PURPOSE:

The purpose of these calculations is to design a Post-Construction Stormwater Management (PCSM) Plan for the Locke Mountain Road block valve site as part of the Sunoco Pipeline L.P. Pennsylvania Pipeline Project. The site is located within Frankstown Township, Blair County, Pennsylvania. Permanent stormwater controls will be developed to satisfy PADEP and Frankstown Township's approved Act 167 Plan.

PCSM DESIGN REQUIREMENTS:

The PCSM design for this project follows the PA Department of Environmental Protection's (PADEP) Pennsylvania Stormwater Best Management Practices Manual (BMP Manual), December 2006; and the standard design criteria from PA Title 25, Chapter 102.8.(g)(2) and (3). The design criteria evaluated for the site are summarized below.

Act 167 Consistency

The Locke Mountain Road block valve site is located in Blair County, which does not have a county-wide Act 167 plan adopted. However, Frankstown Township has enacted the Beaverdam Branch Watershed Act 167 Stormwater Management Plan. This plan requires that the post-development runoff rate be less than or equal to the pre-development rate. The PCSM design at the Locke Mountain Road block valve has been designed for consistency with Frankstown Township's approved Act 167 Plan.

Recommended Volume Control Guideline

Use of Control Guideline 1 is recommended where site conditions offer the opportunity to reduce the increase in runoff volume as follows:

- Do not increase the post-development total runoff volume for all storms equal to or less than the two-year/24-hour event;
- Existing (pre-development) non-forested pervious areas must be considered meadow (good condition) or its equivalent; and
- 20 percent of existing impervious area, when present, shall be considered meadow (good condition) or its equivalent.

Due to the presence of shallow redoximorphic features in soil logs surrounding the Locke Mountain Road block valve site, it is not possible to infiltrate the 2-year/24-hour stormwater runoff volume increase while maintaining a 2-foot separation to the seasonal high groundwater table. Volume reducing BMPs in the PADEP Stormwater BMP Manual were analyzed on a case-by-case basis but did not meet their respective requirements. As a result, two slow-release BMPs have been proposed.

Recommended Peak Rate Control Guideline

The recommended control guideline for peak rate control is:

- Do not increase the peak rate of discharge for the 2-year through 100-year events (at minimum); as necessary, provide additional peak rate control as required by the applicable and approved Act 167 plan.
- The Frankstown Township Act 167 rate requirements mirror PADEP's requirements. Therefore, no additional peak rate control is required under the Act 167 Plan.

This site will utilize two slow-release BMPs with a downslope compacted berm to manage the two-year through 100-year peak rate increases. The proposed BMP will increase the post-construction time of concentration for the drainage area encompassing the block valve.

Recommended Water Quality Control Guideline

Control Guideline 1 will provide water quality control and stream channel protection as well as flood control protection. The use of a slow-release BMP has been approved by PADEP as an appropriate way to meet the requirements of Control Guideline 1 when onsite infiltration is not feasible.

Infiltration

Onsite infiltration testing was conducted in accordance of the PA BMP Manual. Documentation for infiltration testing and design infiltration rates can be found in Attachment 5 of the Site Restoration/Post Construction Stormwater Management Plan. Infiltration test locations and recommended design rates are also labeled on the PCSM Plan Drawings in Attachment 6.

During the onsite infiltration tests, the depth to seasonal high groundwater and shallow bedrock or another confining layer were evaluated. Due to the presence of shallow redoximorphic features which can be indicative of a shallow seasonal high groundwater table, it is not possible to maintain 2 feet of separation between a volume-reducing BMP and the seasonal high groundwater table.

The post-construction stormwater management design utilizes two slow-release BMPs to manage runoff volume due to the presence of shallow seasonal high groundwater.

Loading Ratio

Loading ratio guidelines do not apply because the design does not propose an infiltration BMP.

Disturbed Area

To meet Standard Worksheet 10 guidelines, 90% of the disturbed area is detained by the proposed PCSM BMPs.

Karst Topography

Locke Mountain Road is not located within an area of karst terrain.

Special Protection Watershed

Locke Mountain Road is not located within a special protection watershed, so antidegradation requirements do not apply.

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

3 Infiltrated volume within 72 hours after the 2-yr/24-hr event
(Infiltration Rate/12) x Infiltration Area x 72 hrs = 540 cf
Potential infiltrated volume = 3,888 cf. based on slow release dewatering rate. Since this is greater than the storage volume, only the storage volume can be used and assumed to infiltrate within 72 hours.

VOLUME CREDIT DETERMINATION DETAINED 2
