SRBC Surface Water Withdrawal and Consumptive Use Metering Plan

A. Intake Design

The surface water withdrawal location on Fishing Creek CPLS is located along the proposed gas pipeline route where the water will be required for Horizontal Directional Drill (HDD) boring and hydrostatic testing. Water will be transferred from Fishing Creek CPLS directly to the pipeline and/or hydrotest equipment for hydrostatic testing. For HDD drilling, the water will be transferred from Fishing Creek CPLS to intermediate storage tanks and then used as needed during the drilling process. This water source will only be used to supply water during pipeline construction and testing. Water from this source will only be used consumptively while supplying water for the HDD bore. Transcontinental Gas Pipe Line, LLC (Transco) proposes to use two (2), 5-foot long, 3-inch radius stainless steel screens with slot-size openings of 0.100-inch that are manufactured by Bilfinger Water Technologies™ to withdraw water from Fishing Creek CPLS. The 5-foot long screens are connected by a tee fitting and include a foot valve, which will maintain a flooded suction line and prevent backflow. The intake structure will be connected to a 12-inch diameter flexible hose or HDPE pipe that will be used to convey water to the pump. The intake structure will be submerged in the approximate location of the creek's thalweg (lowest point of creek channel) in close proximity to the project site. The approximate water depth at the point of withdrawal is less than 3 feet. The slot openings were sized to avoid potential aquatic impacts associated with impingement and entrainment. Calculations for the intake's through-screen approach velocity (provided in Attachment A-1) show the screen entrance velocity to be less than 0.5 feet per second (ft/s). Manufacturer information for the intake screens is included in Attachment A-2.

Transco proposes to use one 6" by 6" Pioneer Prime Series PP66C14 vacuum assisted, end suction centrifugal pump. This pump is mechanically driven and operates at a maximum of 2,200 revolutions per minute. Pump specification sheets and head curves are included in Attachments A-3 and A-4, respectively. Transco will limit the instantaneous pumping rate by using a Cla Val Combination Rate of Flow Controller & Solenoid Shut-off Valve (Model 43-01) on the discharge end of the pump. Specifications are included in Attachment A-5. This valve will be locked to prevent unintentional changes to the flow rate. Transco's staff will be prepared to comply with monthly passby rates and withdrawal rates. To protect aquatic resources and downstream users, Transco will cease withdrawals from Fishing Creek CPLS when the creek flow at the assigned reference gage is at or falls below prescribed passby flows.

Transco will ensure that the intake screen is regularly maintained and free of debris. Specifically, to ensure that the screen area is open and not clogged, prior to each operating event, Transco will retrieve the screen intake apparatus from the creek and inspect it for any debris or material that could clog the intake and reduce pumping efficiencies. In addition, the flow rate will be monitored during operation. If the pumping flow rate decreases by 20% or more during operation, the pump will be turned off and the screen intake assembly will be retrieved from the creek and inspected to ensure the screen is not clogged which could result in increased entrance velocities. If debris is present in and around the screen opening, the screen will be cleaned prior to being put back into operation.

Water will be conveyed by the mobile pump to storage tanks near the HDD location for use during construction. Water will be conveyed directly to the hydrotest fill location from the mobile pump for the mainline testing. For both activities, water will be conveyed through a combination of 6-inch steel and 10-inch flexible hose or HDPE pipe. This pipe was sized to accommodate up to 2,000 gpm flow rate (see Attachment A-6 for basis). Any returning mud/water used for the HDD will be collected and stored in tanks and subsequently disposed of off-site at an approved disposal facility. Water used for the pipeline hydrostatic testing will be discharged at a Pennsylvania Department of Environmental Protection permitted location (i.e., PAG-10 permit). The HDD drilling and hydrostatic testing of the segment is currently scheduled to be completed by the end of 2017.

A wetland study was completed for the area on June 8, 2016. There are four wetlands in the vicinity of the proposed intake; however, none of them will be affected by the proposed equipment or withdrawals. The intake pump will be located within the Federal Emergency Management Agency (FEMA) floodplain, but out of the FEMA floodway. The slope of the creek bank at the proposed location is approximately 2:1. All equipment will be temporary and removable, minimizing impact to riparian vegetation. Portable secondary containment will be utilized around the pump. It should also be noted that the pump will be located within the Transco project right-of-way and limit-of-disturbance.

Transco intends to put in place protective controls at its withdrawal site to enforce the passby requirements set by the SRBC with the intent to protect the stream during low-flow periods. For this project, flows at the proposed withdrawal point will be estimated by proportioning based on the drainage area ratio method from a selected USGS gaging station near Fishing Creek. At the proposed location, Fishing Creek has a drainage area of 361 square miles (mi²). Based on that drainage area, the Aquatic Resource Class (ARC) of Fishing Creek CPLS is classified as ARC 4, which represents a medium tributary river. Rivers classified as ARC 4 are likely to be minimally sensitive to potential impacts from withdrawals due to their large size, position in the landscape, and flow volumes.

Transco will stop or decrease withdrawals during low flow periods to avoid negatively impacting the quality of Fishing Creek CPLS. Flow rate data for a SRBC-selected stream or river located near Fishing Creek CPLS that has an active USGS gaging station will be used to estimate the flow rate of Fishing Creek during surface water withdrawal operations.

B. Metering

To meter the volume of water withdrawn at the surface water withdrawal location, a 6-inch Seametrics AG2000 Irrigation Magmeter will be used (see manufacturer information in A-7). This spool-type electromagnetic flow meter and totalizer has no moving parts and minimal straight pipe requirements both above (i.e., 12 inches, minimum) and below (i.e., 6 inches, minimum) the meter. This allows unobstructed flow and makes it an ideal choice for use in surface water withdrawal applications where debris may cause damage to the equipment. This model is capable of displaying up to 5 digits for flow rate and 8 digits for the totalizer. The minimum flow rate for this model of flow meter is 32 gpm; the maximum rate is 2,400 gpm. The proposed withdrawal rate of 2,000 gpm is within this range. The meter is accurate to within +/-1% for flows between 240 gpm and 2,400 gpm and +/- 2% for flows under 240 gpm. The flow meter will be installed so that it cannot be bypassed, zeroed, or reset.

Transco will check the totalizer daily prior to pumping water from Fishing Creek CPLS and at the end of each day to ensure that the proposed 2.880 MGD maximum daily withdrawal is not exceeded. Transco will maintain daily records of the project's withdrawal and consumptive water use and shall report the data to the SRBC on a quarterly and annual basis or as prescribed. Transco will also ensure that the meter readout will be accessible for SRBC staff at all times without locks, keys or other special access requirements.

To meter the volume of water withdrawn from storage and consumptively used for the HDD bore, a 4-inch Seametrics AG2000 Irrigation Magmeter will be used (see manufacturer information in A-1) at the storage tanks (see Drawing 8-1 in Attachment A-8). This spool-type electromagnetic flow meter and totalizer has no moving parts and minimal straight pipe requirements both above (i.e., 8 inches) and below (i.e., 4 inches) the meter. This allows unobstructed flow and makes it an ideal choice for use in surface water withdrawal applications where debris may cause damage to the equipment. This model is capable of displaying up to 5 digits for flow rate and 8 digits for the totalizer. The minimum flow rate for this model of flow meter is 12 gpm; the maximum rate is 1,000 gpm. The proposed withdrawal rate of 69.44 gpm (continuous daily average) is within this range. The meter is accurate to within +/-1% for flows between 100 gpm and 1,000 gpm and +/- 2% for flows under 100 gpm. The flow meter will be installed so that it cannot be bypassed, zeroed, or reset.

Transco will check the totalizer daily prior to pumping water from the Baker storage tanks and at the end of each day to maintain an exact record of water used consumptively. Transco shall report the data to the SRBC on a quarterly and annual basis, or as prescribed. Transco will also ensure that the meter readout will be accessible for SRBC staff at all times without locks, keys or other special access requirements.

C. Plans, Details, and Maps

A site plan, cross-section, details, and location map can be found in Attachment A-8. Site Photographs are included in Attachment A-9.

A-1 Intake Screen Calculations

CLIENT: TRANSCONTINENTAL GAA PIPE LINE COMPANY, LLC		JOB NUMBER: 212C-PB-00282	
SUBJECT: FISHING CREEK CPLS SCREENED INTAKE EVALUATION			
BASED ON: Bilfinger Water Technologies		DRAWING NUMBER:	
BY: LMH	CHECKED BY: CAR	APPROVED BY: CAR	
DATE: 8/22/2016	DATE: 8/23/16	DATE: 8/23/16	

PURPOSE:

The purpose of this calculation is to evaluate the minimum number of intake screens necessary to meet the requirement of maximum intake velocity of 0.5 feet per second. Creek depth is less than 3 feet.

APPROACH:

Use typical industry equations to calculate the minimum number of Bilfinger Water Technologies 6-inch diameter well screens necessary to allow a flow rate of 2,000 gallons per minute. Assume multiple intake screens with 0.1-inch slots.

CALCULATIONS:

- (1) Data was obtained from Bilfinger Water Technologies® for the well screen.

d	=	0.100	= Maximum perforation diameter, inches
V	=	0.5	= Maximum intake velocity, feet per second
Q	=	2,000	= Maximum flow (withdrawal) rate, gallons per minute
r	=	3.09	= Radius of perforated intake pipe, inches
b	=	5.000	= length of perforated intake pipe, feet
n	=	unknown	= number of screens
A _s	=	790	= Area of screen, square inches
A _o	=	494	= Open area of screen, square inches (see attached)
P	=	62.5%	= Open area of perforated intake pipe (P = A _o /A _s)

- (2) Use the following equation from the Handbook of Groundwater Development, Roscoe Moss Company, to calculate first the minimum number of Bilfinger Water Technologies intake screens necessary for a withdrawal of 2,000 gallons per minute.

$$V = \frac{Q / n}{235 \times r \times b \times P}$$

$$n = \frac{Q}{235 \times r \times b \times P \times V}$$

$$n = \frac{2,000}{235 \times 3.09 \times 5 \times 0.625 \times 0.5}$$

$$n = 1.76$$

$$n = 2 \quad (\text{round up})$$

The minimum number of Bilfinger Water Technologies 6-inch diameter well screens necessary to allow for a total flow of 2,000 gpm to be withdrawn is 2.

- (3) Using the equation from Step 2, calculate the entrance velocity when 2 Bilfinger Water Technologies 6-inch diameter well screens are used.

CLIENT: TRANSCONTINENTAL GAA PIPE LINE COMPANY, LLC		JOB NUMBER: 212C-PB-00282	
SUBJECT: FISHING CREEK CPLS SCREENED INTAKE EVALUATION			
BASED ON: Bilfinger Water Technologies		DRAWING NUMBER:	
BY: LMH	CHECKED BY: CAR	APPROVED BY: CAR	
DATE: 8/22/2016	DATE: 8/23/16	DATE: 8/23/16	

$$V = \frac{Q / n}{235 \times r \times b \times P}$$

$$V = \frac{2,000 / 2}{235 \times 3.09 \times 5 \times 0.625}$$

$$V = 0.44 \text{ feet per second}$$

CONCLUSION:

Two Bilfinger Water Technologies 6-inch diameter well screens provide an intake flow capacity of 2,000 gallons per minute with a maximum screen entrance velocity of 0.44 feet per second, which is conservatively below the required maximum intake velocity of 0.5 feet per second. Therefore, Tetra Tech believes that the resulting velocity will minimize impingement and entrainment of aquatic organisms during operation. Additionally, to minimize sediment uptake, the intake screens will be cradled to elevate them a minimum of 6-inches off of the creek bed.

A-3 Pump Specification

Pioneer Prime

PP66C14L71

Typical Pump Configuration

Performance

Pioneer Prime series - vacuum assisted, end suction centrifugal pump

Bare shaft, frame mounted, fully automatic dry priming, vacuum assisted, run dry, heavy duty pump

Size	6" x 6" 150 x 150 mm
Flow, Max	2,825 USgpm 660 m ³ /h 180 l/s
Head, Max	320 feet 100 meters
Flow at BEP	2,625 USgpm 600 m ³ /h 170 l/s
Efficiency at BEP	81%
Solids Handling, Max	1.0" 25 mm
Operating Speed, Max	2200 rpm
Suction Connection	6" (150 mm) 150 ANSI Flanges
Delivery Connection	6" (150 mm) 150 ANSI Flanges
Bearing Lubrication	Oil STD Grease optional
Fasteners	Imperial

Applications

Oil & Gas	Construction
Industrial	Mining
Petrochemical	Rental
Agriculture	Irrigation

High flow, heavy duty pump

The PP66C14 is a high flow, ruggedized pump designed to run over a broad range of performance and deliver outstanding suction lift. The rugged construction and modular design provide proven reliability and flexibility in the most demanding applications.

UltraPrime™ Priming System

Priming System	Mechanically Driven Diaphragm Style Vacuum Pump
Air Removal Capability	50 CFM
Priming Chamber	Single chamber with positive sealing air separation PosiValve™ with stainless steel float ball & linkage.
Discharge Check Valve	Swing Style - ductile iron with Buna-n Disc

Other Specifications

Mechanical Seal	Single seal w/ tungsten carbide vs. silicon carbide seal faces, Viton® elastomers, 300 series stainless steel hardware and spring, designed for indefinite dry running
Pump End Bearing	Single Row Ball
Drive End Bearing	Single Row Ball
Shaft	17-4 PH Stainless Steel

A-5 Flow Control Valve Specification

43-01
(Full Internal Port)

MODEL

643-01
(Reduced Internal Port)

Combination Rate of Flow Controller & Solenoid Shut-Off Valve

Schematic Diagram

Item	Description
1	Hytrol (Main Valve)
2	X58C Restriction Fitting
3	100-01 Hytrol (Reverse Flow)
4	CDHS18 Differential Control
5	CS3 Solenoid Control
6	X52E Orifice Plate Assembly

Optional Features

Item	Description
A	X46A Flow Clean Strainer
B	CK2 (Isolation Valve)
C	CV Flow Control (Closing)
D	Check Valves with Isolation Valve
H	Solenoid Drain to Atmosphere
P	X141 Pressure Gauge
S	CV Speed Control (Opening)
V	X101 Valve Position Indicator
Y	X43 "Y" Strainer

- Multi-functional Capability
- Includes Orifice Plate with Holder
- Optional Check Feature
- Easily Adjusted
- Every Valve Factory Tested

The Cla-Val Model 43-01/643-01 Combination Rate of Flow Controller and Solenoid Shut-Off Valve limits the maximum flow rate, regardless of changing line pressure. It is a hydraulically operated, pilot controlled, diaphragm valve. The pilot control is actuated by the differential pressure produced across an orifice plate installed downstream of the valve. Accurate control is assured as very small changes in the controlling differential pressure produce immediate corrective action of the main valve. A solenoid control is provided to intercept the operation of the differential control and close the main valve.

The Model 43-01/643-01 includes a orifice plate with a holder that should be installed one to five pipe diameters downstream of the main valve. If the check feature option is added and a pressure reversal occurs, the downstream pressure is admitted into the main valve cover chamber and the valve closes to prevent return flow.

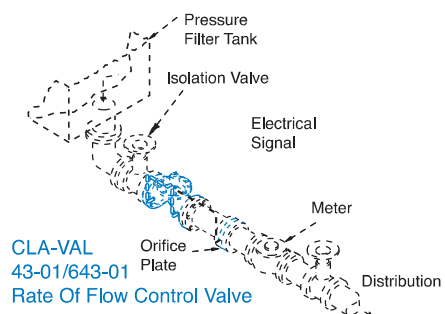

The "D" feature on a vertically installed 6" and larger valves must be horizontally installed.

Typical Applications

The 43-01/643-01 is typically installed where water supply to a system must be limited to a pre-set maximum flow rate at certain times of day. The valve is easily set to maintain the maximum allowable flow rate and is to open or close on an electrical signal.

The 43-01/643-01 is typically installed as a pressure type filter effluent control valve where a constant flow rate is maintained as head loss through the filter varies. The valve opens or closes on an electrical signal.

Model 43-01 (Uses Basic Valve Model 100-01)

For Lower Flows Consult Factory																

Pilot System Specifications

Adjustment Range

Low flow equals one-fourth maximum flow.

Temperature Range

Water: to 180°F

Electrical Ratings

24, 48, 120, 240, 480 - 60 Hz AC
6, 12, 24, 120, 240 DC

Materials

Standard Pilot System Materials

Pilot Control: Bronze ASTM B62

Trim: Stainless Steel 303

Orifice Plate: Stainless Steel 303

Rubber: Buna-N® Synthetic Rubber

Optional Pilot System Materials

Pilot systems are available with optional Aluminum, Stainless Steel or Monel materials.

Note: Orifice plate assembly (X52E) may be attached to the main valve outlet flange, however, better control is obtained if it is located one to five pipe diameters downstream. Orifice plate sensing connection should be located in the pipeline on the side of the orifice plate assembly. The orifice plate assembly should not be mounted directly to a butterfly valve. See E-X52E Data Sheet for Orifice Bore adjustment range.

When Ordering, Please Specify

1. Catalog No. 43-01 or No. 643-01
2. Valve Size
3. Pattern - Globe or Angle
4. Pressure Class
5. Threaded or Flanged
6. Trim Material
7. Adjustment Range/Orifice Bore
8. Energized or De-Energized to Open
9. Desired Options
10. When Vertically Installed

A-6 Pipeline Sizing Justification

Title: Fishing Creek CPLS Pipe Size Calculation

Project Name: Atlantic Sunrise

Client: Transcontinental Gas Pipe Line Company, LLC

Prepare By: LMH

Checked By: GH

Date: 8/22/2016

Date: 8/23/2016

Design Flow Rate	2,000	gpm	
Length ¹	684	ft	
Elevation at Start ¹	478	ft MSL	
Elevation at Pump	488	ft MSL	
Elevation at End ¹	502	ft MSL	
Backpressure at Discharge	27	psig	(NOTE: to account for minor losses; throttle discharge valve as required)
Hazen-Williams Coefficient	140		
Suction Pipe Length	76	ft	

¹ design basis to transfer water to pipeline, additional equipment to be used by hydrotest contractor.

Estimate Pipe Size based on velocity

Maintain Velocity at	15.0	ft/sec or less (temporary piping)
needed area	0.30	sf or a dia. = 7.4 inches I.D.

Pressure Drop Calculations

Use: Hazen-Williams Eq.:

$$h_f = \frac{0.2083 * \left(\frac{100}{C}\right)^{1.85} * Q^{1.85} * L}{100 * D^{4.8655}}$$

Flow rate, gpm	(gpm)	2,000	2,000	2,000	
Pipe Size	(inch)	8	10	12

A-7 Flow Meter Specification

APPLICATIONS

- Irrigation
- Chemigation
- Agricultural automation
- Well usage monitoring
- Dairy Lagoons

FEATURES

- Simple as a mechanical meter
- No moving parts
- Minimal straight pipe required
- Battery power standard; External power optional
- Solar compatible
- Built-in rate & total indicator
- Built-in pulse output for data-logging or telemetry
- Tamper-evident seal

AG2000-600

AG2000-300

Unobstructed Flow

Seametrics' series of standard and IP68 (submersible) flanged magmeters.

Available in sizes from 3" up to 12".

GENERAL INFORMATION

The AG2000 is a spool-type electromagnetic flowmeter for use in irrigation applications in 3" to 12" pipe. With no moving parts, these meters provide unobstructed flow and are resistant to wear from debris found in ground or surface water. Little maintenance is required because there are no bearings to wear out or propellers to stop turning. Minimal straight pipe requirements allow AG2000 meters to be used in piping configurations where there is little space between the meter and an elbow.

The standard AG2000 is battery powered. Where an external power source is available, the AG2000 can be optionally converted to 8-32 Vdc, with the batteries then serving as back-up to maintain continuous operation in case of power failure. This configuration will prolong battery life indefinitely.

An IP68 version (-168 option) is available for burial or applications where the meter may be under water up to a depth of 3 meters for prolonged periods of time.

The meter comes with built-in pulse output (requires optional cable) for data logging or telemetry. Several pulse rates are available. An internal data logger is also available for secure flow logging (-127 option). A Seametrics FT415W or FT420W display can be added if remote rate/total reading is desired, or an AO55W if a (4-20 mA) analog signal is required. (High-frequency pulse rate is required for use with most Seametrics controllers.)

The AG2000 is secured with a seal wire to protect against unauthorized access. The seal can be broken by an authorized agent, to change units of measure, replace the battery pack, or to field-install an optional power/output cable. The cable can be factory or field-installed where external power is available and/or pulse output is needed. An accessory weather guard is available for additional protection in outdoor applications.

For chemigation applications, the chemical injection point must be placed downstream of the meter **OR** far enough upstream for **complete mixing** to occur before the flow reaches the meter. (See tech bulletin on Seametrics' website, www.seametrics.com).
