities, have the subsections of this section detailing incidents requiring suspension of *hydraulic fracturing* activity and 2-hour notification (subsection A above) and 24-hour notification (subsection B above) been reviewed and are they understood by operations staff?
- Has the necessary coordination with adjacent *operators* and *landowners* been implemented to ensure that environmental and safety risks can be addressed expeditiously in the event of an unanticipated *communication incident*?
- Are company personnel responsible for interfacing between operations staff and DEP familiar with the immediate notification and follow-up incident reporting deadlines and where appropriate forms and instructions for notification and follow-up incident reporting can be accessed?
- Have operations staff been in communication with DEP field inspection staff to discuss the timeline for commencement of the *hydraulic fracturing* activities and any aspects of the monitoring plan that may require close coordination with the agency?
- Has the Good Samaritan Act and project proposal template been reviewed and evaluated for future consideration?

Table 7Figure-6: Standard Follow-up Incident Report

Field Heading	Description of Report Parameter
API No. (US Well No.) of <i>Hydraulically Fractured</i> Well	The US Well No. (API No.) assigned to the well that was undergoing <i>hydraulic fracturing</i> at the time of the <i>communication incident</i> . Use the following format: CCC-XXXXX. CCC represents the three-digit county code and XXXXX represents the unique, 5-digit county ID. The sections of the API No. should be separated by a dash (-).
API No. (US Well No.)/ID of Well Where <i>Communication Incident</i> Was Observed	If a US Well Number or API number has been assigned to the well where the <i>communication incident</i> was observed, enter it in the space provided using the format described above. If no API number has been assigned to the well, either enter the ID from the Area of Review Report Summary Table that was previously submitted or, if the well was not identified as part of the area of review survey and does not have an API number, use the following nomenclature: (C1, C2, C3, etc.).
Adjacent <i>Operator</i> ID/ OGO Number	If an adjacent <i>operator's</i> well was involved in the communication incident, this is the OGO No. for that <i>operator</i> . Leave blank if same as the <i>operator</i> who was conducting <i>hydraulic fracturing</i> activities. Indicate "No RP" if well does not have an <i>operator</i> associated with it.
Start Date	The date that the <i>communication incident</i> was first observed in MM/DD/YYYY format.
End Date	The date incident control was established at the well where <i>communication incident</i> was observed, i.e., environmental or safety concerns mitigated. Use MM/DD/YYYY format. Leave blank if incident has not yet been resolved when the report is submitted.
Environmental/Safety/Well Control Incident	"Y" if a surface release, water supply impact, other environmental impacts, or a <i>well control</i> or other safety incident has occurred, otherwise indicate "N."
Communication Type	The type of <i>hydraulic fracturing communication incident</i> from the list of available options: "Stimulation to Operating Well", "Stimulation to Well Being Drilled", Stimulation to <i>Abandoned/Orphan Well</i> ", "Stimulation to <i>Inactive Well</i> ", "Stimulation to Plugged Well", or "Other."
Adjacent Lateral Effects	"Y" if <i>communication incident</i> originated at horizontal well and intervening horizontal wells fall between the source of the communication and the well where the <i>communication incident</i> was observed, otherwise indicate "N."
Latitude of Stage Midpoint for Well Undergoing <i>Hydraulic Fracturing</i> (decimal degrees)	The midpoint latitude and longitude, in decimal degrees, of the stage being <i>hydraulically fractured</i> when the <i>communication incident</i> occurred. If a vertical well was being <i>hydraulically fractured</i> , provide the surface hole location. This should reference NAD 83 datum and, if a vertical well was being <i>hydraulically fractured</i> , the locational information provided should meet the DEP policy regarding locational accuracy (+/- 10 m).
Longitude of Stage Midpoint for Well Undergoing <i>Hydraulic Fracturing</i> (decimal degrees)	
Latitude of Receiving Well (decimal degrees)	The latitude and longitude, in decimal degrees, representing the surface hole location of the well where the <i>communication incident</i> was observed. This applies for vertical wells or when the vertical section of an intentionally deviated is the point of entry for pressure/fluids associated with the well undergoing <i>hydraulic fracturing</i> . This should reference NAD 83 datum and meet the DEP policy regarding locational accuracy (+/- 10 m).
Longitude of Receiving Well (decimal degrees)	

Field Heading	Description of Report Parameter
<i>Bottom Hole/Bit Location Latitude of Receiving Well (decimal degrees)</i>	The latitude and longitude, in decimal degrees, of the well where the <i>communication incident</i> was observed. If being drilled, indicate the bit location, otherwise indicate the <i>bottom hole location</i> . This field applies for intentionally deviated wells only when the point of entry for pressure/fluids associated with the well undergoing <i>hydraulic fracturing</i> occurred along the deviated portion of the production hole section. This should reference NAD 83 datum. This field should be left blank if the <i>communication incident</i> is associated with a vertical well or the vertical section of an intentionally deviated well.
<i>Bottom Hole/Bit Location Longitude of Receiving Well (decimal degrees)</i>	
Landing Point Latitude of Receiving Well (decimal degrees)	The landing point latitude and longitude, in decimal degrees, of the well where the <i>communication incident</i> was observed. This field applies for intentionally deviated wells only when the point of entry for pressure/fluids associated with the well undergoing <i>hydraulic fracturing</i> occurred along the deviated portion of the production hole section. This should reference NAD 83 datum. This field should be left blank if the <i>communication incident</i> is associated with a vertical well or the vertical section of an intentionally deviated well.
Landing Point Longitude of Receiving Well (decimal degrees)	
Kick Volume (bbls)	The volume of the kick circulated out, in barrels (bbls), at the well where the <i>communication incident</i> was observed. This field only applies to offset drilling scenarios when a reportable kick was detected in association with the <i>hydraulic fracturing communication incident</i> .
Stage Fluid Volume (bbls)	The volume of the stage, in bbls, that was being <i>hydraulically fractured</i> at the time of the <i>communication incident</i> .
Maximum Treatment Pressure (psi)	The maximum treatment pressure, in pounds per square inch (psi), of the stage that was being <i>hydraulically fractured</i> at the time of the <i>communication incident</i> .
Average Treatment Pressure (psi)	The average treatment pressure, in psi, of the stage that was being <i>hydraulically fractured</i> at the time of the <i>communication incident</i> .
Abnormal Treatment Volumes Noted	Indicate "Y" if the treatment volume of the stage being <i>hydraulically fractured</i> at the time of the <i>communication incident</i> was significantly higher compared to adjacent stages; otherwise indicate "N."
Abnormal Treatment Pressures Noted	Indicate "Y" if the treatment pressure of the stage being <i>hydraulically fractured</i> at the time of the <i>communication incident</i> was significantly higher compared to adjacent stages; otherwise indicate "N."
Faults Present or Geologic Anomalies Noted	Indicate "Y" if the presence of faults or other geologic anomalies was noted in the intervening area between the well that was being hydraulically fractured and the well that was communicated with, otherwise indicate "N."
Orientation of Fault/Geologic Anomaly in Horizontal Plane	If faults or geologic anomalies were noted, provide the azimuth of the dominant orientation of the fault/geologic anomaly in horizontal plane (0 to 360 degrees). If no faults or geologic anomalies were noted, this space should be left blank.
Brief Description	Additional details related to incident, as needed. Limit description to 255 characters or less.

Table 7~~Figure 6~~ is for *unconventional well hydraulic fracturing communication incident*.

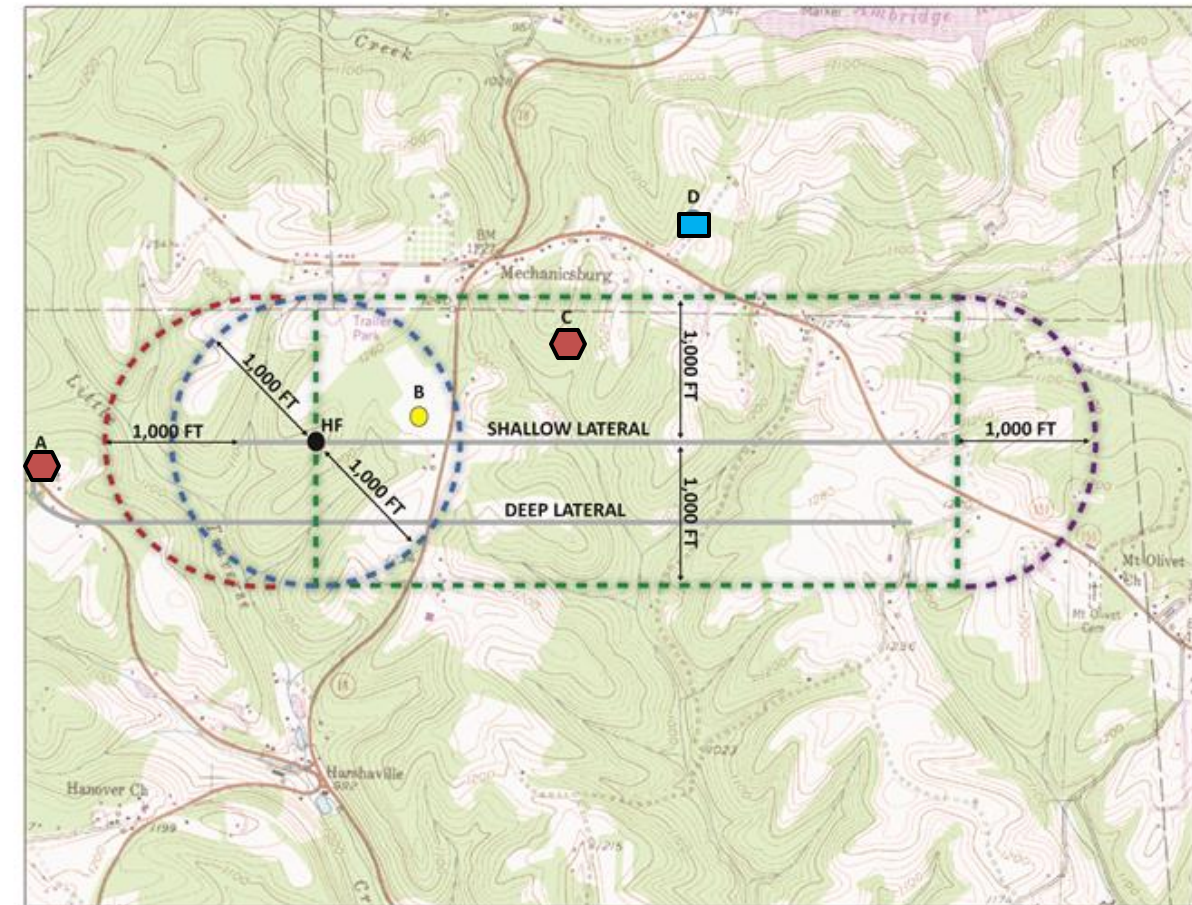

APPENDIX A - AOR GEOMETRY

EXAMPLE 1 - UNCONVENTIONAL GAS WELL WITH NO NEARBY SHALE GAS OFFSET WELLS

Notes: Yellow Circle (identify); Red Hexagon (identify and *visually monitor* or notify); and Blue Rectangle (no requirements); HF (well that is subject of area of review that will be *hydraulically fractured*)

EXAMPLE 2 - UNCONVENTIONAL GAS WELL WITH UNDERLYING SHALE GAS OFFSET WELL

Notes: Yellow Circle (identify); Red Hexagon (identify and *visually monitor* or notify); and Blue Rectangle (no requirements); HF (well that is subject of area of review that will be *hydraulically fractured*)

APPENDIX C - SUPPORTING TECHNICAL INFORMATION

Treatment Pressure and Volume Monitoring

Treatment pressure and volume monitoring are discussed in the AOR regulations of Chapter 78a in section 78a.73(c). The following discussion considers the role of treatment pressure and/or volume monitoring as a direct surrogate for *offset well* monitoring in circumstances where either access cannot be secured or more efficient monitoring strategies may occur at the well that is the subject of the AOR.

Describing, to any reasonable approximation, the theoretical mechanism for *hydraulic fracturing*, is beyond the scope of the regulation and depends greatly on the local lateral and vertical stress fields, depths/pressures, and lithologies of the objective reservoir. Many competing models exist to describe fracture propagation and experts in the field are not aligned on a “standard” model. However, in general, the following statements can be made with some degree of certainty:

- (1) It is important to distinguish between shallow-reservoir *hydraulic fracturing* models and deep-reservoir *hydraulic fracturing* models. In shallow reservoirs, horizontal “pancake” fractures propagate along bedding planes. In deeper reservoirs, tensile vertical fractures are generated when the overburden stress is no longer the least principal stress, i.e., the weight of overburden exceeds the “lift” generated by the hydraulic fracture pressure, causing the fracture to propagate vertically through the rock and laterally away from the well bore, rather than along a bedding plane. Transition from shallow-reservoir to deep-reservoir propagation types typically occurs at 1,000 to 3,000 feet below surface. Deep-reservoir models are generally assumed to be associated with the development of *unconventional* reservoirs at depths greater than 2,000 feet below surface.
- (2) In the simplest deep-reservoir model, two vertical “wing” fractures (180 degrees apart) are generated from the perforation point that extend away from the well bore. Azimuth orientation of the vertical fracture depends on the azimuths of the minimum and maximum horizontal stresses in the rock. However, this assumes a homogeneous reservoir (uniform stresses and rock properties through the volume of rock being stimulated by the hydraulic fracture). Any deviation from this, e.g., natural fractures, layering of rock with very different geomechanical characteristics, etc., would lead to a much more complex three-dimensional set of fractures.
- (3) In the deep-reservoir case, hydraulic fractures may extend out hundreds of feet beyond the well bore in height and lateral extent, but probably not much more than a thousand feet beyond in most circumstances. The only exception may be scenarios where a pre-existing zone of weakness occurs, such as a fault. This is supported by microseismic data, which is the industry’s standard tool for monitoring the extent of fracture propagation in the subsurface.
- (4) Modern *hydraulic fracturing* is most often used in reservoirs with low porosity and permeability, e.g., porosity <10%, permeability < 1000 nD, referred to as a “tight” or *unconventional* reservoirs that cannot be otherwise developed with standard stimulation techniques. Typical examples include gas-bearing shales and siltstones.

During a *hydraulic fracturing* operation, variations in pressure and volume are common. A measurable treatment pressure or volume change that indicates a communication event with another well bore would be so small, relatively speaking, that it would not be possible to distinguish it from the normal variability in any event for high-volume, *hydraulic fracturing* treatments. Therefore, it is not appropriate to recommend a specific requirement for pressure or volume monitoring during an *unconventional* completion job.

Pressure and fluid communication with an adjacent producing well bore is relatively common, and indeed is often by design in the industry. The communication effects are usually detected in the adjacent well bore; however, not in pressure or volume changes in the well being completed. Communication effects can include pressure “spikes” and subsequent drops, changes in production rate, and the detection of chemical tracers, when used. The industry deliberately designs tests, e.g., downspacing trials, to see when inter-well communication starts to occur to optimally develop the hydrocarbon resource in an area. In such trials, adjacent producing wells are designed to handle moderate fluctuations in pressure and volume. These industry-standard trials and variations are not the target of the AOR regulation and are not considered reportable incidents.

Any reporting of downhole pressure or volume changes during an *unconventional* completion job either in the well being completed or in adjacent, producing wells should be done only when a specific event occurs that could indicate a loss of mechanical integrity, i.e., containment, and that could pose a specific risk to the environment (surface or subsurface fluid release) or safety (*loss of well control*). This would amount to a sudden loss of pressure or a volume change that is clearly, statistically beyond the normal variability that a job has. However, these particular guidelines (“normal variability”) cannot be quantified as a standard rule, as each completion job is unique. Therefore, action in these cases is left to the discretion and experience of the *operator*.
