1.0 INTRODUCTION

Tetra Tech, Inc. (Tetra Tech) is pleased to submit this Technical Summary Report to the Pennsylvania Department of Environmental Protection (PADEP). This document summarizes Tetra Tech's investigation and pilot study activities conducted between January 2020 and December 2021 for the Hoff VC Hazardous Sites Cleanup Act (HSCA) Site (the Site), located in Perkiomenville, New Hanover Township, Montgomery County, Pennsylvania.

Tetra Tech's work has been conducted under the Interim Response and Remediation Service Contract 7 (IRRSC7) SAP#4000019261, contract requisition number IRRSC7-1-319.

This section describes the purpose of this document, project objectives, and report organization.

1.1 PURPOSE

This technical summary report summarizes Tetra Tech's investigation and pilot study activities conducted between January 2020 and December 2021, including findings and analytical results of work completed at the Site. All work was performed in accordance with PADEP's Office of Hazardous Sites IRRSC Scope of Work (SOW) and subsequent Change Orders for the project.

1.2 OBJECTIVES

During the project scoping meeting conducted on April 26, 2018, the Pennsylvania Department of Environmental Protection (PADEP) tasked Tetra Tech to develop a remediation plan appropriate for Site conditions, capable of decreasing the high concentrations of volatile organic compounds (VOCs) at specific areas ("hot spots"). Ultimately, the primary objective of this project has been to monitor the Site and evaluate treatment technologies at the pilot scale as a "remediation pilot study." The work discussed in this Technical Summary Report is in support of and considers the above objectives.

1.3 REPORT ORGANIZATION

This report contains the following subsequent sections:

- Section 2 presents the Site description, Site history, and brief summary of previous environmental investigations completed.
- Section 3 describes the remediation pilot study design.
- Section 4 describes the completed remediation pilot study, including details regarding in situ remediation injections (both active and passive), and the simultaneous groundwater monitoring and sampling activities.
- Section 5 includes conclusions and recommendations.
- Section 6 lists reference documents.

2.0 SITE DESCRIPTION AND BACKGROUND

This section summaries the Site description and background information for the Hoff VC HSCA Site, as provided by PADEP.

2.1 SITE DESCRIPTION

The Site is within a primarily rural portion of Pennsylvania, approximately 40-miles north-northwest (NNW) of Philadelphia, located at 334 Layfield Road, New Hanover Township, Montgomery County, Pennsylvania (**Figure 1**). The primary focus area for this pilot study is the northwest portion of property (**Figure 2**). It is suspected that effluent from a historical truck washing facility (presently office and truck shop) was conveyed (via an underground pipe at the eastern corner of the building) to a concrete vault located approximately 95 feet northeast of the building. The dimensions of the concrete vault are approximately 6 feet wide by 40 feet long with a depth of approximately 9.5 feet.

2.2 SITE HISTORY

The Site was formerly used for many decades as an oil distribution facility. Swann Oil initially owned the property from the 1960's through the late 1980's, when it was then purchased by Good Oil Company. Good Oil Company is the current property owner. Multiple Oil storage tanks (both above-and-below ground) used by Swann Oil and Good Oil, have since been removed. Several buildings (offices and maintenance shops), along with an asphalt paved parking area are currently located in the front portion of the property. The developed operating area covers approximately 18 acres, with the remainder of the parcel being undeveloped and wooded.

Historical use of trichloroethene (TCE) solvent at both the maintenance building and truck washing facilities has been reported. In recent years, the property has been leased to a metal fabrication/welding shop and residual waste disposal company**.** Presently, White Tail Disposal operates a residual waste disposal transport operation.

2.3 PREVIOUS INVESTIGATIONS

In 2011, the Montgomery County Health Department (MCHD) collected a potable water sample from a well serving a multi-tenant apartment building property located on Layfield Road. This sample was collected as a response to a heating oil tank leak reported at that property. Results indicated elevated levels of trichlorethylene (TCE), cis-1,2-dichloroethylene (cis-1,2-DCE), 1,1-dichloroethylene (1,1-DCE), vinyl chloride (VC), and methyl-butyl ether (MTBE). These findings triggered PADEP to collect additional potable well samples from wells serving other nearby properties. Results from this additional sampling indicated elevated VOC concentrations above their MCLs at five locations.

From 2012 to 2014, several monitoring wells (MWs) were installed on- and off-site, and multiple site-wide groundwater sampling events were completed.

In 2016, PADEP was informed of (and during inspection with Tetra Tech confirmed) the existence of an underground concrete waste pit (WPA) located at the northwestern portion of Site. PADEP directed Tetra Tech to investigate this waste pit (and the surrounding soils) to determine if it was or had contributed to soil and groundwater contamination.

Tetra Tech conducted an initial soil boring investigation at the WPA and next to southwestern corner of the WPA. Liquid in the waste pit was also sampled by Tetra Tech, and the analytical results revealed detections of VOCs and 1,4-Dioxane (as well as concentrations of several metals and pesticides). Additional soil sampling was performed to close the data gaps from the previous investigation and to follow the suspect subsurface piping adjacent to the waste pit.

With this additional information, PADEP determined it was appropriate to excavate the impacted soils adjacent to the waste pit and along the suspected pipes extending to the nearby main building. Between December 2017 and March 2018, Tetra Tech's subcontractor, Lewis Environmental, completed excavation activities including: the cleanout of the onsite waste pit; investigation of piping associated with the waste pit, and excavation and disposal of impacted soils. Confirmatory soil samples collected during this excavation work indicated VOC and 1,4-Dioxane contamination remaining at the southwestern portion of the excavation near the main building.

In April 2018, PADEP began seeking alternative remedial approaches. In-Situ chemical and/or biochemical/chemical remediation of impacted overburden soils and groundwater was considered for cleanup within the WPA

3.0 REMEDIATION PILOT STUDY DESIGN

PADEP requested that Tetra Tech identify prospective in-situ remediation technologies to target primarily VOCs at the most impacted areas. The proposals included in-situ chemical oxidation (ISCO) technology and application of similar amendments.

Innovative Environmental Technologies, Incorporated's (IET) proposal to use an activated persulfate technology to help remediate groundwater via the implementation of chemical oxidation with both sodium and potassium persulfate, activated by ferric oxide, and buffered by magnesium oxide was selected by PADEP. The proposed treatment amendment is patented under Provectus-OX; additional details about Provectus-OX is provided in **Appendix A**.

Site work was conducted to evaluate baseline conditions. This work included:

March 2019: Two shallow bedrock wells (MW-A and MW-B) were installed by Tetra Tech's subcontractor Summit Drilling in the WPA. These two wells were installed to help further characterize both vertical and horizontal shallow groundwater conditions within the WPA.

May 2019: An initial groundwater sampling event was conducted at wells located in the WPA (MW-A, MW-B and MW-13). These wells were analyzed for VOCs and 1,4-dioxane.

August 2019: An expanded groundwater sampling event was conducted at the following Site wells: MW-A, MW-B, MW-6, MW-8, MW-10, and MW-13. These wells were analyzed for VOCs and 1-4-dioxane.

October 2019: A second groundwater sampling event was conducted at wells located in the WPA (MW-A, MW-B and MW-13). All groundwater samples collected were analyzed for VOCs, 1,4-dioxane, SVOCs, pesticides, and total and dissolved Metals.

Samples from August 2019 were also analyzed for natural attenuation (NA) parameters: sulfate and ethane/ethene/methane. Throughout this report only VOCs, 1,4-dioxane, and NA parameters are presented for evaluation. The full analytical analyses and other site-wide wells results are presented in the analytical laboratory reports (**Appendix E**). A summary of results for VOCs, 1,4-dioxane and NA parameters analytical results from May 2019, August 2019, and October 2019 are presented in **Tables 1a and 2a.**

The final pilot study design included: seven temporary Direct Push Technology (DPT) injection points, four permanent injection well locations (MW-A/-B/-C/-D), and the installation (and injection) of three, double-nested 1-in wells (IW-1, IW-2 and IW-3).

A subsurface vertical barrier situated perpendicular to apparent contaminant groundwater flow was planned (**Figure 3**). This vertical barrier of injected Provectus-OX remedial product, (sodium and potassium pair persulfate and ferric oxide along with added magnesium oxide for a pH buffer) could promote the oxidation of VOCs, via the generation of sulfate free radicals from iron activation. After an initial estimated 3–6-month oxidation period, a facultative attenuation period (where sulfate reduction occurs across the targeted area) was expected, further reducing VOC concentrations.

Tetra Tech developed a performance monitoring plan to monitor long-term post-treatment performance. This included the sampling of both monitoring and injection wells within the WPA, with a schedule of 30/60/180 days after the completion of the ISCO injection phase.

4.0 SITE REMEDIATION PILOT STUDY

This section presents the field activities conducted for the Remedial Pilot Study.

4.1 FIELD ACTIVITIES

This section summarizes the field activities performed during the Remedial Pilot Study and ongoing remediation within the WPA at the Hoff HSCA Site. These field activities included: the installation of monitoring/injection wells, pre-injection (baseline) groundwater sampling, ISCO DPT, nested injection wells installation, well injections, ISCO post-injection performance groundwater sampling, ISCO sleeve deployment and implementation in wells, groundwater monitoring sampling and investigation-derived waste (IDW) disposal.

4.1.1 Injection Well Installation and Sampling (Pre-Injection Baseline)

In January 2020, three additional shallow bedrock wells (MW-C, MW-D and MW-E) were installed. The reasoning for the installation of these three new wells was to serve as both additional monitoring points and for in-situ injection wells (if needed). These three wells were appropriately constructed for the dual purpose of both monitoring well and injection point purposes.

From January 21 - 23, 2020, Tetra Tech conducted a groundwater sampling event to establish a pre-injection baseline to measure initial contaminant levels for future remedial performance evaluations. The following wells were sampled during this pre-injection groundwater sampling: MW-A, MW-B, MW-C, MW-D, MW-E, MW-F, MW-6, MW-8, MW-10, and MW-13.

All groundwater samples were placed into laboratory-provided bottleware and stored in iced coolers for sample preservation. Collected samples were relinquished to PADEP directly for shipment to PADEP's Bureau of Laboratories (BOL) for analysis.

All sample purge water was containerized and treated on-Site through granulated activated carbon (GAC) media (provided by PADEP) and released to the ground in accordance with PADEP.

Summary of 2020 January groundwater analytical results of VOCs; 1,4-dioxane, and NA parameters are presented in **Tables 1b and 2b**.

4.1.2 Injection Event 1 – Active ISCO Implementation

The active ISCO Injection Event 1 was implemented on November 16, 18-20 and 23-24, 2020. This event consisted of: ISCO injection (via DPT) at seven temporary locations (IP-01 through IP-07*)*, the installation of three double-nested injection wells *(*IW-1A/B, IW-2A/B, IW-3A/B), the installation of one double-nested monitoring well (MW-FA/B) and ISCO injections (via existing wells and new installed injection wells).

This ISCO remedial approach utilized sodium persulfate and ferric oxide solutions, with added magnesium oxide to create a pH buffer. When combined, these products pair with a self-activating

oxidation persulfate chemistry while providing the appropriate components for a longer lasting biological attenuation process following the initial oxidation event (**Appendix A**).

On November 16, 2020, IET mobilized to the Site and conducted injection activities at seven (IP-01 to IP-07) temporary DPT locations. By design, each DPT was drilled to 20 ft bgs and within wo intervals in borehole inject 150 gallons of ISCO amendments. None of the borings reached 20 ft bgs due to hitting refusal. Refusal depths differed, however ISCO was injected at each boring just above refusal and at an interval several feet shallower. The details on the quantity of amendment injected and at what intervals are presented in the IET Report attached in **Appendix B**.

From November 18 through 20, 2020, IET installed three double-nested injection wells (IW-1A/B, IW-2A/B, IW-3A/B) and one double-nested monitoring well (MW-FA/B). Drilling of all new wells was completed using a hollow stem auger through overburden, then air rotary drilling through weathered bedrock. Well construction details are provided in **Table 4** and Well Logs in **Appendix C**.

On November 23 – 24, 2020, IET conducted ISCO injection into four existing wells (MW-B, MW-C, MW-D, and MW-13) and three double nested injection wells (IW-A/B, IW-2A/B, and IW-3A/B). The well injections were successful, except in MW-D, where the annulus of the well was compromised, and daylighting of the amendment occurred around the well's casing. A total of 1,400 gallons of ISCO amendment was injected at nine screened well points during this event. Further details on the quantity of amendments injected at each well are presented in the IET Report (**Appendix B**).

4.1.3 Groundwater Sampling (Post-active ISCO Injection 1)

Under the planned performance monitoring events, scheduled 30/60/180 days post-injection; Tetra Tech conducted three groundwater sampling events after the ISCO Injection Event to collect data for comparison with baseline levels and remedial performance monitoring measurements. Dates, wells sampled, and analyses performed for each round are listed below:

- *30 days post-injection* - December 2020: Sampling took place from December 9 through 11, 2020, and included MW-A, MW-B, MW-C, MW-E, MW-FA/FB, MW-6, MW-10, MW-13, IW-1A/1B, IW-2A/2B, and IW-3A/3B. A Summary of the December 2020 groundwater analytical results of VOCs; 1,4-dioxane, and NA parameters are presented in **Tables 1c and 2c.**
- *60 days post-injection*; January 2021: Sampling took place from January 9 through 11, 2020, and included MW-A, MW-B, MW-C, MW-E, MW-FA/FB, MW-6, MW-10, MW-13, IW-1A/1B, IW-2A/2B, and IW-3A/3B. A Summary of the January 2021 groundwater analytical results of VOCs; 1,4-dioxane, and NA parameters are presented in **Tables 1d and 2d**.
- *180 days post-injection*; June 2021: Sampling took place from June 1 through 3 and 22, 2021, and included MW-A, MW-C, MW-E, MW-FA/FB, MW-10, MW-13, IW-2A/2B, and IW-3A/3B. A Summary of the June 2021 groundwater analytical results of VOCs; 1,4-dioxane, and NA parameters are presented in **Tables 1e and 2e**.

As previously noted, for wells located within the in WPA, contaminants of concern (COCs) are only VOCs and 1,4-dioxane, therefore only VOCs, 1,4-dioxane and NA parameters are presented for evaluation.

Low-flow groundwater sampling techniques were followed during each of the individual sampling events. All field sample and purge sheets are included in **Appendix D.**

4.1.4 Pre-deployment Groundwater Sampling and ISCO (Provectus) Sleeves Deployment – Passive ISCO Implementation 1

During this remedial process, Tetra Tech and IET regularly provided PADEP with data evaluations summarizing the remediation progress. In August 2021, while reviewing the performance groundwater data collected in June 2021, it appeared that subsurface oxidation processes (induced by ISCO amendments) were weakened at the WPA. Such was expected as approximately 180-days had passed since the active ISCO injection occurred, which corresponds to the oxidation longevity for the product amended. In several wells (MW-C, MW-FA, MW-FB, IW-2A, and IW-2B) elevated levels of VOCs COCs were detected as well as 1,4-dioxane exceeding criteria (PADEP Medium Specific Concentration for residential used aquifer). However, field observation (brown-red color of sampled groundwater); water quality measurements (specific conductivity, pH, and ORP); and NA parameters (elevated total Fe and high sulfate concentrations) indicate that degradation process still goes on and likely via sulfate reduction.

PADEP requested Tetra Tech to address high COCs concentrations found in WPA wells – “hot spots.” Since ISCO amended material is still within WPA subsurface, another injection at the time was not necessary. Tetra Tech proposed deployment of ISCO sleeves to enhance degradation of COCs at hot spot wells.

- To establish present groundwater conditions and obtain pre-deployment ISCO sleeves implementation data, a groundwater sampling event was conducted approximately 300 days post injection.
- ~300 days post-injection; September 2021: Sampling took place from September 27 through 30, 2021, and included MW-A, MW-B, MW-C, MW-D, MW-FA/FB, MW-10, MW-13, IW-1A/1B, IW-2A/2B, and IW-3A/3B. A Summary of the September 2021 groundwater analytical results of VOCs; 1,4-dioxane, and NA parameters are presented in **Tables 1f and 2f**.

On October 1, 2021, sixteen passive sleeves (provided by Provectus Environmental Services) were installed in wells MW-B, MW-C, and MW-13, upon the completion of the fourth groundwater sampling event. These passive sleeves (filled with sodium persulfate and ferric oxide solutions, with added magnesium oxide) were installed to continue to treat hotspots within the WPA. Details on sleeves placement are provided in **Table 5.**

4.1.5 Groundwater Sampling (Post-Passive ISCO Implementation 1)

Tetra Tech conducted one groundwater sampling event, post-passive sleeve deployment, to collect data for comparison with remedial performance monitoring measurements:

- December 2021: Sampling included MW-A, MW-C, MW-D, IW-B, IW-1A/1B, IW-2A/2B, IW-3A/3B, MW-2S/2DL/2DV, MW-03, MW-04DL/4DV, MW-5S/3DL/5DV, MW-6S/6DL/6DV, MW-7S, MW-

08DL/8DU, MW-10 and MW-FA/FB. A Summary of the December 2021 groundwater analytical results of VOCs, 1,4-dioxane, and NA parameters are presented in **Tables 1g and 2.**

A summary of analytical results of samples collected during each groundwater event conducted over the monitoring period May 2019 through December 2021 is presented on **Tables 1a-g**. Laboratory analytical packages are included in **Appendix E**. Field sampling and purge water sheets with water quality data is attached in **Appendix D**. A summary of water quality records is presented in **Tables 2a-g**. Ground water elevations for each sampling round are summarized in **Table 3.**

5.2 CONCLUSIONS

The Pilot Study results and quantitative data evaluation show that both the active injected ISCO amendment and subsequent ISCO passive sleeve deployments were suitable to address contaminated groundwater at the Site. In general, the Pilot Study was successful in helping to reduce both VOCs and

1,4-Dioxane concentrations, specifically in wells MW-A, MW-B, MW-C, MW-6 and MW-13. The use of the ISCO sleeves was an efficient and economical option to continue treatment in-between injection events. Data from December 2021 sampling event shows that the ISCO sleeves were effective in treatment but were consumed in the short-term.

In monitoring wells where 1,4-dioxane was detected at lower levels, it was difficult to treat and attain the regulatory limit of 6.5 ug/L. Data evaluation shows a particular concern for 1,4-Dioxane concentrations at MW-C and MW-FA/FB. An amendment suitable for 1,4-Dioxane treatment should be applied at the barrier along the contaminant migration pathway at these wells.

Additional noteworthy comments are as follows:

- In MW-6, a significant reduction of VOCs occurred, while in MW-10, VOCs increase was seen. These shallow overburden monitoring wells are further southeast apart from the treatment barrier. Only limited impact on these wells is seen from treatment barrier.
- MW-8 is the furthermost monitoring well (approximately 400 ft southeast of the treatment barrier). Initially, low VOCs concentrations were observed, but in the most-recent sampling round (December 2021), a significant increase in VOCs was seen.
- The results at MW-FA/FB monitoring wells indicate probable contaminant migration in a south-southeast direction.
- VOC concentrations in MW-D (which is close to the ISCO barrier and side-gradient from the WPA) did slightly increase after the injection had completed. Also, in the downgradient south-southeast wells (MW-FA/FB), high VOCs levels were observed. In the deeper screened well (MW-FB), VOCs concentrations increased more than threefold.

For help in further interpreting analytical results, a series of Concentration vs. Time trendline graphs (**Figures 4a-b through 8a-b**) were generated. For selected pair/group of wells, two graphs were made: one showing the sum of VOC COCs (benzene; chlorobenzene; 1,2-dichlorobenzene; 1,4-dichlorobenzene; 1,1-dichloroethene; cis 1,2-dichloroethene; trichloroethene; vinyl chloride; and 1,2,4-trimethylbenzene; trans 1,2-dichloroethene) and the other showing 1,4-Dioxane levels. Additional details are as follows:

MW-A and MW-D

Overall, in both MW-A and MW-D the sum of VOC COCs is low. 1,4-Dioxane concentrations in MW-A and MW-D are also low. A very slight trend of decrease in MW-A and increase in MW-D is noted, but likely it is due to temporal variations. MW-A was not impacted by the pilot study injection, while in MW-D injected material reached (observed daylighting and color in post-injection samples) during injections at surrounding wells.

MW-B, MW-C, MW-13

In MW-B, MW-C, and MW-13 a decreasing trend of VOC concentrations was noted with some rebound in later post-injection samples. The rebound is more prominent in MW-B. Similarly, as for VOCs, 1,4-

Dioxane in MW-B, MW-C, and MW-13 showed a decreasing trend with rebound in concentrations noted in post-injection sampling rounds.

May 2019 results for MW-B show uncharacteristically low contaminant concentrations. MW-B is a flush mount well and frequently floods; the sample was taken under flood conditions and believed to be biased low in contamination due surface/storm water mixing.

MW-FA and MW-FB

MW-FA and MW-FB did not show a decrease in VOC and 1,4 -Dioxane levels. On contrary, the in most-recent sample round (December 2021) in MW-FB, VOCs concentrations increased three-fold from the baseline levels. Also, higher concentrations of 1,4-dioxane are observed in MW-FA than in MW-FB.

MW-6, MW-8, and MW-10

MW-8 and MW-10 showed a VOC increase with a more significant increase noted in MW-8.

MW-6 showed a decrease in VOCs, but recent sample rounds results were not available (well is not accessible for sampling).

In both MW-6 and MW-10 a decrease of VOCs was noted in the first two post-injection sample rounds; while results for these rounds for MW-8 are not available.

In both MW-6 and MW-10 slight fluctuations of I,4 Dioxane from non-detect/very low concentrations to just above and below criteria (6.5 ug/L) were noted. 1,4-Dioxane was detected only in last sampling round (December 2021). In the previous pre-baseline and baseline sampling rounds 1,4 -Dioxane was non-detect.

IW-1B, IW-2B, and IW-3B

IW-2B has the highest VOCs levels among these injection wells. An increasing VOCs trend was observed in IW-1B and IW-2B, while there is a moderate VOCs decrease with some significant decrease observed in last sampling round (December 2021). The highest concentrations of 1,4-Dioxane among these three wells was in IW-2B. An increase trend in 1,4-Dioxane levels was observed in all these three wells, with the highest rate increase seen in IW-2B.

5.3 RECOMMENDATIONS

Tetra Tech recommends continuing the remedial efforts at the Site. These efforts include the continued use of the same ISCO chemical amendment to conduct re-injections at the same wells as the Pilot Study (or installing additional injection points). These additional new injection points include areas predominately in the south-southeast direction of the WPA.

Tetra Tech also recommends:

- The use of additional chemical ISCO treatments (or mix with the current amendments) that specifically degrades 1,4-dioxane, when injecting at nearby MW-C and MW-FA/FB wells.

- Recovering and rehabilitating monitoring wells MW-12 and MW-14 to include them in future performance monitoring sampling.
- Adding new monitoring wells in between MW-12 and MW-14 (with corresponding depths to match Site injection wells (~35 ft bgs)). If wells MW-12 and MW-14 cannot be recovered, installing a second monitoring well in this area is appropriate.
- Continuing with ISCO sleeves implementation at MW-B (near WPA) and other hot spot wells (MW-C and MW-13).
- Consider placing ISCO sleeves in MW-8.
- Continue with routine WPA groundwater sampling.
- After the proposed re-injection event, apply the suggested post-injection groundwater sampling schedule.
- Evaluate the re-injection event and post -injection sampling data for possible further approaches of remediating and attaining concentrations below regulated standards for all COCs.

Technical Data Sheet

Provect-OX2™

Self-Activating, Extended Release ISCO + Enhanced Bioremediation Reagent

TECHNOLOGY DESCRIPTION

Provect-OX2™ is an *in situ* chemical oxidation (ISCO) + enhanced bioremediation reagent that integrates an extended release source of potassium persulfate into the modern Provect-OX® formula. Ferric iron (Fe III) activation is used as a safe and effective means of activating the potassium and sodium persulfates (US Patent No. 9,126,245; patents pending). Similar to our original Provect-OX® technology, Provect-OX2™ oxidizes a wide variety of organic compounds present in impacted soil, sediment and groundwater, including chlorinated solvents, petroleum hydrocarbons, and pesticides. However, Provect-OX2™ ensures extended release of oxidant throughout the treatment media. The ferric oxide iron, along with the residual sulfate, will provide enhanced bioremediation components following the chemical oxidation processes. Provect-OX2™ will also include Terr-OR™ ferrate stabilizer and pH buffer to offset the sulfuric acid produced during breakdown of the persulfates.

Provect-OX® and Provect-OX2™ are the only ISCO technologies designed to actively manage rebound. The advanced activation catalyst is further unique considering its ability to enhance bioremediation processes. This is accomplished via the subsequent utilization of sulfate and iron as terminal electron acceptors for facultative reductive processes. Degradation intermediates generated during pollutant oxidation may act as electron shuttles, allowing the reduction of Fe(III) to Fe(II) in the redox cycling of iron and continued activation of persulfate. This combined remedy provides supplemental treatment mechanisms thereby allowing for more cost-efficient dosing of the product.

Like all Provectus products, Provect-OX2™ was developed by experienced practitioners who understand real-world field applications. For example, the oxidants (potassium and sodium persulfate) and its activator (ferric oxide) are conveniently packaged in a single, pre-mixed bag for ease of use and safe handling. Moreover, due to its safe and non-extreme activation chemistry, Provect-OX2™ will not generate excessive heat / off-gases, nor will it mobilize heavy metals or lead to the generation of secondary impact issues, such as elevated arsenic, chromium, or pH.

TRADITIONAL ACTIVATION CHEMISTRIES

Heretofore, sodium persulfate has been activated via heat, chelated metals, hydrogen peroxide, ZVI/surface catalysis, and/or pH extremes in order to generate sulfate radicals, hydroxyl radicals, etc. (Tsitonaki *et al.,* 2010). Not only do these systems require the addition of other products or energy, they tend to disregard the many biologically mediated processes possible as a consequence of the decomposition products of persulfate.

Divalent metal activation: The utilization of ferrous iron, usually as a chelated cation consumes the oxidant (persulfate) in a conversion of the ferrous iron to ferric iron. Additionally, the presence of the chelator

Provect-IR®, Provect-OX®, Provect-OX2™, Provect-GS™, Provect-IRM®, ABC-CH4®, EZVI-CH4™ AquaGate®-CH4 and Provect-CH4® are registered trademarks of Provectus Environmental Products, Inc. and/or our affiliates v1 – July 31, 2018 • Copyright ©2018 Provectus Environmental Products, Inc.

inhibits biological utilization of the generated ferric species as a biological terminal electron acceptor and consumes oxidant. Over dosing of the chelated ferrous iron further consumes the oxidant.

Caustic Activation: The utilization of caustic (high pH) activation of persulfate presents inherit health and safety issues while creating an unsuitably high pH environment for biological attenuation. Further, within this activation mechanism is a self-limiting biological attenuation process once the pH returns to suitable levels. The sulfate, when used as a biological terminal electron acceptor, transitions to sulfite and finally sulfide. This final product forms hydrogen sulfide which inhibits further biological activity.

Heat Activation: The utilization of heat as an activation mechanism is generally difficult to implement, and it incurs high implementation costs while not addressing the hydrogen sulfide issue.

Hydrogen Peroxide Activation: The use of peroxide as an activating mechanism again does not address the hydrogen sulfide generation problem while having limited efficacy on many targeted compounds.

MODE OF ACTION

ISCO: Under the Provectus approach, potassium and sodium persulfate are activated by Fe III (pre-mixed formulation) which requires a lower activation energy than alternative mechanisms while not consuming the persulfate oxidant. The mechanism is believed to elevate the oxidation state of the iron transiently to a supercharged iron ion which in itself may act as an oxidant. As this supercharged iron cation is consumed, the resulting ferric species can act as a terminal electron acceptor for biological attenuation. Coincidentally, the generated sulfate ion from the decomposition of the persulfate provides a terminal electron acceptor for sulfate reducers which may further remediate the targeted compounds in the groundwater and soils. The reactions that occur in the chemical oxidation include persulfate radicals and ferrate, as summarized below (Equation 1):

$$S_2O_8^{-2} + Fe^{+3} \text{ ---------> } Fe^{(+4 \text{ to } +6)} + SO_4^{2-} + SO_4^{2-\bullet} \quad \text{(Eq. 1)}$$

SECONDARY ATTENUATION PROCESS (Biologically Mediated):

1) Sulfate Residual

After dissolved oxygen has been depleted in the treatment area, sulfate (a by-product of the persulfate oxidation) may be used as an electron acceptor for anaerobic biodegradation by indigenous microbes. This process is termed sulfidogenesis and results in the production of sulfide. Stoichiometrically, each 1.0 mg/L of sulfate consumed by microbes results in the destruction of approximately 0.21 mg/L of BTEX compounds. Sulfate can play an important role in bioremediation of petroleum products, acting as an electron acceptor in co-metabolic processes as well. For example, the basic reactions for the mineralization of benzene and toluene under sulfate reducing conditions are presented in equations 2 and 3:

$$C_6H_6 + 3.75\ SO_4^{2-} + 3\ H_2O \rightarrow 0.37\ H^+ + 6\ HCO_3^- + 1.87\ HS^- + 1.88\ H_2S^-$$ (Eq. 2)

$$C_7H_8 + 4.5\ SO_4^{2-} + 3\ H_2O \rightarrow 0.25\ H^+ + 7\ HCO_3^- + 2.25\ HS^- + 2.25\ H_2S^-$$ (Eq. 3)

2) Ferric Iron:

Ferric iron is also used as an electron acceptor during anaerobic biodegradation of many contaminants, sometimes in conjunction with sulfate. During this process, ferric iron is reduced to ferrous iron, which is soluble in water. Hence, ferrous iron may be used as an indicator of anaerobic activity. As an example, Stoichiometrically, the degradation of 1 mg/L of BTEX results in the average consumption of approximately 22 mg/L of ferric iron (or "production" of ferrous iron) as shown below (equations 4-6).

$$C_6H_6 + 18\ H_2O + 30\ Fe^{3+} \text{-------}> 6\ HCO_3^- + 30\ Fe^{2+} + 36\ H^+$$ (Eq. 4)

$$C_7H_8 + 21\ H_2O + 36\ Fe^{3+} \text{-------}> 7\ HCO_3^- + 36\ Fe^{2+} + 43\ H^+$$ (Eq. 5)

$$C_8H_{10} + 24\ H_2O + 42\ Fe^{3+} \text{-------}> 8\ HCO_3^- + 42\ Fe^{2+} + 50\ H^+$$ (Eq. 6)

3) Pyrite Formation:

While ferrous iron is formed as a result of the use of the ferric species as a terminal electron acceptor, residual sulfate is utilized as a terminal electron acceptor by facultative organisms thereby generating sulfide under these same conditions. Together, the ferrous iron and the sulfide promote the formation of pyrite as a remedial byproduct (equation 7). This reaction combats the toxic effects of sulfide and hydrogen sulfide accumulation on the facultative bacteria, while also providing a means of removing targeted organic and inorganic COIs via precipitation reactions. Moreover, pyrite possesses a high number of reactive sites that are directly proportional to both its reductive capacity and the rate of decay for the target organics.

$$Fe^{2+} + 2S^{2-} \text{-------}> FeS_2 + 2e$$ (Eq. 7)

PRIMARY FEATURES:

The combination of potassium and sodium persulfates provide a short and long-term oxidant release that will be effective for many different treatment matrices. The combined persulfates and activation methodology maximizes the synergy between coupled oxidation and enhanced bioremediation: i) sulfate is

generated from persulfate, i) ferric iron (Fe III) is microbiologically reduced to ferrous iron (Fe II) readily supplying electrons to exchange and react with sulfide. Together, sulfide and iron form pyrite, an iron bearing soil mineral with a favorable reductive capacity.

- Extended Longevity: ISCO reactions remain active for an estimated 1 to 4 months (versus < 2 weeks for standard persulfate -based oxidants); secondary enhanced bioremediation processes remain active for many years
- Effective: Promotes multiple oxidation pathways of a wide-range of organic contaminants for an extended time compared to traditional persulfate options. Also provides a unique microbiological component for multiple accelerated attenuation processes.
- Efficient: Significantly lower costs as a result of sub-stoichiometric dosing requirements.
- Safe: Fewer health and safety concerns as compared with use of traditional activation methods such as heat, chelated metals, hydrogen peroxide or pH extremes. Contains built-in activation, which eliminates the need for additional and potentially hazardous chemicals required to achieve traditional persulfate activation.
- Ease of Use: Single component product with integrated activator results in simplified logistics and application. No additional containers or multi-step mixing ratios required prior to application. Fewer material compatibility issues.
- Improved Performance: Combined remedy prevents "rebound" which is often seen in other oxidation processes. Maximizes the inherent geochemistry of a "post-oxidation" environment for biologically based attenuation.
- Eliminates Secondary Groundwater Issues: Includes Terr-OR™ ferrate stabilizer and pH buffer to offset the sulfuric acid produced during breakdown of the persulfates and limit the mobilization of pH sensitive heavy metals (e.g., arsenic).
- Patented Technology: US Patent No. 9,126,245 (international filings in EU, Australia, Brazil, Canada, China, Colombia, Japan and Mexico) and others pending allow us to freely market this advanced persulfate-based ISCO technology globally, using our choice of suppliers.
- Manufactured Globally: USA, Italy, Taiwan

Provect-OX is an *in situ* chemical oxidation (ISCO) + enhanced bioremediation technology that combines persulfate with ferric iron in a single, premixed package. The persulfate is activated by ferric iron to create strong oxidizers including the sulfate radical and ferrate ($Fe^{+4 \text{ to } +6}$) that can address a wide variety of organic compounds present in impacted soil, sediment and groundwater, including chlorinated solvents, petroleum hydrocarbons, and pesticides. This built-in activation method eliminates the need for traditional activation chemistries (*e.g.,* hydrogen peroxide and sodium hydroxide) that have associated health, safety, and handling concerns.

Provect-OX uniquely provides long-term, sustained secondary enhanced bioremediation to manage residuals and prevent contaminant rebound, which is a common problem encountered with conventional ISCO technologies. This is accomplished via the utilization of residual iron and sulfate (generated from decomposition of persulfate) as terminal electron acceptors for facultative reductive processes. This technique maximizes the synergy between persulfate and iron for coupled oxidation and enhanced bioremediation.

Provect-OX was developed by experienced practitioners who understand field applications. Our convenient packaging includes 50 lb bags or various sized supersacks and our non-extreme activation chemistry will prevent the mobilization of metals (high pH) and generation of excessive heat or off-gasses.

Executive Summary

On behalf of Tetra Tech Engineering Services (Tetra Tech), Innovative Environmental Technologies, Inc. (IET) has prepared the following injection report. This report has been prepared to document remediation activities conducted at the site.
The injection program was implemented on November 16th,23rd, and 24th 2020. The remedial approach employed the oxidation remediation products, sodium persulfate and ferric oxide with an added magnesium oxide for a pH buffer. These product pair a self-activating oxidation persulfate chemistry while providing the appropriate components for a longer lasting biological attenuation process following the initial oxidation event.

The materials introduced in the vicinity of MW-13, MW-C, MW-D and MW-B included: 4,410 pounds of Sodium Persulfate, 266 pounds of Potassium Persulfate, 578 pounds of Ferric Oxide, 218 pounds of Magnesium Oxide and approximately 2300 gallons of total solution. The point by point dosages along with all field notes are provided in the attached field logs.

Introduction

The Hoff VC HSCA Site located in New Hanover township, Pennsylvania, was identified as having soils and groundwater impacted by the historical release of petroleum hydrocarbons. The primary compounds of concern at the site was Chlorobenzene and Halogenated VOCs. An injection program was proposed by IET for the remediation of these impacts in both soil and groundwater around MW-13, MW-C, MW-D and MW-B utilizing advanced oxidation technologies.

Remediation Implementation

Injection Procedures

IET attempted a total of 7 dpt injection locations, 6 injection wells and 4 existing wells at the site. Details regarding each injection attempt are provided in the field logs in the Appendix.

FIGURE 1: AMS POWER PROBE 9500 VTR

Direct-Push-Driven Perforated Rod Placement

A Powerprobe 9580 unit comparable to the one pictured in Figure 1, was utilized to drive the injection screen (as seen in Figure 2) to depths ranging from 8 to 15 feet below ground surface (bgs). It is at these depths that dpt refusal was encountered.

Subsurface Pathway Development

FIGURE 2: RETRACTABLE INJECTION SCREEN

Compressed air was used to propel all injectants into the subsurface. Compressed air was first injected into the subsurface at approximately 150 pounds per square inch (psi) until a significant pressure drop was observed at the injection pressure vessel. This process is referred to as pathway development. The intent of this step is to open pathways in the subsurface for the injectants to follow. These pathways are believed to be those more permeable pathways along which COCs are more likely to have migrated, both in the vadose and saturated zones. Liquid and liquid-entrained injectants are then delivered with pressurized gas to the pathways that were produced during the development step.

Slurry Injection

A predetermined volume of the material was immediately injected into the subsurface fractures and voids that were developed during the compressed air injection step.

Liquid Rinse

A small amount of water was injected to clear the injection lines of the injectant and promotes mounding of groundwater into the vadose zone.

Post Injection Line Purge

Compressed air was injected to clear the lines of all material and to force the remedial components further into the formation before moving to the next injection location.

Site Map

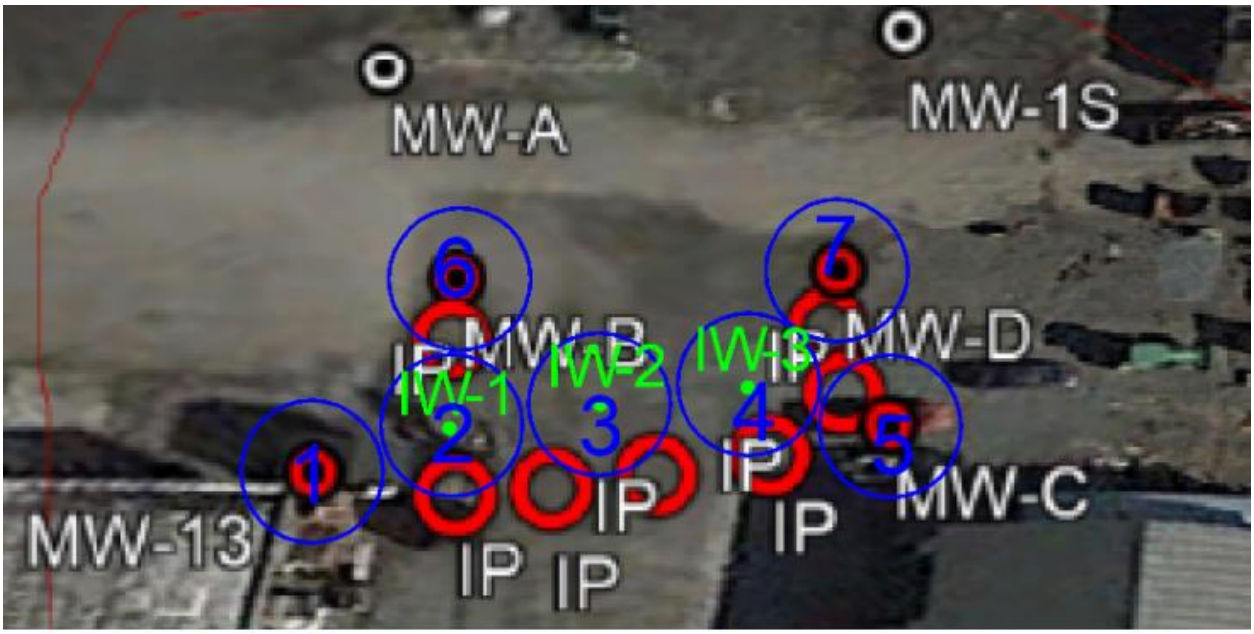

FIGURE 3: GENERAL INJECTION IMPLEMENTATION – INJECTION LOCATIONS

Conclusion

The injection program at the former Hoff VC HSCA Site was implemented based on the proposed design. All proposed injectants were introduced at the targeted depths. All of the proposed injection locations were completed with the exception of MW-D. MW-D was attempted, but the annulus of the well was compromised and daylighting of the reagent occurred around the well's casing. It is expected that the injection event will yield positive results and IET looks forward the assessing the data following future sampling events.

Project Summary

Innovative Environmental Technologies, Inc. (IET) has reviewed the January 2021 data provided, regarding the Former Hoff VC HSCA site located in New Hanover township, Pennsylvania. The last data set reflects the most recent groundwater conditions approximately 60 days after the implementation of the first injection event (from November 16th and November 24th, 2020).

The remedial approach included the direct injection of ferric oxide, sodium persulfate, potassium persulfate and magnesium hydroxide suspended in solution. The integration of these amendments initiate direct oxidation of VOCs via the generation of sulfate free radicals via iron activation. This oxidation period is designed to persist for three to six months following the injection program. This period is than followed by facultative attenuation period where further degradation of VOCs is expected to occur while sulfate reduction occurs across the targeted area.

The mechanisms employed by IET in the injection process utilized compressed air followed by the introduction of the remedial liquid. The liquid injection was accomplished via a double diaphragm pump. As a result of the injection process, the pre-existing pore volume was displaced both laterally and vertically. The transient elevation in groundwater and the rapid radial movement of the injectant often results in an initial homogenization of the targeted compounds, such as chlorobenzene and other chlorinated VOCs. The overall effect is an in-situ mixing of the subsurface contaminants with the remedial materials.

During the injection program, the materials introduced in the vicinity of monitoring wells MW-B, MW-C, MW-D and MW-13 included 4,410 pounds of Sodium Persulfate, Potassium Persulfate, 578 pounds of ferric oxide and 218 pounds of magnesium hydroxide was suspended in 2,300 gallons of water. The injectants were distributed among 7 dpt locations from 7-15' bgs, six injection wells that were installed between 20 and 35' bgs. (IW-1S, 1D, 2S, 2D, 3S, 3D) and three permanent monitoring wells which were screened between 5 and 35' bgs (MW-B, MW-C and MW-13).

Slight surfacing of remedial material was encountered during the implementation of the design at several locations, including from around the outer casing of MW-13 and MW-B. Shallow refusal was also encountered at all of the dpt locations between 12-16' bgs. One monitoring location proposed to be injected (MW-D) was compromised because the well itself rose 2-3' out of the ground upon being pressurized.

Two figures picturing the injection locations are included below.

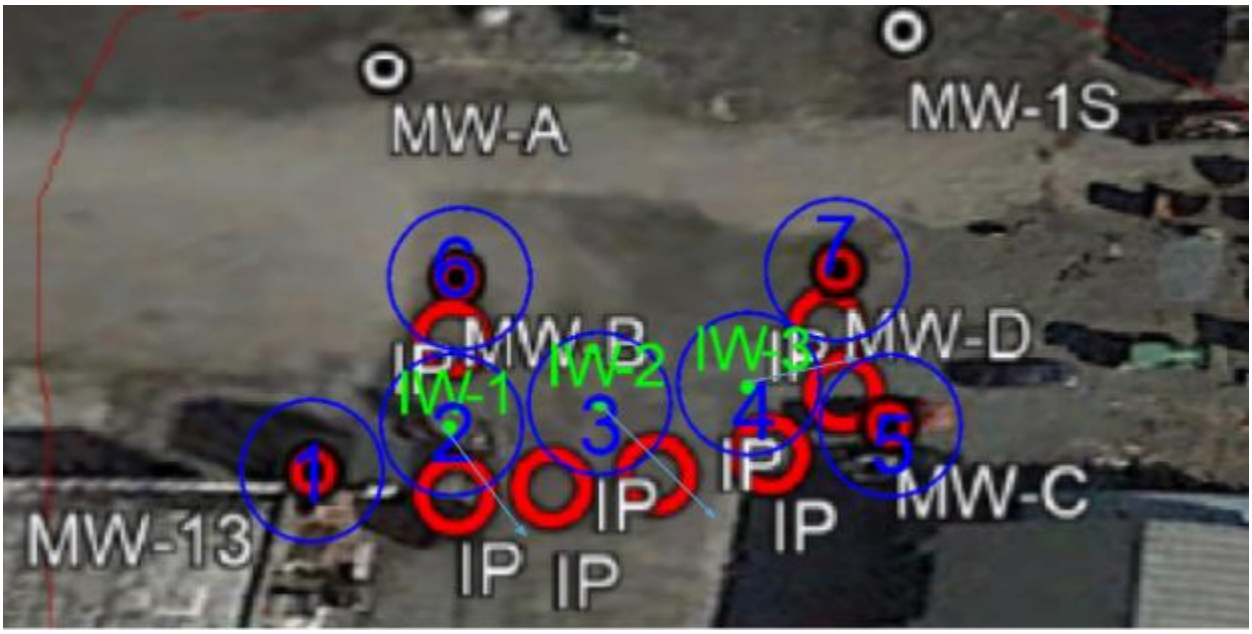

Figure 1. Shows a zoomed in photo of the injection locations

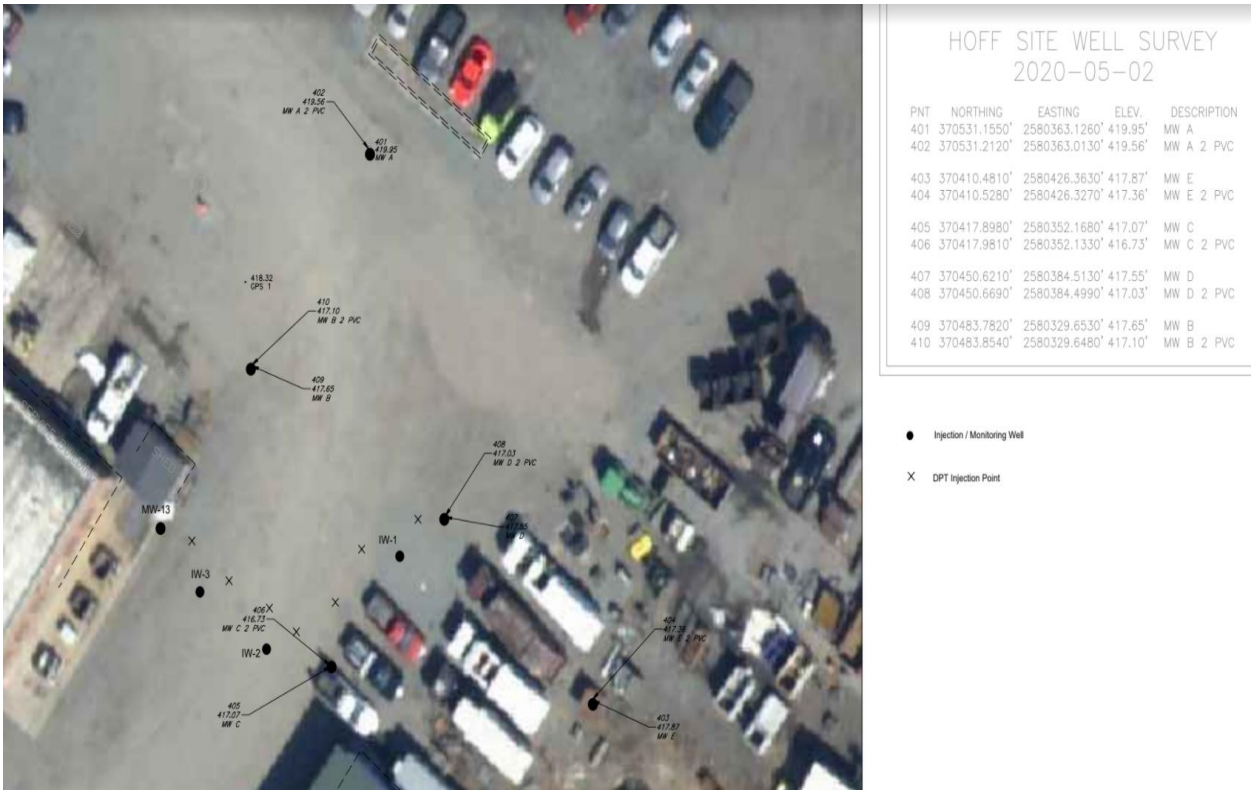

Figure 2. Shows the MW, IW and the DPT locations - Injection Locations Map.

Data Analysis

The treatment area targeted an approximate 2,736-square foot area in the vicinity of monitoring wells MW-B, MW-C, MW-D and MW-3. Targeting the soils, weathered bedrock and groundwater present from 7-35' bgs.

Three monitoring locations within the area directly targeted were sampled for compounds of concern both prior to and post injection, all of these wells were utilized for injection during the application of the amendments and are discussed below (MW-B, MW-C and MW-13).

MW-B

The field, geochemical and VOC data for the monitoring well MW-B is presented in Tables 1 and 2 below. As the field parameter and geochemical data shows, the monitoring location was favorably impacted by the remedial injections. This location is screened 16-36' bgs and is located in the northeast corner of the targeted area. In the 60-day sampling event pH has remained relatively neutral at 7.7 pH units and the ORP has increased to +328 mV. Sulfate concentrations are elevated as a result of the successful emplacement of the amendments.

MW-C

The field, geochemical and VOC data for the monitoring well MW-C is presented in Tables 3 and 4 below. As the field parameter and geochemical data shows, the monitoring location was favorably impacted by the remedial injections. This location is screened 15-35' bgs and is located in the southern corner of the targeted area. In the 60-day sampling event pH has been elevated at 9.2 pH units and the ORP has increased to +443 mV. Sulfate, Iron and dissolved oxygen concentrations are elevated as a result of the successful emplacement of the amendments and continued oxidation of the groundwater within this area.

Total recorded VOCs have decreased in the 60 days following the injection program when compared to the baseline sampling event of January 2020. When tabulated, total VOCs have decreased by 89% in this location and currently two compounds have been recorded above their residential PADEP MSC, 1,1 DCA and Chloromethane. Chloromethane is anticipated to be a transient compound associated with the oxidation of soil organics.

Monitoring Locations sampled outside of the Treatment Area

Monitoring locations MW-6, MW-10 and MW-F have been sampled during the January 2021 sampling event, to date these locations to not appear to have been impacted by the injection event as conductivity measurements have not varied and VOC concentrations have not substantially changed when compared to previous sampling events. MW-A and MW-E are upgradient and sidegradient, respectively, of the injection area, data collected during the January 2021 does not indicate that these injections or amendments associated with the injections have affected groundwater in these areas either.

Conclusions and Recommendations

As of the January 2021 sampling event that was conducted at the Hoff VC site VOC concentrations are trending down and chemical oxidation of targeted groundwater is continuing. Almost all iron species exists in its oxidized form of Fe^{3+} and ORP values are elevated. Sulfate concentrations are elevated and remain prevalent in the sites groundwater, while the pH values have remained neutral to slightly basic. These parameters will allow for enhanced attenuation of most to all VOCs via sulfate reduction once the oxidant that was added via the injections has been consumed.

At this time IET expects further degradation of VOCs to be recorded in the future monitoring events and recommends the continued monitoring of the site as planned.

Thank you for considering IET for your remediation needs. If you have any questions or concerns, please contact our office.

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Analytical test results meet all requirements of the associated regulatory program (e.g., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis. Data qualifiers are applied to note exceptions. Noncompliant quality control (QC) is further explained in narrative comments.
· QC results that exceed the upper limits and are associated with non-detect samples are qualified but further narration is not required since the bias is high and does not change a non-detect result. Further narration is also not required with QC blank detection when the associated sample concentration is non-detect or more than ten times the level in the blank.
· Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD is performed, unless otherwise specified in the method.
· Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.
Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Measurement uncertainty values, as applicable, are available upon request.

Test results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as "analyze immediately" and tested in the laboratory are not performed within 15 minutes of collection.

This report shall not be reproduced except in full, without the written approval of the laboratory.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. The foregoing express warranty is exclusive and is given in lieu of all other warranties, expressed or implied. We disclaim any other warranties, expressed or implied, including a warranty of fitness for particular purpose and warranty of merchantability. In no event shall Eurofins Lancaster Laboratories Environmental, LLC be liable for indirect, special, consequential, or incidental damages including, but not limited to, damages for loss of profit or goodwill regardless of (A) the negligence (either sole or concurrent) of Eurofins Lancaster Laboratories Environmental and (B) whether Eurofins Lancaster Laboratories Environmental has been informed of the possibility of such damages. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Analytical test results meet all requirements of the associated regulatory program (e.g., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis. Data qualifiers are applied to note exceptions. Noncompliant quality control (QC) is further explained in narrative comments.
· QC results that exceed the upper limits and are associated with non-detect samples are qualified but further narration is not required since the bias is high and does not change a non-detect result. Further narration is also not required with QC blank detection when the associated sample concentration is non-detect or more than ten times the level in the blank.
· Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD is performed, unless otherwise specified in the method.
· Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.
Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Measurement uncertainty values, as applicable, are available upon request.

Test results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as "analyze immediately" and tested in the laboratory are not performed within 15 minutes of collection.

This report shall not be reproduced except in full, without the written approval of the laboratory.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. The foregoing express warranty is exclusive and is given in lieu of all other warranties, expressed or implied, except as otherwise agreed. We disclaim any other warranties, expressed or implied, including a warranty of fitness for particular purpose and warranty of merchantability. In no event shall Eurofins Lancaster Laboratories Environmental, LLC be liable for indirect, special, consequential, or incidental damages including, but not limited to, damages for loss of profit or goodwill regardless of (A) the negligence (either sole or concurrent) of Eurofins Lancaster Laboratories Environmental and (B) whether Eurofins Lancaster Laboratories Environmental has been informed of the possibility of such damages. We accept no legal responsibility for the purposes for which the client uses the test results. Except as otherwise agreed, no purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Receipt
The samples were received on 12/10/2020 7:20 PM; the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 3.9º C and 4.2º C.

GC/MS VOA
Method 8260C LL: The continuing calibration verification (CCV) associated with batch 410-78295 recovered outside acceptance criteria, low biased, for 1,1-Dichloroethene, Carbon disulfide and trans-1,2-Dichloroethene. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Non-detections of the affected analytes are reported. Any detections are considered estimated.

Methods 8260C LL, 8260D: The continuing calibration verification (CCV) associated with batch 410-78607 recovered outside acceptance criteria, low biased, for Carbon disulfide 1,1-Dichloroethene and trans-1,2-Dichloroethene. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Non-detections of the affected analytes are reported. Any detections are considered estimated.

Method 8260C LL: The method requirement for no headspace was not met on analytical batch 410-78976. Due to the need for re-analysis, the container used for the following sample was previously opened and contained headspace: HOFF IW-1B (410-23571-7). The original sample container did not contain headspace.

Method 8260C SIM 14D: The following samples were diluted due to the abundance of non-target analytes: HOFF MW-F_A (410-23571-1) and HOFF MW-6 (410-23571-5). Elevated reporting limits (RLs) are provided.

Method 8260C SIM 14D: The following sample was diluted due to the abundance of non-target analytes: HOFF IW-1 A (410-23571-6). Elevated reporting limits (RLs) are provided.

Method 8260C SIM 14D: The method requirement for no headspace was not met. The container (s) used for reanalysis of the following sample contained headspace: HOFF IW-1A (410-23571-6).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC/MS Semi VOA
Method 8270D: The method blank for preparation batch 410-77321 and analytical batch 410-77649 contained Naphthalene above the method detection limit (MDL). Associated sample(s) were not re-extracted and/or re-analyzed because results were greater than 10X the value found in the method blank.

Method 8270D: Surrogate recovery for the following samples were outside acceptance limits: HOFF MW-F_A (410-23571-1), HOFF MW-F_B (410-23571-2), HOFF IW-1A (410-23571-6) and HOFF IW-1B (410-23571-7). The results have been reported per client request.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Analytical test results meet all requirements of the associated regulatory program (e.g., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis. Data qualifiers are applied to note exceptions. Noncompliant quality control (QC) is further explained in narrative comments.
· QC results that exceed the upper limits and are associated with non-detect samples are qualified but further narration is not required since the bias is high and does not change a non-detect result. Further narration is also not required with QC blank detection when the associated sample concentration is non-detect or more than ten times the level in the blank.
· Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD is performed, unless otherwise specified in the method.
· Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.
Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Measurement uncertainty values, as applicable, are available upon request.

Test results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as "analyze immediately" and tested in the laboratory are not performed within 15 minutes of collection.

This report shall not be reproduced except in full, without the written approval of the laboratory.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. The foregoing express warranty is exclusive and is given in lieu of all other warranties, expressed or implied, except as otherwise agreed. We disclaim any other warranties, expressed or implied, including a warranty of fitness for particular purpose and warranty of merchantability. In no event shall Eurofins Lancaster Laboratories Environmental, LLC be liable for indirect, special, consequential, or incidental damages including, but not limited to, damages for loss of profit or goodwill regardless of (A) the negligence (either sole or concurrent) of Eurofins Lancaster Laboratories Environmental and (B) whether Eurofins Lancaster Laboratories Environmental has been informed of the possibility of such damages. We accept no legal responsibility for the purposes for which the client uses the test results. Except as otherwise agreed, no purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Receipt
The samples were received on 12/11/2020 5:56 PM; the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 2.6°C and 3.9°C

Receipt Exceptions
The container count for the following sample did not match the information listed on the Chain-of-Custody (COC): HOFF IW-2A (410-23806-6). The COC lists a container count of 11. Received 10 containers (1 HCl vial received empty).

The following sample(s) was submitted for analysis; however, it was not listed on the Chain-of-Custody (COC): HOFF DUP-121120

GC/MS VOA
Method 8260C_SIM_14DX: The following sample(s) was collected in a properly preserved vial; however, the pH was outside the required criteria when verified by the laboratory. The samples were analyzed outside the 7-day holding time specified for unpreserved samples but within the 14-day holding time specified for preserved samples: HOFF IW-3A (410-23806-5), HOFF IW-2A (410-23806-6) and HOFF IW-3B (410-23806-7).

Method 8260C_SIM_14DX: The following volatiles sample was diluted due to foaming at the time of purging during the original sample analysis: HOFF IW-3A (410-23806-5). Elevated reporting limits (RLs) are provided.

Method 8260C_SIM_14DX: The following samples were diluted due to the abundance of non-target analytes: HOFF MW-C (410-23806-1), HOFF MW-B (410-23806-2), HOFF IW-2A (410-23806-6), HOFF IW-3B (410-23806-7), HOFF IW-2B (410-23806-8) and HOFF DUP-121120 (410-23806-9). Elevated reporting limits (RLs) are provided.

Method 8260C_LL: The continuing calibration verification (CCV) associated with batch 410-78610 recovered outside acceptance criteria, low biased, for Carbon disulfide and 1,1-Dichloroethene. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Non-detections of the affected analytes are reported. Any detections are considered estimated.

Method 8260C_LL: The following samples contained residual chlorine upon receipt: HOFF IW-3A (410-23806-5) and HOFF IW-3B (410-23806-7).

Method 8260C_LL: The following sample(s) was collected in a properly preserved vial; however, the pH was outside the required criteria when verified by the laboratory. The samples were analyzed within the 7-day holding time specified for unpreserved samples: HOFF IW-3A (410-23806-5) and HOFF IW-2A (410-23806-6).

Method 8260C_LL: The following samples contained residual chlorine upon receipt: HOFF IW-3A (410-23806-5) and HOFF IW-3B (410-23806-7).

The samples were analyzed within the 7-day holding time specified for unpreserved samples: HOFF IW-3A (410-23806-5), HOFF IW-2A (410-23806-6) and HOFF IW-3B (410-23806-7).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

GC/MS Semi VOA
Method 8270D: Internal standard responses were outside of acceptance limits for the following sample: HOFF MW-13 (410-23806-3). The sample was re-analyzed and internal standard responses was again outside of the acceptance limits, indicating a matrix effect. The reported data is from the initial analysis of the sample.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Pesticides

Method 8081B: Surrogate recovery for the following samples were outside control limits: HOFF IW-3A (410-23806-5), HOFF IW-2A (410-23806-6) and HOFF IW-3B (410-23806-7). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals

Method 6010C: The reference method requires samples to be preserved to a pH of <2. The following sample(s) were received with insufficient preservation at a pH of 7: HOFF IW-2A (410-23806-6).

Method 6010C: The following samples were diluted due to the nature of the sample matrix: HOFF MW-C (410-23806-1), HOFF IW-2A (410-23806-6) and HOFF IW-3B (410-23806-7). Elevated reporting limits (RLs) are provided.
