

Module 13.5 Addendum: Pond Operation & Maintenance Plan
For
Rockwood Stone, LLC – Rockwood Quarry
Permit No. 56250301

Active ponds should be inspected on a quarterly basis for the following items:

- Embankments should be inspected for any signs of erosion, stress cracking, slumping or sliding, seepage, and any other signs of structural weakness. Repair any issues as soon as possible after discovery.
- All pipes and spillways should be inspected for any debris, blockage, or damage. All debris shall be removed upon finding.
- The depth of sediment should be monitored weekly. If the accumulated sediment reaches the design sediment elevation, the sediment shall be removed and properly disposed of.
- Inspect for the growth of trees or brush on the embankment, and remove if present.
- Monitor the vegetative stabilization present on the embankment. Immediately seed any bare areas, as necessary.
