

COMMENT RESPONSE DOCUMENT PART 1 of 2

Environmental Protection Performance Standards at Oil and Gas Well Sites

Title 25. Environmental Protection
Part I. Department of Environmental Protection
Subpart C. Protection of Natural Resources
Article II. Land Resources
Chapters 78 and 78a. Oil and Gas Wells

43 Pa.B. 7377 (December 14, 2013)
Environmental Quality Board Regulation #7-484
Independent Regulatory Review Commission #3042

This page intentionally left blank.

INTRODUCTION:

On December 14, 2013, the Environmental Quality Board (EQB) published notice in the *Pennsylvania Bulletin* (43 Pa.B. 7377) announcing seven public hearings and a 60-day public comment period for a proposed rulemaking concerning revisions to 25 *Pa. Code* Chapter 78 (relating to Oil and Gas Wells).

The proposed rulemaking would amend Chapter 78 to adopt new requirements that ensure oil and gas operators employ effective measures that prevent pollution, while allowing flexibility for the optimal development of the natural resources. The amendments are designed to strengthen the environmental controls employed by the industry to ensure the protection of public health, safety, and the environment.

On February 1, 2014, the EQB published a notice in the *Pennsylvania Bulletin* (44 Pa.B. 648) announcing two additional public hearings and an extension of the public comment period by 30 days. In total, the EQB held nine public hearings over a 90-day public comment period accepting comments on the proposed rulemaking. During this comment period, 3,128 comments were received from 23,213 commentators.

During the pendency of this rulemaking process, the General Assembly also passed two acts directly relating to the subject matter of the proposed rulemaking. As a result of the passage of the act of July 10, 2014 (P. L. 1053, No. 126), all regulations promulgated under 58 Pa.C.S. (relating to oil and gas) were required to differentiate between conventional oil and gas wells and unconventional gas wells. The Department determined that the current rulemaking process would continue, but that the regulations would be completely bifurcated (separated into two distinct chapters) on final-form rulemaking. The act of October 22, 2014 (P. L. 2853, No. 173) requires monthly reporting of production by unconventional well operators to the Department of Environmental Protection (Department or DEP).

On April 4, 2015, the Department published notice in the *Pennsylvania Bulletin* (45 Pa.B. 1615) announcing an Advanced Notice of Final Rulemaking (ANFR) procedure. This allowed DEP to solicit additional comments on the draft-final rulemaking for 30 days. On April 18, 2015, DEP published notice in the *Pennsylvania Bulletin* (45 Pa.B. 1951) announcing three public hearings and extending the ANFR public comment period by 15 days. During this additional public comment period, 2,482 comments were received from 4,914 commentators.

In assembling this document, the Department has addressed all pertinent and relevant comments associated with this rulemaking. For the purposes of this document, comments of similar subject material have been grouped together and responded to accordingly.

Due to the volume of comments received, this document is separated into two parts. Part one contains all of the comments received during the initial public comment period from December 14, 2013 through March 14, 2014. Part two contains all of the comments received during the ANFR procedure, open from April 4, 2015 through May 19, 2015. Each part of the comment response document has its own Commentator List. Additionally, several large attachments were submitted and are included in Appendices to each of the parts of the Comment Response Document.

Table of Contents

§ 78.1	Definitions.....	6
§ 78.2	Scope.....	60
§ 78.11	Permit requirements	61
§ 78.14	Transfer of well ownership or change of address	63
§ 78.15	Application requirements	63
§ 78.17	Permit expiration and renewal	180
§ 78.18	Disposal and enhanced recovery well permits	181
§ 78.19	Permit application fee schedule	184
§ 78.21	Opportunity for objections and conferences; surface landowners	185
§ 78.51	Protection of water supplies.....	186
§ 78.52	Predrilling or prealteration survey	217
§ 78.52a	Area of review	240
§ 78.53	Erosion and sediment control and stormwater management.....	295
§ 78.55	Control and disposal planning.....	303
§ 78.56	Temporary storage	325
§ 78.57	Control, storage and disposal of production fluids	391
§ 78.58	Onsite processing	416
§ 78.59a.	Impoundment embankments	439
§ 78.59b	Well development impoundments	447
§ 78.59c	Centralized impoundments.....	460
§ 78.60	Discharge requirements.....	508
§ 78.61	Disposal of drill cuttings	512
§ 78.62	Disposal of residual waste – pits.....	527
§ 78.63	Disposal of residual waste – land application	556
§ 78.64	Containment around oil and condensate tanks.....	567
§ 78.64a	Containment systems and practices at unconventional well sites	568
§ 78.65	Site restoration	580
§ 78.66	Reporting and remediating spills and releases	624
§ 78.67	Borrow pits.....	663

§ 78.68 Oil and gas gathering lines.....	668
§ 78.68a Horizontal directional drilling for oil and gas pipelines.....	682
§ 78.68b Well development pipelines for oil and gas operations	692
§ 78.69 Water management plans	721
§ 78.70 Road-spreading of brine for dust control and road stabilization.....	736
§ 78.70a Pre-wetting, anti-icing and de-icing	755
§ 78.72 Use of safety devices—blow-out prevention equipment	762
§ 78.73 General provisions for well construction and operation	766
§ 78.75 Alternative methods	781
§ 78.103 Annual monitoring of inactive wells.....	783
§ 78.121 Production reporting	785
§ 78.122 Well record and completion report	786
§ 78.123 Logs and additional data	798
Subchapter G, Bonding Requirements.....	802
§ 78.402 Inspections by the gas storage operator	812
§ 78.403 Gas storage well integrity testing.....	812
§ 78.404 Maximum storage pressure	812
§ 78.902 Policy	812
General Comments.....	812

§ 78.1 Definitions

1. Comment: There are a number of definitions and sections of text that refer the reader to other statutes or regulations. This causes the reader search elsewhere to find that other statute or regulation and review it before being able to understand what Chapter 78 requires. This is not user friendly and does not facilitate regulatory understanding and compliance. For example, it would be better to state, “As defined in 25 Pa. Code § XXX.X,” and repeat the definition or section. This should be done for the definitions of body of water, PCSM plan, process or processing, regulated substance, watercourse, water purveyor, and wetland. It should also be done for § 78.51(d)(2), § 78.57(f), § 78.65 (d)(l)(v), § 78.66 (a)(2), § 78.66 (c)(l), 78.68a(k), 78.69(b) and numerous other sections. (124, 861, 913, 861a, 913a, 124a)

Response: The Department acknowledges that the interrelation of environmental statutes and regulations can be complex, as befits the complexities of the activities regulated under those authorities. There are two problems with inclusion of the referenced language in Chapter 78. First, and most importantly, if the referenced language changes through statutory amendment or regulatory development, the language in Chapter 78 would not automatically change to match the new language. This would create two sets of regulations addressing the same subject in different ways. Simply referencing the other statute or regulation allows for these updates to occur automatically. Second, including the cross-referenced language would result in Chapter 78 being significantly larger than it is without including that language. The Department notes that all of the cross-referenced authorities are available for free on websites accessible to the public.

2. Comment: Definitions that are taken from another source or act should still be defined and not just the reference to the source, i.e.; body of water, process or processing, regulated substance, water purveyor, watercourse and wetland. This would allow for easier comprehension while reading the chapter.

Words whose definitions were not provided but should be: brine, flowback water, production waters, abandoned wells, orphaned wells, disposal wells, enhanced recovery wells and temporary storage. (1149, 1150)

Response: See responses to comments 1 (cross-references to other statutes or regulations), and 28 (“brine”). The term “temporary storage” is defined through its use in the regulation. The terms “abandoned wells” and “orphan wells” are defined through their use in the 2012 Oil and Gas Act. “Enhanced recovery wells” and “disposal wells” are defined through the United States Environmental Protection Agency’s underground injection control regulations. The terms “flowback” and “produced fluid” are defined in Appendix D of the Department’s “Oil and Gas Production and Waste Reporting Manual” which is available on the Department’s website on the “Oil and Gas Electronic Submission Guides” web page. The changes to the final-form rulemaking limited the use of these terms such that inclusion of the definitions in the regulation was unnecessary.

3. Comment: The EQB has proposed to add a number of new definitions to 25 Pa. Code Chapter 78 and to modify or delete certain definitions that are currently found in the regulations. These definitions in turn have a ripple effect as they are used in other sections of the regulations. (1173)

Response: The Department acknowledges the comment.

4. Comment: This rulemaking has been several years in the making. Beginning with policies from as

early as 2010 being codified, to Act 13 of 2012 provisions being adopted, and more recently created provisions addressing important issues; this rulemaking was not done in a vacuum. There have been many opportunities for industry groups to express and even lobby for provisions and yes, definitions. During the Tunkhannock hearing, an industry group testified of their displeasure with at least nine definitions. We are not new to the rulemaking process. We have learned that definitions are a very important part of any legislation, rulemaking, or statute. Therefore, we are very concerned about the advocacy of an industry group lobbying for so many definition changes for important items such as centralized impoundments, gathering pipeline, mine influenced water, temporary pipelines, and watercourse to name but a few. We plan to further detail our concerns with definition changes within our comprehensive written comment.

Changing any definition may weaken the backbone of this rulemaking, let alone nine definitions. We understand that DEP has taken a great deal of painstaking time to draft these definitions. We do not desire to see this rulemaking weakened in any way. Sites and facilities are located near our homes, schools and even local hospitals. We should not lose sight of that fact. We therefore recommend that in the spirit of not seeing these definitions revised to weakened or ambiguous language and thus weakening the framework of this entire rulemaking that any definition revisions be very carefully considered and should there be a tendency to modify, that that modification err on the side of more stringent rather than less.

Policies in place as early as 2010 and Act 13 of 2012 indicate how long we've been waiting for this regulation package to move forward. Our region needs these regulations; current practices are exactly what have created the need for them. We therefore ask that the Department to move forward with this rulemaking package as swiftly as reasonably Possible. We do not want any further delays that in fact will place our Northern Tier's public health and safety, environment or communities at any further unnecessary risk. (660)

Response: The Department acknowledges the comment and has revised the definition to be "well development pipelines" instead of "temporary pipelines".

5. Comment: The Department should define and clarify what is meant by terms related to "waste", and "water" and/or "freshwater" in the Proposed Rulemaking. Our review revealed various permutations of those terms used interchangeably, or without specific definitions. For example, the term "residual waste" should be defined in the regulations, even if by reference to another Chapter in the Pennsylvania Code. (997a)

Response: The definitions of the terms such as "waste" and "water" and/or "freshwater" identified by the commentator are readily understood. The Department has added a definition for the term "residual waste" in the final rulemaking. Referencing a term through a specific Chapter of the Pennsylvania Code eliminates confusion as to the definition and provides consistency in the meaning should the other regulation change.

Additionally, some terms are defined in by statute or in the existing regulations. For example, "unconventional formation" is currently defined in Act 13 as any geologic shale formation below the Elk Sandstone or its geologic equivalent from which natural gas cannot be produced at economic flow rates or in economic volumes except by vertical or horizontal well bores stimulated by hydraulic fracture treatments or by using multilateral well bores or other techniques to expose more of the formation to the well bore. "Casing seat" is currently defined in Chapter 78.

6. Comment: We object to the Department's efforts by policy and/or regulation to compel oil and gas

operators to utilize what is a voluntary process for all other entities. Act 2 procedures should not be required for spills at oil and gas well sites but should continue to be available for operators who choose to use them to obtain relief from liability. As the Department is aware, Act 2 does not provide soil statewide health cleanup standards for chlorides, which is likely to be the most common constituent in spills on well sites. The absence of such a standard, along with the requirement to utilize Act 2 procedures rather than simply using a background standard or developing a site specific standard, would impose excessive and unnecessary costs on oil and gas operators that are not justified by any clear environmental benefit. Remove the definition of “Act 2” and all references throughout Chapter 78 unless non-Act 2 alternatives are added. (1153)

Response: The Department has retained the definition of “Act 2” in the final rulemaking. Act 2 has both voluntary and involuntary aspects. The Land Recycling Program relies, in large measure, on voluntary, remediator-initiated cleanups that have been and will continue to be encouraged by the Department.

Act 2 establishes “cleanup standards” for persons who remediate contaminated soil and groundwater caused by regulated substances released into the environment as defined under various environmental laws. These standards apply when persons either voluntarily perform or are required to perform remediation of soils and groundwater.

Section 106(a) of Act 2 states that, “The environmental remediation standards established under this act shall be used whenever site remediation is voluntarily conducted or is required under” the referenced environmental laws, including the Clean Streams Law, the Solid Waste Management Act, and the Hazardous Sites Cleanup Act. Many substances that are spilled at sites regulated under the Oil and Gas Act are regulated as waste under the Solid Waste Management Act or as pollutants under the Clean Streams Law (see, for example, sections 3273 and 3273.1 of the 2012 Oil and Gas Act, 35 Pa.C.S. §§ 3273, 3273.1). If these wastes and pollutants are regulated substances as defined under Act 2 and have contaminated soils and groundwater, they must be addressed under Act 2.

Section 106(b) of Act 2 states; “Nothing in this act is intended to nor shall it be construed to amend, modify, repeal or otherwise alter any provision of any act cited in this section relating to civil and criminal penalties or enforcement actions and remedies available to the department or in any way to amend, modify, repeal or alter the authority of the department to take appropriate civil and criminal action under these statutes.” 35 P.S. § 6026.106(a). Thus, Act 2 contemplates that the Department may require (e.g., by issuance of a DEP Order) responsible persons to meet an Act 2 remediation standard. The Department has issued many such Orders since the adoption of Act 2.

7. **Comment: There are various other terms requiring definition in § 78.1. There is no definition of unconventional formation. This is a recipe for trouble. There are numerous references to “casing seat” — including substantive differences in the regulation of drill cuttings from below vs. above the casing seat. But there is no definition of “casing seat”. This should be included in § 78.1. (869a)**

Response: Unconventional formation is currently defined in the 2012 Oil and Gas Act as any “geologic shale formation below the Elk Sandstone or its geologic equivalent from which natural gas cannot be produced at economic flow rates or in economic volumes except by vertical or horizontal well bores stimulated by hydraulic fracture treatments or by using multilateral well bores or other techniques to expose more of the formation to the well bore.” “Casing seat” is currently defined in Chapter 78.

8. Comment: The Department should provide a definition for “Temporary Storage” as used in the Proposed Rulemaking. (997a)

Response: The term is defined through its use in the regulation.

9. Comment: The Department should define the term “responsible party” as used in Section 78.66 (relating to reporting and remediating releases). At the time of a spill, the “responsible” party may be uncertain or in dispute, which could inadvertently delay spill reporting and remediating. Consequently, a clearer designation of who is responsible for reporting and remediating to ensure prompt response is needed. (997a)

Response: The term is difficult to define with specificity because of the intensely fact-specific nature of determinations of liability. The Department notes that the term “responsible person” is defined in section 103 of the Hazardous Sites Cleanup Act (35 P.S. § 6020.103) and section 103 of the Land Recycling Act (35 P.S. § 6026.103), as well as substantively in 25 Pa.Code § 91.33. Further, the Department considers the permitted well operator to be a “person at the time in charge of the substance or owning or in possession of the premises, facility, vehicle or vessel from or on which the substance is discharged or placed” for the purpose of spills or releases occurring at permitted well sites.

10. Comment: Provide the substance around which a rulemaking is created. Therefore, we recommend at a minimum the adoption of definitions as proposed. (1035)

Response: The Department acknowledges the comment.

11. Comment: The Department should provide a definition for “hydraulic fracturing” that includes all fracturing and well stimulation activities. This more inclusive definition is clearly contemplated in Act 13 (see definition of “Unconventional formation” in 58 Pa.C.S. § 3203, which includes the phrase “or other techniques to expose more of the formation to the well bore”). In the alternative, the Department could provide a broad definition for “Fracturing” and use that term throughout the Rulemaking. We recognize that the Department may have a more limited definition for any rulemaking pursuant to 58 Pa.C.S. § 3222.1. (997a)

Response: The Department disagrees that a definition for hydraulic fracturing is necessary, as the term indicates the process with specificity. Further, it would be inappropriate to include all well stimulation activities in a definition for hydraulic fracturing, as certain stimulation activities do not include the physical breaking apart of the reservoir rock through the injection of water at high pressure.

12. Comment: The Department should define the term “additive” to mean “any substance or combination of substances found in a hydraulic fracturing fluid, including a proppant that is added to a base fluid in the context of hydraulic fracturing treatment, whether or not the function of any such substance or combination of substances is to create fractures in the formation.” This definition is consistent with the definition adopted by the vast majority of states that have addressed the issue. (997a)

Response: The Department disagrees with the proposed definition for additive - additives may include substances added to hydraulic fracturing fluid, drilling fluids, or cement blends. Because of this, the Department believes the context is more important for understanding the intended meaning of the term. Finally, the term is already defined in section 3203 of the 2012 Oil and Gas Act as a “hydraulic fracturing chemical.”

13. Comment: Opportunity to Streamline Inconsistent Definitions and Scope of Impacted Oil and Gas Processes. Throughout the Rule, various provisions, including definitions, of the proposed Rule use the term “oil and gas activities” as a subject for triggering regulatory requirements: however, this term is not expressly defined in Chapter 78 or Act 13. In our view, the applicability specified for “oil and gas activities” and “oil and gas operations” needs further clarification. In Section 78.1 of Rule, outlining express definitions, “approximate original conditions,” “centralized impoundment” and “pit” use the term “oil and gas activities”- yet this term is not defined. It would be helpful if this term was clearly defined, or, if it is meant to be the same as “oil and gas operations,” which is expressly defined in the Rule, one term should be selected and used in each instance. Without such clarification, using these definitions in an effective and responsible manner is difficult. See the comment on “oil and gas operations” in the following section of our General Comments. (1085, 1147)

Response: The Department has made revisions in the final-form rulemaking to replace “oil and gas activities” with the defined term “oil and gas operations”.

14. Comment: The clarity of the regulation could be improved if the following words or terms are defined: Additive; brine; discrete area; freshwater; hydraulic fracturing; leak protection system; occupied dwelling; pipeline infrastructure; **residual waste**; responsible party; seasonal high water, **Regulated substances, water source, Water of this Commonwealth, groundwater table; temporary storage**; and **waste**. We ask EQB to consider defining the words or terms above to assist the regulated community with compliance. (1099, 1142)

Response: The Department acknowledges the comment but disagrees that these definitions need to be added to the final-form rulemaking to achieve clarity. Individual responses are provided below:

-The term “additive” is defined in the 2012 Oil and Gas Act. See response to comment 12.

“brine” see response to comment 28.

“discrete area” see response to comment 280.

“freshwater” see response to comment 53.

“hydraulic fracturing” the meaning of this term is commonly known and understood. The Department does not believe it is necessary or appropriate to define it in regulation.

“leak protection system” all instances of the term “leak detection system” have been removed from the rule, therefore there is no need to define the term in the rule.

“occupied dwelling” See response to comment 34. The term “occupied dwelling” is no longer used in the regulations.

pipeline infrastructure; the term “pipeline infrastructure” is not used in the rule, therefore there is no need to define the term in the rule.

“residual waste” a definition has been added to the final rule. *Residual waste – the term as defined in § 287.1 (relating to definitions)*

“responsible party” See response to comment 9.

“seasonal high water” the term “seasonal high water” is not used in the rule, therefore there is no need to define the term in the rule. To the extent that the commenter is referring to seasonal high groundwater table, there is a definition provided in the rule which has been in effect since the rule was initially promulgated in 1989.

“regulated substances” a definition for “regulated substances” was provided in the rule when proposed and has been retained in the final rule.

“water source” a definition for the term “water source” was provided when the rule was initially proposed. This definition has been retained in Chapter 78a but was removed from Chapter 78 because it is not used in Chapter 78.

“waters of the Commonwealth” a definition for “waters of the Commonwealth” has been added to the final rule. Waters of the Commonwealth - the term as defined by the Clean Streams Law (35 P.S. §691.1)

“waste” This term is defined in § 287.1, therefore there is no need to define this term in Chapter 78.

Waste—

(i) Discarded material which is recycled or abandoned. A waste is abandoned by being disposed of, burned or incinerated or accumulated, stored or processed before or in lieu of being abandoned by being disposed of, burned or incinerated. A discarded material includes contaminated soil, contaminated water, contaminated dredge material, spent material or by-product recycled in accordance with subparagraph (iii), processed or disposed.

(ii) Materials that are not waste when recycled include materials when they can be shown to be recycled by being:

(A) Used or reused as ingredients in an industrial process to make a product or employed in a particular function or application as an effective substitute for a commercial product, provided the materials are not being reclaimed. This includes materials from the slaughter and preparation of animals that are used as raw materials in the production or manufacture of products. Steel slag is not waste if used onsite as a waste processing liming agent in acid neutralization or onsite in place of aggregate. Sizing, shaping or sorting of the material will not be considered processing for the purpose of this subclause of the definition.

(B) Coproducts.

(C) Returned to the original process from which they are generated, without first being reclaimed or land disposed. The material shall be returned as a substitute for feedstock materials. When the original process to which the material is returned is a secondary process, the materials shall be managed so that there is no placement on the land and the secondary process takes place onsite.

(iii) The following materials are wastes, even if the recycling involves use, reuse or return to the original process (as described as follows):

(A) Except for coproducts, materials used in a manner constituting disposal, or used to produce products that are applied to the land.

(B) Except for coproducts, materials burned for energy recovery, used to produce fuel or contained in fuel.

(C) Materials accumulated speculatively.

(iv) Discarded or recycled material may not be waste if a determination is made by the Department in accordance with § 287.7.

(v) In enforcement actions implementing the act, a person who claims that the material is not a waste in accordance with subparagraph (ii) shall demonstrate that there is a known market or disposition for the material, and that the terms of the exclusion have been met. In doing so, appropriate documentation shall be provided (such as contracts showing that a second person uses the material as an ingredient in a production process) to demonstrate that the material is not a waste. In addition, owners or operators of facilities claiming that they actually are recycling materials shall show that they have the necessary equipment to do so.

“regional groundwater table” a definition for “regional groundwater table” was provided in the rule when proposed and has been retained in the final rule.

“temporary storage” is defined in the substance of sections 78.56 and 78a.56 and 78.65 and 78a.65 (that is, nine months after the completion of drilling or the expiration of the final permit on the well site).

15. Comment: Approximate original conditions — we ask that consideration be given to better defining “approximate original conditions”. Is the intent to restore the site to conditions that existed immediately prior to oil and gas activities? Also, there should be significant latitude built into this requirement to allow input from and negotiation with the Lessor and/or surface owner. In addition land use is outside of the DEP’s jurisdiction to regulate and is largely an issue to be resolved between the Lessor and the Operator. (124a, 952)

Response: The definition is appropriate. The Department interprets the definition to apply to conditions immediately prior to commencement of oil and gas operations. The restoration requirements in § 78.65 or § 78a.65 allow for landowner input when conducting restoration. These sections also further clarify the restorations requirements.

16. Comment: Approximate original conditions – Commentator objects to any requirement to return land to “approximate original conditions” unless such a commitment has been made in the approved site restoration plans or private agreements with landowners. No such obligation is created under any relevant statute and is without environmental justification. The use of the surface by those who hold the dominant mineral estate is constrained under Pennsylvania property law to a demonstration of “due regard” for the surface, which is unlikely to require restoration to the standards created in the definition above. The Department has failed to provide any environmental justification for this requirement.

Act 13 provides that portions of well sites not occupied by production facilities or equipment should be returned to approximate original “contours” during an extension of the site restoration period. This language, which is more limited than the term “approximate original conditions”, does not

authorize the Department to create the unreasonable obligations described in the definition above. Remove this term throughout the rule. (1135, 1153)

Response: It is unreasonable to interpret the restoration requirements in the 2012 Oil and Gas Act to require restoration of the well site to a different standard depending upon whether or not a restoration extension has been granted. The Department believes that the restoration requirements are appropriate. The restoration requirements in §§ 78.65 and 78a.65 allow for landowner input when conducting restoration. See response to comment 377.

17. Comment: We appreciate the inclusion of definitions for a number of terms associated with unconventional gas development. We believe there are a few additional terms that should be defined, as well as a few terms that we hope will be clarified. Clearly defined terms is the first step in creating a shared understanding among stakeholders and specifically, will help us understand what is being proposed as development proceeds and how this might affect National Park System units and affiliated areas. We offer the following additions and/or clarifications to the existing list of terms:

Approximate Original Conditions: This definition is relatively clear until the last two words: “extent practicable”. This term is not defined. Who will determine whether “to the extent practicable” has been met? What criteria will be used? Cost to the operator? Environmental aspects? Will there be recourse should there be disagreements between the operator and the landowner or impacted neighbors? We are concerned that efforts to restore approximate original conditions after natural gas operations on adjacent lands could be insufficient due to an undefined “extent practicable” clause, resulting in impacts to National Park System resources and values. (1062, 1133)

Response: The term is specific enough while retaining flexibility for Department inspectors to require appropriate steps to be taken to adequately restore well sites as needed to protect the waters of the Commonwealth. The qualifier “to the extent practicable” in the definition of “approximate original contours” does not modify to the environmental protections in this section, but rather makes clear that the obligation is not an identical replication of pre-development site conditions.

18. Comment: Approximate Original Conditions. The definition uses the term “original land uses”; however, the term is ambiguous in our view: Does it mean the most recent land use or the first use of the land ever? We ask that the Board further clarify its intent for this definition. (1085)

Response: The definition is appropriate. The Department interprets the definition to apply to conditions immediately prior to commencement of oil and gas operations. The term does not require restoration to exact preconstruction conditions or to the first land use ever.

19. Comment: Approximate original conditions should go beyond general surface configuration, land use, and complementary drainage patterns. Re-vegetation must be specified with reference to native species, size of trees, and similar factors to prevent degradation to sensitive environments and water resources. This is true not only for the well pads but also for the pipelines – many of which are unregulated in Class 1 areas. Eliminate language such as “to the extent practicable” with clearer parameters including cost, feasibility, and long-term value. Criteria need to be established and reviewed with objectivity to reduce environmental risks and the negative impact of cumulative development. (1098)

Response: Restoration to approximate original conditions, capable of supporting original uses to the extent practicable is the best practice to achieve site restoration within reasonable operational parameters. It is not necessary to include technical performance standards

including requirements for type and density of perennial vegetation, soil characteristics and drainage patterns in this section because those issues are already appropriately addressed by the proposed requirements. Projects meeting the proposed requirements will satisfy the statutory restoration requirements and include performance requirements that will protect waters of the Commonwealth.

20. Comment: Borrow pits that are earth disturbances for construction purposes should be clarified to specify “facilities that are related to oil and gas development.” It needs to be clear if “facilities” include compressor stations, pipelines, export terminals, storage tanks and/or processing facilities. (1098)

Response: The definition is appropriate. The applicability of the borrow pit provisions are explained in §78.67.

21. Comment: Approximate original conditions – This definition concludes with the phrase, “. . . to the extent practicable.” This phrase is vague and should be deleted or further clarified. (1099)

Response: See response to comment 17.

22. Comment: Approximate original conditions - Reclamation of the land affected to preconstruction contours so that it closely resembles the general surface configuration of the land prior to construction activities and blends into and complements the drainage pattern of the surrounding terrain, and can support the land uses that existed prior to oil and gas activities to the extent practicable. Our comment: Act 13 does not define or require well sites to be restored to approximate original “conditions.” The only place where the term is proposed by EQB to be used is in Section 78.66, where we propose revisions to clarify that the term is not necessary or appropriate. Suggest language deleting the defined term. (1174)

Response: The restoration requirements are consistent with the restoration requirements described in section 3216(g) of the 2012 Oil and Gas Act. The mere fact of granting of a restoration extension does not change the post-drilling restoration requirements for a well site. The Department interprets section 3216 to require consistent restoration of well sites regardless of whether or not the restoration is occurring after an extension has been granted. This includes making portions of the site “capable of supporting the uses that existed prior to drilling the well,” which the Department interprets as “approximate original conditions” in the regulation. See response to comment 16.

This term is also used in the well development impoundment sections, §§ 78.59b and 78a.59b; the centralized impoundment sections, §§ 78.59c and 78a.59c; restoration sections, §§ 78.65 and 78a.65; and the borrow pit sections, §§ 78.67 and 78a.67.

23. Comment: Act 13 does not define or require well sites to be restored to approximate original “conditions.” The only place where the term is proposed by EQB to be used is in Section 78.66, where MSC’s proposed revisions clarify that the term is not necessary or appropriate. Commentator suggests deleting the defined term. (1137)

Response: See response to comment 16 and 22.

24. Comment: Act 13 does not define or require well sites to be restored to approximate original “conditions.” We suggest deletion of the defined term. We recognize that well sites need to be reclaimed with vegetation and effectively managed per post construction stormwater management

practices. We understand the intent is to reduce the pad foot print but achieving original contour is not practical and often unwanted by the landowner. (1103)

Response: See response to comment 16 and 22.

25. Comment: Approximate original conditions – While some may argue that land use is outside of DEP’s jurisdiction to regulate, and is largely an issue to be resolved between the lessor and the operator, we do not agree. Marcellus Shale is not a typical landowner land use issue. We want to see this definition in place as it provides protection for our Region’s rural and agricultural and forested integrity. Land use issues are not solely landowner issues as the flavor of land use directly relates to the integrity of our regional community. The Region hosts approximately 43% of the total unconventional wells within the Commonwealth. Reducing reclamation to standards other than preconstruction contours may greatly unravel the beautiful fabric of our Region’s aesthetic value. When industry negotiates agreements to do otherwise, we only need to reflect back in recent history to unscrupulous land men who did their bidding and more than a few landowners regret making decisions they had made during that time. Lease agreements and regulations protect landowners when they lack information or knowledge concerning land use issues. We strongly recommend the Department adopt this definition at a minimum in the scope and spirit in which it is written. (660a)

Response: The Department acknowledges the comment.

26. Comment: Body of water: This definition is a cross-reference to § 105.I (relating to definitions) of the Department’s regulations. Chapter 105 pertains to dam safety and waterway management. Why is this definition appropriate for the regulation of the oil and gas industry? (1099)

Response: The oil and gas industry is subject to the requirements of Chapter 105 due to impacts to water bodies on a regular basis.

27. Comment: Given this definition all site development activities would classify as borrow pits since they involve earth disturbance activity. The definition would add additional permitting and bonding obligations under other applicable laws as referenced in the proposed Section 78.67. Borrow Pits. Commentators suggest amending the language:

Borrow pit -An area of earth disturbance activity where rock, stone, gravel, sand, soil or similar material is excavated to be used for the construction of well sites, access roads or facilities that are related to oil and gas operations. This definition does not include earth disturbance at well sites or otherwise permitted by the Department under the Oil and Gas Act. (1071, 1085, 1103, 1137, 1147, 1153, 1174).

Response: The definition of the term “borrow pit” as used in Chapters 78 and 78a is readily understood.

28. Comment: Brine: the term brine does not appear in the proposed § 78.1, nor does it appear to be defined anywhere in the current version of CH 78. Although definitions are hinted at in numerous sections none is clearly provided. We believe it would be helpful to clearly define this term given its extensive use throughout CH 78, and to ensure that the use of brine as described in these regulations meets the intended goal to ensure that particular chemicals and substances used in hydraulic fracture stimulation do not end up in the waters of the Commonwealth. Given the use of brine for multiple purposes (e.g. dust suppression, road stabilization, pre-treatment of roads, etc.) and the numerous state and local roads present within and near NPS units such as the Upper Delaware Scenic and Recreational River (UPDE), we believe the use of brine absent a definition as to its contents could

potentially impact NPS resources and affect our ability to adequately design monitoring to determine if or when brine is reaching the waters of the Commonwealth. (1062, 1133)

Response: The definition of the term “brine” is the common English definition.

29. Comment: I would also like to see definitions of: Brine (since this is beyond just salt or salt water, I would like to have a clear articulation of the chemical composition of what the document is referring to as brine). Since I am assuming that this will also apply to the other shale formations and not just the Marcellus, there should also be definitions of the other formations in the area, such as the Utica and Upper Devonian. (945)

Response: See response to comment 28. Including a clear articulation of the chemical composition of what is being referred to as brine is not necessary because the regulations provide chemical composition specifications where necessary.

30. Comment: Brine: The proposed version of 25 Pa. Code Chapter 78 uses the term “brine” in numerous places, including in newly defined terms “anti-icing,” “de-icing” and “pre-wetting.” However, the term itself is undefined. The use of the term in the proposed regulations indicates that “brine” consists of liquids that result from drilling, altering, completing, recompleting, operating, servicing or plugging a well rather than a liquid that is specifically manufactured or produced for use as an additive by service providers in well stimulation activities. To draw this distinction more clearly, we suggest that the following definition be added to the proposed regulations:

Brine - saline geological formation water resulting from, obtained from, or produced in connection with exploration, drilling, well stimulation, production of oil or gas, or plugging of a well. (1173)

Response: See responses to comment 28 and 29.

31. Comment: Buffer Zone – an area designated that is beyond the setback in which mitigations are required to enable both the operator and public to enjoy their respective activities. Buffer zones are created ideally to create a safety and comfort corridor which is beneficial to both operators and the public enjoying the same area on publicly owned lands. (660a)

Response: A buffer zone is synonymous with a setback.

32. Comment: Centralized impoundment – We applaud the Department’s recognition of air pollution that may endanger persons or property. While it is true, that the air program does indeed regulate some air regulations on oil and gas facilities, there are still some sources that are not effectively regulated with emission control technologies. Additionally, at the recent Appropriation’s Budget Hearings, it was noted that the expected fee increase will provide for an addition of field staff complement in the program, some of which will have air quality specialist expertise. This is really an excellent step forward by the Department which will enable the Marcellus Shale Play to reach that delicate balance where all may thrive. Therefore, we strongly recommend the Department adopt this definition at a minimum in the scope and spirit in which it is written. (660a)

Response: The Department acknowledges the comment.

33. Comment: Centralized impoundment – Centralized impoundments may be designed to hold fluids or semi-fluids from “oil and gas operations,” as defined in this Chapter.

Suggested Language: “Centralized impoundment-A facility that meets the following: (1) a natural topographic depression, manmade excavation or diked area formed primarily of earthen materials, (2) designed to hold fluids or semi-fluids associated with oil and gas operations, including wastewater, flowback and mine influenced water, the escape of which may result in air, water or land pollution or endanger persons or property, (3) constructed solely for the purpose of servicing multiple well sites.” (1137, 1174)

Response: The Department has changed the definition of centralized impoundment in the final regulatory language as a facility authorized by a dam permit for a centralized impoundment dam for oil and gas operations (DEP #8000-PM-OOGM0084).

34. Comment: Centralized impoundment – The EQB proposes to add a new definition for “centralized impoundment” that would allow the construction of large, centralized open pits for waste storage. The proposed definition acknowledges that the escape of waste from the impoundment “may result in air, water, or land pollution or endanger persons or property.”

We oppose the use of centralized impoundments. Centralized impoundments should be prohibited because they are inefficient, cause large-scale surface disturbance, pose a risk of surface and ground water contamination, and contribute to local air pollution. These concerns already have led some companies to transition away from the use of impoundments and pits and toward closed-loop systems. (See, e.g., ExxonMobil, 2010 Corporate Citizenship Report, http://cdn.exxonmobil.com/~media/Reports/Corporate%20Citizenship%20Report/2010/community_ccr_2010.pdf; Anadarko, Questions and Answers regarding fracture stimulation, <https://www.anadarko.com/sitecollectiondocuments/hydraulic%20fracturing/fracQA.pdf>) Wastewater, flowback, and other fluids generated or employed by oil and gas drilling should be contained in closed systems only.

Best practices support the elimination of surface impoundments altogether. Waste collected in tanks at the drill site and moved by pipeline or truck to be pumped into a larger open impoundment at a centralized location (away from the well site) results in additional unnecessary transportation and transfer steps that provide unnecessary opportunities for pollution releases.

Eliminating use of centralized surface impoundments prevents: large scale surface disturbance that requires multi-year rehabilitation (surface disturbance is less for temporary tanks than impoundments. Impoundments require surface soil excavation and multiyear rehabilitation. Temporary tanks used at the drill site use existing gravel space already in place for drilling operations rather than impacting new and additional surface terrain away from the drill site); the potential for structural failure and significant pollutant release for centralized impoundments constructed with embankments; the potential for leakage to occur through or around the liner, impacting soil and ground and surface water (a cause of many pollution events in Pennsylvania); hazardous air pollution emissions from evaporation and aeration processes; and, potential exposure of wildlife and domestic animals to the impoundment contents that could be harmful.

The use of large centralized impoundments requires large areas of surface excavation (cut) and embankment placement (fill). The proposed regulation does not include any upper limit on the size or depth of centralized impoundment.

The proposed regulation exempts centralized impoundments of hazard potential 4 and size Category C (up to 40 feet embankment or 1,000 acre-feet of storage) from the regulatory and permitting requirements of Chapter 105, Subchapter B, Dam Safety and Waterway Management. The proposed regulation would only require impoundments of 40 feet or greater in depth (Size Category A or B) or

hazard potential 1, 2, or 3 to comply with the requirements of Chapter 105. The implications of an impoundment failure or overtopping for a centralized impoundment have all of the same health, safety, and welfare concerns as any other impoundment, with the added concern that the contents of a centralized impoundment can include compounds that are hazardous to both human and ecological health. There was no safety or technical basis provided for the proposed exemption.

If flowback is recycled, it should be subject to strict waste management guidelines, permitting, and trucked or piped from tank-to-tank to another drill site or used at the same drill site in a different well.

A centralized surface impoundment photograph in Pennsylvania is shown below.

The most serious concern with the use of centralized surface impoundments for hydraulic fluid waste (“flowback”) is the amount of hazardous air pollution predicted for these centralized surface impoundments. In 2009, New York State Department of Environmental Conservation (NYSDEC) estimated that each centralized impoundment would be a major source of hazardous air pollution, emitting more than 32.5 tons of air toxins per year, and it was unclear if NYSDEC’s estimate was even a worst-case estimate:

Based on an assumed installation of ten wells per well site in a given year, an annual methanol air emission [estimate] of 32.5 tons (i.e., “major” quantity of HAP) is theoretically possible at a central impoundment⁴ [emphasis added].

The US Environmental Protection Agency (USEPA) classifies a major source of hazardous air pollution as a source that emits more than 25 tons per year. These centralized impoundments have been sited close to residential homes and community facilities in Pennsylvania, increasing the amount of hazardous air pollution exposure to nearby humans and animals, including increased exposure to benzene, a known human carcinogen.

The proposed definition for “centralized impoundment” (§ 78.1) states that air pollution “may” occur; this is incorrect, air pollution will occur. The amount and type of pollution will depend on the amount and type of waste stored in this open air pit.

We recommend that the proposed definition for “centralized impoundment” be revised and that centralized impoundments be prohibited. Closed-loop tank systems should be required to store and transport waste to prevent the release of substantial amounts of air pollution, particularly hazardous air pollutants to the atmosphere.

We recommend the following changes:

Centralized impoundment—A facility, prohibited under § 78.59c, that is:

- (i) A natural topographic depression, manmade excavation or diked area formed primarily of earthen materials, the construction of which causes large-scale surface disturbance.
- (ii) Designed to hold contaminated fluids or semifluids associated with oil and gas activities, including wastewater, flowback and mine influenced water, emissions from or the escape of which will result in air pollution, will pose a risk of water or land pollution, and may endanger persons or property.
- (iii) Constructed solely for the purpose of servicing multiple well sites. (1143)

Response: Due to changes disallowing the construction of new centralized impoundments without a residual waste permit and requiring the closure of existing centralized impoundments, the Department has changed the definition of centralized impoundments in the final-form regulation to be “A facility authorized by a Dam Permit for a Centralized Impoundment Dam for Oil and Gas Operations (DEP #8000-PM-OOGM0084).”

35. Comment: Centralized impoundment requires clarification. Must such a facility include all or one of the following three descriptors listed since there is no and or within the items? Certainly regulation surrounding each should be distinct as a depression or diked area formed primarily of earthen materials for fluids is different from semi-fluids and wastewater, flowback and mine influenced waters are very different by definition. Mine influenced water could be acid mine drainage that is considered hazardous as opposed to wastes from oil and gas industries that are not defined or regulated in the same way. This should be clarified to avoid problematic interpretation. (1098)

Response: See response to comment 34.

36. Comment: Centralized impoundment, number (2) - This definition talks about “... the escape of which may result in air, water or land pollution ...” It is interesting to note that the oil and gas program regulations contain air pollution controls. This should be carefully considered, especially in light of recently promulgated federal air rules found at 40 CFR Part 60 Subpart 0000 which will be implemented by the air quality program.

In addition, it is suggested that language be added to clarify that this definition does not include secondary containment or impoundments at well sites. The language should also clarify that a “centralized impoundment” does not include freshwater impoundments. (124a)

Response: See response to comment 34.

37. Comment: Centralized Impoundment – Language should be added to clarify that this definition does not include secondary containment or impoundments at well sites. Exclude pits, impoundments, tanks restored on a well site that are restored within applicable restoration period for the well site. (1057)

Response: See response to comment 34

38. Comment: Centralized Impoundment – Commentator proposes that the definition expressly exclude freshwater from its scope for the sake of clarity. Further, because the Department’s air quality program, not the oil and gas program, is implementing the recently promulgated federal air regulations found at 40 C.F.R. Part 60, Subpart 0000, any references to air pollution should be deleted from the proposed definitional language as the reference could create confusion. To accommodate these recommendations, Talisman recommends that subsection (ii) be amended to state: “designed to hold fluids or semi-fluids associated with oil and gas operations, including wastewater flowback and mine influenced water, but not freshwater, the escape of which may result in water or land pollution.”(1085)

Response: See response to comment 34.

39. Comment: Centralized Impoundment – Commentator suggests that this definition and any related provisions be separated into a separate subchapter of the regulation for unconventional operations. There is no need in the general rule for this concept. (1135)

Response: The Department disagrees and has included the definition in both Chapters 78 and 78a. See response to comment 34. Centralized impoundments are not limited to servicing unconventional wells, although that is their typical use.

40. Comment: Centralized impoundment – Impoundments that contain freshwater, other fluids, and residual waste are extensively regulated in Pennsylvania by, inter alia, the Solid Waste Management Act and the Dam Safety and Encroachments Act. The proposed Chapter 78 standards are more stringent than existing state law. The Department has not justified a basis to impose more stringent standards than currently exist, and does not impose specific, more stringent standards on other industries. Delete this definition and section 78.59c. (1153)

Response: The Department has eliminated the authorization of centralized impoundments under Chapter 78. See response to comment 34.

41. Comment: Condensate should be delineated beyond the industry standard by including a comprehensive, continually up-dated lists of substances so classified. This is particularly important in dealing with environmental protection, leaks, and public health risks. (1098)

Response: The Department believes that the American Petroleum Institute definition of condensate, as included in 78.1 of the Rulemaking is appropriate.

42. Comment: Containment systems are critical and should be defined in such a way as to provide the public with assurance that they will, in fact, hold spilled substances to the ground surface or off the well site. Lists should be provided based on what substances the system is designed to contain. Please define “Other Materials” such as the substance “synthetic liners are made of and what type of coating will be used. (1098)

Response: Section 78.64(a) addresses concerns regarding containment systems and the

Department added definitions for “primary containment” and ‘secondary containment” in the final rulemaking.

43. Comment: Based on Act 13, the proposed regulation defines a “Conventional well – A bore hole drilled or being drilled for the purpose of or to be used for the production of oil or gas from a conventional formation” and “Conventional formation – A formation that is not an unconventional formation.” However, an “unconventional formation” is not defined and should be. (636a)

Response: The Department does not agree that a definition is required for conventional wells. Unconventional formations are already defined in Act 13. For the definition of unconventional formation, please see response to comment 7.

44. Comment: Conventional and Unconventional Formation: As currently written, the definitions of conventional formation and unconventional formation may result in wells which are, by strict application of the definition, conventional, while containing critical elements of unconventional formations. This is important because the regulations ban the use of certain materials from unconventional formations, yet the definition creates a loophole which would allow the use of the very materials which these proposed regulations ban. It is especially important that there is no loophole and that these two types of formations are clearly defined and distinct from one another as they inform the types of materials that can be buried in pits, applied to the land and spread on roads in the Commonwealth, all of which may affect National Park System units and affiliated areas. These activities have the potential for adversely impacting the waters of the Commonwealth should certain materials generated from natural gas development be used.

The definition of conventional as “a formation that is not an unconventional formation” is a circular definition that hinges on the definition of “unconventional formation.” Our recommendation lies in changing this definition. Most of the current definition serves to differentiate unconventional from conventional formations. The phrase “existing below the base of the Elk Sandstone or its geologic equivalent stratigraphic interval” is the element which we recommend be clarified or dropped for the reasons we discuss below.

One of the critical elements in the definition of unconventional formation appears to be the use of stimulation “by hydraulic fracture treatments or by using multilateral well bores or other techniques to expose more of the formation to the well bore” regardless of whether such techniques are applied to a vertical or horizontal well bore. Also critical is the lack of economic flow rates or economic volumes necessitating hydraulic fracture stimulation or other techniques. The use of hydraulic fracturing is the critical element in the definition.

The percentage of all natural gas wells that are hydraulically fractured is important in this case. The Congressional Research Service states that “hydraulic fracturing is a technique developed initially to stimulate oil production from wells in declining oil reservoirs. With technological advances, hydraulic fracturing is now widely used to initiate oil and gas production from unconventional (low-permeability) oil and gas formations in which the hydrocarbon was previously inaccessible. This process now is used in more than 90% of new oil and gas wells.”

When this geologic location is included, however, it creates a class of wells that do not exist “below the base of the Elk Sandstone or its geologic equivalent stratigraphic interval”, but to which hydraulic fracturing has been applied, with all the attendant chemical concentrations, presence of naturally occurring radioactive material (NORM), etc. common to the technique. It is the use of material from these wells that the regulations ban. Yet the current definition would define these

wells as conventional and allow the use of materials from them simply because their stratigraphic interval was not “below the base of the Elk Sandstone or its geologic equivalent.” This appears to be the opposite of what the Commonwealth intends in the proposed regulations. It could result in adverse impacts to the waters of the Commonwealth should materials from these wells be spread on roads, applied to the land or buried in pits. We recommend dropping the locational element from the unconventional formation definition or clarifying why its inclusion will not result in the potential problems identified. (1062, 1133)

Response: The Department does not agree that the current statutory definition of unconventional formation lessens existing environmental protection standards.

45. Comment: I would like to add the technical definition of a Conventional Well that is most compatible with the Pennsylvania Grade Crude Oil Coalition: A bore hole drilled or being drilled for the purpose of or to be used for the production of oil and gas from a conventional formation. Conventional wells are, irrespective of technology or design: (1) any wells drilled to produce oil; (2) wells drilled to produce natural gas from formations other than shale formations; (3) wells drilled to produce natural gas from shale formations located above the base of the Elk Group or its stratigraphic equivalent; and (4) wells drilled to produce natural gas from shale formations located below the base of the Elk Group where natural gas can be produced at economic flow rates or in economic volumes without the use of vertical or non-vertical well bored stimulated by hydraulic fracture treatments or by using multilateral well bores or other techniques to expose more of the formation to the well bore; and (5) irrespective of formation, wells drilled for collateral purposes, such as monitoring, geologic logging, secondary, and tertiary recovery or disposal injection. (1120)

Response: A definition for “conventional well” was added to Chapter 78 on June 14, 2014 (44 Pa.B. 3517) as part of the permit fee rulemaking. Because of the timing of the two regulation packages, this change could not be reflected in this proposed rulemaking.

46. Comment: Conventional formation should not be defined relative to what it is not included. Specificity is required. (1098)

Response: For matters related to establishing the definition of a conventional well, please see response to comment 45.

47. Comment: Conventional wells, with reference to the Conventional formation, definition is problematic. Clarification is needed in the instances where conventional wells become unconventional wells. (1098)

Response: For matters related to establishing the definition of a conventional well, please see response to comment 45.

48. Comment: Conventional Well. As what constitutes conventional versus unconventional can vary at any particular time based on resource characteristics, available exploration and production technologies, the economic environment, and the scale, frequency, and duration of production, We suggest the Board base the qualifying language of this definition on what technologies the Board currently believes constitute conventional production, rather than cross referencing to the definition of “conventional formation.”(1085)

Response: For matters related to establishing the definition of a conventional well, please see response to comment 45.

49. Comment: However, in DEP’s proposed rulemaking for Oil and Gas Well Fee Amendments, industry comments were submitted to change the “conventional well” definition in order to address some of the ambiguity concerns such as that a well shall not be determined due to technology because technology changes over time. (636a)

Response: For matters related to establishing the definition of a conventional well, please see response to comment 45.

50. Comment: The rules as drafted do not adequately distinguish between conventional and unconventional wells. The way originally drafted the additional administrative and operational changes would apply across the board regardless of the nature or type of wells being developed or the scope or size of the business in operation.

Suggested amendatory language:

Conventional well—A bore hole drilled or being drilled for the purpose of or to be used for the production of oil or gas from a conventional formation. Conventional wells are, irrespective of technology or design: (1) any wells drilled to produce oil; (2) wells drilled to produce natural gas from formations other than shale formations; (3) wells drilled to produce natural gas from shale formations located above the base of the Elk Group or its stratigraphic equivalent; and (4) wells drilled to produce natural gas from shale formations located below the base of the Elk Group where natural gas can be produced at economic flow rates or in economic volumes without the use of vertical or nonvertical well bores stimulated by hydraulic fracture treatments or by using multilateral well bores or other techniques to expose more of the formation to the well bore; and (5) irrespective of formation, wells drilled for collateral purposes, such as monitoring, geologic logging, secondary and tertiary recovery or disposal injection. (1153)

Response: For matters related to establishing the definition of a conventional well, please see response to comment 45.

51. Comment: Discrete Area: This term is undefined in the regulations, but used in § 78.15(f)(4) to set limits for the applicant on the information they are required to submit about public resources (including NPS resources) and efforts to avoid or mitigate impacts to those resources. The NPS seeks clarification of the meaning of the term. We provide more detail on our concerns in our comments on § 78.15(f)(4) below. (133, 1062)

Response: The Department does not agree that this term requires definition.

52. Comment: Freeboard seems convoluted. We believe it is simply the shortest distance between the top of the contained liquid and the open, secure container that is holding it. (1098)

Response: The definition accurately describes the term.

53. Comment: Define “freshwater” which in its current undefined state allows driller to mix contaminated water with uncontaminated to avoid regulations on the disposal of contaminated substances and protect our fresh water source. (16, 102)

Response: The Department has revised the definition to be “well development impoundments” instead of “freshwater impoundments.” While the term “freshwater” is not defined, the term “well development impoundment” is defined by the materials that may be stored within the impoundment which includes surface water, fresh groundwater and other Department

approved sources which the Department must review and approve based on a variety of factors including the quality of the water and the risks of storage of the water.

54. Comment: Define “freshwater” that is used in oil & gas operations. Water leftover from fracking and contaminated fluids being recycled for fracking (such as from mining or sewage) is often mixed with clean water for additional operations. The lack of a clear definition allows operators to avoid regulations on the use and disposal of polluted substances. (17, 18, 79, 160, 161, 168, 169, 195, 475, 564, 565, 566, 808, 843, 865, 884, 947, 492a, 1000, 1039, 1058, 4582 – 4584)

Response: See response to comment 53.

55. Comment: There should be changes and additions to the definitions used in this chapter. Specifically, there should be a definition of “fresh water” such that it is distinguished from fluids that are “other Department approved sources,” such as mine water, that have been recycled and diluted with clean water (78.l(a)). (1089, 1229)

Response: See response to comment 53.

56. Comment: The Department does not define the term “freshwater.” If it does not intend to define the term, the Department should provide an explanation in the preamble to the final regulations on why a definition is not warranted. (852a)

Response: See response to comment 53.

57. Comment: I call on DEP to clearly define “freshwater” as used in oil and gas operations. The definition should be clarified that it comprises uncontaminated sources that are part of the natural hydrologic cycle including underground sources of drinking water protected under that Safe Drinking Water Act. Water leftover from fracking and contaminated fluids being recycled for fracking (such as from mining or sewage) is often mixed with clean water for additional operations. The lack of a clear definition allows operators to avoid regulations on the use and disposal of polluted substances. (402, 853a, 1102)

Response: See response to comment 53.

58. Comment: The term ‘freshwater’ is confusing and needs to be better defined and classified. (104, 901, 939, 1148)

Response: See response to comment 53.

59. Comment: Also, although there is a definition of freshwater impoundment, there is no definition of freshwater. Is water reclaimed from acid mine drainage “fresh water”? (869)

Response: See response to comment 53.

60. Comment: I would also like to see definitions of: Freshwater (since this is not truly unadulterated water as might be assumed by the term itself). I would like to know what substances are and are not acceptable to be included in freshwater. (945)

Response: See response to comment 53.

61. Comment: The term “fresh water” should no longer be used to define both uncontaminated

previously unused water and wastewater left over from fracking that is then recycled to be reused. (912, 926)

Response: See response to comment 53.

62. Comment: The term “fresh water” is confusing to the public and ambiguous for operators. The so called “fresh water” (i.e. water fresh to a well pad) comes from a wide range of sources each with different, often undocumented contaminants.

For example, this “fresh water” can be any of the following:

- Produced water from a prior well fracking that is intended to be recycled into a future well; therefore, this water will have chemicals from the previously fracked shale deposits (e.g., salts, heavy metals, organic compounds and radionucleotides) as well as chemicals introduced by the prior tracking company (e.g., acids and preservatives} .
- Surface or ground water impacted by another industry, e.g., mercury in rivers downstream from coal burning power plants
- Surface or ground water where acid deposition has dissolved naturally occurring metals, such as aluminum. (938, 938a)

Response: See response to comment 53.

63. Comment: There is no definition of the term ‘freshwater’ in § 78.1. Although there is a definition of ‘freshwater impoundment’, there is no definition of freshwater. Is water reclaimed from acid mine drainage “fresh water”? § 78.59b(g) states: “Prior to storing mine influenced water in a freshwater impoundment, the operator shall develop a mine influenced water storage plan and submit it to the Department for approval.” This implies directly that the Environmental Quality Board intends that we should allow the term freshwater to include “mine influenced water”. This is certainly not what the public knows as the meaning of “freshwater”. The common sense meaning of “freshwater” is: potable water. What is the standard to which “mine influenced water” must be treated to be considered “freshwater”? What about “mine influenced water” from a mine which has been subject to illegal dumping of produced water from an unconventional gas well? There are numerous anecdotes of such dumping, as well as scientifically based reports of signature chemicals associated with unconventional natural gas production but not associated with mine drainage (e.g. bromides) in “mine influenced water”. Is it the intent of the Environmental Quality Board that we consider such waters “freshwater”? (869a)

Response: See response to comment 53.

64. Comment: Freshwater. The regulations should contain a definition of the term “freshwater,” being that it is a term of art used in several parts of Chapter 78. (852a)

Response: See response to comment 53.

65. Comment: The EQB proposes to add a new definition for “freshwater impoundment” at § 78.1. There is no definition for “freshwater” at § 78.1. We support the inclusion of a new definition for a freshwater impoundment. However, it is important to ensure that any “freshwater impoundment” is allowed to actually store only “uncontaminated freshwater” from the Earth’s surface and “uncontaminated fresh groundwater.” The proposed regulation would allow a freshwater impoundment to hold “surface water,” “groundwater” and “other Department approved substances.”

The term “fresh groundwater” is defined at § 78.1 as:

Water in that portion of the generally recognized hydrologic cycle which occupies the pore spaces and fractures of saturated subsurface materials.

We recommend the definition of “fresh groundwater” be modified to clarify that the water must be uncontaminated and include waters protected under the Safe Drinking Water Act (SDWA) as underground sources of drinking water (USDWs). With respect to the definition of “fresh groundwater,” we recommend the following changes:

Fresh groundwater—Uncontaminated water in that portion of the generally recognized hydrologic cycle which occupies the pore spaces and fractures of saturated subsurface materials and all underground sources of drinking water, as defined in 40 CFR §§ 144.3, 146.4, including all primary and principal aquifers.

We recommend a definition of “fresh surface water” be added as follows:

Fresh surface water—Uncontaminated water in that portion of the generally recognized hydrologic cycle which occupies the surface of the Earth.

A definition for “freshwater” should be added as follows:

Freshwater—fresh surface water or fresh groundwater or both.

It is not clear what “other Department approved sources” might be allowed to be stored in the freshwater impoundment.

We recommend that the clause “other Department approved sources” be deleted unless the EQB can provide clarity on what other “sources” it would allow and explain how it would be safe to store these “other approved sources” with freshwater without contaminating the freshwater. The EQB should provide the name, composition, concentration, and maximum volume of each “other approved source” that would be allowed. The EQB should provide information on the toxicity, biodegradability, and bioaccumulation potential of each “source.” All “sources” that do not meet the definition of “freshwater” (recommended above), that the PADEP currently allows to be stored in open impoundments, should be included in this inventory.

The inclusion of “synthetic liner materials” in the definition of freshwater impoundment is an indication that the material planned for storage in the impoundment could pose a contamination hazard to surface or groundwater if released. Impoundments intended to hold only freshwater that poses no threat to human health are often cost-effectively lined with materials such as clay (bentonite) liners.

The proposed definition for freshwater impoundment states that a freshwater impoundment is a facility that is “not regulated under § 105.3 (relating to scope).” It is unclear what is intended by this clause. Chapter 105.3(a)(2) includes in its scope:

Dams used for the storage of water not located on a watercourse and which have no contributory drainage where the greatest depth of water measured at upstream toe of the dam at maximum storage elevation exceeds 15 feet and the impounding capacity at maximum storage elevation exceeds 50 acre-feet.

This definition would include freshwater impoundments for Oil and Gas Operations that meet the depth and size criteria. Because there is no size limit proposed, there could be freshwater impoundments that exceed the 15 feet and 50 acre-feet threshold. We recommend these freshwater impoundments meet the Chapter 105 requirements or freshwater impoundments be limited to a size below this threshold.

We recommend the definition for “freshwater impoundment” be revised to read:

Freshwater impoundment—A facility that:

- (i) Meets the Chapter 105 requirements if regulated under § 105.3 (relating to scope).
- (ii) Is a natural topographic depression, manmade excavation or diked area formed primarily of earthen materials and lined with synthetic materials.
- (iii) Designed to hold freshwater.
- (iv) Constructed for the purpose of servicing multiple well sites. (1143)

Response: The Department has revised the definition to be “well development impoundments” instead of “freshwater impoundments”. Impoundments that are regulated under § 105.3 are not included in the definition of well development impoundment and must be constructed in accordance to the Chapter 105 requirements. See response to comment 53 regarding the definition of freshwater.

66. Comment: Our streams and groundwater should be secure from pollution caused by the storage of wastes and fluids associated with oil and gas production operations. The definitions of “pit” and “freshwater impoundment” raise questions about that objective because they continue to incorporate the concept of “natural topographic depressions” within the definitions. We should not even suggest that Pennsylvania will allow fluids related to oil and gas operations to be managed in “natural depressions.” All facilities used to hold fluids that may contain potential water pollutants should be specifically engineered for the task. (22, 23, 26, 142, 192, 391, 637, 843, 946, 958, 1005)

Response: Natural topographic depressions can safely be used to construct a pit or impoundment.

67. Comment: Freshwater Impoundment - It is suggested that language be added to clarify that this definition does not include secondary containment or impoundments at well sites. Exclude pits, impoundments, tanks restored on a well site that are restored within applicable restoration period for the well site. Exclude pits, impoundments, tanks at a well site. (1057)

Response: The definition addresses the commentator’s concern because it includes a requirement that a centralized impoundment must be constructed for the purpose of servicing multiple well sites.

68. Comment: Freshwater Impoundment. The Board appropriately recognized the purpose and scope of a freshwater impoundment in the oil and gas development process. However, the definition states in subpart (iv) that such an impoundment is “constructed for the purpose of servicing multiple wells,” which creates unnecessary confusion as a freshwater impoundment can be constructed to service either a single well site or multiple well sites. We support deleting this phrase.(1085)

Response: The term is appropriately defined. See response to comment 53.

69. Comment: Freshwater impoundment should be limited to holding only surface water and groundwater that is, in fact, freshwater. Other liquids, such as acid mine drainage or mine influenced

water could become approved and held without adequate safeguards. It should be made clear that no acid mine drainage or other industrial wastewater has been added under this definition. (1098)

Response: See response to comment 53.

70. Comment: Freshwater impoundment – No new regulations targeting the use of freshwater impoundments by the oil and gas industry are necessary or appropriate. The definition and the subsections below should be stricken. (1135, 1153)

Response: The Department has revised the definition to be “well development impoundments” instead of “freshwater impoundments.” The scope and type of use of well development impoundments by the oil and gas industry is significantly different from the scope and type of use by other industries in such a manner that the Department has determined that the proposed regulations are appropriate.

71. Comment: Gathering pipeline—A pipeline that transports oil, liquid hydrocarbons or natural gas from individual wells to an intrastate or interstate transmission pipeline. The definition is too vague. What is an Intrastate Transmission Pipeline? What is an Interstate Transmission Pipeline? Is a pipeline taking gas from several well pads and delivering the gas to a small power plant a gathering line or an intrastate transmission Line? Is a pipeline taking gas from a well or several wells to a local industry a Gathering Line? This is important as different agencies review applications for and inspect construction of Gathering lines and for/of Transmission lines. (108)

Response: The Department has revised the definition in the final-form rulemaking to specify what is meant by the terms ‘intrastate transmission pipeline’ and ‘interstate transmission pipeline’.

72. Comment: To avoid inconsistencies between state and federal laws, we recommend the proposed definition language in Chapter 78. for “Gathering Pipeline” be struck and instead incorporate by reference the definition in 49 CFR 192.3 and the guidance around jurisdiction for gathering lines in 49 CFR 192.8. (1071)

Response: The Department disagrees, the Federal definition referenced by the commentator includes only natural gas or other gas and Chapter 78 applies to the production of oil, liquid hydrocarbons, and gas.

73. Comment: Pipeline infrastructure is listed as a subcategory of Oil and Gas Operations:

- (i) Oil and gas pipelines;
- (ii) Natural gas compressor stations; and
- (iii) Natural gas processing plants or facilities performing equivalent functions;

Recommendation: This subcategorizing is incomplete, misleading and a vague representation of pipelines associated with Oil and Gas Operations.

Although it is perhaps appropriate to include pipeline infrastructure as a subsection of Oil and Gas Operations, Pipeline Infrastructure should be a primary definition in Chapter 78, as was gathering lines. Inclusive and accurate definitions, purpose and function of pipeline infrastructure in oil and gas operations is needed for holistic assessment of cumulative impacts.

Recommendation: Chapter 78 could review its definition of a Gathering Pipeline as a pipeline that transports oil, liquid hydrocarbons or natural gas from individual wells to an intrastate or interstate transmission pipeline to a more inclusive definition as used by US DOT PHMSA: “Gathering pipelines transport gases and liquids from the commodity’s source - like rock formations located far below the drilling site - to a processing facility, refinery or a transmission line. In the past, most gathering lines were built in minimally populated areas, used smaller- diameter pipelines that operated at lower pressures, and appeared to pose a much lower risk than for other types of pipelines.” In Pennsylvania it should be noted that gathering lines in unregulated Class One areas may be sized 20-60” and operating at a 700-1300 psi, equivalent to transmission lines. (118)

Response: The Department has clarified the definition of oil and gas operations by specifying what types of pipelines are included. See response to comment 72. After the revisions both the definition of oil and gas operations and gathering pipelines are appropriate.

74. Comment: Gathering Pipeline – A gathering pipeline should be defined as a pipeline that transports oil, liquid hydrocarbons or natural gas from individual wells to the point of transfer of custody. (411)

Response: The definition is appropriate.

75. Comment: Gathering Pipeline. To the extent that the Board must use the term “gathering pipelines” throughout the Rule, its definition should be replaced and, therefore, made consistent with the PHMSA definition to ensure alignment with the Department with other regulating agencies at the federal and state levels. “Gathering line” is defined by PHMSA in 49 C.F.R. § 192.3 as “a pipeline that transports gas from a current production facility to a transmission line or main.” Pipeline terms get used interchangeably in common conversation, creating confusion and ambiguity. Thus, it is important to clearly and uniformly define the various types of pipelines in the regulations. See comment addressing § 78.68 of the Rule where Department does not have the authority to regulate some issues related to gathering pipelines. (1085, 1071, 1103, 1164, 1174, 1155)

Response: See response to comment 72.

76. Comment: Gathering pipelines – The current scope of Chapter 78 is limited to oil and gas wells. It does not apply to pipelines. See 25 Pa. Code § 78.2. Act 13 does not require the Department to regulate gathering pipelines; Section 3218.5 of Act 13 merely requires owners and operators of gathering lines to comply with certain requirements of Pennsylvania’s One-Call law. Further, the proposed definition of a “gathering” pipeline is at odds and inconsistent with that term as defined under applicable state and federal law: Act 127, PA One Call law and the federal pipeline safety laws and regulations. Pipeline activities that create any earth disturbance or require stream crossings, for this industry and all others, are sufficiently regulated in accordance with 25 Pa. Code Chapters 102 and 105. There is no need for the Department to create a new term that will create confusion and impose additional burdens on oil and gas operators that are unique to this industry and unjustified by any clear additional environmental benefit. The Department has no authority to regulate the safety of gathering lines, which is exercised exclusively by other state (PUC) and federal agencies (primarily PHMSA). The proposed definition is inconsistent with the definitions in Act 127, the federal pipeline safety laws and regulations, the PA One Call law and Act 13. Delete this definition and section 78.68, and remove all references to pipelines throughout Chapter 78. (1153)

Response: See response to comment 72 regarding the definition of gathering pipeline. The regulations regarding pipelines in Chapter 78a are appropriate due to the scope and nature of oil and gas pipeline construction that is occurring in Pennsylvania.

77. Comment: Gathering pipelines may also take natural gas to processing facilities. The starting point of gathering lines should also be specified as well as their termination. It should be clear where a production line ends and a gathering line begins. (1098)

Response: The term is clearly defined and includes the starting and ending points for gathering pipelines. Gathering lines begin at each individual well and end at a transmission pipeline.

78. Comment: Gathering pipeline – Since the federal government and the Pennsylvania Public Utility Commission have jurisdiction over pipelines, we ask EQB to ensure this definition does not conflict with any definitions from those regulatory agencies. (1099)

Response: See response to comment 72.

79. Comment: Gathering pipeline. To avoid confusion and conflict, the commentator suggests that the regulation should use the Federal definition for gathering pipeline contained in 49 CFR, Part 192, which is consistent with how the term is defined in Act 13, Section 3218.5. Commentator also suggests the following amendatory language: “Gathering Pipelines - A pipeline that transports gas from a current production facility to a transmission line or main.” (1137, 1147)

Response: See response to comment 72.

80. Comment: Gathering Pipeline - As an advocacy organization, C.O.G.E.N.T. advocates on many unconventional shale gas issues in addition to environmental protection performance standards, one being pipeline safety. Thus, we are well familiar with and aware of many issues related to gathering lines. The very first draft of this rulemaking [1/22/2013] defined Gathering Pipelines – A pipeline that transports oil, liquid hydrocarbons or natural gas from individual wells to an intrastate or interstate transmission pipeline. The term includes pumps, headers, separators, emulsion treaters, tanks, regulators, compressors, dehydrators, valves and associated equipment. Subsequent to that draft, industry comments provided that by the 2nd draft, the definition substantially changed. Gathering Pipeline – A pipeline that transports oil, liquid hydrocarbons or natural gas from individual wells to an intrastate or interstate transmission pipeline. This is the same definition that is in the rulemaking that we are now commenting on.

At the Tunkhannock hearing, it was noted by the industry group that the gathering pipeline definition is not consistent with the DOT definition. We are well aware of that fact. We also are well aware that the DOT PHMSA – CFR definition is not a definition created by the regulator, but rather, it is the 1st edition, issued April 2000 of American Petroleum Institute Recommended Practice 80 which has been incorporated in total by reference. However, some limitations to the RP are defined in CFR Title 49 § 192.8. Now, as a pipeline safety advocate, I can tell you there are important issues related to incorporating recommended practices into any regulation. First, there is the issue of transparency. It is very difficult for the average citizen to even know what a recommended practice is, let alone know where to find it and whether they are reading the most current version. Secondly, they are recommended practices, not standards, so there is wiggle room in them. There is no reason to conform to a DOT definition or RP80 for that matter as we are not dealing with pipeline safety regulations here, with the exception of 78.68(h) which pertains to corrosion control as adopted in Act 13 of 2012. All other provisions deal with environmental issues related to soil, water protections, and HDD. The spirit of regulating gathering line pipeline safety has not presently designated DEP with that authority. If you were to ask any pipeline safety advocate and even some in industry, they would tell you that RP80 is convoluted and ambiguous. Thirdly, we

are very concerned that by adopting/referencing any API RP into this or any other rulemaking that we are treading on dangerous ground in setting such a precedent. Any pipeline safety advocate can aptly advise of the problems encountered when regulations refer to a recommended practice rather than explicitly state the regulation in full detail. Therefore, we strongly recommend that this definition is not revised to comply with API's RP80 or the Department of Transportation definition, but rather stands as is written. (660a)

Response: The Department acknowledges the comment.

81. Comment: Gathering pipelines – This definition of a “gathering” pipeline is at odds and inconsistent with that term as defined under applicable state and federal law. Pipeline activities that create any earth disturbance or require stream crossings, for this industry and all others, are sufficiently regulated in accordance with 25 Pa. Code Chapter 102 and 105. There is no need for the Department to create a new term that will create confusion and impose burdens on oil and gas operators that are unique to this industry and unjustified by any clear environmental benefit. In addition, the Department has no authority to regulate the safety of gathering lines, which is exercised exclusively by other state and federal agencies. Remove the term throughout the rule. These new sections should all be stricken from any rule that applies to conventional operations. (1135)

Response: See response to comment 72 regarding the definition of gathering pipeline. The rulemaking provisions regarding pipelines are appropriate due to the scope and nature of oil and gas pipeline construction that is occurring in Pennsylvania.

82. Comment: Inactive well – The regulations at § 78.1 do not include a proposed definition for “inactive well status.” We recommend that the definition used in Texas Administrative Code § 3.15(a)(6) be used to clarify what constitutes an inactive well:

Inactive well – An unplugged well that has been spudded or has been equipped with cemented casing and that has had no reported production, disposal, injection, or other permitted activity for a period of greater than 12 months. (1143)

Response: The Department has added a definition for the term inactive well to the final-form rulemaking which is consistent with 2012 Oil and Gas Act requirements.

83. Comment: Leak Detection System: is undefined in both the current and proposed regulations. Given the importance of these regulations in protecting the waters of the Commonwealth, we believe it should be defined. (1062, 1133)

Response: The Department disagrees that it is necessary to define this term. The Department will provide guidance on how to construct a leak detection system in permit documents related to the centralized tank storage permit proposed in §§ 78.57a and 78a.57a.

84. Comment: Mine influenced water - Mine influenced water does not always have to be a pollutant or a threat of pollution to waters of the Commonwealth. An example is a limestone mine pool that contains water that meets or exceeds drinking water standards. (411)

Response: The Department acknowledges the comment.

85. Comment: Mine influenced water - It is suggested that the second sentence be deleted. The first sentence captures any relevant discharges to surface waters from mining activities. The term “mine influenced water” should not also include the entire surface water body into which those discharges

occur, as the second sentence implies. (124a)

Response: The definition is appropriate.

86. Comment: Mine influenced water (MIW) – We recommend the definition be adopted at a minimum as it is written. MIW is a new concept into water sources used for hydraulic fracturing. The Department needs to be as detailed as possible with this definition and involved in the implementation of MIW usage. Creating a good definition as is indicated here will flow forward into good and reasonable regulation and compliance. (660a)

Response: The Department acknowledges the comment.

87. Comment: Mine influenced water – “...the term may also include surface waters that have been impaired by pollutional mine drainage as determined by the Department”. It is suggested that this sentence is deleted since the language is redundant of the first clause which already includes surface discharges. (1057)

Response: The language is appropriate to describe all potential sources of mine influenced water.

88. Comment: Mine influenced water - The proposed definition appears to include all waters impaired by mine drainage. Given this breadth, the definition would include many surface waters throughout the Commonwealth, including sections of major rivers, such as the Allegheny, Monongahela, Youghiogheny and West Branch of the Susquehanna, some of which are widely used for public water supplies. The definition seems overly broad. Storage and use of such a broad universe of waters should not be subject to the special approval requirements of section 78.59b(g). To allow for the beneficial reuse of waters impacted by acid mine drainage, we recommend narrowing the definition to state: “Water contained in a mine pool or a surface discharge of water caused by mining activities that pollutes, or may create a threat of pollution to, waters of the Commonwealth.”(1085)

Response: See response to comment 87.

89. Comment: Mine influenced water: The second sentence of this definition states, “The term may also include surface waters that have been impaired by pollution mine drainage as determined by the Department.” This sentence is not regulatory because it does not establish a binding norm. It is unclear under what circumstances this sentence would apply, what criteria the Department will use to determine impairments, and how the regulated community is advised that surface waters have been impaired by pollutional mine drainage. We recommend that the sentence either be amended or deleted. (1099)

Response: The Department must review and approve water sources based on a variety of factors including the quality of the water and the risks of storage of the water.

90. Comment: Mine influenced water - This definition is too broad and could potentially include a majority of the surface waters in the coal fields of the Commonwealth. “Mine influenced water” does not necessarily pose a threat to the waters of the state. In this definition, the determination of “impaired” is not linked to the requirements for impairment designation in Section 303(d) of the Clean Water Act, 33 U.S.C. § 1333(d). Given the breadth of the DEP’s list of waters impaired by mine drainage this definition would include many surface waters throughout the Commonwealth, including sections of the major rivers such as Allegheny, Monongahela, Youghiogheny and Susquehanna, some of which are widely used for public water supplies. This definition is overly

broad. Storage and use of such a vaguely defined and broad inventory of waters, which are routinely used for numerous other purposes by municipalities and industries beyond the oil and gas industry, should not be subject to the special approval requirements of section 78.59b(g). The second sentence of this proposed definition should be deleted. (1103, 1135, 1137, 1147, 1153, 1174)

Response: See response to comment 87

91. Comment: Mine influenced water should not include waters influenced by oil and gas operations. It should be limited to what is commonly considered mine as for ore, coal, etc. (1098)

Response: See response to comment 87.

92. Comment: Natural Gas Processing Plants: this term is not defined so we are seeking clarification. Does this term include natural gas fractionation (“cracker” plants) and liquefied natural gas (LNG) liquefaction and purification facilities (LNG trains)? These large scale facilities are either being built, proposed or likely to be built in the Commonwealth. Is the term “natural gas processing plant” meant to be used broadly to include these kinds of facilities or is it meant to be narrower in scope? (1062, 1133)

Response: The term is intended to be narrower in scope than what is suggested in the comment. The facilities included in oil and gas operations are those directly connected to the well site or immediately adjacent, and not remote facilities such as natural gas fractionation and liquefied natural gas liquefaction and purification facilities.

93. Comment: The definition of “oil and gas operations” has been expanded from the definition that is used in Chapter 33 of the act. Subpart 5 is not part of the statutory definition and is not needed. (415, 1164)

Response: The definition of oil and gas operations provides needed clarity for implementation of the act and for coordination with other applicable regulatory requirements. Subpart 5 is necessary for coordination of this Chapter with the requirements in Chapter 102, which are applicable to these activities.

94. Comment: Oil and Gas Operations – A comment has been submitted that there are not earth disturbance activities associated with oil and gas exploration, production, processing or treatment operations or transmission facilities. Due to the fact that when an incident occurs, such as at the YARASAVAGE site, during hydraulic fracturing, earth disturbance did in fact occur as the operator quickly and out of necessity needed to construct containment areas to attempt to control the flow of over 200,000 gallons of fluids. Therefore, we recommend that this definition be adopted as written at a minimum. (660a)

Response: The Department acknowledges the comment.

95. Comment: Oil and Gas Operations – The terms “oil and gas activities” and “oil and gas operations” are used throughout the draft interchangeably. It is suggested to use one term/phrase throughout the regulation to remain consistent. (952)

Response: The Department agrees and has removed all references to the term “oil and gas activities”.

96. The term of Oil and Gas Operations should be used consistently throughout the regulations rather

than oil and gas activities; to be sure all the activities included in the definition for operations are covered. (1089, 1229)

Response: See response to comment 95.

97. Comment: Oil and Gas Operations – It is noted that this definition differs slightly from the same definition in the Oil and Gas Act. It is suggested that the definition be kept consistent with the statutory term rather than create confusion on what that term means when it is used by the Department. (1057)

Response: See response to comment 93.

98. Comment: Oil and Gas Operations - The term includes the following: (1) well location assessment, seismic operations, well site preparation, construction, drilling, hydraulic fracturing, completion, production, operation, alteration, plugging and site restoration associated with an oil or gas well:

The Department should clarify which activities the Department considers as part of “well location assessment.” In addition, while this definition is provided, the similar phrase “oil and gas activities” is also used in numerous sections creating confusion as to whether different meanings are intended. Clarify the use of the phrases “oil and gas operations” and “oil and gas activities.” (1071)

Response: The Department has deleted the term “well location assessment” from the definition which addresses the commentator’s concerns. See response to comment 95.

99. Comment: Oil and gas operations, as listed, should be referenced in such definitions as previously cited burrow pits. (1098)

Response: See response to comment 95.

100. Comment: Oil and Gas Operations: This definition deviates from the same definition found in Section 3301 of Act 13. What is the reason for the differences? We also note that the term “oil and gas activities” is used throughout the regulation. Do these two terms mean the same thing? If so, we recommend that the defined term be used consistently throughout the regulation. If not, we recommend that “oil and gas activities” also be defined. (1099)

Response: See responses to comments 93 and 95.

101. Comment: Although the definition of “Oil and Gas Operations” is provided, the proposed regulations also use the phrase “oil and gas activities” in numerous subsections. This creates confusion as to whether different meanings are intended. Commentator requests that the Department pay particular attention to the commentator’s specific notes and suggested amendatory language in this comment letter regarding the Department’s use of the phrases “oil and gas operations” and “oil and gas activities” throughout its Proposal. Also, this definition does not match the definition used in Act 13, Section 3301. Subpart (5) is not part of the statutory definition and, in view of 78.53 below, may not be needed in the definition. (1103, 1137, 1174)

Response: See response to comment 95.

102. Comment: Oil and Gas Operations – This proposed definition of oil and gas operations significantly expands the current scope of Chapter 78. It proposes to regulate seismic operations, water withdrawals, and pipelines, among other activities that are currently beyond the scope of Chapter 78.

See §78.2. Act 13 does not require the Department to expand the scope of Chapter 78. The Act 13 definition of “Oil and Gas Operations” appears in Chapter 33 (section 3301), which is the chapter governing local ordinances relating to the oil and gas industry. There is no such definition in Chapter 32, which establishes technical standards for drilling, altering, operating, and plugging oil and gas wells. The General Assembly thus provided a definition of “oil and gas operations” to be used for determining “where” drilling may occur (Chapter 33) but not for regulating “how” drilling will occur (Chapter 32). The Pennsylvania Supreme Court’s decisions in *Range Resources v. Salem Township*, 964 A. 2d 869 (Pa. 2009) and *Huntley & Huntley v. Borough of Oakmont*, 964 A. 2d 855 (Pa. 2009) confirm and uphold this distinction.

There is no reason, and DEP has not suggested any, that these regulations should enlarge the current scope of Chapter 78. In addition, DEP has used the term “oil and gas activities” throughout Chapter 78, which raises questions about the significance of the varied usages. The key to regulatory success is in its consistency and clarity, which is yet to be attained here. Delete this proposed definition. (1153)

Response: See responses to comments 93 and 95.

- 103.** Comment: Oil and Gas Operations – Commentator objects to the effort to expand the scope of Chapter 78 Subchapter C to activities and operations other than the operation and plugging of oil and gas wells. This definition should be stricken and the scope Section 78.2 below should be retained unless otherwise provided in a new subchapter for unconventional operations. (1135)

Response: See response to comment 93.

- 104.** Comment: Occupied Dwelling: This term is used in § 78.59c(c)(4) on centralized impoundments and is a critical element in determining the required setback location for construction of an impoundment. As we explain further in our comments on this section below, providing a definition in § 78.1 would provide needed clarification in understanding potential impacts to NPS resources. (1062, 1133)

Response: See response to comment 34. The term “occupied dwelling” is no longer used in the regulations.

- 105.** Comment: The regulation should include “Pipeline and Pipeline Infrastructure” in the section: Definitions.

- 1) Pipeline categories, definitions and prescriptive regulatory language should be reviewed
- 2) Review Chapter 78 Definitions for accuracy and inadequacies (118)

Response: The Department acknowledges the comment.

- 106.** Comment: Pit – The EQB proposes to add a new definition for “pit” that would allow the storage and ultimate burial of drilling mud and drill cuttings at the well site. We oppose the use of pits for long-term storage and the burial of solid waste and other substances at well sites. We also oppose the issuance of waivers to operators for the burial of waste onsite using any “alternate methods” other than those in regulation. Pits can leak and fail, and cause a substantially larger surface impact than temporary tank use. It is inefficient from a logistics and energy use standpoint to construct a reserve pit for the temporary storage of drilling muds and cuttings, and then remove this pit later.

In 2013, the State Review of Oil and Natural Gas Environmental Regulations (STRONGER) Board determined that Pennsylvania’s continued use of production pits poses significant environmental

problems. Finding III.4 of the STRONGER Report concluded: “ The review team finds that the PADEP’s experience with pits has shown that, although their use is decreasing, many liner failures still occur with pits and other types of waste are being dumped into pits.” (STRONGER, *Pennsylvania Follow-up State Review*, Finding III.4 (Sept. 2013), <http://strongerinc.org/sites/all/themes/stronger02/downloads/Final%20Report%20of%20Pennsylvania%20State%20Review%20Approved%20for%20Publication.pdf>.)

STRONGER recommended that the PADEP “consider adopting regulations or incentives for alternatives to pits used for unconventional wells in order to prevent the threat of pollution to the waters of the Commonwealth.” (Id., Recommendation III.4.)

Our 2014 review of the PADEP pit oversight and inspection practices found that dozens of well files at the PADEP regional offices did not include evidence that the PADEP inspectors are present at the time of pit burial to ensure that the PADEP’s criteria are met. The PADEP confirmed that it does not require operators to perform chemical analysis of waste prior to burial in every instance, nor does the agency keep track of the location or number of buried waste pits. We documented our concerns in an August 12, 2013 letter to the Susquehanna River Basin Commission (SRBC) requesting that they consider an investigation to determine whether Pennsylvania is complying with its obligations as a member jurisdiction to prohibit, control, and abate pollution of the Basin, followed by a January 15, 2014 on the same topic.

Drilling muds and cuttings should not be buried on site due to the risk of surface water and groundwater contamination from leaks that may occur as the pit ages and liners fail over time. Drilling muds and cuttings, gels, cement, and hydraulic fracturing flowback can contain Naturally Occurring Radioactive Material (NORM), Technologically Enhanced Naturally Occurring Radioactive Material (TENORM), mercury, other heavy metals and other harmful chemical additives.

A 2011 Groundwater Protection Council Report found that the leading cause of historical groundwater contamination in Ohio from oil and gas operations was from pit leakage.

During the 25 year study period (1983-2007), Ohio documented 185 groundwater contamination incidents caused by historic or regulated oilfield activities. Of those, 144 groundwater contamination incidents were caused by regulated activities, and 41 incidents resulted from orphaned well leakage. Seventy-six of the incidents caused by regulated activities (52.7 percent) occurred during the first five years of the study (1983-1987). When viewed in five year increments, the number of incidents caused by regulated activities declined significantly (90.1 percent) during the study period. Seventy-eight percent (113) of all documented regulated activity incidents were caused by drilling or production phase activities. Improper construction or maintenance of reserve pits was the primary source of groundwater contamination, which accounted for 43.8 percent of all regulated activity incidents (63) in Ohio.

During the 16 year study period (1993-2008), Texas documented 211 groundwater contamination incidents. More than 35 percent of these incidents (75) resulted from waste management and disposal activities ... [emphasis added]. (Groundwater Protection Council, *Groundwater Investigations, and their Role in Advancing Regulatory Reforms. A Two-State Review: Ohio and Texas* (2011)).

It is substantially more efficient to use a closed-loop tank system to collect the drill muds and cuttings and to transport the collected muds and cuttings directly to a waste handling facility permitted to handle contaminated waste.

In 2008, New Mexico instituted a “pit rule,” that banned reserve pits. While some claimed the pit rule would decrease drilling rates, the number of rigs operating in New Mexico increased slightly after the rule was enacted in June 2008. As drilling rig counts dropped across the country in 2009, New Mexico’s rig count only dropped 55% when Texas (who allows pits) dropped more than 62%. (M. Soraghan, N.M. Is Loosening Drilling Rules, Bucking Trends and Riling Ranchers, *Energy Wire*, Nov. 15, 2012.) By 2011, as the economy started to rebound, both Texas and New Mexico rebounded to pre-2008 drilling rig counts. Yet, despite reports of costs savings from individual operators in New Mexico using closed-loop drilling systems, industry worked to overturn the pit rule in 2013. A permit is now required in New Mexico for a pit, and is subject to regulatory requirements at Title 19, Chapter 15, Part 17.

<u>Cost comparison items</u>	<u>Low</u>	<u>High</u>
Pad construction, liner	\$5,000	\$12,000
Water delivery, cost	\$5,000	\$5,000
Trucking recycled fluid	\$4,000	\$4,000
Solids control equipment rental	\$100,000	\$127,000
Surface handling equipment rental	\$18,000	\$26,000
Mud costs	\$40,000	\$40,000
Re-use solids costs	\$14,000	
Haul and dispose solids		\$50,000
Pad closure, restoration	\$3,000	\$3,000
<u>Total Cost</u>	<u>\$189,000</u>	<u>\$267,000</u>

In 2006, Cimarex Energy Co. and M-I SWACO (a drilling contractor) published a paper documenting the equipment required and the cost savings associated with drilling without pits in New Mexico. (D. Rogers, et al., New Innovative Process Allows Drilling without Pits in New Mexico (2006) (Annual International Petroleum Environmental Conference) The authors concluded that, while additional equipment is needed on the surface to implement closed-loop drilling operations, cost savings can be achieved by eliminating the pit construction and burial costs.

Pitless drilling also provides the added advantage of maintaining low levels of low-gravity solids that can decrease drilling time and reduce non-productive time associated with stuck pipe and loss of circulation and by reducing long-term liability from onsite waste burial and potential pit leakage.

When the pit is eliminated, the costs associated with the pit are eliminated. Mud and mud additive costs and water usage costs are decreased, since fluid usage volume is reduced. However, equipment rental costs are increased for surface handling facilities.

The 2006, Cimarex and M-I SWACO paper showed a cost comparison of drilling with a pit that ranged from \$210,500 to \$447,000 for wells in New Mexico drilled in 2006, as shown in the table to the right.

When the pit was eliminated, costs dropped to \$189,000 to \$267,000 for a cost savings of \$21,500 to \$180,000 per well, as shown in the table here.

The authors concluded: “the results of this analysis indicate that eliminating the pit in New Mexico is cost-effective and does not add significant cost to the overall operation. When solids cannot be buried on-site and must be hauled to commercial disposal, eliminating the pit actually saves money.” (*Id.* at 5).

<u>Cost comparison items</u>	<u>Low</u>	<u>High</u>
Reserve pit construction, liner	\$31,000	\$54,000
Water delivery, transport and cost	\$13,500	\$18,000
Water haul off, disposal	\$42,000	\$47,000
Mud costs	\$74,000	\$74,000
Pit closure activities	\$50,000	\$104,000
Extra rig time, NPT		\$150,000
<u>Total Cost</u>	<u>\$210,500</u>	<u>\$447,000</u>

Furthermore, the use of closed-loop, “pit-less” drilling systems is endorsed by the U.S. Bureau of Land Management (BLM) in its 2006 Gold Book of best management practices for drilling on federal lands because such systems prevent soil and water contamination and conserves water.¹² Those systems also were determined to be environmentally preferable in 2011.

Use of enclosed tanks and closed loop or semi-closed loop systems is environmentally preferable to the use of open pits and is to be encouraged by the BLM. Open production pits are to be strongly discouraged. Closed tanks and systems minimize waste, entry by wildlife, fugitive emissions that affect air quality, and reduce the risk of soil and groundwater contamination. In addition, the use of tanks instead of pits expedites the ability to complete interim reclamation. Costs may be reduced with the use of tanks, particularly when the pit requires solidification or netting [emphasis added]. (USDOJ, BLM, Management of Oil and Gas Exploration and Production Pits (Nov. 15, 2011).

Earthworks examined alternatives to pits and documented five cases where operators reported cost savings by using pit-less drilling options. (Earthworks, Alternatives to Pits, http://www.earthworksaction.org/issues/detail/alternatives_to_pits#.UvLOWsKYapo (last visited Mar. 1, 2014).

Other drilling contractors report that pit-less drilling results in less surface damage:

If the surface land is used for growing row crops or other crops for which level ground is important, subsequent subsidence of a reclaimed pit may be a burden to the surface owner. Moreover, many farmers claim to experience a long-term loss of production from the land on which a pit was constructed. (Lance Astrella, Closed Loop Drilling Systems Can Eliminate Reserve Pit Costs, Oil & Gas Journal (May 27, 1996).

The Colorado Division of Wildlife’s list of actions to minimize adverse impacts to wildlife resources includes maximizing the state-of-the-art drilling technology including use of closed-loop “pit-less” drilling technology. (Colo. Div. of Wildlife, Actions to Minimize Adverse Impacts to Wildlife Resources (Oct. 27, 2008)).

We recommend the definition for “pit” be revised to read:

Pit—A facility, prohibited under §§ 78.56, 78.61, and 78.62, that is:

- (i) A natural topographic depression, manmade excavation or diked area formed primarily of earthen materials, which services a single well site and is
- (ii) Designed to hold drill cuttings or contaminated fluids, semifluids or solids associated with oil and gas activities, including, but not limited to, wastewater, flowback, mine influenced water, and drilling mud, emissions from or the escape of which will result in air pollution, will pose a risk of water or land pollution, and may or endanger persons or property. (1143)

Response: The Department disagrees that the changes proposed to the definition are needed. The Department has revised §§ 78a.56, 78a.61 and 78a.62 to disallow the use of pits for temporary containment for an unconventional well and to require a permit for the disposal of contaminated drill cuttings or drill cuttings from below the surface casing seat on an unconventional well site.

107. Comment: Pit – Small conventional operators utilize small pits on short temporary basis that should not be subject to the numerous obligations and standards created in the proposed revisions, which mention pits more than 50 times. The costs of such obligations significantly outweigh any environmental benefit. Exemptions should be created throughout this rulemaking for pits with a footprint less than 1/5 of an acre. See relevant sections below for such exemptions. (1135, 1153)

Response: Pits containing regulated substances must be constructed properly to ensure protection of public health and safety and the environment.

108. Comment: Pit - It is suggested that language be added to clarify that this definition does not include secondary containment or impoundments at well sites. (124a, 1057)

Response: The Department disagrees that the changes suggested by the commentators are needed. The regulations adequately address and differentiate between pits, impoundments, and secondary containment.

109. Comment: Pit –It is our recommendation to remove the term “Oil and Gas Activities” from the definition for “Pit” as this term is not defined in Chapter 78 nor its enabling statute. We suggest removing the term “fresh water” from the definition. We recommend rewriting the definition to state: “A natural topographic depression, manmade excavation or diked area formed primarily of earthen materials designed to hold fluids, semi-fluids or solids associated with activities at oil and gas well sites, including, but not limited to, wastewater, flowback, mine influenced water, drilling mud and drill cuttings, on the well site.” (1085)

Response: See response to comment 95 regarding the use of the term “oil and gas activities”. The Department has revised the definition to state that a pit is a natural topographic depression, manmade excavation or diked area formed primarily of earthen materials designed to hold fluids, semifluids, or solids.

110. Comment: Pit –To avoid any confusion, we propose that the Department use the phrase “activities at oil and gas well sites” in lieu of the Chapter 102 defined term “oil and gas activities” in this definition. Suggested Language: Pit-A natural topographic depression, manmade excavation or diked area formed primarily of earthen materials designed to hold fluids, semi-fluids or solids associated with activities at oil and gas well sites, including but not limited to fresh water, wastewater, flowback, mine influenced water, drilling mud and drill cuttings, that services a single well site. (1137, 1174)

Response: See response to comment 95 regarding the use of the term “oil and gas activities”.

111. Comment: Pre-wetting needs clarification as to the use of the brine for antiskid purposes. In what circumstances would it be used –around sharp turns, only under certain weather conditions, or other condition? This could result in an unlimited “beneficial” use of a solution that puts the environment and our water resources at risk. (1098)

Response: The requirements for pre-wetting are described in §78.70a.

112. Comment: Process or processing: This definition is a cross-reference to the definition found in Section 103 of the SWMA (35 P.S. § 6018.103). Why is this definition appropriate for the regulation of the oil and gas industry? (1099)

Response: The proposed regulation allows for temporary onsite processing in §§ 78.58 and 78a.58.

113. Comment: Process or processing: This definition causes confusion because the Solid Waste Management Act generally requires a permit for residual waste processing activities. The term “processing” can also refer to natural gas processing which is not considered in this definition. (1103)

Response: The Department has made clarifications to the instances in the regulation where the term processing is used and does not refer to residual waste processing.

114. Comment: Process or Processing must go beyond the meaning provided in the Solid Waste Management Act given the presence of heavy metals, biocides, radioactive substances, and other known and unknown toxins. In spite of existing regulatory exceptions, substances processed should be considered and treated as hazardous. (1098)

Response: The definition provided in the Solid Waste Management Act is appropriate for oil and gas wastes.

115. Comment: Process or processing – The term “processing” cannot have this meaning in a rule that considers both residual waste processing and natural gas processing. See the definition of “Oil and Gas Operations” above. EQB should revise the definition to restrict it to the term as used in Section 78.58. (1135)

Response: See response to comment 113.

116. Comment: Process or processing – DEP should remove the definition and use the term ‘processing’ in the ordinary, plain meaning sense of the word, or revise the definition above to restrict it to the term as used in Section 78.58. (1153)

Response: See response to comment 113.

117. Comment: PPC plan should be defined in accordance with a statutory or regulatory reference. Commentator is concerned about the unnecessary burden created for small operators who conduct operations at multiple well sites in close proximity where the PPC plan would be the same for all such operations. If the Department’s concern is that PPC plans tend to become outdated with changing personnel or methods, that concern can be addressed by requiring PPC plans to be updated with any change in the relevant information. See Section 78.55 for suggested edits. (1135)

Response: Subsection 78.55(e) requires the well operator to revise the PPC plan prior to implementing changes in the PPC plan.

118. Comment: PPC plan – Change the definition to read: “A written preparedness, prevention and contingency plan prepared in accordance with 25 Pa. Code 91.34, 102.5(l), or developed in conformance with the *Guidelines for the Development and Implementation of Environmental*

Emergency Response Plans, Commonwealth of Pennsylvania, Department of Environmental Protection, No. 400-2200-001, as amended and updated.” (1153)

Response: The intent of the definition is to define the acronym. The requirements for a PPC plan are described in § 78.55 and 78a.55.

119. Comment – Public water supply – We recommend that this definition be revised as follows:
Public water supply—[A water system that is subject to the Pennsylvania Safe Drinking Water Act (35 P.S. §§ 721.1—721.17).] A source of water used by a water purveyor or for a public water system, as defined in 35 P.S. § 721.3. (1143)

Response: The Department has revised the definition to be “a source of water used by a water purveyor”.

120. Comment: Regional groundwater table – The seasonal high water table should be included as part of the regional groundwater table definition. In Pennsylvania, the unconfined aquifer can fluctuate significantly and this fluctuation is often represented by the seasonal high water table. The seasonal high water table is hydrologically linked to nearby wetlands, springs, and stream systems. Due to the seasonal high water table connectivity to both surface and groundwater, and potential for contamination, Chapter 73 precludes the use of on-site wastewater systems in areas where the seasonal high water table is within 20 inches of the ground surface.

The proposed regulations should recognize the seasonal high water table as a component of the regional groundwater table. Therefore, we recommend the definition for “regional groundwater table” be revised to read:

Regional groundwater table—

- (i) The fluctuating upper water level surface of an unconfined or confined aquifer where the hydrostatic pressure is equal to the ambient atmospheric pressure.
- (ii) The term does not include the perched water table. (1143)

Response: The definitions were written specifically for Chapters 78 and 78a and are appropriate for their use in those Chapters.

121. Comment: There are two definitions which are either incorrect or unclear as proposed.

Regional groundwater table – the definition proposed is incorrect in almost every manner. The proposed definition states that the regional water table is “the fluctuating upper surface” of the groundwater zone, but it then goes on to state that the term does NOT include “the seasonal high water table.”

The only reason there is such a thing as a seasonal high water table at any location is because the water table elevation fluctuates. Accordingly, the definition is a self-contradictory misrepresentation of the very concept of a water table.

It is incorrect to define the potentiometric elevation of groundwater in a confined aquifer as a water table condition. By definition a water table aquifer is an unconfined aquifer (American Geological Institute, 1998 & 2006). The proposed incorrect definition could have resulted from the AGI definition of the term “water table” which states that the water table might be present and measurable within a confining bed, but the cross-referenced definition of the included term “confining bed” does not mean, a priori a confined aquifer.

Regional groundwater table – There is no water table in the context of a confined aquifer. The definition is confusing and could result in misinterpretation and erroneous conclusions, especially pertaining to shallow drinking water aquifer systems. Commentator proposes an alternative definition below.

a)The proposed definition of the water table is that at the depth of the water table “the hydrostatic pressure is equal to ambient atmospheric pressure.”

That definition is patently incorrect. Hydrostatic pressure is the internal water pressure which results at any depth from the weight of an overlying column of water; i.e., a column of water of some height will result in a unique hydrostatic pressure. It is not physically possible for there to even be a hydrostatic pressure at the upper surface of a column of water. The correct term in this instance is “pore water pressure” (AGI, 1998 & 2006) and not hydrostatic.

This entire definition must be changed for the simple reason that it is wholly contradictory to established definitions and to the common understanding and usage of the term throughout the groundwater sciences and engineering community. Inflection is concerned that an inconsistent definition will result in confusion and misconceptions in the general public regarding the natural condition of water resources which could create ambiguities in any public forum or legal action.

Commentator recommends the following definition as a replacement:

Regional groundwater table – The fluctuating upper water level surface of an unconfined aquifer at which the pore water pressure is at atmospheric pressure. The term does not include the upper surfaces of perched groundwater zones. (954)

Response: Response: See response to comment 120.

122. Comment: Regional Groundwater Table – Subpart (ii) of this proposed definition should read “seasonal high groundwater table,” as opposed to “seasonal high water table,” for the sake of consistency and clarity throughout the Rule. (1085)

Response: The Department agrees and has modified the definition.

123. Comment: Regional ground water table – The definition should be more specific in terms of seasonal, long-term and short-term fluctuations. (1098)

Response: Response: See response to comment 120.

124. Comment: Regulated substance – Because the term regulated substance is used ubiquitously throughout Chapter 78, it would be useful to expand the definition to provide further clarification that regulated substances are hazardous substances and contaminants that require safe handling, storage and disposal methods and equipment. In addition, the current scope of substances covered by the definition is too narrow.

We recommend the definition for “regulated substances” be revised to read:

Regulated substance—Any substance defined as a regulated substance in section 103 of Act 2 (35 P.S. § 6026.103), which includes hazardous substances and contaminants regulated under the Hazardous Sites Cleanup Act, 35 P.S. § 6020.101 et seq.; and pollutants and substances covered by:

The Clean Streams Law, 35 P.S. §§ 691.1 et seq.; the Air Pollution Control Act, 35 P.S. §§ 4001 et seq.; the Solid Waste Management Act, 35 P.S. §§ 6018.101 et seq.; the Infectious and Chemotherapeutic Waste Law, 35 P.S. §§ 6019.1 et seq.; the Storage Tank and Spill Prevention Act, 35 P.S. §§ 6021.101 et seq.; any waste regulated under the Pennsylvania Low-Level Radioactive Waste Disposal Act of 1988, 35 P.S. §§ 7131.101 et seq.; and any toxic substance or contaminant regulated under federal law, including but not limited to pollutants for which a total maximum daily load may be established under the Clean Water Act, 33 U.S.C. §§ 1251 et seq., and chemicals substances and mixtures for which reports must be submitted under section 8(e) of the Toxic Substances Control Act, 15 U.S.C. §§ 2601 et seq. (1143)

Response: See response to comment 1. A cross-reference to the statutory definition is adequate to address the commentator's concerns. The Department does not believe that the additional language will cover any additional substances not already covered by the expansive definition of "regulated substance" in Act 2.

125. Comment: The definition of Regulated Substance in § 78.1 is massively flawed and must be rewritten. The term 'Regulated Substance' has been introduced throughout this rulemaking as a fundamental "strategic" concept. Accordingly, its definition in § 78.1 must be subject to the closest scrutiny, as issues pertaining to this definition will, on adoption of this rulemaking, have a widespread effect throughout 25 PA Code Chapter 78. The issues pertaining to this definition are many and are profoundly serious. The loopholes in the current wording of the definition of "regulated substance" are so severe as to undermine the entire regulatory effect of 25 PA Code Chapter 78 as it concerns the entirety of toxic substance control, contamination, waste disposal, spill reporting and many other issues. While it is understandable that the Environmental Quality Board might see fit to reconcile 25 PA Code Chapter 78 with other parts of PA Code, e.g. those parts of the code implementing Act 2, a cynic could be forgiven for believing that the defects in the definition of "regulated substance" are an intentional effort at a wholesale weakening of Oil & Gas regulation. This must be corrected. Specifically:

Which exact terms from 35 P.S. § 6020.103 are incorporated?

The word 'regulated' does not appear in 35 P.S. § 6020.103! Thus there is considerable doubt as to exactly what is meant by the phrase "Any substance defined as a regulated substance in section 103 of The Pennsylvania Land Recycling and Environmental Remediation Act (Act 2) (35 P.S. § 6020.103)". Which specific terms? 'Contaminant'? 'Hazardous substance'? 'Hazardous waste'? The rulemaking doesn't specify. Surely many of the definitions in 35 P.S. § 6020.103 do not apply. Does the Environmental Quality Board intend for us to infer that under 25 PA Code § 78.1, the concept "Responsible person" is to be interpreted as a "Regulated Substance"? Obviously not. For those offended by this little bit of sarcasm, let it be taken as an indication of just how non-definitive the current wording of the definition of Regulated Substance is.

Does the "Halliburton Loophole" exemption for Oil & Gas from the Superfund Act now carry over to 25 PA Code § 78.1?

There are numerous references in 35 P.S. § 6020.103 to "the Federal Superfund Act". Unfortunately, Oil & Gas has been given an exemption from the Superfund Act — one of many regulatory exemptions contained in the Federal Energy Act of 2005 known colloquially as "the Halliburton Loophole". Because of this exemption it is impossible to know based on the current wording of § 78.1 that anything at all is a Regulated Substance. This introduces into 25 PA Code Chapter 78 a loophole of such massive and serious proportions as to call into question the entire regulatory intent of 25 PA Code Chapter 78. The Environmental Quality Board must eliminate even the hint of an

application of the Halliburton Loophole to 25 PA Code Chapter 78. Presence of these references is completely unacceptable. They must be stricken. Regulated Substances must be fully specified.

What is the actual workaday operator of a well to know about just what substances are regulated?

The word ‘brine’ is a simple word that everyone can understand. Its replacement by ‘Regulated Substance’ is unfortunate. If the definition of Regulated Substance is so opaque that it takes a team of lawyers a week to figure it out, how is an Oil & Gas operator supposed to train its personnel to know what substances are regulated? Not only is the definition of Regulated Substance completely indirect (relying entirely on an “external” specification in 35 P.S. § 6020.103), 35 P.S. § 6020.103 is itself indirect. This provides no actual guidance to working Oil & Gas industry personnel (or DEP inspectors, for that matter) as to what substances are and are not regulated. While it would be possible to remedy this problem by issuance of a Technical Guidance on this matter from DEP, the definition of Regulated Substance as currently worded is so vague that such a Technical Guidance would have the effect of carrying the entire force of PA Code. This is too important a matter to leave to Technical Guidance. The Environmental Quality Board must provide clarity as to which substances are regulated.

The definition of Regulated Substance must explicitly, unambiguously, and without indirection include produced water from unconventional gas wells. Produced water is likely to be hazardous, and can contain an unpredictable mix of chemicals from several sources, including toxic chemicals and biocides injected in the hydraulic fracturing process, radionuclides leached from the Marcellus Shale (which is known to be significantly radioactive), and chemicals resulting from underground reactions among these. This cluster of hazards is unique to Oil & Gas production. 25 PA Code Chapter 78 is unequivocally the correct place to define such material as a Regulated Substance. It should not be delegated to some other rulemaking body. (869a)

Response: The definition and use of the term “regulated substance” was intentionally selected to be very broad and cover all substances that may cause pollution. The Department does not believe that additional language is needed to cover any additional substances not already covered by the expansive definition of “regulated substance” in Act 2. The Department notes that the definition of “regulated substance” in section 103 of Act 2 (35 P.S. § 6026.103) specifically includes any “hazardous substances and contaminants regulated under the act of October 18, 1988 (P.L.756, No.108), known as the Hazardous Sites Cleanup Act.” The commentator raises concerns about exemptions from Federal laws but fails to note that the definition only cross-references state laws that do not contain similar exemptions. Thus, the definition of “regulated substance” in section 103 of Act 2 also specifically includes “substances covered by the act of June 22, 1937 (P.L.1987, No.394), known as The Clean Streams Law.”

126. Comment: Section 78.1, definitions: the “external” definition of regulated substance is a problem. What is the actual workaday operator of a well to know about just what is regulated? The word brine is a simple word that everyone can understand. Its replacement by ‘regulated substance’ is unfortunate. There is no definition of unconventional formation. This is a recipe for trouble. (869)

Response: See responses to comments 5 and 125. “Unconventional formation” is defined in section 3202 of the 2012 Oil and Gas Act as: “A geological shale formation existing below the base of the Elk Sandstone or its geologic equivalent stratigraphic interval where natural gas generally cannot be produced at economic flow rates or in economic volumes except by vertical or horizontal well bores stimulated by hydraulic fracture treatments or by using multilateral well bores or other techniques to expose more of the formation to the well bore.”

127. Comment: Regulated substance — “Any substance defined as a regulated substance in section 103 of The Pennsylvania Land Recycling and Environmental Remediation Act (Act 2) (35 P.S. § 6020.103).” This definition appears throughout the draft regulation. The concern is that referencing the Act 2 definition makes this unnecessarily broad and potentially affecting any substance stored or used. (952, 1164)

Response: The definition and use of the term “regulated substance” was intentionally selected to be very broad and cover all substances that may cause pollution.

128. Comment: Regulated substance-Any substance defined as a regulated substance in section 103 of The Pennsylvania Land Recycling and Environmental Remediation Act (Act 2) (35 P.S. § 6020.103). This definition in Act 2 was developed to assist those conducting cleanup operations at brownfield sites throughout the Commonwealth. The definition, which includes substances “covered by” six other named statutes, is overly broad and fails to provide the necessary guidance for reporting obligations that would be imposed under the proposed Section 78.66(b). At a minimum, the definition must be further clarified by reference to some known list of substances, such as those found in Chapter 250. (1071)

Response: See response to comment 127. A discrete list of substances would not meet the intent of the definition. There are many substances that are considered “regulated substances” for which adequate toxicological data does not exist and therefore do not appear in the tables of remediation standards contained in 25 Pa. Code Chapter 250.

129. Comment: Regulated Substance. This proposed definition refers to the definition in Section 103 of Act 2, which was developed to assist those conducting cleanup operations at brownfield sites throughout the Commonwealth. We are concerned that the definition, which includes substances “covered by” six other named statutes, appears overly broad, and when applied to specific proposed sections, creates ambiguity. To provide the needed guidance on how to apply the Board’s proposed requirements, it is suggested that the definition be replaced, and therefore clarified, with a definition that contains an express list of substances. In addition, the term should be replaced or removed entirely where the intent of the Rule is better served by a different term. Examples could include: Sections 78.55 (Control and disposal planning), 78.56 (Temporary storage), 78.59c (Centralized impoundments), 78.61 (Disposal of drill cuttings), and 78.64a (Containment systems and practices at unconventional well sites). (1085)

Response: See response to comment 128.

130. Comment: Regulated substances must be defined as pollutional substances. This is imperative for adequate preservation and protection. (1098)

Response: See response to comment 127.

131. Comment: Regulated Substance: This term is defined as, “Any substance defined as a regulated substance in section 103 of Act 2 (35 P.S. § 6026.103).” Act 2 is a land recycling program that encourages the voluntary cleanup and reuse of contaminated commercial and industrial sites. Why is this definition appropriate for the regulation of the oil and gas industry? (1099)

Response: See response to comment 127. Use of this term is appropriate to ensure that all substances which may cause pollution are managed and handled in a manner that protects public health and safety and the environment.

132. Comment: The definition of the term “regulated substance” is very broad and its use throughout the proposed regulation is often difficult to apply to the oil and gas industry. The term “regulated substance” was adopted in the context of Act 2 which focuses on characterization and remediation of releases causing impacts to environmental media. The term was not designed to be used in the context of affirmative regulatory obligations. Commentator recommends that revisions be made as suggested throughout the subsections below to address the DEP’s particular intent of the regulatory section in which the term has been proposed. The term may be appropriate in the spill reporting and remediation subsection 78.66, but even there, the scope of the term as defined above creates uncertainty with respect to reporting obligations in particular. Section 78.66(b) creates a two-tiered release reporting system for the oil and gas industry. The oil and gas industry is already subject to the requirements for reporting releases pursuant to 25 Pa. Code § 91.33 that apply to all other regulated entities in Pennsylvania, as well as the numerous federal reporting requirements under CERCLA (e.g. 40 C.F.R. 302), CWA (e.g. 40 C.F.R. 112), and EPCRA (e.g. 40 C.F.R. 355) that provide specified reportable quantity thresholds. In particular, Section 78.66(b)(1) as currently proposed would impose an obligation to report any spill or release of 5 gallons or more of a regulated substance over a 24-hour period that is not completely contained by a containment system. This reporting obligation applies regardless of whether there is any actual or threatened impact to waters of the Commonwealth or any other impact to the environment or to public health or safety. In recognition that EQB is proposing to eliminate the existing “reportable release of brine” definition and provision, MSC recommends that this additional requirement be clarified and limited to reporting brine spills over 5 gallons outside of containment.

Commentator suggests the following amendatory language: “Regulated substance — Any substance defined as a regulated substance in section 103 of Act 2 (35 P.S. § 6020.103) and listed in 25 Pa. Code Chapter 250.” (1137)

Response: There are many substances that are considered “regulated substances” for which adequate toxicological data does not exist and therefore do not appear in the tables of remediation standards contained in 25 Pa. Code Chapter 250.

133. Comment: The definition of the term “regulated substance” is very broad and its use throughout the proposed regulation is often difficult to apply to the oil and gas industry. The term “regulated substance” was adopted in the context of Act 2 which focuses on characterization and remediation of releases causing impacts to environmental media. The term was not designed to be used in the context of affirmative regulatory obligations. Suggested amendatory language: Regulated substance—Any substance defined as a regulated substance in section 103 of Act 2 (35 P.S. § 6020.103) and listed in 25 Pa. Code Chapter 250. (1147)

Response: It is correct that the term was developed as part of the statutory oversight of remedial activities in Pennsylvania. However, it is appropriate for use in the manner it is used in Chapter 78 – generally relating to the storage, handling, and containment of substances that would cause pollution or contamination if released.

134. Comment: Regulated Substance-- The definition of the term ‘regulated substance’ is very broad and its use throughout the proposed regulation is often difficult to apply to the oil and gas industry. The term “regulated substance” was adopted in the context of Act 2 which focuses on characterization and remediation of releases causing impacts to environmental media. The term was not designed to be used in the context of affirmative regulatory obligations. We recommend that revisions be made as suggested throughout the subsections below to address the DEP’s particular intent of the regulatory section in which the term has been proposed.

The term may be appropriate in the spill reporting and remediation subsection 78.66, but even there, the scope of the term as defined above creates uncertainty with respect to reporting obligations in particular. Section 78.66(b) creates a two-tiered release reporting system for the oil and gas industry. The oil and gas industry is already subject to the requirements for reporting releases pursuant to 25 Pa. Code § 91.33 that apply to all other regulated entities in Pennsylvania, as well as the numerous federal reporting requirements under CERCLA (e.g. 40 C.F.R. 302), CWA (e.g. 40 C.F.R. 112), and EPCRA (e.g. 40 C.F.R. 355) that provide specified reportable quantity thresholds.

In particular, Section 78.66(b)(1) as currently proposed would impose an obligation to report any spill or release of 5 gallons or more of a regulated substance over a 24-hour period that is not completely contained by a containment system. This reporting obligation applies regardless of whether there is any actual or threatened impact to waters of the Commonwealth or any other impact to the environment or to public health or safety. In recognition that EQB is proposing to eliminate the existing “reportable release of brine” definition and provision, we recommend that this additional requirement be clarified and limited to reporting brine spills over 5 gallons outside of containment. (1103)

Response: See response to comment 133.

- 135.** Comment: The Department should define “Regulated substances” to make it clear that, throughout the entirety of the Proposed Rulemaking, the definition includes, at a minimum, brines, drill cuttings, drilling muds, oils, stimulation fluids, well treatment and servicing fluid, plugging and drilling fluids as provided in § 78.56(a). (997a)

Response: See response to comment 125.

- 136.** Comment: The EQB has proposed to add to 25 PA Code § 78.1 a definition for the term “regulated substance.” On its face, the definition simply incorporates the definition of that term found in the Pennsylvania Land Recycling and Environmental Remediation Standards Act (“Act 2”). The definition of a “regulated substance” under Act 2 is extremely broad and was developed in the context of describing the framework under Act 2 for characterization and remediation of environmental media at brownfields and other locations. As such, the universe of regulated substances is wide-ranging and designed to cover a sweeping array of conditions that may be found at such locations. Moreover, regulated substances include many naturally occurring substances. Unlike the land recycling program under Act 2, more traditional regulatory programs that impose affirmative obligations generally focus on particular types or categories of materials (such as asbestos, lead, and hazardous wastes) that are more precisely defined than the universe of “regulated substances” under Act 2.

In the context of the proposed changes to 25 PA Code Chapter 78, the EQB has liberally used the term “regulated substance” in many places. In certain instances, the term “regulated substance” is appropriately used such as in the proposed version of 25 PA Code § 78.66(c) (addressing remediation of spills and releases). However, in many other instances, the use of the term does not appear to be warranted and may lead to unintended adverse consequences for both PADEP and the regulated community. For example, as noted above, regulated substances include many naturally occurring substances that would become subject to affirmative regulatory obligations if the proposed regulations are not modified. As a general proposition, the term “regulated substance” should not be used outside of the proposed provisions of 25 PA Code § 78.66(c). More precise terminology is necessary in lieu of use of the term “regulated substance.” In many instances, the proposed regulations can readily be modified by using terminology that is close to what is currently included

in 25 PA Code Chapter 78 or by simply eliminating the term “regulated substance.”

As illustration of the foregoing, we offer three examples. First, the proposed version of 25 PA Code § 78.56 (relating to temporary storage) contains multiple references to “regulated substances.” This term can be modified to read “substances” because in most instances, it is used in the context of describing what results from drilling, altering, completing, recompleting, servicing or plugging of a well. Second, in the proposed version of 25 PA Code § 78.61, the EQB has set forth requirements for handling drill cuttings “that are not contaminated with a regulated substance, including brines, drilling muds, stimulation fluids, well servicing fluids, oil, production fluids or drilling fluids other than tophole water, fresh water or gases.” Given the breadth of the definition of a “regulated substance,” naturally occurring regulated substances will invariably be found in drill cuttings. To avoid confusion while preserving the intent of the provision, the phrase in question should be revised to read: “that are not contaminated with brines, drilling muds, stimulation fluids, well servicing fluids, oil, production fluids or drilling fluids other than tophole water, fresh water or gases.” Third, the proposed version of 25 PA Code § 78.64a uses the term “regulated substance” in various locations, some of which lead to presumably unintended consequences. The proposed version of 25 PA Code § 78.64a(c) provides that all regulated substances must be managed within a containment system. This provision provides no delineation of when containment systems are required because virtually any materials present at a well site will contain one or more regulated substances. By contrast, Section 3218.2(c) of Act 13, 58 PA C.S.A. § 3218.2(c), specifies that containment systems must be used whenever the following materials are stored: drilling mud, hydraulic oil, diesel fuel, drilling mud additives, hydraulic fracturing additives, and hydraulic fracturing flowback. The same over-breadth problem presents itself in the other provisions of the proposed version of 25 PA Code § 78.64a where the term “regulated substance” is used. (1173)

Response: See response to comment 133.

137. Comment: Regulated substance – The definition of the term “regulated substance” is very broad and its use throughout the proposed regulation is often difficult to apply to the oil and gas industry. The term “regulated substance” was adopted in the context of Act 2 which focuses on characterization and remediation of releases causing impacts to environmental media. The term was not designed to be used in the context of affirmative regulatory obligations. Revisions should be made as suggested throughout the subsections below to address DEP’s particular intent of the regulatory section in which the term has been proposed. The term may be appropriate in the spill reporting and remediation Section 78.66, but even there, the scope of the term as defined above creates uncertainty with respect to reporting obligations in particular. Section 78.66(b) creates a two-tiered release reporting system for the oil and gas industry. The oil and gas industry is already subject to the requirements for reporting releases pursuant to 25 PA Code § 91.33 that apply to all other regulated entities in Pennsylvania, as well as the numerous federal reporting requirements under CERCLA, (e.g. 40 C.F.R. 302), CWA (e.g. 40 C.F.R. 112), and EPCRA (e.g. 40 C.F.R. 355) that provide specified reportable quantity thresholds. In particular, Section 78.66(b)(1) as currently proposed would impose an obligation to report any spill or release of 5 gallons or more of a regulated substance over a 24-hour period that is not completely contained by a containment system. This reporting obligation applies regardless of whether there is any actual or threatened impact to waters of the Commonwealth or any other impact to the environment or to public health or safety. In recognition that the EQB is proposing to eliminate the existing “reportable release of brine” definition and provision, Range recommends that this additional requirement be clarified and limited to reporting brine spills over 5 gallons outside of containment. See the subsections below for additional comments and suggestions that explain our recommendations for terms that will serve the purpose of the regulation and provide better guidance to the regulated community. Suggested

language: “Regulated substance -Any substance defined as a regulated substance in Section 103 of Act 2 (35 P.S. § 6020.103) and listed in 25 PA Code Chapter 250.” (1174)

Response: See responses to comments 132 and 133.

- 138.** Comment: Regulated substance – The use of the term “regulated substances” as defined under Act 2, which includes “substances covered by” the Clean Streams Law such as sediment, “hazardous substances and contaminants” under the Hazardous Substance Cleanup Act, and substances regulated by the Solid Waste Management Act and Air Pollution Control Act, would create an unreasonable and unattainable standard under several sections of Chapter 78. These statutes regulate literally thousands of substances, some of which are naturally occurring and generally benign (such as iron, manganese, chloride and sulfate) and most of which have no threshold concentration for regulation.

For example, Section 78.61 would allow the disposal of drill cuttings only if they are not contaminated with “regulated substances.” Under Act 2’s definition, however, any and all materials that might be considered as pollution under the Clean Streams Law or hazardous substances and contaminants under HSCA are regulated substances and therefore no cuttings may be disposed under this section because cuttings, no matter what they contain, are “covered” by Clean Streams Law or designated by HSCA. Section 78.66 is likewise impaired by the use of such a broadly defined term where some “regulated substances” may have absolutely no environmental impact when spilled on well sites. Several subsections of Chapter 78 must be modified to clarify that certain activities are permissible, even if the materials being managed may contain “regulated substances,” provided there is no pollution or reasonable potential for pollution. See recommended changes below in relevant subsections. (1135)

Response: See responses to comments 133 and 1446.

- 139.** Comment: The use of the term “regulated substances” as defined under Act 2 is too broad.

The term “regulated substances” was developed in a cleanup context but does not apply in the regulatory management of residual waste, in part because there is no threshold concentration to qualify as a regulated substance. The DEP’s approach ignores the facts that: (i) in the regulatory context, the focus of the Oil and Gas Act is on preventing pollution (Clean Streams Law) or harm to the public health, safety, welfare or the environment (Act 97, Solid Waste Management Act) from oil and gas operations; and (ii) not all materials containing regulated substances cause pollution or harm to the public health, safety, welfare or the environment. For example, when the concentration of regulated substances is low, such as meeting “Clean Fill” limits, the material is not regulated as a residual waste.

In addition, the proposed definition includes “substances covered by” the Clean Streams Law, such as sediment. This would create an unreasonable and unattainable standard under several sections of Chapter 78. See, for example, Section 78.61 that would allow the “disposal” of drill cuttings only if they are not contaminated with “regulated substances.” Under the Act 2 definition, however, any and all materials that might be considered as “pollution” under the Clean Streams Law are regulated substances and therefore no cuttings may be disposed under this section because cuttings, no matter what they contain, are “substances covered by” the Clean Streams Law. Section 78.66 is likewise impaired by the use of such a broadly defined term where some “regulated substances” may have absolutely no environmental impact when spilled on well sites.

Commentator suggests that materials generated at the well site that contain regulated substances should be managed so as not to cause (i) “pollution” (per the Clean Streams Law standards) or (ii)

harm to the public health, safety, welfare or the environment (per the standards of Act 97 and 25 Pa. Code Chapter 287. Delete this definition. (1153)

Response: See responses to comments 133 and 1446.

140. Comment: Reportable release of brine is problematic given that some is emitted in various “beneficial uses.” All releases should be reported along with their intended uses. (1098)

Response: This definition was deleted from the regulation.

141. Comment: Reportable release of brine – EQB has not provided the required harms analysis to explain why the reporting and remediation provisions in section 78.66 below would be revised to target the oil and gas industry when other industries are regulated under 25 Pa. Code § 91.33 with respect to spill reporting, and have access to the Act 2 process where desired. PGCC members are unaware of problems created by the current rule with respect to reporting releases of brine. The new proposal in section 78.66 improperly expands reporting obligations for this industry in a manner that creates uncertainty and ambiguity. If the Department does not substantially revise the reporting and remediation provisions as recommended below, it should simply maintain the current rule with respect to brines because it provides better guidance and accomplishes the appropriate level of environmental protection. (1135)

Response: This definition was deleted from the regulation to ensure that spills and remediation of all regulated substances are handled in a consistent manner.

142. Comment: Residual Waste and Waste: Neither term is defined in the proposed or current regulations. Given the importance of these regulations in protecting the waters of the Commonwealth, and the various controls proposed for these two substances, we believe the terms should be defined. (1062, 1133)

Response: A definition for the term “residual waste” has been added as the definition for the term in §287.1.

143. Comment: A definition for a “seasonal aquifer” should be added to § 78.1. The definition should provide for alternatives to groundwater monitoring wells in instances where the first water bearing zone located beneath an impoundment is approximately 50 feet or more below the impoundment sump elevation and the seasonal outcrops topographically. In cases where groundwater is >50 feet below an impoundment, groundwater monitoring wells may not detect a release since horizontal flow is preferential to vertical flow. A secondary collection zone constructed between the sub-base and secondary liner and similarly to the required Leak Detection Zone would be a reasonable alternative. (175)

Response: The term seasonal high groundwater table is retained in the regulations. The Department has revised §§ 79.59c and 78a.59c to disallow use of centralized impoundments without obtaining a residual waste permit from the Department.

144. Comment: Seasonal high groundwater table – The definition should be retained in the proposed regulations, because the term continues to play a key role in regulating oil and gas activities. (Section 78.1) (19, 19a, 21, 22, 23, 26, 142, 189, 192, 391, 429a, 843, 851, 868, 938, 938a, 946, 951, 958, 1005, 1019)

Response: The Department acknowledges the comment.

145. Comment: Clear definitions of terms like “seasonal high groundwater table” must be provided. Ambiguity in such vital terms is very dangerous. Clear definitions will be needed to facilitate enforcement. (153, 1229)

Response: The Department acknowledges the comment.

146. Comment: Proposed section 78.1 deletes the definition of “seasonal high groundwater table” even though that term is still used throughout the regulations, including in sections 78.56(a)(11), 78.59b(e). This definition should be maintained to ensure clarity and consistent enforcement. (938a)

Response: The term was not proposed for deletion and remains in the regulation.

147. Comment: There should be a definition for “seasonal high groundwater table,” since this term is used in the regulations. (1089)

Response: The Department acknowledges the comment.

148. Comment: Small business – Commentator recommends the addition of a defined term to allow for exemptions that would be appropriate for small businesses to comply with the 2012 amendments to the Regulatory Review Act and DEP’s obligation to consider exemptions for small businesses.

Suggested regulatory amendment:

“Small Business – defined in accordance with the size standards described by the United States Small Business Administration’s Small Business regulations under 13 C.F.R. Ch 1. Part 121 or its successor regulation.” (1135)

Response: The Department disagrees because the term is not used in the regulation.

149. Comment: Small Business – Commentator strongly supports and recommends the addition of a Small Business Exemption to provide relief to operators where such relief will have minimal or no environmental impact. In accordance with the Regulatory Review Act, the Department is required to provide such exemptions to reduce the impact of the proposed regulation on small businesses.

Suggested regulatory amendment:

Small Business—the term is defined in accordance with the size standards described by the United States Small Business Administration’s Small Business regulations under 13 C.F.R. Ch. 1. Part 121 or its successor regulation. (1153)

Response: See response to comment 819.

150. Comment: Stormwater – Commentator proposes to simplify the proposed definition which states:

“Runoff from precipitation, snowmelt, surface runoff and drainage.”

The problem with the definition as proposed is that it literally says that stormwater is: Runoff from runoff, which does not make sense; and it is: Runoff from drainage. Runoff occurs as a result of drainage – it is not caused by it.

The definition is also exclusive of a significant portion of stormwater which occurs as sub- surface runoff, referred to technically as “interflow”.

Commentator notes that the inclusion of the concept of interflow is critical to the definition because of the antidegradation requirement to replicate predevelopment hydrology as part of the PCSM requirements in special protection watersheds. The procedures for characterizing predevelopment hydrology were decided by the Environmental Hearing Board in 2011 in the *BMPA v PADEP & Alpine Rose Motor Sports* decision in which all components of stormwater flow had been required by DEP to ensure replication of water resources in special protection watersheds. The current definition is inadequate and does not provide DEP with the tools it needs to regulate stormwater in special protection watersheds. The definition should be modified to read:

“Stormwater – Water flow resulting from the drainage of direct precipitation or snowmelt. The term includes both overland runoff and subsurface interflow.” (954)

Response: The Department disagrees that the definition of stormwater should be modified. The definition in this rulemaking is consistent with the definition in Chapter 102, as amended in 2010. The record and hearing related to Environmental Hearing Board decision referenced occurred were developed before the Chapter 102 revisions in 2010 were effective in November 2010. The Department believes the definition is appropriate and has not made any revisions.

151. Comment: Oil and Gas operations are required to obtain Submerged Lands License Agreements from the State of Pennsylvania. Those Submerged lands of the Commonwealth need to be defined. For example, Submerged Lands of the Commonwealth - waters and permanently or periodically inundated lands owned by the commonwealth including beds of streams declared public highways which are owned and held in trust by the commonwealth. (92)

Response: Submerged lands license agreements are beyond the scope of Chapters 78 and 78a.

152. Comment: Temporary Pipelines - As proposed, the difference between a gathering pipeline and a temporary pipeline is that the gathering pipeline is used to transport hydrocarbons from wells to transmission pipelines, versus the temporary pipelines that are used to transport materials used in construction or stimulation of the oil or gas well or to transport residual waste from the well. The proposed definition for temporary pipelines appears to allow the temporary pipeline to exist until well site reclamation is triggered under § 78.65, nine months later (or 30 days after permit expiration).

Because temporary pipelines are not designed to safely transport hydrocarbons to a transmission pipeline, and these pipelines could potentially be operating at the well site while hydrocarbons are initially produced, the definition should make it clear that temporary pipelines cannot be used to transport hydrocarbons to a transmission line.

We also recommend that either § 78.65 or the definition of temporary pipelines be revised to make clear that these temporary pipelines must be removed within nine months of drilling and completing a well. The proposed requirements at § 78.65 state that drilling supplies and equipment not needed for production must be removed. This regulation should specifically state that temporary pipelines must be removed.

We recommend the definition for “temporary pipelines” be revised to read:

Temporary pipelines - Pipelines used for oil and gas operations, including well construction and waste removal, that:

- (i) Transport materials used for the drilling or hydraulic fracture stimulation, or both, of a well and the residual waste generated as a result of the activities.
- (ii) Lose functionality after the well site it serviced has been restored under § 78.65 (related to site restoration) and are prohibited from use as gathering pipelines. (1143)

Response: The Department has revised the definition to be “well development pipelines” instead of “temporary pipelines”.

Section 78a.68b does not allow flammable materials to be transported through well development pipelines. The same section also requires the pipeline to be removed in accordance with §78a.65 timeframes.

153. Comment: Temporary Pipelines – is this definition inclusive or exclusive of fresh water temporary pipelines? As written, the definition is inclusive but § 78.68b is exclusive in certain circumstances. (952)

Response: The proposed definition included transport of residual wastes. Section 78a.68b includes operational restrictions where appropriate, depending on the type of material being transported. The Department has revised the definition of “temporary pipelines” to now be “well development pipelines.”

154. Comment: Temporary Pipelines – The term must be given fixed timelines given the potential for fracking and refracking wells over time and the long-term residual wastes that accompany such natural gas production. They are a threat to waters of the Commonwealth and must be defined more restrictively. Definitions should include criteria as to contents, composition, protective coatings, welding/connections, diameter, operational pressure, and so on to reduce risk.(1098)

Response: The definition as proposed is appropriate to meet the intent of the regulation. Additionally, the Department has revised 78a.68b to disallow use of the pipeline for longer than 12 months without approval from the Department. The Department has revised the definition of “temporary pipelines” to now be “well development pipelines.”

155. Comment: Water purveyor needs clarification. Could those corporations involved with natural gas operations be subject to PL 842, No. 365 as persons (under the Supreme Court’s *Citizens United* decision) and hence develop their own source of water that may jeopardize public and/or private supplies? (1098)

Response: The Department believes the definition is appropriate and has not made any revisions. Water purveyor, as defined, captures those that fall within the purview of the Pennsylvania Safe Drinking Water Act and/or the Water Rights Act. This definition is appropriate to meet the intent of the regulation. According to Section 78a.69, a Department approved water management plan must be obtained prior to a corporation or person withdrawing or using water from water sources within this Commonwealth for drilling or hydraulic fracture stimulation of an unconventional well.

156. Comment: Temporary Pipeline – Inclusion of the phrase “pipelines used for oil and gas operations” in this definition is confusing, as “oil and gas pipelines” are included in the definition of “oil and gas operations”. The definition of “oil and gas operations” also includes “water and other fluids management and storage used exclusively for the development of oil and gas wells.” Commentators

recommend that the introductory clause be clarified to read as follows: “Pipelines that are part of oil and gas operations and that meet the following: ...” Also, those portions of temporary pipelines that are located within the boundaries of unconventional well sites subject to the containment system requirements of section 78.64a should be excluded from this definition. The Commentator suggests the following amendatory language: “Temporary pipelines—Pipeline that is part of oil and gas operations and that: (1) transport materials used for the drilling or hydraulic fracture stimulation, or both, of a well and the residual waste generated as a result of those activities; and (2) lose its functionality after the well site it serviced has been restored under § 78.65 (related to restoration). The term does not include those portions of pipelines that are located within the boundaries of unconventional well sites subject to the containment system requirements of § 78.64a.” (1137, 1174)

Response: The Department has revised the definition to be “well development pipelines” instead of “temporary pipelines.” Additionally, the definition of “oil and gas operations” has been revised to be consistent with the definition of “well development pipelines.” The definitions as proposed are appropriate to meet the intent of the regulation.

157. Comment: Temporary Pipeline – DEP should not target the oil and gas industry for special provisions related to pipelines that are not imposed on other activities and are largely duplicative of Chapter 102. Delete the definition and the new Section 78.68b. (1153)

Response: The scope and type of use of well development pipelines by the oil and gas industry is significantly different from the scope and type of use by other industries in such a manner that the Department has determined that the proposed regulations are appropriate.

The Department has revised the definition of “temporary pipelines” to now be “well development pipelines.”

158. Comment: Temporary Pipeline – Commentator recommends deletion of the term “temporary pipelines” as an unnecessary term beyond the scope of the subchapter C. (1135)

Response: See response to comment 157.

159. Comment: Unique Buffer Zone – A Buffer Zone that is created to further provide for mitigations for special scenic areas, such as waterfalls, glens, vistas, nationally recognized features and Commonwealth recognized ecological resources within Commonwealth lands managed for recreational and wildlife management purposes may have a Unique Buffer Zone (UBZ) applied. These areas need to be designated. Designations may be done by public resources agencies and need to involve public input. (660a)

Response: The Department has considered this recommendation but does not agree that it is necessary or appropriate for inclusion in this rulemaking. See response to comment 31.

160. Comment: Viewshed – an area of land or water or that is visible to the human eye from a fixed vantage point, and of particular scenic value that is deemed worthy of preservation against development or other change as designated by a Commonwealth or County Agency. (660a)

Response: See response to comment 3019.

161. Comment: Vista – a pleasing view, especially one seen through a long, narrow opening which is designated as such by a Commonwealth or County Agency. (660a)

Response: See response to comment 3019.

- 162.** Comment: Watercourse – We strongly support consistent use of the watercourse definition at § 105.1 and recommend for clarity that it be spelled out in the new regulations.

Watercourse—The term as defined in 25 Pa. Code § 105.1, namely a channel or conveyance of surface water having defined bed and banks, whether natural or artificial, with perennial or intermittent flow.

Furthermore, we urge the EQB to use this watercourse definition where stream or other watercourse protection is required in the proposed regulation or in associated guidance documents.

For example, proposed regulation § 78.59c(c)(5) bars construction of centralized impoundments “within 100 feet measured horizontally from any solid blue line stream, spring or body of water, except wetlands, identified on the most current 7.5 minute quadrangle map of the United States Geological Survey.” There is no technical or scientifically supported basis or consistent set of standards, however, for the identification of a watercourse as a blue line stream on a 7.5 minute U.S. Geological Survey quadrangle map. Luna Leopold, former Chief Hydrologist of the U.S. Geological Survey (1956-1966), stated that “blue lines do not reflect any statistical characteristics of stream flow occurrence. The specification that the blue line terminates no higher than about 1,000 feet from the watershed divide does not reflect differences in hydrologic performance among various combinations of climate, topography, and geology.” (Luna B. Leopold, *A View of the River* (Harvard University Press 1994). As a result of this practice, many perennial and intermittent streams are not represented as blue lines on 7.5 minute U.S. Geological Survey quadrangle maps.

The definition of watercourse as defined in 25 Pa. Code § 105.1 is a technically accurate definition of stream, and we urge the EQB to eliminate all references to blue-line streams. (1143)

Response: The Department has added a definition for the term “watercourse” which references the definition in Chapter 105. Section 78.59c has been revised to disallow construction of new centralized impoundments.

- 163.** Comment: Watercourse – We urge the Department to be consistent across programs and adopt the same definition for watercourse regulatory language that is noted in 25 PA Code § 105.1. (660a)

Response: The Department has added a definition for the term “watercourse” which references the definition in Chapter 105.

- 164.** Comment: Water Management Plan – The commentator asks that the Board specify the purpose of a Water Management Plan in the definition to clarify the expectations and purpose of such a plan. Accordingly, we suggest rewriting the definition to state: “a plan associated with drilling or completing a well in an unconventional formation that helps assure compliance with the withdrawal limits and use limitation established for that water source.” (1085)

Response: Requirements regarding Water Management Plans are described in §78a.69. The definition is appropriate as proposed.

- 165.** Comment: Water Management Plan – All oil and gas drilling and hydraulic fracturing operations require the use of water. As proposed by the EQB, a Water Management Plan (WMP) is defined to apply only to a well drilled or completed in an unconventional formation. As defined in § 78.1 an

“unconventional formation” would include only natural gas wells drilled and hydraulically fractured into geologic shale formations below the base of the Elk Sandstone. A WMP thus would not be associated with oil wells and all gas wells that are drilled into shale formations above the base of the Elk Sandstone or to oil and gas wells that are drilled into all other geologic formations. WMPs should be defined to apply to the drilling and completion of all oil and gas wells.

If the EQB rejects this recommendation, we ask that the EQB:

- (1) Provide an explanation of why not, or set a specific volume threshold for water use in any cases where detailed planning is not warranted; and,
- (2) Provide evidence that the proposed regulation would not result in adverse impacts to local water resources (e.g., the dewatering of streams).

We recommend that the definition of WMP be revised to read:

WMP - A plan associated with drilling or completing an oil and gas well that demonstrates that the withdrawal and use of water sources protects those sources, as required under law, and protects public health, safety and welfare. (1143)

Response: The regulation, is consistent with requirements in the 2012 Oil and Gas Act which provides that persons withdrawing or using water sources within this Commonwealth for drilling or hydraulic fracture stimulation of unconventional wells are required to obtain Department approved water management plans.

166. Comment: Water source – The “water source” definition precisely tracks 58 PA C.S. § 3203, so the problems with the statute are imported into the proposed regulations. All oil and gas drilling and hydraulic fracturing operations require the use of water. The EQB should seek a statutory amendment to define “water source” to include not only water used for drilling or completing a well in an unconventional formation but rather water used for drilling or completing a well in either a conventional or an unconventional formation. In addition, the EQB should ask the legislature to amend the definition to ensure that additives used in drilling or completing a well do not fall within the definition of “water source.” (1143)

Response: The proposed definition is consistent with the definition in the 2012 Oil and Gas Act. Statutory revisions are beyond the scope of Chapter 78.

167. Comment: Water source – Paragraph (i)(D) contradicts (ii)(A). Flowback or production water has and typically can be a beneficial use in the drilling or completion of another well. (411)

Response: Waters described in paragraph (ii) are explicitly excluded from paragraph (i).

168. Comment: Water source – The definition uses the phrase “Water of this Commonwealth,” which is undefined. An already defined term that should be used in its stead is “Waters of the Commonwealth,” as defined in Section One (1) of The Clean Streams Law. In addition, the definition for “Body of water” does reference the definition in 25 PA Code Chapter 105, but it is unclear why that term is limited to “a natural or artificial lake, pond reservoir, swamp, marsh or wetland,” and does not include all “Waters of the Commonwealth” as defined in The Clean Streams Law. See 25 PA Code § 105.1 and 35 P.S. § 691.1. (997a)

Response: The definition is consistent with the definition in the 2012 Oil and Gas Act. The two terms are understood to be synonymous.

169. Comment: Water source – Paragraphs (iv) and (2) - It is not clear whether recycled water obtained from third party vendors would require a WMP. This should be clarified. (1049)

Response: See response to comment 167.

170. Comment: Water source – It seems as though the first term, (i)(A) “Waters of the Commonwealth,” would encompass the following three sources of water listed in (i)(B)-(D). It is suggested that it read, “Waters of the Commonwealth, including” and then go on to list the other sources. (124a)

Response: The definition is consistent with the definition in the 2012 Oil and Gas Act.

171. Comment: Water source – Commentator understands subsection (ii) of this definition to be intended to allow operators to reuse flowback and production waters for drilling and completing unconventional wells without including those sources in a Water Management Plan. The definition is confusing, however, because subsection (ii) appears to conflict with, rather than provide an exception to, subsection (i)(D). Delete subsections (i)(D) and (ii). (1153)

Response: The definition is consistent with the definition in the 2012 Oil and Gas Act. The commentator’s proposed changes would alter the intent of the definition.

172. Comment: Water source – The definition is all inclusive and needs clarification. Are waters used for completing a well in an unconventional formation inclusive of chemicals and natural substances added to it? Does it include the reuse of flowback or produced waters or other fluid that may be used to complete such a well? Should the word “permitted” be added relative to waters that may be discharged in the Commonwealth? Please clarify. (1098)

Response: The definition is consistent with the definition in the 2012 Oil and Gas Act. Water source does not include chemicals and other natural substances added to water. The term does not include flowback or production waters or other fluids which are used for drilling or completing of a well or do not discharge to waters of the Commonwealth. Addition of the word “permitted” is not necessary.

173. Comment: Water supply – The term needs specificity as to “legitimate beneficial uses” that must be based on long-term scientific, peer-reviewed studies as to environmental benefit as opposed to risk for such use. (1098)

Response: The Department disagrees that water supply owners should be required to conduct long-term, scientific, peer-reviewed studies to demonstrate that a water supply serves a legitimate beneficial use.

174. Comment: Well operator or operator – The definition may include those who are trying to plug wells to prevent long term consequences. How does one determine intent or purpose of such an act to avoid misidentification? A storage operator should be defined separately given the nature of duties and responsibilities. (1098)

Response: The Department believes that the statutory definitions for operator and storage operator in Act 13 are sufficient to distinguish between duties and responsibilities.

175. Comment: Well pad spacing – minimum distance between well pads. (660a)

Response: Chapter 78 does not address well pad spacing.

176. Comment: Well site - Does this definition include the roads and gathering lines “necessary for or incidental to the drilling, production or plugging of a well”? (1062, 1133)

Response: Depending on site-specific conditions, the term may include roads and gathering lines.

177. Comment: Well site – The term should be limited to the permitted area and not be inclusive of facilities necessary or “incidental” to the drilling, production or plugging of a well. (1098)

Response: It is not clear to the Department as to what permitted area the commentator is referring to. The Department believes the definition is appropriate and has not made any revisions.

178. Comment: Well site – This definition should be updated to reflect the fact that multiple wells will be located on one well site with unconventional shale gas development. Suggested language: “Well site - The area occupied by the equipment or facilities necessary for or incidental to the drilling, production or plugging of a well or multiple wells.” (1137, 1147, 1174)

Response: The Department disagrees that the proposed change is necessary. The definition is clear as written.

179. Comment: Well site – The definition should be updated to expressly narrow it to the surface area required for oil and gas development. This would clarify that a horizontal well bore does not expand the well site beyond what is intended by the regulations. We recommend modifying the definition of well site to read as follows: “the area occupied at the surface by the equipment or facilities necessary for or incidental to the drilling, production or plugging of a well.” (1140)

Response: The Department disagrees that this clarification is necessary. The definition as proposed is appropriate to meet the intent of the regulation.

180. Comment: Numerous new definitions have been proposed that would expand the scope of obligations under Chapter 78, if adopted as written. Two definitions that potentially create major uncertainty are: The definition of “Mine influenced water” gives DEP discretion to include all waters impaired by mine drainage. Given the breadth of the DEP’s list of waters impaired by mine drainage this definition would include many surface waters throughout the Commonwealth, including sections of the major rivers such as the Allegheny, Monongahela, Youghiogheny and West Branch of the Susquehanna some of which are widely used for public water supplies. The definition is overly broad. Storage and use of such a vaguely defined and potentially broad universe of waters, which are routinely used for numerous other purposes by industries beyond the oil and gas industry, should not be subject to the special approval requirements of Section 78.59b(g). The definition of “Regulated substances” refers to the definition in Act 2 that was developed to assist those conducting cleanup operations at brownfield sites throughout the Commonwealth. The definition, which includes substances “covered by” six other named statutes, is overly broad and fails to provide the necessary guidance for reporting obligations that would be imposed under the proposed Section 78.66(b). At a minimum, the definition must be further clarified by reference to some known list of substances, such as those found in Chapter 250. In addition, the term should be replaced or removed entirely where the intent of the rule is better served by a different term. See Sections 78.55 (Control and disposal planning), 78.56 (Temporary storage), 78.59c (Centralized impoundments), 78.61

(Disposal of drill cuttings), and 78.64a (Containment systems and practices at unconventional well sites) for specific recommendations below. (1174)

Response: See responses to comments 87 regarding mine influenced water and 128 regarding regulated substances.

181. Comment: “Right-Of-Way” shall mean any permanently maintained opening in the forest cover which allows for access and maintenance of infrastructure and roadways. (643)

Response: The proposed definition of the term right-of-way is specific to forested areas but is used in a different context within the regulations. Therefore, inclusion of this definition is not appropriate.

182. Comment: “Native” shall mean any species that originate naturally and are indigenous to Pennsylvania. (643)

Response: The proposed definition of the term native is specific to plant species but is used in a different context within the regulations. Therefore, inclusion of this definition is not appropriate.

183. Comment: “Coverage” shall mean the amount of surface area covered by the vegetation’s point of contact with the ground. (643)

Response: The proposed term is not used in the regulation. Therefore, inclusion of this definition is not appropriate.

184. Comment: “Diversity” shall mean the number of species represented at a single instance. (643)

Response: The proposed term is not used in the regulation. Therefore, inclusion of this definition is not appropriate.

185. Comment: “Width” shall mean the horizontal distance running perpendicular from the centerline of the right-of-way to the right-of-way’s edge. (643)

Response: The proposed definition of the term width is specific to right of way measurements but is used in a different context within the regulations. Therefore, inclusion of this definition is not appropriate.

186. Comment: Define provisions for assurance that pipelines used to transport flow back may not be used to withdraw and transport fresh water. (118)

Response: Sections 78a.68 and 78a.68b provide appropriate requirements for the construction and operation of pipelines to ensure protection of public health and safety and the environment. Further requirements restricting use of pipelines are not necessary.

187. Comment: Define pipeline material requirements in prescriptive language by categorizing pipelines by what they carry (residual waste, production fluids, condensate, oil, gas) (118)

Response: Sections 78a.68 and 78a.68b provide appropriate requirements for the construction and operation of pipelines to ensure protection of public health and safety and the environment.

188. Comment: Suggested Changes:

Definitions:

Unless otherwise specified, the terms indicated below shall have the following meaning:

“Benches” or “shelves” shall mean flat areas which could be used as a development site which are otherwise surrounded by slopes of fifteen percent or greater.

“Development” shall mean any and all earth moving or vegetation clearing procedures related to oil and gas industry including, but not limited to, well pads, machinery storage areas, water or waste product retention or storage areas, access and maintenance roads, and pipeline right-of-ways.

“Director” shall mean the director of the conservation, development and planning department and/or his designee.

“Grading” shall be defined as earthmoving activity.

“Ridgeline” shall mean a visually prominent, relatively narrow strip or crest of land, which includes the highest points of elevation within a watershed, separating one drainage basin from another.

“Slope” means the inclination of the terrain, calculated as a percentile, the change in vertical distance divided by the change in horizontal distance.

“Viewshed” shall mean all visible areas that can be seen from a designated location, feature, roadway, waterway, or recreational trail. A viewshed is an area of land, water, or other environmental element that is visible to the human eye from (a) fixed or linear vantage point(s). (1016)

Response: The Department has considered the recommended additional definitions but does not agree that inclusion of these terms is necessary or appropriate, and in some instances the definitions proposed by the commentator conflict with definitions in this rulemaking or in other applicable chapters of the Pennsylvania Code. See also the Department’s response to comment 3019.

§ 78.2 Scope

189. Comment: Commentator recommends that the EQB retain this scope as the proper description of activities subject to Chapter 78 Subchapter C. Consistent with this scope, there is no need to provide a definition of “oil and gas operations” and several subsections below would be deleted entirely, including 78.59a, 78.59b, 78.59c and 78.68, 78.68a and 78.68b. (1135)

Response: This section is deleted to avoid confusion regarding the activities regulated under the final rulemaking and maintain consistency with the framework of the 2012 Oil and Gas Act whose scope “relates to oil and gas.” See 58 Pa.C.S. § 3201.

190. Comment: The current scope of Chapter 78 should be retained as is. (1153)

Response: The revisions to the regulation and to the scope are necessary and appropriate to comply with amendments to the statute, technological advances in the industry and to

adequately protect the environment.

§ 78.11 Permit requirements

- 191.** Comment: Commentators are concerned about the Department's new position, following the adoption of Act 13, which interprets some provisions of the Act to require well permits to be posted prior to construction of well sites or access roads. The Commentators do not believe that this interpretation is required or necessary under the language of Act 13. The timing of permit applications and issuance is further complicated and delayed by the Department's proposed revisions to Section 78.15, discussed in more detail below. Revisions to Section 78.11 should clarify an operator's permit and approval obligations to construct a well site.

Suggested amendatory language (note, this is new language, not replacing the proposed subsection (c)):

(c) Well permits, once obtained, must be posted at the drilling site during site preparation, drilling, operating or altering the well. Well sites, including access roads, may be constructed prior to issuance of a well permit, in accordance with any necessary permits or approvals required and obtained under the Clean Streams Law. (1137, 1153)

Response: This rulemaking does not relieve an Operator from the requirements of Title 58, Chapter 32, particularly 3211(g) requiring well permits to be posted during overall well site construction including but not limited to access roads, well pads, etc.

- 192.** Comment: Commentator is concerned about the Department's new position following the adoption of Act 13, which interpreted some provisions of the Act to require well permits to be posted prior to construction of well sites or access roads. This interpretation is neither required nor necessary under the language of the Act and it has imposed great burdens on conventional operators who build well sites on leases according to operational efficiency and contractor availability, which does not ordinarily coincide with permit applications and issuance. Conventional operators routinely build locations during the dry time of the year when there is a diminished potential for accelerated erosion and sedimentation and the new interpretation, the timing of which is impeded by this new requirement. Building the locations months or years before drilling allows the locations to become firm before use, reducing the amount of stone that must be applied and commensurately reducing earth disturbance and the number of necessary truck trips. Construction of locations more than a year in advance of drilling was formerly a Best Management Practice recommended by the Department. The timing of permit applications and issuance is further complicated and delayed by the Department's proposed revisions to Section 78.15 below. Revisions to Chapter 78.11 would clarify the obligations with respect to the permits and approvals needed to construct well sites.

Suggested amendatory language (note, this is new language, not replacing the proposed subsection (c)):

(c) Well permits, once obtained, must be posted at the drilling site during site preparation, drilling, operating or altering the well. Well sites, including access roads, may be constructed prior to issuance of a well permit, in accordance with any necessary permits or approvals required and obtained under the Clean Streams Law, including Chapters 102 and 105 approvals. (1135)

Response: See response to comment 191.

193. Comment: § 78.11(c) Suggested amendatory language: Well permits, once obtained, must be posted at the drilling site during site preparation, drilling, operating or altering the well. Well sites, including access roads, may be constructed prior to issuance of a well permit, in accordance with any necessary permits or approvals required and obtained under the Clean Streams Law. (1147)

Response: See response to comment 191.

194. Comment: We are writing in support of the 10 public water systems in Potter County and many others in northern and central Pennsylvania who are calling on the Pennsylvania Department of Environmental Protection to include the location of delineated water supply recharge areas in its gas/oil permit review process, and to require that public drinking water system operators be notified when a permit is issued in close proximity to these sensitive areas. This requirement would assure that municipal water authorities are informed of pending drilling activity, while opening a line of communication between the drillers, DEP's Oil and Gas and Safe Drinking Water Programs, and the municipal water authorities.

We appreciate DEP's support of our local public water system operators' development of Source Water Protection Plans. It naturally follows that these facilities and the recharge areas that feed their sources should be afforded priority protection in DEP's consideration of applications for energy development and other permitted activities and should be incorporated into the eFACTS system, as they are mapped in electronic format.

One of the common misconceptions sometimes voiced during discussions on this issue is the assumption that it was adequately addressed in Pennsylvania Act 13 of 2012. Indeed, Act 13 increased the regulatory notification distance for drilling activities in close proximity to a Source Water Protection Zone from 1,000 feet to a new standard of 3,000 feet. However, in many cases – especially for the water systems with high-capacity water supply wells – the Zone II wellhead protection area (as defined in 25 Pa. Code Chapter 109) is larger than the 3,000-foot limit. The complicated geology of Pennsylvania requires that a standard be based on each water supply source's individual characteristics, rather than a blanket generalized distance.

Potter County's interest in this and related issues goes back to the early stages of shale gas exploration and development in Pennsylvania. Given our unique location as a headwaters region for three of the major river systems in the east, local leaders formed three organizations – the Natural Gas Task Force, the Water Quality Work Group and the Triple Divide Watershed Coalition (not to be confused with a documentary or a hiking trail system using the same 'Triple Divide' moniker).

The Task Force was dedicated to responsible public education on gas drilling and related issues and facilitation of respectful dialogue between all affected parties. It has since evolved to the Natural Gas Resource Center, dedicated to those same objectives while serving as a clearinghouse and information/referral service.

The Work Group brings together a broad cross-section of individuals directly or indirectly involved in water conservation and related topics. (96)

Response: The Department acknowledges the comment. The final-form rulemaking adds zones 1 or 2 of a wellhead protection area identified as part of a wellhead protection program approved under § 109.713 to the list of public resources included in the public resources impact screening process established by §§ 78.15(f) and 78a.15(f).

§ 78.14 Transfer of well ownership or change of address

195. Comment: While beyond the scope of this rulemaking, nevertheless, this is an issue that landowners are concerned about, that is not being notified when their lease is sold, especially when there are permits issued concerning their property with an operator other than whom they are leased. Most recently, this occurred with Chief Oil & Gas LLC. Permit 131-20367 Garrison West Unit 3H where landowners were leased with a different operator and found out via the community grapevine that their property was proposed to be laterally crossed with this well and others. This was months in advance of any news release stating that the leases had been sold. Repeated calls to their operator availed no information. Landowners had a variety of concerns; some of them related environmental protection issues. It is well known that not all operations are created equal and thus, landowners are concerned about what those operations may mean to their property when such a variety of methods are employed. This is a simple matter of notification that operators can easily comply through regular mail.

(d) The permittee shall notify all leasehold landowners subject to the transfer of a change in address or name within 30 days of the change. (660a)

Response: As noted by the commentator, notifications to landowners when leases are bought and sold are beyond the scope of this rulemaking.

§ 78.15 Application requirements

196. Comment: Application requirements (includes conventional drillers) -- This provision also applies to conventional drillers. While conventional drilling locations are much smaller than unconventional, they still have the possibility of accessing areas that require special and careful evaluation. Since the area of review is generally limited to the discrete area, we see no unreasonable hardship here to the conventional drillers. What we see is a measure of consideration towards core habitat areas for example. We need to consider the comprehensive view of the amount of new disturbed areas that are subject to both conventional and unconventional drilling. We need to sufficiently and adequately protect such areas towards the great balancing act of exploitation. We support these provisions as they pertain to the conventional drillers at a minimum as they are written. (660a)

Response: The Department acknowledges this comment.

197. Comment: The permit application has become a nightmare. The application for a permit has gone from two pages to 17. The notification of all adjoining townships or municipalities bordering the township or municipalities you are applying for a permit in is ridiculous especially for a shallow well. (987, 1091)

Response: The well permit application requirements are reasonable and appropriate to ensure compliance with applicable law. The referenced notifications are required by Section 3211(b)(2). Any change to those provisions should be legislative.

198. Comment: As with other regulatory programs (e.g., RCRA), the regulations should provide language that allows the operators to rely on generator knowledge for disposal purposes in lieu of continued chemical analysis of materials generated on site. (639)

Response: To the extent that the commentator is referring to provisions in §§ 78.58 and 78a.58 regarding characterization of waste prior to removing the waste from the site, the Department does not believe that any revisions are necessary because this section

incorporates the requirements of Chapter 287 by reference. To the extent that the commentator is referring to chemical analysis requirements in §§ 78.62 and 78.63, the Department does not believe that any revisions are necessary to address the commenter's concerns. These requirements remain unchanged and the Department has in the past and will continue to allow generator knowledge, as appropriate to ensure compliance with these requirements.

- 199.** Comment: We urge the EQB to reconsider the proposed regulations. Modifying and revising the Oil & Gas regulations at this time without providing scientifically sound and clear language would be detrimental to the EQB, PADEP, industry and the citizens of the Commonwealth. (639)

Response: Please see the Department's response to question 10 of the regulatory analysis form for the final form rulemaking.

- 200.** DEP should not be required to consider the rights of the applicants: DEP's mission is to uphold citizens' constitutional right to a clean environment. Abrogating these rights through consideration of the rights of applicants would be unconstitutional. (153)

Response: The well permit application process outlined in §§ 78.15 and 78a.15 ensure that the Department fulfills its constitutional and statutory obligation. Sections 78.15(g) and 78a.15(g) have been amended to clarify the criteria the Department will consider when deciding whether to condition an oil or gas well permit based on impacts to public resources. Sections 78.15(g) and 78a.15(g) have been revised to remove the language regarding the Department's burden of proof upon appeal of a condition necessary to protect a public resource. Section 3215(e) of the Oil and Gas Act of 2012 states that the Department has the burden of proving that a well permit condition imposed to protect a public resource is necessary to protect against a probable harmful impact of the public resource.

Please see the response to comment 264 and 416.

- 201.** Comment: The continued rulemaking activity to include any potential promulgation of rules within or associated with Sections 78.15 (d) through (g) must be discontinued and all proposed revisions to 25 Pa. Code Chapter 78 that would apply or implement those regulation sections should be removed from the rulemaking proposal. The Pennsylvania Supreme Court in the recent December 19, 2013 decision in *Robinson Township v. Commonwealth of Pennsylvania*, No. 63 MAP 2012, has ruled that Sections 3215 (c) and (e) of Act 13 - the statute sections delegating authority to the DEP/EQB to develop regulations and apply the statutory requirements therein - has been enjoined.

Specifically, at pages 158 & 159 (*pages attached*) of the *Robinson* decision Sections 3215 (c) and 3215 (e) of Act 13 have been held to not be severable from Section 3215 (b) which was enjoined in its entirety. "Moreover, insofar as Section 3215 (c) and (e) are part of the 3215 (b) decisional process; these provisions are as well incomplete and incapable of execution in accordance with legislative intent. Application of Section 3215 (c) and (e) is therefore, also enjoined."

The Section fails to comply with the Act 13 section 3215 (e) statutory requirement to develop "criteria" for 1) conditioning a well permit based on its impact, 2) ensuring optimal development of oil and gas resources, and for 3) respecting property rights of oil and gas owners. Put simply, no "criteria" or standards whatsoever are identified or articulated in the proposed regulations that would carry these mandates into effect.

ordinance purportedly does not comply. The prerogatives of acting upon policy judgments and enacting local legislation, while limited by the General Assembly's enactment, remain ultimately with local government under the Act 13 scheme. No valid separation of powers concern exists regarding Section 3305(a). See 828 A.2d at 1051. As against this claim, the Commonwealth Court's decision is affirmed, on these different grounds.

V. Severability

The citizens' requested relief is a declaration that Act 13 is unconstitutional in its entirety, based solely on arguments related to the discrete provisions discussed above. We recognize that certain of the provisions we have held to be unconstitutional represent core aspects of Act 13. But, by the same token, several provisions appear relatively independent of other parts of Act 13. See, e.g., 58 Pa.C.S. § 2302 (unconventional gas well fee); § 2505 (appropriations for Marcellus Legacy Fund). Notably, neither the parties nor Act 13 itself address the potential severability of provisions found unconstitutional. Nevertheless, our holding that Sections 3215(b)(4) and (d), 3303, and 3304 violate the Environmental Rights Amendment does not automatically require finding Act 13 unconstitutional in its entirety. Mockaitis, 834 A.2d at 502. Indeed, the presumption is that "[t]he provisions of every statute shall be severable." 1 Pa.C.S. § 1925 (constitutional construction of statutes).⁶⁹ Notably, while not citing to the Section 1925 severability

⁶⁹ Section 1925 of the Statutory Construction Act provides that:

If any provision of any statute . . . is held invalid, the remainder of the statute . . . shall not be affected thereby, unless the court finds that the valid provisions of the statute are so essentially and inseparably connected with, and so depend upon, the void provision . . . that it cannot be presumed the General Assembly would have enacted the remaining valid provisions without the void one; or unless the

(continued...)

presumption expressly, the Commonwealth Court obviously recognized that the issue was implicated because, upon finding Section 3304 unconstitutional, the panel was careful to enjoin only those “provisions of Chapter 33 that enforce 58 Pa.C.S. § 3304.” Robinson Twp., 52 A.3d at 485

Setting aside the question of global severability – *i.e.*, whether the specific provisions held to be unconstitutional require that the entire Act be enjoined – there are obvious consequences of certain of our holdings. Thus, we have already recognized that Section 3215(b)(4), which addresses waivers of the general rule requiring setbacks for the protection of certain waters of the Commonwealth, is a key part of the Section 3215(b) scheme. It would appear that the General Assembly did not intend for the setback provision to operate without allowing industry operators to secure waivers from the setbacks. Absent the enjoined Section 3215(b)(4), the remaining parts of Section 3215(b) – which the citizens do not challenge on appeal – are incomplete and incapable of execution in accordance with the legislative intent. Having held that Section 3215(b)(4) is unconstitutional, we conclude that the remaining parts of Section 3215(b) are not severable. Accordingly, application of Section 3215(b) is enjoined.

Moreover, insofar as Section 3215(c) and (e) are part of the Section 3215(b) decisional process, these provisions as well are incomplete and incapable of execution in accordance with legislative intent. Application of Section 3215(c) and (e) is, therefore, also enjoined. Finally, Sections 3305 through 3309 are those parts of the statutory scheme that establish a mechanism by which to enforce compliance with the Municipalities Planning

(...continued)

court finds that the remaining valid provisions, standing alone, are incomplete and are incapable of being executed in accordance with the legislative intent.

1 Pa.C.S. § 1925.

[J-127A-D-2012] - 159

(81, 419)

Response: Please see the responses to comments 265 and 413.

202. Comment: I am very heartened to see that the natural gas industry will be required to consult with the Pennsylvania Natural Heritage Program as well as be required to notify about the impacts to

public lands, natural landmarks, and historic properties. While it is not as encompassing or as protective as it should be, it is a start and these regulations need to be approved quickly to afford some type of Endangered Species and public land protection.

I recommend that DEP look at adding a provision to this section that a company planning for a well, pipeline right-of-way, compressor station or other gas processing facility, should only be allowed to apply for a permit if they have a current lease in place or a Letter of Authorization from the landowner. Currently the above-described applications can be submitted to the DEP for review without a lease in place with the landowner. It would save DEP's time and resources and allow the public to have accurate information on a facility prior to the installation instead of receiving amendments to the permit after the fact. (870)

Response: The Department has considered this comment and declines to make the suggested amendment to this rulemaking. The well permit does not convey any property rights. Further, the well permit is conditioned on the permittee's compliance with all applicable law.

203. Comment: We fully support the Department of Environmental Protection's (DEP) efforts towards amending Chapter 78 Subchapter C, relating to Oil and Gas regulations in order to strengthen environmental protection measures at oil and gas sites within Pennsylvania. For the most part, we concur with the proposed amendments. (1006)

Response: The Department acknowledges this comment.

204. Comment: I would suggest the EQB address the issue of operators applying for additional wells at well sites with a history of violations. A permit should not be granted to operators that have committed multiple and ongoing violations at specific well sites. Permits should not be granted to those operators until they have a proven track record of implementing improved best practices at their leased well sites. (1066)

Response: Section 3211(e.1)(5) of the 2012 Oil and Gas Act gives the Department the authority to deny a well permit based on the well permit applicant's compliance history. Any change to that provision should be legislative.

205. Comment: When protecting public resources, the Board, Department and industry must have a thorough mutual understanding of all permit application requirements related to all public resource regulations, and these regulations must be based in law. We appreciate the Board's efforts to streamline the permitting process. (1085)

Response: The Department acknowledges this comment.

206. Comment: Section 78.15 includes references to wells, well sites and access roads. Do the requirements of this section pertain to all activities included under the definition of "oil and gas operations"? (1099)

Response: No. Sections 78.15 and 78a.15 establish the well permit application process and are limited to activities associated with well construction and development. The requirements of these sections are designed to address the impacts within the limit of disturbance of the well site. Other activities associated with the oil and gas operations are regulated through various other provisions in Chapters 78 and 78a or other laws implemented by the Department.

207. Comment: This letter is written in direct response to Oil City Engineer, Chris Sporer's public

comments regarding Act 13 generally and the protection of the Oil City water supply in particular. I write this letter from the perspective of a lifetime resident of Venango County, a landowner with in excess of 100 acres, a landowner within Zone III of the Oil City water wells, and an experienced employee in the oil & gas industry as a retired Senior Gas Measurement and Regulator Specialist for National Fuel Gas.

Let me begin by saying that I believe state regulation of the oil & gas industry, as well as protection of our water resources is a good thing. However, overregulation of oil & gas exploration is almost as detrimental as proper regulation is beneficial. To that end, the greatest scientific mind in the history of our country, Albert Einstein, had it exactly right whenever he said, "Make everything as simple as possible, but not simpler."

As such, the Department of Environmental Protection already has proper and sufficient regulations in place to accomplish the dual purpose of regulating the oil & gas industry and protecting our natural resources, in particular our water.

A few ways that our water is already protected are as follows: First, the drilling of deep or unconventional oil & gas wells is thousands of feet below the aquifers, which means any tracking done will not communicate with the aquifer. Second, any bore hole that penetrates the aquifer is already protected pursuant to DEP regulations and industry best practices by multiple layers of casing and cement. Third, all of the landowners within a 3,000 foot radius of the well are notified so that they can object if they see fit 'in order to protect their water supply or for some other reason:

Further, in relation to the Oil City water wells in particular, they already have more than enough protection given the above regulations, as well as for a number of other reasons. Namely, the .water wells are located on 300 acres of land owned by the city, which means they already have a protective buffer zone of almost one-half of a square mile (a square mile being approximately 27.9 million square feet and the 300 acres being approximately 13.2 million square feet). This protective zone is well in excess of the 105 acres (4.6 million square feet) required for Zone II protection.

Moreover, in the event that a Zone III classification is imposed on the Oil City water wells my farm and most of my neighbors' and friends' properties would fall within this Zone. This would essentially result in a *de facto* taking of our oil & gas rights due to the restrictions and liabilities that would be imposed upon us and any oil & gas exploration company that may otherwise be interested in developing our properties. On that subject, development of our properties is not just a fleeting, unrealistic possibility given that our properties were recently leased by Halcon Resources, which spent millions of dollars in order to obtain the right to develop the oil & gas rights under our properties.

To head off such diligent and environmentally responsible development would not only be a financial blow to us as local property owners, but would also be a financial stumbling block for all of our fellow Venangonians who are waiting for an economic resurrection of our county. The DEP should also remember not just to worry about greasing the squeaky wheel (of the 200 people at the meeting 37 spoke according to the Meadville newspaper some for more regulation some for less regulation), but should maintain focus on the vast majority of Venangonians who have relied on the economics of oil & gas for more than 150 years.

In conclusion, my hope is that the already-in-place responsible regulations and the existing 300-acre buffer zone be determined to be significant, substantial, and suitable protection. Additionally, I would argue that the strong standing regulations already in existence be used to regulate the oil & gas industry rather than imposing greater, unnecessary regulations that would unduly restrict

Venango County's - and Pennsylvania's - economic resurrection. Some may think that the current regulations are simple; however, these regulations are perfect in their simplicity. (451a)

Response: Please see Department's response to question 10 of the Regulatory Analysis Form of the final rulemaking for more details regarding the need for the regulations.

208. We are concerned that the current Chapter 78 Environmental Protection Performance Standards for Oil and Gas Well sites which regulate natural gas operations, as proposed, do not provide sufficient protection from potential adverse impacts of gas well drilling and associated activities on the recharge areas associated with drinking water resources.

Source Water Protection Plans for public drinking water sources have been developed included Source Water Protection Zones (SWPZs) to delineate sensitive surface supply and groundwater recharge areas which may be vulnerable to contamination. The SWPZs are used to identify and evaluate risks of potential contamination threats to the drinking water supply in order to help prevent and mitigate the impact of any contamination incidents from such identified potential sources.

The relatively new and large-scale development of natural gas drilling and pipeline operations in source water supply areas raise significant risks of contamination to surface and groundwater supplies from activities associated with unconventional gas development including, but not limited to, changes to the land use in sensitive recharge areas, erosion and sedimentation, the potential for aquifer contamination from inadequately cased and cemented well bore holes through fresh water zones and orphaned and abandoned wells, and spills and leakage from well pads, access roads, compressor stations or transmission lines.

While we support all of the proposed changes in the Chapter 78 regulations which strengthen performance standards for natural gas operations and improve the degree of protection for water supplies, we believe that the regulations also need to require the Department, as part of the gas well drilling permitting process, utilize SWPZ delineations for public water supplies, where available and appropriate, to expand the prescribed set isolation distances from public water supply sources used throughout the regulations. The regulations should specifically require the use of these delineations and enable the Department staff to condition, deny or modify well drilling permits where necessary to prevent potential contaminants from reaching sensitive surface and ground waters in order to adequately protect drinking water supplies.

We appreciate this opportunity to comment on the proposed Chapter 78 regulations, and urge the Department to carefully consider additional measures to protect Source Water Protection Zones of public water supplies during the permit review process for natural gas wells, pipelines, and associated facilities. (852a, 137)

Response: The Department amended §§ 78.15(f)(1) and 78a.15(f)(1) of the final rulemaking to wellhead protection areas.

The Department has determined that the public resource impact screening provisions as outlined in Section 78.15(f)-(g) and 78a.15(f)-(g) are reasonable, appropriate and necessary to ensure that the Department has complied with its obligation to protect public resources under Article I, Section 27 of the Pennsylvania Constitution, the Administrative Code of 1929, the 2012 Oil and Gas Act, the Clean Streams Law, the Dam Safety and Encroachments Act, the Solid Waste Management Act and other statutes. Please see the response to comment 265.

Wellhead protection areas were added because these resources are similar in nature to those included in Section 3215(c) of the 2012 Oil and Gas Act. Wellhead protection areas are associated with sources used for public drinking supplies, another listed resource.

In further response to comments, wellhead protection areas have been clarified by including a cross reference to 25 Pa. Code §109.713 and limiting the areas to those classified as zones 1 and 2.

- 209.** Comment: We strongly believe in the protection of Pennsylvania's vital drinking water resources. The broadening development of the oil and gas industry may expose our water sources to multiple avenues for contamination if the proper safeguards are not put into place. While the proposed amendments enact source water risk-reduction regulations, there is room to further strengthen these amendments by utilizing the information collected in Source Water Protection Plans (SWPPs).

DEP should recognize and apply the Source Water Protection Zones (SWPZs) during the permit review process, when they are available, instead of the blanket setback distance. We recommend that no drilling and related activity be allowed in areas delineated as groundwater protection Zone II and surface water protection Zone A. At a minimum Zone IIs and Zone As should be recognized as needing special consideration with locating of the well sites, centralized impoundments, freshwater impoundments, temporary storage pits and tanks, any drill cutting and residual waste disposal, including access roads. Also, the Zone affiliated water system should be notified and be given the opportunity to submit a comment within a minimum of 30 days, to DEP on the proposed permit activity.

Whenever possible, DEP should be allowed to assist water systems, Source Water Protection Committees and Coalitions in their endeavors to protect these Zones that have been deemed vital, in essence by DEP, in preventing the contamination of drinking water sources. The proposed amendments to Chapter 78 present an opportunity to formalize this assistance. (951, 1019, 1054 1128, 1149, 1150, 1169, 1189-1200)

Response: Please see response to comment 208.

- 210.** Comment: The City of Oil City owns and operates a public drinking water system which serves all residents of Oil City, as well as parts of neighboring Cranberry and Cornplanter Townships. The source of our drinking water is a well field, and the City is fortunate that it owns over 300 acres of the watershed, which at one time was thought to protect the source water from contamination. However, the area that actually needs protecting is now known to extend beyond the City's ownership onto privately owned land.

In 2010, the City participated in the Source Water Protection Technical Assistance Program sponsored by the Pennsylvania Department of Environmental Protection or DEP. DEP hired and paid a consultant, SSM Group of Reading, PA, to develop a Source Water Protection Plan for the City's well field. Part of that Plan was to determine the area from which the wells withdraw water; this is a challenging task since water flows through the ground in complex ways. SSM Group developed a computer model using the Groundwater Modeling System developed by the United States Department of Defense. This model is well-accepted among geologists and hydrogeologists, and is commonly used to help manage groundwater resources. The model required significant information about the study area -topography, geology, slopes, soils, infiltration rates, and water table elevations. SSM Group collected the necessary data for the model to estimate the recharge areas of the wells, and how long it takes water to travel through the subsurface to the wells. The model was then used to delineate protection Zones I, II, and III.

Zone I is the smallest of the three zones, encompassing a 400' radius around each well. Zone II is defined as the land that contributes groundwater to the wells in a ten-year time of travel, and is an area of 105 acres; it is irregular-shaped, not just a radius around each well, and it goes onto privately-owned land not under the City's control. Zone III is the remaining land that can contribute water to Zone II and ultimately reach the groundwater wells in more than ten years' time of travel. Zone III for Oil City's wells occupies an area of 1.45 square miles, and is also irregular-shaped.

The State's oil and gas regulations do not protect our drinking water sources. The regulations call for unconventional well developers to simply notify water purveyors when a proposed well is within 1,000 feet from a public water source - that's it! We can comment, and then DEP will make a decision. Why would the Commonwealth of Pennsylvania not use the information developed by source water protection plans throughout the State to limit oil and gas well development? Allowing oil and gas wells within delineated drinking water protection zones doesn't make sense!

I have been told that private property owners have rights. Do they have the right to threaten contamination of a drinking water supply in existence since 1897 serving 15,000 people? How about setting up a State fund using impact fees for water suppliers to purchase mineral rights within our water protection zones?

I have been told that well drilling is very safe and the threat of contamination is very small. I say to you, is it worth the risk? According to DEP, clean safe and reliable drinking water is fundamental to the viability of any community, and as advanced as today's treatment technologies are, they are not perfect. Not all contaminants can be removed or treated - and it is often far more costly to treat contaminated water than prevent contamination from occurring in the first place. The oil and gas regulations completely contradict what DEP already knows.

Information from the State puts all the responsibility for source water protection on the water supplier. They tell us to perform baseline monitoring for contaminants, stay abreast of oil and gas development in the area, and have a collaborative dialogue with resource extraction companies. The regulations tell us what we can do after our water becomes polluted. All of this is a mockery to those of us who take the quality of our drinking water seriously - it is time for the Commonwealth of Pennsylvania to take a stand and be proactive in protecting our drinking water instead of passing the buck.

And finally, I want you all to know I am not against oil and gas development. Indeed, the new shale gas extraction methods offer a shining ray of hope in our dismal regional economy. Rather, I support the intelligent development of oil and gas resources while protecting existing resources that provide our citizens a good quality of life and that includes our drinking water.

If the current drilling technology and methods are completely safe, is the Commonwealth of Pennsylvania willing to provide unlimited grant funding to cover the costs of clean-up and alternate supply of water associated with contamination of a municipal water supply resulting from oil or gas drilling? In other words, is the state willing to put its money where its mouth is? (795)

Response: Please see response to comment 208.

- 211.** Comment: Pennsylvania American Water has many final Source Water Protection Plans and Wellhead Protection Plans that have been developed in partnership with external stakeholders and the Pa Department of Environmental Protection (PaDEP). The first general comment to the proposed regulatory changes is that these plans should be used to establish set-back distances for drilling

operations and storage of waste materials (flowback water, cuttings, waste pits, impoundments) instead of a universal distance. Detailed work has been completed to form the various zones of protection for groundwater and surface water systems used as sources of drinking water. It is recommended that DEP create isolation zones for activity within Zone I of the wellhead protection plan radius identified. It is also recommended that no activity be permitted within Zone A for surface water supplies under the final Source Water Protection Plan. These zones have been identified by DEP, the public water supplier, and external experts as the areas of direct impact to the source in a short time. (1138)

Response: Please see response to comment 208.

212. Comment: Whenever possible, DEP should be allowed to assist water systems, Source Water Protection Committees and Coalitions in their endeavors to protect these Zones that have been deemed vital, in essence by DEP, in preventing the contamination of drinking water sources. The proposed amendment to Chapter 78 presents an opportunity to formalize this assistance. (1149)

Response: Please see response to comment 208.

213. Comment: 78.15(a) – We support electronic submittal of applications to improve processing efficiency. We recommend, however, the following revision to § 78.15(a) to improve transparency to the public and to require that the applicant provide a secure electronic signature on the application, certifying under penalty of perjury that the application contents are true and correct:

(a) An application for a well permit shall be submitted [on forms furnished by the] electronically to the Department through its web site. The permit application shall be made available to the public on the Department's website on the same day that the Department has determined that the application is complete. The electronic application must and contain the information required by the Department to evaluate the application and must include a secure electronic signature on the application certifying under penalty of perjury that the application contents are true and correct. (1143)

Response: The Department is committed to continually improving public access to environmental information. The Department declines to make posting application materials on our website a requirement; however, the Department will be working to make this information publically accessible on our website. The electronic well permit application has been developed and includes a certification and secure signature.

214. Comment: 78.15(a) should explain how the Department will make public an application submitted electronically and how public comment on the application will be accepted electronically, such as through email or its web portal. The Department has an obligation to make available to the public permit applications submitted to it for review and approval. The Department should explain in its regulation how it will make electronic applications available to the public, and how the public can submit comments on the applications. (852a)

Response: The Department's objective with respect to oil and gas operations is to make all electronic submissions available on our website as soon as possible after submission. Additionally, the Department provides access to public records in accordance with the Department's "Public Access to Information and Right to Know Law Policy," Document Number 012-0200-005. DEP routinely provides an extensive range of records for public inspection at its Regional Offices, including applications submitted electronically. Well permit applications are available for review at the Department's Southwest District Office of Oil and Gas Operations and Northwest Office of District Office of Oil and Gas Operations.

Additionally, the Board further declines to include a process for public comment as 2012 Oil and Gas Act outlines a notice, objection and conference process in Sections 3211(b)(2), 3212, and 3251.

215. Comment: Simultaneous electronic posting of the entire text of all well permit applications grouped by watersheds and political subdivisions. This should be in an easily accessible and user-friendly format on a website for public review. Will the PA DEP ensure that the public may review electronic submittals at PA DEP Regional offices? (15, 92, 867, 1098)

Response: The Department's objective with respect to oil and gas operations is to make all electronic submissions available on our website as soon as possible after submission. All electronic documents that the Department currently receives with respect to oil and gas operations are currently available via the Oil and Gas Mapping application. Additionally, electronic copies of some paper document submissions are available via the Oil and Gas Mapping application after scanning and upload by Department staff. Additional electronic documentation will become available as additional electronic reporting functionality is developed.

216. Comment: 78.15(a) Given the complexity of establishing electronic permitting, we recommend electronic submission be an option for a period of time, no less than 2 years, from the date electronic well permit submission is fully operational. (1174)

Response: The Department declines to make electronic permitting a voluntary requirement. The Department developed Electronic "eWell" Permitting in 2013 and this application became available to all permit applicants in early 2014. The eWell process streamlines the current oil and gas permitting process by converting the paper-based Drill and Operate a Well (DOW) permit, to an online process that includes an electronic application submission, online fee payment, and electronic review by Department staff.

217. Comment: We would like to see electronic comments, electronic submission of well application permits available to the public in advance of drilling and fracking. These should identify the full, range of cumulative impacts that may occur on that site, not only from the well pad but from storage tank area to the ponds to the pipelines and roads that come in. (845)

Response: Please see response to comment 215.

218. Comment: We would like support for the submittal of electronic permit applications. Travelling to the Regional Offices in for permit reviews is expensive in terms of staff time and resources. Electronic permit files should be available to the public upon request to limit the burden on affected citizens and interested organizations. (943)

Response: The Department acknowledges this comment.

219. Comment: 78.15(a) should be revised to state the following:

(a) An application for a well permit **may** ~~shall~~ be submitted [on forms furnished by the] **electronically to the Department through its website** and contain the information required by the Department to evaluate the application. **Registered Small Businesses may submit hard copy applications on forms furnished by the Department.** (1135)

Response: To the extent this comment recommends that electronic permitting be voluntary; please see response to comment 216.

To the extent this comment recommends that Registered Small Businesses be exempt from electronic permitting requirements, the Department has considered this comment but declines to make this change. The Department believes that the requirement to submit an electronic permit application is reasonable, appropriate, and necessary to allow the Department to fulfill its mission.

The Department is not initiating required electronic communication by operators with this final-form rulemaking. The Department notes that electronic reporting of production data for all operators – conventional and unconventional - was established by the “Oil and Gas Well Cementing and Casing” rulemaking (41 Pa.B. 805) in 2011 and is not a new requirement. Therefore, all operators should already be registered with the Department and submitting information to the Department electronically.

The Department also believes that utilization of electronic well permit application will have the effect of reducing the time spent filing information with the Department. In addition, it is the intent of the Department to utilize electronic filings and reports to enhance the transparency of the Department activities relative to oil and gas extraction in the Commonwealth. The Department strives to develop a process for submitting information that is user friendly and reliable for both external users and Department staff. Electronic submissions allow the public to have easy access to data via the Department’s web site.

Electronic submissions also have the benefit of reducing Department staff time doing data entry and avoiding the inevitable errors that occur when data is transferred from paper to a database.

Because applications cannot be filed electronically until they are complete, electronic reporting and notifications allow the Department to develop business rules to ensure that the data submitted is complete and accurate, thereby reducing the workload for both the Department and operators in returning and addressing deficient submissions.

Finally, electronic reporting and notifications allow the Department to have a complete picture regarding well development/operations to more efficiently determine compliance. For example, when reviewing production data, Department staff needs to have the permit, Well Record, Completion Report, and additional information readily available in order to help determine the validity of the production/waste data. Currently, paper files need to be retrieved, sometimes from other offices, to obtain this information.

The Department will continue in this effort by continually enhancing the existing applications based upon user feedback.

Please see the RAF for the final rulemaking to see how the Department considered cost of permit conditions against the benefits of electronic submission of forms.

220. Comment: Section 78.15 Application requirements: “An application for a well permit shall be submitted... and contain the information required by the Department to evaluate the application” appears to be absent of pipeline infrastructure requirements. Recommendation: include pipelines and infrastructure in application information requirements. (118)

Response: The Department disagrees that this information is needed as part of the well permit application as the well permit does not authorize pipelines activities. Pipeline construction activities are separately permitted under other laws, regulations and permits administered by the Department.

221. Comment: Since the onset of Unconventional gas well drilling, well applications have morphed from a two page application to a ten plus page application which must be applied for electronically to the DEP website. (627, 4681 – 4682)

Response: The Department acknowledges the comment.

222. Comment: 78.15(a), 78.15(b) We recommend that “complete” permit applications be further clarified, as provided in suggested language for 78.15(d), so that the applicant’s obligation to provide information with respect to threatened and endangered species is clear. We suggest that the Department carefully evaluate the placement of all submitted application forms on its public website for all public access, given the need expressed by public resource agencies to limit location information regarding threatened and endangered species and their habitat. (1103, 1174, 1137)

Response: The Department amended §§ 78.15 and 78a.15 to clarify that the permit application will not be considered complete until the applicant provides the information in subsection (d). In terms of posting well permits and well permit application materials on the Department’s website, the information contained in well permits and application materials is public information and it is appropriate for the Department to post public information on its website. The Department may redact sensitive habitat information.

223. Comment: Section 78.15(b) should be revised to state the following:

(b) The permit application will not be considered complete until the applicant submits a complete and accurate plat, an approvable bond or other means of complying with section [215] 3225 of the act [(58 P. S. § 601.215)] (58 Pa.C.S. § 3225), the fee in compliance with § 78.19 (relating to permit application fee schedule), proof of the notifications required under section 3211(b.1) of the act (58 Pa.C.S. § 3211(b.1), necessary requests for variance or waivers or other documents required to be furnished by law or the Department, and the information contained in subsection (c)–(e). **For purposes of notification, the adjacent municipality is the municipality in which the well is actually located unless the well is within 1,000 feet of the municipal boundary, in which case the bordering municipality shall also be notified under section 3211.b.2.** The person named in the permit shall be the same person named in the bond or other security. (1135)

Response: The Department declines to make the commentator’s suggested revision. Section 3211(b)(2) of the 2012 Oil and Gas Act requires both conventional and unconventional operators to forward a copy of the plat to “the municipalities adjacent to the well.” The Department has interpreted this requirement to require notice to those municipalities sharing a common border with the municipality in which the tract of land upon which the well to be drilled is located. Any change to this provision should be legislative.

224. Comment: Section 78.15 (b): The Section is inadequate for at least four reasons.

First, the Department has no authority to designate or regulate species or condition well permits based on species apart from the “habitat” of species that have otherwise been properly designated by the governing resource agency.

Second, for a permit application to be considered “complete” the applicant must provide “information contained in subsections (c) - (e).” Existing subsection (d) describes a negotiation process and both applicant and department duties rather than an information requirement. It requires the applicant to “consult” and “demonstrate,” and provide “proof of consultation.” None of this is clear with respect to anyone knowing what it is that is the required “information” to be supplied in order to satisfy subsection (b) and have a complete application. In effect, an endless merry-go-round of dialogue is proffered seemingly designed to force applicants to submit to whatever demonstrations or responses that the Department or a resource agency demand before an application may be considered complete.

Third, the standard of “may adversely impact” is in conflict with the Act 13 Section 3215 (e) statutory standard of “probable harmful impact” and for that reason the “may impact” standard is illegal as DEP was not delegated the authority to condition well permits unless the impact was “probable.”

Fourth, the subsection is in direct conflict with and appears to duplicate what appears in proposed subsection (f) (iv). Special concern species is discussed below, but any use or application of the term in what we have observed has always included threatened and endangered species. For the foregoing reasons, subsection (d) should simply be stricken from the proposed regulations. (81, 419)

Response: The Department has determined that the public resource impact screening provisions as outlined in Section 78.15(f)-(g) and 78a.15(f)-(g) are reasonable, appropriate and necessary to ensure that the Department has complied with its obligation to protect public resources under Article I, Section 27 of the Pennsylvania Constitution, the Administrative Code of 1929, the 2012 Oil and Gas Act, the Clean Streams Law, the Dam Safety and Encroachments Act, the Solid Waste Management Act and other statutes. Please see the response to comment 265.

The Department amended §§ 78.15(d) and 78a.15(d) to clarify what is required to be submitted as part of the well permit application.

The Department amended 78.15(d) and 78a.15(d) to require a detailed analysis of the impact of the well, well site and access road on threatened and endangered species. The process outlined in this section ensures that permit issuance will not violate the Endangered Species Act of 1972, 16 U.S.C.A. § 1531 et seq.; the Wild Resource Conservation Act, 32 P.S. § 5301; the Fish and Boat Code, 30 Pa. code § 101 et seq.; and the Game and Wildlife Code, 34 Pa.C.S. § 101 et seq.

The Department added definitions of “threatened and endangered species” and “other critical communities” in both 78.1 and 78a.1. These definitions seek to clarify that §§ 78.15(d) and 78a.15(d) apply to threatened and endangered species and §§ 78.15(f) and 78a.15(f) applies to other critical communities.

225. Comment: 78.15(b) – The EQB proposes minor changes to § 78.15(b) to conform the rule to the Act. The EQB does not propose to change the requirements for a complete permit application.

Because the current rules do not require submission of any substantive baseline assessment of the original ecological and soil characteristics of the well site, the site “restoration” required in proposed § 78.65 is largely meaningless. Without such an assessment, the PADEP will have no basis for judging whether the site actually has been restored to its original condition. To provide an empirical basis for that judgment, the applicant should be required to submit a written site restoration plan

with studies of baseline conditions sufficient to serve as the benchmark for the site restoration we recommend in our comments on § 78.65. The restoration plan also should identify measures sufficient to restore the site to its original condition. Where such restoration is not possible, the restoration plan should identify measures sufficient to mitigate any remaining adverse effects of the well construction and operation. The burden should be on the applicant to prove any claim that full site restoration is not possible and that proposed mitigation measures will be adequate to compensate for any loss of original features. The permit application should not be considered complete without the restoration plan, and submission of the application should be deemed a commitment to implementing the plan.

We recommend that proposed § 78.15(b) should be revised as follows:

(b) The permit application will not be considered complete until the applicant submits a complete and accurate plat, a site restoration plan including the baseline studies in paragraph (1), the restoration measures in paragraph (2), and the mitigation plan in paragraph (3), an approvable bond or other means of complying with section 3225 of the act (relating to bonding), the fee in compliance with § 78.19 (relating to permit application fee schedule), proof of the notification required under section 3211(b.1) of the act (relating to well permits), necessary requests for variance or waivers or other documents required to be furnished by law or the Department, and the information in subsections (c)-(e). The person named in the permit shall be the same person named in the bond or other security.

(1) A site restoration plan shall include studies and photographs documenting the existing contours, drainage patterns, type and density of native plant community, soil characteristics, and habitat of the full footprint of the proposed well site and any area potentially affected by Oil and Gas Operations associated with the proposed well construction and operation. Documentation of existing conditions shall include field data and shall not be based solely upon aerial and/or remote sensing studies. The site restoration plan shall be prepared by a qualified professional ecologist, certified forester, or landscape architect with demonstrated experience in restoration ecology.

(2) A site restoration plan shall include measures that the applicant will implement to restore the contours, drainage patterns, type and density of native plant community, soil characteristics, and habitat of the full footprint of the proposed well site and any area potentially affected by Oil and Gas Operations associated with the proposed well construction and operation to the baseline conditions documented in paragraph (1).

(3) If it is not technically feasible fully to restore the well site and potentially affected area in accordance with paragraph (2), the site restoration plan shall include measures that the applicant will implement to mitigate remaining impacts of Oil and Gas Operations associated with the proposed well construction and operation. The burden shall be on the applicant to prove that full site restoration is not technically feasible and that the proposed mitigation measures will be adequate to compensate for the loss of features that cannot be restored. (1143)

Response: The Department added requirements in 78.65(b) and 78a.65(b) outlining the requirements for a site restoration plan. The Department disagrees that this must be a component of the well permit application or that the restoration plan must contain an assessment as described by the commentator. Rather, restoration to approximate original conditions, capable of supporting original uses to the extent practicable is the best practice to achieve site restoration within reasonable operational parameters. Projects meeting the well site restoration requirements in Sections 78.65 and 78a.65 will satisfy the statutory restoration requirements and include performance requirements that will protect waters of the

Commonwealth. Additionally, well site projects that trigger the Chapter 102 requirements for an erosion and sediment control permit must submit a Site Restoration/Post Construction Stormwater Management Plan to the Department for review and approval prior to construction of the site as part of the Chapter 102 permitting requirements. Moreover, in Sections 78.65 and 78a.65, operators must submit a well site restoration report to the Department 60 days after restoration. When this report is submitted, the Department conducts an inspection to ensure that the restoration requirements have been met.

226. Comment: Notification of all municipalities touching the host municipality of a conventional or unconventional well is excessive. Notification of the host municipality and any municipality that will be drilled under should be sufficient.

There are no less than 23 separate notification requirements for the completion of a new well. This is excessive, time consuming and frankly an opportunity for well-meaning operators to get caught in non-compliance issues.

There are 19 separate and new forms referenced in the regulation package and not one of the forms was included in the draft package. This is a significant oversight and does not allow for public comment on the forms. (606, 606a)

Response: The referenced notifications are required by Section 3211(b)(2) of the 2012 Oil and Gas Act. Any change to those provisions should be legislative. The Department plans to have all necessary forms, guidance documents, and procedures available at the effective date of the rule making.

227. Comment: One of my biggest objections to the proposed regulations is the increased burdens concerning notification requirements. For example, on wells that I drilled on my property in Venango County last year, it was necessary for me to notify the surface landowner, the local municipality, and no less than an additional eight adjacent municipalities. What possible environmental benefit can come from me notifying these eight adjacent municipalities of my intention to drill four shallow, nine hundred foot deep oil wells? Municipality notification is just a start. You are then faced with spud notifications, casing cement notifications, frac notifications, well reports after drilling, completion reports after fracing, well sight restoration reports, and last but not least, annual production reports, and probably a few yet that I can't bring to mind. Forget to do any of them, and you are faced with a possible Notice of Violation. Additionally D.E.P.'s proposed Mechanical Integrity Assessment program will add another crushing layer of operator reporting requirements, with very little environmental benefit to show for it. (875)

Response: The referenced notifications are required by Section 3211(b)(2) of the 2012 Oil and Gas Act. Any change to those provisions should be legislative.

228. Comment: The requirement to notify the host municipality and all municipalities surrounding a proposed well adds unnecessary and time-consuming costs on the well drilling application process. We understand the need to notify surrounding municipalities due to the amount of truck traffic associated with unconventional well projects however, this requirement is especially burdensome to conventional shallow well projects. Shallow oil and gas wells typically see 10 to 20 truckloads over the entire drilling and completion process.

We support the PGCC recommendation that the requirement to notify adjacent municipalities be limited to within a reasonable distance, such as 2,000 feet, from the proposed well location. (885)

Response: The referenced notifications are required by Section 3211(b)(2) of the 2012 Oil and Gas Act. Any change to those provisions should be legislative.

229. Comment: The currently proposed regulations reference no less than 23 separate notifications to the Department. This onerous notification process should be limited or streamlined wherever possible. Furthermore, we would support the establishment of a building permit for conventional well operators, which would allow for well pad and access road construction if appropriate erosion and sediment controls are followed. (1118)

Response: The Department has considered this comment and declines to make the suggested amendments to this rulemaking. The referenced notifications are required by Section 3211(b)(2) of the 2012 Oil and Gas Act. Any change to those provisions should be legislative.

230. Comment: Jurisdictional agencies, including municipalities, should be encouraged to participate in decision making. Similarly other aspects of the proposed rulemaking that result in permits or decisions that can impact agencies and local governments and the resources they responsible for should be designed to encourage participation and sharing of information. Participation of these entities will improve the public input process and, in turn, provide DEP with valuable information and perspective, resulting in better decisions by the agency. There are several reporting requirements proposed, for instance, in this rulemaking. Municipalities and jurisdictional agencies should be copied on reports, sampling results, and other information that will assist in the management and protection of important resources and community assets. (1156)

Response: The Department has considered this comment and declines to make the suggested amendment to this rulemaking. Municipalities and applicable public resource agencies receive notice of the well permit application. To the extent that municipalities want access to additional information, the Department's objective with respect to oil and gas operations is to make all electronic submissions available on our website as soon as possible after submission.

231. Comment: **Setbacks from Waters of the Commonwealth**

- We recommend the establishment of setbacks at a minimum of 300 feet from the wellbore from any stream, water body, or wetland and a minimum of 100 feet from the edge of the disturbance of the well site.
- For High Quality and Exceptional Value streams, we recommend the requirement of additional setbacks or best management practices as determined necessary by the Department to protect existing high value water quality. (1031)

Response: The Department has considered this comment and declines to make the suggested change to this rulemaking. The Department added §§ 78.15(b.1) and 78a.15(b.1) to the final rulemaking that require additional consideration during the well permit application review process for any watercourse or any high quality or exceptional value body of water or any wetland one acre or greater in size. Importantly, Chapters 78 and 78a contain many provisions, including the requirements related to erosion and sediment control, surface water discharges, waste management, onsite processing, protection of water supplies, water management planning, secondary containment, well construction, and site restoration that ensure protection of waters of the Commonwealth.

232. Comment: § 78.15(c) The term “any changes to its business relationships” is overly broad and ambiguous. The commentator suggests the following amendatory language: “(c) The applicant shall submit information identifying parent and subsidiary business entities operating in this Commonwealth with the first well permit application submitted after [effective date] and provide

any changes to this information with each subsequent well permit application.” (1137,1147)

Response: The Department agrees. Sections 78.15(c) and 78a.15(c) have been modified to address the comment.

233. Comment: Given the nature of subcontracting in the industry, the identification of parent/subsidiary business entities is important. (15, 867, 1098)

Response: The Department acknowledges the comment.

234. Comment: We commend the Department for ensuring that the Proposed Regulations requires corporate disclosure information on parent and subsidiary entities in the permit application requirements in Section 78.15 (c). We believe this requirement should also extend to partnership and joint venture interests. (1142, 997a)

Response: The Department acknowledges the comments. To the extent that the commentator recommends adding partnerships and joint venture interests, the Department declines to make this change as Section 3211(e.1)(5) limits this inquiry to parent or subsidiary corporations. This change should be made to the 2012 Oil and Gas Act.

235. Comment: § 78.15 (c) Language should be added to clarify what change in business relationships means or alternatively, replace the wording “changes to its business relationships” with “changes to this information” which would more clearly refer back to the information previously provided (i.e. The information identifying parent and subsidiary business entities operating in Pennsylvania). (124a)

Response: The Department agrees. Sections 78.15(c) and 78a.15(c) have been modified to address the comment.

236. Comment: We support requiring identification of well operators’ parent and subsidiary companies (113)

Response: The Department acknowledges the comment.

237. Comment: Section 78.15(c) should be revised to state the following:

(c) The applicant shall submit information identifying parent and subsidiary business entities operating in Pennsylvania with the first application submitted after [effective date] and provide updated parent/subsidiary information ~~[any changes to its business relationships]~~ with each subsequent application. (1135)

Response: The Department has clarified when and what information must be updated in 78.15(c) and 78a.15(c) to address this suggested change.

238. Comment: 78.15(c): Clarify Parent and Subsidiary Compliance History and When a Change is Deemed to have occurred. Clarifying the proposed text in Section 78.15(c) will ensure the requested information on compliance history is utilized as an effective and responsible compliance tool. We agree that the Ownership and Control form need only be submitted once and updated when applicable. We hope the Board will consider events that trigger the proposed language of “provide any changes to its (the operator’s) business relationships” to ensure expectations on operator reporting are met. Without clarity on such triggering events, operators will likely continue the practice of submitting an Ownership and Control form with each permit application, generating

approximately nine pages of unnecessary filings with each permit application. This appears to be exactly the scenario that the Board is attempting to avoid with its proposal. (1085)

Response: The Department has clarified when and what information must be updated in 78.15(c) and 78a.15(c).

239. Comment: 78.15(c) The Proposed Rulemaking would add 25 Pa. Code § 78.15(c), which requires applicants for drilling permits to identify parent and subsidiary entities in their initial permit applications following the effective date of the rulemaking, and also identify changes to their “business relationships” in subsequent permit applications. The EQB should clarify exactly which “business relationships” must be disclosed. Further, applicants should be required to identify joint ventures and sister entities (meaning, those having the same parent entity as the applicant) in their initial permit applications. The Department must consider joint ventures and sister entities when determining whether nearby facilities are under common control and thus potentially subject to aggregation under the Title V, New Source Review and/or Prevention of Significant Deterioration rules established under the federal Clean Air Act and Pennsylvania’s Air Pollution Control Act.2 (1159)

Response: The Department has clarified when and what information must be updated in 78.15(c) and 78a.15(c). To the extent that the commentator recommends adding joint ventures and sister entities, the Department declines to make this change as Section 3211(e.1)(5) limits this inquiry to parent or subsidiary corporations. That change should be made to the 2012 Oil and Gas Act.

240. Comment: 78.15(c) We recommend clarifying language for “information identifying parent and subsidiary business entities.” Suggested Language: The applicant shall submit information identifying parent and subsidiary business entities operating in Pennsylvania with the first well permit application submitted after [effective date] and provide any changes to this information with each subsequent well permit application. (1174)

Response: The Department agrees. Sections 78.15(c) and 78a.15(c) have been modified to address the comment.

241. Comment: 78.15(c) Application Requirements - “within 30 days of any change to its business relationships”. It is suggested that the language be revised to state “any change of control or ownership in the local operating entity” so that operators do not have to notify the DEP every time there is a change in the business entity. In addition, language should be added to clarify what change in control means (e.g. merger, transfer of more than 50% of the parent company’s stock, etc.). (1057)

Response: The Department agrees that clarity is needed and has modified 78.15(c) and 78a.15(c). The Department declines to make the suggested change relating to “change in control.” Given the language in 3211(e.1)(5), it is appropriate to ask for well permit applicants to update this information when the applicant’s parent or subsidiary corporations change.

242. Comment: 78.15(c) should require the applicant to identify all corporate affiliates – not just parent and subsidiaries, and include a certification that no violations exist or are being contested.

The Department’s preamble to this provision mistakenly indicates that the amendment is intended to address a permit applicant’s “compliance history.” Section 3211(e.1) does not authorize the Department to deny a permit based on compliance history; it instead addresses continuing violations of the law – a concept completely different than violation history. The authority to deny a permit for

a continuing violation of law enables the agency to leverage the operator's need for a permit to obtain compliance with the law at other operations throughout the Commonwealth at a specific point in time; the authority to deny a permit based on violation history provides a continuing incentive for companies to comply with the law for fear that its cumulative history of violations will be deemed to demonstrate a lack of ability or intent to comply with the law, which thereby justifies a permit denial.

We support disclosure of parent and subsidiary relationships, and encourage the Department to extend that disclosure to affiliates with common financial or ownership interests. The reasoning that supports disclosure of parent and subsidiary relationships applies equally to affiliates – persons should not benefit financially from a company when a related company is violating the law. To maximize the Department's ability to ensure compliance with the law within the industry, the Department should extend the disclosure under this section to include affiliates that have a common financial or ownership interest.

Second, we urge the Department to add a requirement to this section that applicants submit a certification, under penalty of law pursuant to 18 Pa. Cons. Stat. § 4904, that the companies, its parents and subsidiaries are in compliance with the law or have obtained a supersede as in relation to an appeal of the alleged violation. Considering the limited time that the Department has to make permit decisions, such a certification would promote the efficient processing of permits by ensuring that companies self-police their own conduct prior to submitting a permit application. It would also promote self-reporting and self-correction of violations by applicants. Further, any company that knowingly fails to self-report or self-correct when submitting an application would risk serious penalties for submitting a false sworn statement to the Department. (852a)

Response: To the extent that the commentator recommends requiring applicants to identify all corporate affiliates with common financial or ownership interests, the Department declines to make this change as Section 3211(e.1)(5) limits this inquiry to parent or subsidiary corporations. To the extent that the commentator suggests a requirement that the well permit applicant submit a certification that the applicant and its parent and subsidiary corporations are in compliance with the law, the Department declines to make that change in this rulemaking.

243. Comment: The permit applicant, not DEP, should be responsible for determining whether proposed oil and gas operations would affect threatened or endangered species. (Section 78.15(d)). (19, 21, 23, 26, 90, 142, 153, 165, 180, 189, 192, 391, 429a, 609, 843, 851, 938, 946, 958, 1005, 938a)

Response: Sections 78.15(d) and 78a.15(d) require the well permit applicant to provide a detailed analysis of the impact of the well, well site and access road on threatened and endangered species. This analysis must include a PNDI receipt and, if there is conflict, written documentation demonstrating that the impact will be avoided, mitigated, or minimized along with any clearance letters, determinations, or correspondence with the applicable public resource agency. This process is necessary to ensure compliance with applicable law. Additionally, the Department has an obligation to ensure that permit issuance will not violate the laws that protect threatened and endangered species.

244. Comment: I applaud the addition of the proposed Subsection (d). With gas well drilling occurring in over 60% of the Commonwealth, and oil and gas pipeline activities occurring throughout the entire Commonwealth, the protection of threatened or endangered species is paramount. Hopefully, the misguided attempt to revise the Pennsylvania Endangered Species Act does not pass through the state legislature. (625)

Response: The Department acknowledges the comment.

245. Comment: § 78.15(d) - Suggested amendatory language: The applicant shall utilize PNDI to identify the presence or absence of a State or Federal threatened or endangered species where the proposed well site or access road is located and shall provide proof of notification and consultation with the applicable resource agency regarding the screening for the presence of such species and their critical habitat in the well permit application. For purposes of consulting with the Department, if the proposed well site or access road will have a probable adverse impact on such species or their critical habitat, the applicant shall submit a proposed plan or measures to avoid, prevent, or minimize the impact in accordance with State and Federal laws pertaining to the protection of threatened or endangered species and their habitat. An applicant's submission of the proposed plan or measures concludes the information required to be submitted to the Department pursuant to subsection (b). (1103, 1137, 1147, 1174, 1171)

Response: The Department disagrees and declines to include the suggested language. In accordance with federal and state law, the Department has an obligation to ensure that permit issuance will not result in a violation of the laws that protect federal or state threatened or endangered species. Accordingly, the Department has amended §§ 78.15(d) and 78a.15(d) in the final rulemaking to require well permit applicants to include a detailed analysis of the impact of the well, well site and access road on threatened and endangered species. This analysis must include a PNDI receipt and, if there is conflict, written documentation demonstrating that the impact will be avoided, mitigated, or minimized along with any clearance letters, determinations, or correspondence with the applicable public resource agency. This process is necessary to ensure compliance with applicable law.

246. Comment: Proof of consultation with the Pennsylvania Natural Heritage Program (PNHP) for State and Federal threatened or endangered species extended to all ecologically significant species and communities. Given rapidly increasing rate of environmental degradation and evolving issues related to climate change, the broader the purview, the greater protection of our Constitutional rights. [78.15 (d)] (15, 867, 1098)

Response: Sections 78.15(d) and 78a.15(d) apply to threatened and endangered species. Sections 78.15(f) and 78a.15(f) apply to "other critical communities" as that term is defined in §§ 78.1 and 78a.1. Section 78.15(d) and 78a.15(d) work in tandem with the public resource consideration requirements in §§ 78.15(f)-(g) and 78a.(f)-(g) to ensure the Department complies with its constitutional and statutory obligations.

247. Comment: 78.15(d) New Section – Proposed - Concurrent review of any permits and PNDI clearances (1057)

Response: The Department applies the "Policy for Pennsylvania Natural Diversity Inventory (PNDI) Coordination During Permit Review and Evaluation," Document No. 021-0200-001 (PNDI Policy), to applicable permits and authorizations related to threatened and endangered species and special concern species. In accordance with the PNDI policy, there are two options available to permit applicants for handling PNDI coordination in conjunction with DEP's permit review process involving either threatened and endangered species or special concern species – sequential review or concurrent review. For more information, refer to page 7 of the PNDI Policy. The Department follows this policy when reviewing well permit applications.

248. Comment: 78.15(d) – The EQB proposes to add a new requirement that the applicant provide proof of consultation with the Pennsylvania Natural Heritage Program (PNHP), with the goal of protecting threatened or endangered species where the well site or access road is located. If impacts are identified, the EQB proposes working with the applicant to minimize the impacts, without further inclusion of the PNHP in the decision-making process.

We support the additional consultation requirements with the PNHP. We recommend, however, that the consultation be improved in three ways.

First, the consultation should consider all species of special concern, as defined by the PNHP, not only threatened or endangered (T&E) species.

Second, the examination conducted for purposes of the consultation should include impacts from the full footprint of development, including all areas required for waste handling, processing, pipeline construction, storage, and other activities encompassed in the new proposed definition for “Oil and Gas Operations.” The newly defined term “Oil and Gas Operations” should be used to make the full scope of the activities within the development footprint clear. The area of analysis also should account for noise, light, and air pollution impacts that reach beyond the immediate footprint of Oil and Gas Operations. When Oil and Gas Operations are located in forest, the area of analysis should extend at least an additional 100 meters (328 feet) from the footprint perimeter of all Oil and Gas Operations to account for edge effects of tree cutting and their potential impacts on migratory birds. (19 See K.A. Harper, et al., Edge Influence on Forest Structure and Composition in Fragmented Landscapes, 19 Conserv. Biology 768–82 (2005); U.S. Geological Survey, Landscape Consequences of Natural Gas Extraction in Bradford and Washington Counties, Pennsylvania, 2004-2010, <http://pubs.usgs.gov/of/2012/1154/>; Md. Dep’t Natural Res., Maryland Forest Land Use Assessment, http://www.dnr.state.md.us/forests/download/sfla_report.pdf.)

Third, the regulations should require more than a standard T&E consultation, which is a minimal, reductionist approach to addressing habitat and forest sustainability. The standard approach is grossly inadequate for protecting forest structure and function, as it makes no attempt to define the spatial parameters of the ecosystem prior to the proposed disturbance. A failure to address pad, road, and gathering line configuration with respect to habitat continuity and connectivity will ensure widespread disruption of ecological processes. The science is clear on this issue, as the species impacts of habitat fragmentation are not specific to oil and gas development. What sets Oil and Gas Operations apart, however, is the dispersed area of build-out. We recommend that the deficiencies in the standard consultation process be cured in these regulations

Finally, PADEP should work with the applicant and PNHP to determine the appropriate mitigation (if any) for impacts that cannot be eliminated or determine when projects cannot be sufficiently mitigated.

The regulation should also require that all mitigation measures be included as conditions in the final permit.

We propose the following revisions:

§ 78.15(d) Application Requirements

The applicant shall provide proof of consultation with the Pennsylvania Natural Heritage Program (PNHP) regarding the presence of a State or Federal threatened or endangered species or species of special concern anywhere the proposed well site or access road is located within the full footprint

of the Oil and Gas Operations and adjacent area affected by such operations. The area of analysis must account for noise, light, and air pollution impacts that reach beyond the immediate footprint of Oil and Gas Operations. When Oil and Gas Operations are located in forest, the spatial parameters of the ecosystem in existence prior to the proposed disturbance shall define the area of analysis, which also shall extend at least an additional 100 meters (328 feet) from the footprint perimeter of all Oil and Gas Operations, and the analysis shall include a description of impacts on habitat continuity, forest connectivity, patch size, and core forest area.

If the Department determines, based on PNHP data or other sources, that the full footprint of the proposed Oil and Gas Operations well site or access road may adversely impact the species or critical habitat within the appropriately defined ecosystem, the applicant shall consult with the Department and PNHP to avoid or prevent the impact. If the impact cannot be avoided or prevented, the applicant shall demonstrate how the impacts will be minimized in accordance with State and Federal laws pertaining to the protection of threatened or endangered flora and fauna and species of special concern and their habitat by proposing specific mitigation measures for Department and PNHP consideration. The Department may deny the permit if no acceptable means is available to avoid or mitigate the impact. If avoidance or mitigation methods proposed by the applicant are acceptable to the Department and PNHP, those requirements shall be included as conditions of permit approval. (1143)

Response: Regarding noise, see response to comment 2913.

To the extent the commentator suggests that species of special concerns be addressed in §§ 78.15(d) and 78a.15(d), please see response to comment 246.

To the extent that the commentator suggests that these provisions extend to all oil and gas operations, Sections 78.15 and 78a.15 establish the well permit application process and are limited to activities associated with well construction and development. The requirements of these sections are designed to address the impacts within the limit of disturbance of the well site. Other activities associated with the oil and gas operations are regulated through various other provisions in Chapters 78 and 78a, or other laws implemented by the Department.

To the extent that the commentator suggests that the threatened and endangered species impacts review must be expanded to consider additional public resources, §§ 78.15(d) and 78a.15(d) work in tandem with the public resource consideration requirements in §§ 78.15(f)-(g) and 78a.(f)-(g). Notwithstanding the enumeration of specific public resources in the regulations, the Department will consider the potential impacts to other public resources identified during the permitting process. To the extent that the commentator suggests that additional protections are needed, Chapters 78 and 78a, as well as other regulations, permits and policies implemented by the Department under Pennsylvania's environmental laws as well as the laws implemented by other agencies, establish a comprehensive regulatory scheme for oil and gas well development activities to ensure protection of public health, safety and the environment. The purpose of these provisions is to identify, consider, and protect public resources.

- 249. Comment: 78.15(d). Application Requirements. - Well pads, access roads and gathering lines have been located either within or in close proximity to core habitat areas in Wyoming County. [Sharpe Location ESX13-131-0010, EDF 1H-6H ESX10-131-0002] Core habitat polygons typically represent the aggregation of core habitats for the assortment of species of concern occurring in any one area. Core habitat areas host critical communities, species of special concern. The fact that we have such areas within our region, attests to the healthy environment in which we live. Because**

we've been unable to adequately protect these areas on private lands, it is imperative to protect these areas on our public lands. Therefore, we recommend this provision as written. (660a)

Response: The Department acknowledges this comment. Please see comment 245 relating to amendments to this section in the final rulemaking.

250. Comment: Request for Clarification as to Scope of Operator Consultation with Pennsylvania Natural Heritage Program (PNHP). We ask that the Board streamline its use of terms related to species and habitats throughout this section and others to ensure uniformity of interpretation among the Department and the regulated community; especially, when related to obligations of permit applications that relate back to the direction of Act 13 Section 3215(e) related to well permit conditions for public resources. The proposed provision creates uncertainty about a permit applicant's obligations related to protecting important public resources.

In Section 78.15(d), the Board proposes that operators consult PNHP regarding the presence of a federal or state threatened or endangered species where a well site or access road is proposed. The Rule then goes on to give the Department the authority to determine, based on PNHP data or other sources, if the proposed well site or access road may adversely impact a species or critical habitat. We note that neither the PNHP Species of Special Concerns Lists nor PNHP's Pennsylvania Natural Diversity Inventory (PNDI) is defined as tools to find, define, or verify any potential impacts to "critical habitats." Currently, as stated on the PNHP website, the PNHP Species of Special Concerns List system is not used to find, define, or verify any potential impacts to critical habitats; rather it inventories and maintains a list of ecologically significant species and communities. PNHP's PNDI lists potential impacts on resources of special concern, and PNDI offers a means of documenting that it was consulted (i.e., issues a receipt). Thus, the use of this term appears superfluous in the proposed language and it should be deleted. However, If the Board intends "consultation with the PNHP" to mean a search through the PNHP's PNDI system, it could expressly state so in the Rule to assure uniform consultation among operators.

Additionally, the proposed language allowing for the Department to consult other sources to determine whether the proposed well site or access road may have an adverse impact should be further clarified as to set reasonable expectations. To maximize compliance, we recommend including a clear and expressly enumerated list of Department consulted sources. (1085)

Response: The Department has amended these sections in the final rulemaking. For the changes to §§ 78.15(d) and 78.15(d), please see response to comment 245. Additionally, the Department added definitions for "common area of a school's property," "limit of disturbance," "other critical communities," "Pennsylvania Natural Diversity Inventory," "PNDI receipt," "playground," "public resource agency," and "threatened and endangered species." These new definitions were added to provide clarity and establish a known universe of public resources that are identifiable. The purpose of these public resource provisions is to largely codify how the Department currently implements its obligations to consider public resources as part of the well permit application process through the well permit applicable forms, the PNDI policy, and "Coordination with Public Resources" form.

251. Comment: 78.15(d) – Commentator supports requiring well permit applicants to consult with the Pennsylvania Natural Diversity Inventory Environmental Review Tool (PNDI ER Tool) and we strongly recommend that the Pennsylvania Department of Environmental Protection (Department) Policy for Pennsylvania Natural Diversity Inventory (PNDI) Coordination During Permit Review and Evaluation (Document Number 021-0200-001) be followed during this environmental review process. The PNDI ER Tool provides immediate access to a database of known occurrences of

federally listed threatened and endangered species. The PNDI ER Tool is continually updated. Although field habitat or species surveys may reveal previously unknown locations, the PNDI ER Tool will assist the Department with avoiding issuance of a permit that may result in take of known federally listed species in a proposed permit area. Section 9 of the Act prohibits the take of any federally listed animal species by any person subject to the jurisdiction of the United States. Section 11 of the Act provides for both civil and criminal penalties for those convicted of section 9 violations. When no federal nexus (i.e., a Federal agency funds, authorizes, or carries out an action) exists, take incidental to an otherwise lawful activity may be authorized, and a section 9 violation avoided, through issuance of an incidental take permit pursuant to section 10(a)(1)(B) of the Act should be obtained. The Service may issue such a permit upon completion of a satisfactory habitat conservation plan for the listed species that would be taken by the project. (1006, 1134)

Response: The Department acknowledges the comment.

252. Comment: 78.15(d) should clarify that it applies to any activities associated with well construction that may impact threatened or endangered species.

Subsection (d) requires consultation with PNHP for any threatened or endangered species where the proposed well site and access road are to be located. The term “well site” means the area where the equipment necessary for or incidental to drilling, production or plugging of the well. The investigation should encompass all activities authorized under the permit that may affect threatened or endangered species, including those that are not located on the specific area where equipment will be located for drilling, production or plugging. To ensure a properly scoped investigation, we suggest the proposed language 78.15(d) read: “the well site, access road, or other area that may be impacted by activities authorized by the permit.” (852a)

Response: See responses to comments 245 and 250.

253. Comment: The proposed regulations change that obligation by only requiring gas operators to mitigate the impact of their operations on threatened or endangered species if the DEP determines that the well site location will adversely impact species or “critical habitat.” Because an operator proposing an oil or gas project stands to gain financially from the project, and is in the best position to understand the scope and potential impact of its proposal, the operator (and not DEP) should have the burden of determining whether its project would affect listed species and their habitat.” The analysis of the habitat and the species at risk can then be reviewed by the public. (19, 21, 23, 26, 90, 142, 165, 189, 192, 391, 938, 946, 958, 1005, 938a)

Response: See response to comment 245.

254. Comment: Section 78.15(d) should be revised to state the following:

(d) The applicant shall utilize the Pennsylvania Natural Diversity Inventory (PNDI), or comparable database, to identify [provide proof of consultation with the Pennsylvania Natural Heritage Program (PNHP) regarding] the presence of a State or Federal threatened or endangered species where the proposed well site [~~or access road~~] is located. If [~~the Department determines, based on PNHP data or other sources, that~~] the proposed well site [~~or access road~~] may adversely impact the species or critical habitat, the applicant [~~shall consult with the Department to avoid or prevent the impact. If the impact cannot be avoided or prevented, the applicant~~] shall demonstrate how the impacts will be minimized in accordance with State and Federal laws pertaining to the protection of threatened or endangered flora and fauna and their habitat. An applicant’s submission of the proposed

plan or measures concludes the information required to be submitted to the Department pursuant to subsection (b). (1135)

Response: The Department disagrees that the suggested changes should be included in the final rulemaking.

The Department has amended §§ 78.15(d) and 78a.15(d) in the final rulemaking to require well permit applicants to include a detailed analysis of the impact of the well, well site and access road on threatened and endangered species. This analysis must include a PNDI receipt and, if there is conflict, written documentation demonstrating that the impact will be avoided, mitigated, or minimized along with any clearance letters, determinations, or correspondence with the applicable public resource agency. This process is necessary to ensure compliance with applicable law.

Use of PNDI is consistent with the Department's past practices and policies. Prior to this rulemaking, the Department's well permit application materials and its "Policy for Pennsylvania Natural Diversity Inventory (PNDI) Coordination During Permit Review and Evaluation," Doc. No. 021-0200-001 establish a process that has been and continues to be in use by well permit applicants to identify the impacts to threatened and endangered species. The final rulemaking codifies this process and is consistent with the Department's long-standing use of PNDI to fulfill its responsibilities related to threatened and endangered species when issuing permits under various environmental statutes.

§§ 78.15(d) and 78a.15(d) make appropriate use of information available in the PNDI database from the public resources agencies with the authority, knowledge and expertise to identify and protect species of special concern. Sections 78.15(d) and 78a.15(d) outlines a reasonable and appropriate process that provides important information to the Department to ensure compliance with applicable federal and state law related to threatened and endangered species.

To the extent the commentator suggested limiting this obligation to the well site, the Department disagrees because it considers the impacts of the well to include impacts from the well site and access road.

255. Comment: The Pennsylvania Natural Diversity Inventory (PNDI) system was originally set up with two goals—species protection as part of the DEP permitting process and government and conservation planning efforts - two goals that do not necessarily coincide.

The Pennsylvania Natural Heritage Program (PNHP) maintains a list of special concern species, which cannot be the source of undefined obligations for permit applicants because it is a disparate grouping of entries, over 50% of which have not been designated any status in accordance with rulemaking procedures. Even among those designated by state agencies, aside from those listed as threatened or endangered, no particular protections are conferred upon any species.

Recent activity on the PNHP list, which contains over 1600 entries, also indicates why the database cannot be used to determine legal obligations of permit applicants. Between May 2012 and August 2012, entries with no codes increased from 400 to 534. In the 14 months between 5/25/2012 and 7/31/2013, the following activity occurred:

- federal listed species increased from 25 to 39, most of which are "partial" status;
- state listed species increased from 751 to 776, which is not reflective of rulemaking activity during that time period, raising a question about the daily accuracy of the list;

- species with Pennsylvania Biological Survey codes, but with no corresponding federal or state codes, increased from 145 to 204.

PHNP's list of special concern "species" includes non-species entries as well.

- 20 "geology" entries, listing anticlines, drainage patterns, erosional remnants, kettelholes, meandering channels, potholes, dunes, waterfalls and rapids; and
- 161 "community" entries, listing lakes, wetlands, woodlands, marshes, cliffs, meadows, tree stands, forests, thickets, shrubland, peatland, and more.

PNDI receipts do in fact provide hits for plant communities. Every natural plant community that occurs in Pennsylvania is on that list including the most common forest types, such as the "northern hardwood" plant community. Pennsylvania has over 29 million acres of land, over 16 million of which is forested. About 38% of Pennsylvania forests, over 6 million acres, are of the northern hardwoods type. We are unaware if anyone received a hit for "northern hardwoods" but there have been hits for the very common "hemlock-northern hardwood" subtype.

In an effort to further understand the scope of the proposed obligations related to special concern species—which are any species other than threatened or endangered species that have been placed in a database tool used for project and permit reviews — Commentator requested a meeting and met on October 8, 2013 with representatives from DEP, Pennsylvania Game Commission, Pennsylvania Fish and Boat Commission and the Department of Conservation and Natural Resources. DCNR informed attendees that:

- The actual database of special concern species, upon which permit obligations are based, is not public, viewable or printable;
- "Special concern" species, other than threatened or endangered species, are added by agencies and scientist volunteers without public notice, comment, participation or rulemaking procedures; and
- The resource agencies acknowledged that there are no binding legal survey or mitigation obligations associated with special concerns species that are neither threatened nor endangered.

In the absence of any explanation and in an effort to understand how the DEP recently arrived at the conclusion that "special concern species" meant or equates to the term "critical communities" in Section 3215(c)(4) of Act 13 and the identical and earlier use of the term in the original 1984 Oil and Gas Act legislation, it is instructive to examine the legislative record and relevant historic publications. This review resulted in the following findings:

- Senate Bill 402 of the 1983 and 1984 Legislative Session was the Bill that comprised the 1984 Oil and Gas Act or what became Act 223.
- The Original Bill referred to the Senate Environmental Resources and Energy Committee on February 24, 1983 had no separate provisions addressing consideration of public resources in well permitting.
- Printers copy number 2087 of the Bill, which first appeared on June 12, 1984 included a Section 205(c) which is identical to the current Act 13 Section 3215(c), to include the term "critical communities" except for the Act 13 addition of subsection 3215(c) (6) pertaining to public drinking water supplies and 3215(b) waivers.
- Act 223, to include Section 205(c) was signed in the House and Senate on November 29, 1984 and approved by the Governor on December 19, 1984.

- As reported on the Pennsylvania Biological Survey (PABS) website, the book or publication discussing ‘species of special concern’ in Pennsylvania was not published until 1985.
- The PABS history states: “The Pennsylvania Biological Survey traces its origin to an initiative by representatives of the National Audubon Society, Pennsylvania Game Commission, Pennsylvania Fish and Boat Commission, and the former Department of Natural Resources (now two departments - Department of Conservation and Natural Resources and Department of Environmental Protection), who met in 1979 to discuss the need to develop a coordinated inventory and assessment of the flora and fauna of Pennsylvania. The Survey’s first task was to document the status of plants and animals of special concern in Pennsylvania. A subsequent five-year effort resulted in the publication in 1985 of Species of Special Concern in Pennsylvania (H. H. Genoways and F. J. Brenner, eds., Carnegie Museum of Natural History, Special Public. No. 11, Pittsburgh, Pa. 1985). This volume contained information on the status of 297 species, including representatives of all 5 classes of vertebrates, selected groups of invertebrates, and vascular plants.” According to the experts who wrote an edited this book, the term “special concern species” includes both listed and non-listed species; it is an umbrella term with no clear meaning or definition.
- The term “critical communities” as used in Act 223 and Act 13 predated the publication of this inventory of and any general use of the term “species of special concern” or “special concern species” by at least 7 months.
- There is no reference in the legislative history of Act 223 to “species of special concern” or “special concern species.”

Because the term, concept, and actual inventory of “special concern species” or “species of special concern” with respect to Pennsylvania post-dates the use of the term “critical communities,” in Act 223 the Pennsylvania legislature could not and did not intend for the term to include or mean “species of special concern” or “special concern species.” Accordingly, the DEP has no basis in law or fact from which to conclude that the terms “critical communities” means or is synonymous with the terms “special concern species” or “species of special concern.” Accordingly, it cannot extend legal protection obligations to such species via Chapter 78 regulatory revisions absent authority delegated to it to do so by the legislature.

When the DEP submitted proposed Section 78.15(f)(iv) to the EQB as a proposed rule on August 30, 2013, it did not even know the meaning or potential meaning of the term “special concern species.”

The Agenda for a “DEP and Jurisdictional Agency Meeting” held on Friday, November 1, 2013 with respect to “public resources” poses in the 9:10 to 9:30 meeting time frame titled “Species of Special Concern” three questions. The questions were: 1) “What is the universe of species considered as species of special concern?” 2) What is the process for listing a species of special concern by each jurisdictional agency?” and 3) What are the mitigation measures recommended by the jurisdictional agencies for species of special concern?”

Suggested amendatory language:
Section 78.15 Application Requirements

* * * * *

(d) The applicant shall utilize the Pennsylvania Natural Diversity Inventory (PNDI) to identify the presence or absence of a state or federal threatened or endangered species where the proposed well site or access road is located and shall provide proof of notification and consultation with the applicable resource agency regarding the screening for the presence of such species and their critical habitat in the well permit application. For purposes of consulting with the Department, if the proposed well site or access road will have a probable harmful impact on such species or their critical habitat, the applicant shall submit a proposed plan or measures to avoid, prevent, or minimize the impact in accordance with state and federal laws pertaining to the protection of threatened or endangered species and their habitat. An applicant's submission of the proposed plan or measures concludes the information required to be submitted to the Department pursuant to subsection (b).

(e) If an applicant seeks to locate a well on a well site where the applicant has obtained a permit under § 102.5 (relating to permit requirements), the applicant is deemed to comply with the application submission requirements of subsections (b) and (d) with respect to supplying the required information regarding proof of consultation with the applicable resource agency and the Department.

(f) An applicant proposing to drill a well at a location listed in paragraph (1) shall notify the applicable resource agency, if any, in accordance with paragraph (2) and provide the information in paragraph (3) to the Department in the well permit application.

(1) This subsection applies if the proposed well is located:

- (i) in or within 200 feet of a publicly owned park, forest, game land or wildlife area.
- (ii) in or within the corridor of a state or national scenic river.
- (iii) within 200 feet of a national natural landmark.
- (iv) within 200 feet of a historical or archeological site listed on the Federal or State list of historic places.
- (v) in the case of an unconventional well, within 1000 feet of a water well, surface water intake, reservoir or other water supply extraction point used by a water purveyor.
- (vi) in a location that will impact critical habitat of state or federal threatened or endangered species.

(2) The applicant shall notify the public resource agency responsible for managing the public resource identified in paragraph (1), if any. The applicant shall forward by certified mail a copy of the plat identifying the proposed location of the well, well site and access road and information in paragraph (3) to the public resource agency at least 15 days prior to submitting its well permit application to the Department. With respect to surface landowners who are also the public resource agency to be notified, the notification required by Section 3211 (b.1.) of the Act, provided it includes the information prescribed by this subsection, satisfies the notification requirements of this subsection. With respect to subsection (f) (vi) above, the notification requirements of this paragraph only apply if the applicant has not previously notified the applicable resource agency pursuant to the applicant's use of the PNDI process. The applicant shall submit proof of notification required by this subsection with the well permit application. From the date of notification, the public resource agency shall have 15 days to provide written comments to the Department and the applicant on the functions and uses of the public resource and the measures, if any, that the public resource agency recommends the Department consider to avoid or minimize probable harmful impacts to the public resource where the well, well site and access road is located. The applicant may provide a response to the Department to any such comments within 10 days of receipt of the comments.

(3) The applicant shall include the following information in the well permit application on forms provided by the Department:

- (i) an identification of the public resource.
- (ii) a description of the measures proposed to be taken to avoid or mitigate impacts, if any.

(4) The information required in paragraph (3) shall be limited to the discrete and physically separate and distinct area of the public resource that may be affected by the well, well site and access road.

(g) Subject to satisfying and complying with the criteria prescribed in subparagraphs (1)-(3) below, the Department may include conditions in the well permit to avoid or mitigate impacts to the public resource. The presence of well sites and the conduct of oil and gas operations on or in the vicinity of public resources, as listed in Section 3215(c) of the Act, are not in and of themselves an impact or considered a harm requiring or authorizing the imposition of any well permit conditions under Section 3215(e). The conduct of oil and gas operations is one of many lawful and multiple uses of land that occur on or in the vicinity of public resources. As prescribed in Section 3215(e)(1) of the Act, in determining whether to impose a condition, the Department shall utilize the following three sets of criteria:

(1) Criteria to use for conditioning a well permit based on its impact:

- (i) No permit condition may be imposed unless DEP determines that such a condition is necessary to protect against the probable harm.
- (ii) No permit condition may be imposed unless the evidence of probable harm is supported by clear and convincing evidence that the harm to the public resource is probable, rather than merely possible or speculative harm.
- (iii) No permit condition may be more restrictive or limiting with respect to a well, well site or access road than the set-back prescriptions contained in the applicable section of Act 13 unless it is shown by clear and convincing evidence that the existing protections of Act 13, Clean Streams Law, or other applicable statutes are insufficient to protect against the specified harm or unless the applicant consents in writing to the condition.
- (iv) No permit condition may be more restrictive or limiting with respect to a well, well site, or access road or the conduct of oil and gas operations incident thereto than the existing measures and protections established and required under Chapter 78, Act 13, or any other environmental Act or regulation administered by the Department unless it is shown by clear and convincing evidence that the existing measures and protections are insufficient to protect against the specified harm or unless the applicant consents in writing to the condition.
- (v) The nature of the harm to be avoided or mitigated by the permit condition must be clearly described in the terms of any proposed permit condition and permit.

(2) Criteria, in addition to those in paragraph (1), to ensure optimal development of oil and gas resources:

- (i) no condition implicating surface activities or operations may be imposed that results in commercially unreasonable financial burdens on applicants.
- (ii) for purposes of conservation and avoiding the waste of recoverable oil and gas resources, no conditions may be imposed that result in alterations to the well design in a way that will reduce the anticipated volume of recoverable gas or oil resources.
- (iii) for purposes of administering this subsection, no condition may be imposed that results, or could result, in permitting delays in violation of the Permit Decision Program.
- (iv) permitting decisions may not be influenced by an applicant's refusal to waive the financial burden restriction.

(3) Criteria, in addition to those in paragraphs (1) and (2) above, to use for respecting private property rights of oil and gas owners:

- (i) in accordance with subsection 3215(g)(2) of the Act, no conditions may be imposed on well permits where the proposed condition itself alters or abridges the terms of any lease, deed, surface use agreement or similar contract or agreement between a surface owner and subsurface oil and gas owner or to which they are subject as signatories or successors in interest.
- (ii) denial of a well permit is not a prevention, avoidance, or mitigation measure authorized by this section.
- (iii) no permit conditions may be imposed if the effect would deprive the owner of the oil and gas rights of the right to produce or share in the oil or gas underlying a surface tract.

(h) A decision to impose or not to impose a condition is non-precedential and does not bind the Department or applicant or require either adhering to or including the same condition or conditions addressing the same subject matter in any subsequent permits.

(i) The issuance of a permit containing conditions imposed by the Department pursuant to this subsection shall be an action that is appealable to the Environmental Hearing Board. The Department shall have the burden of proving that the conditions were necessary to protect against a probable harmful impact of the public resource. (1153)

Response: The Department has considered the commentator's comments and declines to make the suggested changes.

To provide clarity; however, the Department has made several changes in the final rulemaking in §§ 78.15 and 78a.15.

For changes to §§ 78.15(d) and 78a.15(d), please see response to comment 245.

To the extent the commentator comments on the provisions related to species of special concern, the Department has determined that the public resource impact screening provisions as outlined in Section 78.15 and 78a.15 are reasonable, appropriate and necessary to ensure that the Department has complied with its obligation to protect public resources under Article I, Section 27 of the Pennsylvania Constitution, the Administrative Code of 1929, the 2012 Oil and Gas Act, the Clean Streams Law, the Dam Safety and Encroachments Act, the Solid Waste Management Act and other statutes. Please see the response to comment 265.

Specifically, under Section 3215(c)(4) of the 2012 Oil and Gas Act, the Department has a legal obligation when reviewing a well permit application to consider the impacts to public resources including "other critical communities." The phrase "other critical communities" is defined in the final rulemaking to mean species of special concern identified through the Pennsylvania Natural Diversity Inventory (PNDI) consistent with the Department's past practices and policies. Under Section 3274 of the 2012 Oil and Gas Act, the Environmental Quality Board has the authority to promulgate regulations necessary to implement the statute.

The Department's well permit application materials and its "Policy for Pennsylvania Natural Diversity Inventory (PNDI) Coordination During Permit Review and Evaluation," Doc. No. 021-0200-001 establish a process that has been and continues to be in use by well permit applicants to identify and consider species of special concern. The final rulemaking codifies this process and is consistent with the Department's long-standing use of PNDI to fulfill its

responsibility to consider impacts on species of special concern when issuing permits under various environmental statutes. Any suggestion that there is no basis for this process ignores long-standing, existing Department practice prior to the General Assembly's re-codification of these requirements in Act 13 of 2012.

In response to comments, the final rulemaking amends the definition of "other critical communities" to clarify that this term applies only to those species of special concern that appear on a PNDI receipt. Also in response to comments, the Department removed the provisions in the draft-final rulemaking relating to specific areas within the geographical area occupied by a threatened or endangered species and significant non-species resources. These changes were to ensure that the definition reflects the existing PNDI process.

The processes for consideration of public resources in Sections 78.15 and 78a.15 makes appropriate use of information available in the PNDI database from the public resources agencies with the authority, knowledge, and expertise to identify and protect species of special concern. Sections 78.15(f) and 78a.15(f) outline a reasonable and appropriate process that provides important information to the Department to evaluate potential impacts and to assess the need for additional conditions in the well permit using the criteria in Section 78.15(g) and 78a.15(g). This process is necessary to ensure that the Department fulfills its constitutional and statutory obligations.

To the extent that the commentator suggests amendments to §§ 78.15(g) and 78a.15(g), these sections have been amended to clarify the criteria the Department will consider when deciding whether to condition an oil or gas well permit based on impacts to public resources.

256. Comment: The permit applicant and the PA Fish, Boat and Game Commission (not the DEP) should be responsible for determining whether proposed oil and gas operations would affect threatened or endangered species.(429a)

Response: In accordance with federal and state law, the Department has an obligation to ensure that permit issuance will not result in a violation of the laws that protect federal or state threatened or endangered species. Please see response to comment 245.

257. Comment: An additional problem with DEP's proposed revision to 78.15 is the cumulative nature of the obligations. The PNDI requirements for the protection of threatened and endangered species are time consuming and sometimes require modifications of well sites, activity times, or dates, and other operational sequencing. There is a cost involved with paying a professional consultant to conduct the PNDI search and those costs increase when PNDI conflicts are encountered. (413a)

Response: The provisions in this rulemaking impose no new requirements on well permit applicants. Rather, these provisions seek to codify existing practices and policies to ensure compliance with applicable federal and state law relating to threatened and endangered species.

258. Comment: Like others, the conventional oil and gas industry has been adversely impacted by the ambiguity surrounding the requirements related to threatened species, endangered species and species of special concern. We urge cooperation between the Department of Environmental Protection and the resource agencies to establish an efficient system for identifying and protecting endangered species, including availability of a centralized database of endangered species and their areas of critical habitat. (1113, 1115a, 1118, 1120, 1176-1188)

Response: The Pennsylvania Natural Diversity Inventory is the applicable tool. To provide clarity, the Department has added definitions for “limit of disturbance,” “other critical communities,” “Pennsylvania Natural Diversity Inventory,” “PNDI receipt,” “public resource agency,” and “threatened and endangered species” to the final-form rulemaking. These new definitions were added to provide clarity and establish a known universe of public resources that are identifiable. The purpose of these public resource provisions is to largely codify how the Department currently implements its obligations to consider public resources as part of the well permit application process through the well permit applicable forms, the PNDI policy, and “Coordination with Public Resources” form.

259. Comment: Section 78.15(e) should be revised to state the following:

(e) If an applicant seeks to locate a well on a well site where the applicant has obtained a permit under 25 Pa. Code § 102.5 (relating to permit requirements) and complied with 25 Pa. Code § 102.6(a)(2), the applicant is deemed to comply with the application submission requirements of subsections (b) and (d) with respect to supplying the required information regarding proof of consultation with the applicable resource agency and the Department. (1135)

Response: The Department has amended §§ 78.15(e) and 78a.15(e) in the final rulemaking to clarify when and how Chapter 102 permitting may be used to demonstrate compliance with the provisions of Chapter 78 and 78a.

260. Comment: 78.15(e) – The EQB proposes to exempt applicants from the new requirement at § 78.15(d) to provide proof of consultation with the PNHP if the applicant has submitted an Erosion and Sediment Control Permit Application under 25 Pa. Code § 102.5 and complies with 25 Pa. Code § 102.6(a)(2). We do not support the proposed exemption under § 78.15(e), because, existing regulations at Pa. Code § 102.6(a)(2) do not incorporate the changes we have recommended to the proposed regulatory language in § 78.15(d).

Permits issued under Chapter 102 are issued as General Permits under an Erosion and Sediment Control General Permit (ESCGP), specifically permit number ESCGP-2 (and formerly ESCGP-1). Many permit applications are administered at the County Conservation District level, but even those administered at the Department level are not subject to detailed technical review. As a result, many projects that are operating under an ESCGP-1 or ESCGP -2 permit are operating in violation of permit requirements for erosion and sediment control and stormwater management. Since permits issued under § 102 are currently failing to meet the requirements of Chapter 102 for erosion and sediment control and stormwater management, it would be inappropriate to assume that adequate consultation with the PNHP has occurred for purposes of a well permit simply because general permit coverage under Chapter 102 has been obtained. General permit coverage under ESCGP-2 provides no assurance that permit requirements have been met.

We recommend that the PADEP work with the applicant and the PNHP to determine the appropriate mitigation for adverse impacts and require that those mitigation measures be included in the final permit, or if adverse impacts cannot be sufficiently mitigated to deny the permit.

We recommend that § 78.15(e) be deleted in its entirety. (1143)

Response: The Department does not agree that “many projects that are operating under an ESCGP-1 or ESCGP -2 permit are operating in violation of permit requirements for erosion and sediment control and stormwater management.” The Department has amended the

language of Sections 78.15(e) and 78a.15(e) to include the requirement that the PNDI must have been received by the permittee within two years of the application submitted under this section. This is consistent with the PNDI policy which provides that PNDI receipts are valid for two years.

- 261.** Comment: § 78.15(e) - This section is apparently meant to preclude duplicate PNDI clearances for the same location. We understand the purpose of this section is to provide for circumstances where the applicant has obtained an ESCGP-2 for a well site, and the PNDI review would therefore not need to be duplicated for the permit application. Because we have experienced several lengthy delays as a result of just such a situation, this is a particularly important change in our view. We recommend clarification that this deemed compliance also incorporates the application submission requirements under 78.15(b). Suggested amendatory language: § 78.15(e) If an applicant seeks to locate a well on a well site where the applicant has obtained a permit under § 102.5 (relating to permit requirements), the applicant is deemed to comply with the application submission requirements of subsections (b) and (d) with respect to supplying the required information regarding proof of consultation with the applicable resource agency and the Department. (1147, 1103, 1174)

Response: The Department disagrees that this change is necessary. Sections 78.15(e) and 78a.15(e) specify that Chapter 102 permit coverage may be used to comply with §§ 78.15(b.1), 78.15(d), 78a.15(b.1) and 78a.15(d) respectively. This applies when the project area is the same and the Chapter 102 permit was obtained within 2 years of receipt of the well permit application. When an applicant makes this demonstration in the well permit application, the applicant has complied with §§ 78.15(d) and 78a.15(d) for purposes of § 78.15(b) and 78a.15(d).

- 262.** Comment: Avoid duplication via a permit under 25 Pa. Code § 102.5 but trigger the initiation of the 78.15 process when modifications or renewals of permits occur. [78.15 (e)] (15, 867, 1098)

Response: In accordance with the PNDI policy, PNDI receipts are valid for two years. To the extent that an operator seeks a modification or renewal during that timeframe, a new PNDI receipt is not required.

- 263.** Comment: § 78.15(e) - Because 78.15(d) essentially restates 25 Pa. Code 102.6(a)(2), it seems unnecessary to refer to Chapter 102. This section is apparently meant to preclude duplicate PNDI clearances for the same location. We understand that the purpose of this section to provide for circumstances where the applicant has obtained an ESCGP-2 for a well site, and the PNDI review would therefore not need to be duplicated for the permit application. We recommend clarification that this deemed compliance also incorporates the application submission requirements under 78.15(b).

The Commentator suggests the following amendatory language: “(e) If an applicant seeks to locate a well on a well site where the applicant has obtained a permit under § 102.5 (relating to permit requirements), the applicant is deemed to comply with the application submission requirements of subsections (b) and (d) with respect to supplying the required information regarding proof of consultation with the applicable resource agency and the Department.” (1137)

Response: Please see response to comment 261.

264. Comment: The DEP's constitutional obligation is to protect the environment. So long as the DEP's actions do not affect a taking of private property, the DEP should be obligated to take whatever actions are necessary to condition permits in a manner that protects important public resources. (55)

Response: The Department has an obligation to protect public resources under Article I, Section 27 of the Pennsylvania Constitution, the Administrative Code of 1929, the 2012 Oil and Gas Act, the Clean Streams Law, the Dam Safety and Encroachments Act, the Solid Waste Management Act and other statutes. Moreover, the Department shares responsibility for the protection of natural resources with other Commonwealth agencies and municipalities that also have trustee duties under Article I, Section 27 of the Pennsylvania Constitution, as well as federal agencies. To meet these constitutional and statutory obligations, Sections 78.15 and 78a.15 establish a process for the Department to identify, consider and protect public resources from the potential impacts of a proposed well and to coordinate with applicable public resource agencies.

265. Comment: The holdings in the recent Pennsylvania Supreme Court decision, *Robinson et al. v. Commonwealth of Pennsylvania et al.*, may have implications with respect to the Department's authority to propose rules that implement or apply section 3215(c) and/or (e) of Act 13, such as the provisions related to public resources below. Revisions are needed to accommodate and mitigate impacts on conventional operators if the rulemaking under these sections proceeds to a final rule. Revisions are needed that will not result in any significant environmental impact and will substantially reduce the compliance costs for conventional operators. (1135)

Response: The Department has determined that the public resource impact screening provisions as outlined in Section 78.15(f)-(g) and 78a.15(f)-(g) are reasonable, appropriate and necessary to ensure that the Department has complied with its obligation to protect public resources under Article I, Section 27 of the Pennsylvania Constitution, the Administrative Code of 1929, the 2012 Oil and Gas Act, the Clean Streams Law, the Dam Safety and Encroachments Act, the Solid Waste Management Act and other statutes.

The public resource impact screening process in Sections 78.15(f)-(g) and 78a.15(f)-(g) is needed because the Department has an obligation to protect public resources under Article I, Section 27 of the Pennsylvania Constitution, the Administrative Code of 1929, the 2012 Oil and Gas Act, the Clean Streams Law, the Dam Safety and Encroachments Act, the Solid Waste Management Act and other statutes. Moreover, the Department shares responsibility for the protection of natural resources with other Commonwealth agencies and municipalities that also have trustee duties under Article I, Section 27 of the Pennsylvania Constitution, as well as federal agencies. To meet these constitutional and statutory obligations, Sections 78.15 and 78a.15 establish a process for the Department to identify, consider and protect public resources from the potential impacts of a proposed well and to coordinate with applicable public resource agencies.

Public resource consideration has been a required component of the well permit application process since the Oil and Gas Act was first enacted in 1984. The provisions in this final-form rulemaking are needed to provide a clear process for identifying potentially impacted public resources, notifying applicable public resource agencies, soliciting any recommended mitigation measures and supplying the Department with sufficient information to determine whether permit conditions are necessary to avoid a potentially harmful impact to public resources.

If the limit of disturbance associated with a proposed oil or gas well site is located within a certain distance of a listed public resource as provided in Sections 78.15(f)(1) and 78a.15(f)(1), the well permit operator must provide additional information in the well permit application and notify applicable public resource agencies thirty days prior to submitting the well permit application. Under Sections 78.15(f)(2) and 78a.15(f)(2), the public resource agencies have thirty days to provide written comments to the Department and the applicant on the functions and uses of the public resource and any recommended mitigation measures. The applicant is then afforded an opportunity to provide a response to those comments. The Department then evaluates the potential impacts and assesses the need for conditions in the well permit using the criteria in Sections 78.15(g) and 78a.15(g). Section 78.15(g) and 78a.15(g) are added to this rulemaking to provide needed clarity regarding implementation of these obligations and to comply with Section 3215(e) of the 2012 Oil and Gas Act, which specifically directs the Environmental Quality Board to develop such criteria by regulation.

The right of the people of Pennsylvania to clean air, pure water, and the preservation of the natural, scenic, historic and esthetic values of the environment as expressly provided by Article I, Section 27 of the Pennsylvania Constitution are fundamental to the quality of life of the people of Pennsylvania. Additionally, public natural resources held in trust by the Commonwealth for the benefit of the people are a major economic contributor to Pennsylvania through tourism, outdoor fish and game sports, and recreation. The public resource impact screening provisions in this rulemaking provide needed clarity and clear standards for the Department to carry out its trustee obligations in administering the 2012 Oil and Gas Act program and will ensure the continued availability and benefits of these public resources throughout the Commonwealth.

Despite the Department's duties and obligations as described above, some commentators argued that the Department does not have the statutory authority to promulgate regulations regarding public resources under Sections 78.15(f)-(g) and 78a.15(f)-(g) because the Pennsylvania Supreme Court enjoined Sections 3215(c) and (e) in *Robinson Twp. v. Commonwealth*, 83 A.3d 901 (Pa. 2013) (*Robinson Twp.*). The Department asserts that Sections 3215(c) and (e) were not enjoined or otherwise invalidated by *Robinson Twp.* and that neither the plurality nor the concurring opinions in *Robinson Twp.* read in their totality overturn the public resource protection requirements as part of the well permitting process. Additionally, as of the date of the finalization of this document, this issue is being litigated in Commonwealth Court. See *Pennsylvania Independent Oil & Gas Association v. Commonwealth* (321 M.D. 2015). The Department's Answer reflecting its interpretation of *Robinson Twp.* will be filed before Commonwealth Court by January 30, 2016."

The Pennsylvania Supreme Court's decision in *Robinson Twp.* invalidated Sections 3215(b)(4), 3215(d), 3303 and 3304 of the 2012 Oil and Gas Act as unconstitutional. As for Sections 3215(c) and 3215(e), the Court held: "Sections 3215(c) and (e) . . . are not severable to the extent that these provisions implement or enforce those Sections of [the 2012 Oil and Gas Act] which we have found invalid and in this respect, their application or enforcement is also enjoined." *Id.* at 1000 (emphasis added).

Sections 3215(b), 3215(d), 3303 and 3304 of the 2012 Oil and Gas Act address protection of surface water quality; comment and appeal rights of municipalities and storage operators; preemption of local ordinances; and uniformity of local ordinances, respectively. Section 3215(c) is a separate, independent, free-standing provision that does not implement or enforce these invalidated provisions. Rather, Section 3215(c) requires the Department to consider the impacts of a proposed well on “public resources” including, but not limited to, publicly owned parks, forests, game lands and wildlife areas; national and state scenic rivers; national natural landmarks; habitats of threatened and endangered species and other critical communities; historical and archeological sites; and sources used for public drinking supplies.

Section 3215(e) of the 2012 Oil and Gas Act operates in tandem with Section 3215(c). Under Section 3215(e), the Environmental Quality Board is directed to develop regulations to establish criteria for the Department to consider when conditioning well permits based on impacts to public resources identified under Section 3215(c).

The Department believes that Sections 3215(c) and 3215(e) do not implement or enforce Sections 3215(b), 3215(d), 3303 or 3304 of the 2012 Oil and Gas Act and, therefore, remain valid and enforceable.

For these reasons, in addition to the authority discussed above, the Department retains a specific statutory obligation to protect public resources under Sections 3215(c) and (e) of the 2012 Oil and Gas Act.

However, even if those paragraphs were invalidated as some commentators assert the provision under the prior law enacted in 1984 mandating protection of public resources would then remain in effect. See 58 P.S. § 601.205(c). Thus, the Environmental Quality Board has authority under either the 2012 revisions to the law or the prior provision enacted in 1984 to promulgate regulations for the consideration of impacts to protect public resources when issuing an oil or gas well permit.

Additionally, other provisions of the 2012 Oil and Gas Act also support the requirements in Sections 78.15 and 78a.15 of this final-form rulemaking. The General Assembly recognized the constitutional obligation to protect public resources in Section 3202 of the 2012 Oil and Gas Act, which provides that the purpose of the act is to “[p]rotect the natural resources, environmental rights and values secured by the Constitution of Pennsylvania.” 58 Pa.C.S. § 3203. Under Section 3274 of the 2012 Oil and Gas Act, the Environmental Quality Board has the authority to promulgate regulations necessary to implement the statute. The public resource protection provisions in Sections 78.15 and 78a.15 provide a reasonable and appropriate process for the Department to implement the constitutional and statutory requirements discussed above.

Further, the General Assembly has enacted several other statutes that provide the Department with the broad power and duty to protect public natural resources consistent with the

mandates of Article I, Section 27 of the Pennsylvania Constitution, including the Clean Streams Law, the Solid Waste Management Act, the Dam Safety and Encroachment Act, the Pennsylvania Land Recycling and Environmental Remediation Standards Act and the Administrative Code of 1929. These statutes also provide authority for this rulemaking.

Additionally, the General Assembly has enacted statutes that provide authority for other Commonwealth agencies to protect public natural resources, and the Department must coordinate with those agencies to fulfill its constitutional and statutory duties to protect public natural resources. The public resource protection provisions included in the Chapter 78 and Chapter 78a rulemaking facilitate the Department's compliance with this obligation.

Finally, the public screening requirements provided in this rulemaking establish a standardized and transparent process for the Department to identify, consider and to protect public resources from the impacts of a proposed well and to coordinate with other public resource agencies with constitutional and statutory duties to conserve and maintain these resources, in a manner that demonstrates compliance with Article I, Section 27 under the most recent court decisions interpreting the 1973 *Payne v. Kassab*, 312 A.2d 86 (Pa. Cmwlth. 1973) three-part test.

- 266. Comment: Public resources need greater protection. All species, for instance, need their habitats identified and protected, not only threatened and endangered species. And all oil and gas activities, including infrastructure such as pipelines and processing facilities, should be analyzed, and negative impacts should be avoided and prevented, not just mitigated. Science tells us that once a natural resource, like wetlands, for instance, or a mature forest is damaged, it will likely never be restored to its original value. Therefore prevention of harm makes more sense. (649)**

Response: The Department has determined that the public resource impact screening provisions as outlined in Section 78.15(f)-(g) and 78a.15(f)-(g) are reasonable, appropriate and necessary to ensure that the Department has complied with its obligation to protect public resources under Article I, Section 27 of the Pennsylvania Constitution, the Administrative Code of 1929, the 2012 Oil and Gas Act, the Clean Streams Law, the Dam Safety and Encroachments Act, the Solid Waste Management Act and other statutes. Please see the response to comment 265.

To the extent that the commentator suggests that additional public resources should be added to the list of public resources in §§ 78.15(f)(1) and 78a.15(f)(1), under Section 3215(c) of the 2012 Oil and Gas Act, the Department has the obligation to consider the impacts of a proposed well on public resources “including, but not limited to” certain enumerated resources when making a determination on a well permit. Accordingly, the Department has the authority to expand the list of public resources to include public resources similar to those listed.

Sections 78.15(f)(1) and 78a.15(f)(1) of the final rulemaking include the public resources listed in 3215(c). Based on comments received, common areas of a school's property or playground and wellhead protection areas were added because these resources are similar in nature to those included in Section 3215(c). Playgrounds and school common areas are frequently used by the public for recreation, similar to parks. Wellhead protection areas are associated with sources used for public drinking supplies, another listed resource. In further response to comments, wellhead protection areas have been clarified by including a cross reference to 25

Pa. Code §109.713 and limiting the areas to those classified as zones 1 and 2. Additionally, definitions for the terms “common areas of a school’s property” and “playground” have been added.

Notwithstanding the enumeration of specific public resources in the regulations, the Department will consider the potential impacts to other public resources identified during the permitting process.

To the extent that the commentator suggests greater species protection, please see the response to comments related to the threatened and endangered species and other critical communities related.

To the extent that the commentator suggests the public resource consideration provision should apply to all oil and gas operations, §§ 78.15 and 78a.15 establish the well permit application process and are limited to activities associated with well construction and development. The requirements of these sections are designed to address the impacts within the limit of disturbance of the well site. Other activities associated with the oil and gas operations are regulated through various other provisions in Chapters 78 and 78a, or other laws implemented by the Department.

- 267.** Comment: The proposed regulations focus exclusively upon on problems arising at a single well site, such sediment and other contaminant releases to water resources. The draft rules do not attempt to address the chronic and cumulatively more serious water pollution, flow disruption, and surface compaction impacts across a watershed from a dispersed industrialization. The proposal also fails to address forest fragmentation or habitat connectivity issues and ignores cumulative impacts of numerous but dispersed Oil and Gas Operations on cover type conversion, edge creation, invasive species, and deforestation. This limited vision ensures that the proliferation of well sites, access roads, gathering pipelines, and other Oil and Gas Operations will transect and disrupt areas important to continued ecological functioning. (1143)

Response: See response to comment 2910.

- 268.** Comment: To mitigate the impacts on public natural resources held in trust by the Commonwealth for the benefit of the people, a number of measures are needed. In particular, this provision should expand the scope of public natural resources with respect to which information is required in a permit application. This provision should also require submission and implementation of a detailed restoration plan for every site, to promote sustainable development to the extent possible with an extractive industry and to ensure against degradation of the trust. (1143)

Response: The Department has considered this comment and declines to make the suggested amendment to this rulemaking. Please see the restoration requirements outlined in §§ 78.65 and 78a.65.

- 269.** Comment: We are concerned that the current permitting process does not provide sufficient protection from potential adverse impacts from gas well drilling and associated activities on the recharge areas associated with drinking water resources, due to the absence of mandatory notification of public water system operators.

We have observed that the new isolation distances proposed in the Chapter 78 regulations provide an increased degree of protection for water supplies. However, we strongly urge you to consider utilizing specific recharge area delineations when they are available, rather than a generic setback

distance, when requiring notification of public water system operators. The 3,000 ft. setback, as proposed, should be utilized as a default in those cases when a specific delineation is not available. Enabling language could be included by inserting a new paragraph similar to Section 78.15 (d) or by adding the term “delineated source water protection areas” in Section 78.15 (e). Many systems have delineations which were written by professional geologists and approved by DEP staff. These recharge areas are mapped in electronic format and could easily be included into the eFACTS system and referenced by DEP staff during the permit review process.

We request that the Department carefully consider Source Water Protection Areas during the permit review process for natural gas wells, pipelines, and appurtenant facilities. (408)

Response: To the extent that this comment suggest notifications requirements for public water systems, Section 3211(b.1) of the 2012 Oil and Gas Act specifies that public water suppliers within 1000 feet of a conventional well and 3000 feet of an unconventional well are required to get notice of the location of a proposed well.

In the final rulemaking, the Department added zones 1 and 2 of a wellhead protection area as part of a wellhead protection program approved under § 109.713 (relating to wellhead protection program) to the list of public resources in §§ 78.15(f)(1) and 78a.15(f)(2) that require additional consideration as part of the well permit application review process.

To the extent that the commentator suggests that §§ 78.15 apply to pipeline and appurtenant facilities, please see response to comment 266.

270. Comment: DEP failed to properly balance the cost of permit conditions to protect public resources against the benefits of these provisions. In an attempt to demonstrate how the benefits of the new consultation and mitigation provisions outweigh the costs, DEP simply compared the cost of consulting a database and a field site visit to the “permanent loss of a public resource.” (RAF 18) Such a comparison is very misleading. That analysis assumes every impact results in a total loss of a public resource or endangered species, which is a facially unreasonable assumption, and assumes there are no costs beyond the search of a database and field visit. Yet when estimating the costs of the public resource provisions, DEP fails to include even these costs and assumes that consultation costs are zero. (RAF 19) Experience with current consultation requirement indicates that there will be considerable expense in industry personnel time, expert consultants needed for surveys, and project delays in receiving resource agency responses - all well beyond a simple field visit. The Commentator believes the costs will be orders of magnitude higher than the DEP estimate, even without considering mitigation. DEP plainly acknowledges that it has included no estimate of mitigation costs, which precludes full analysis of the provision by EQB, the Independent Regulatory Review Commission, and interested stakeholders. Even under existing, less expansive, requirements individual operators have experienced mitigation costs in the hundreds of thousands of dollars. (1137, 1174)

Response: The Department believes that the cost estimates provided in the regulatory analysis form developed for the proposed rulemaking were accurate and appropriate. The Department has developed a comprehensive cost estimate for the final-form rulemaking. Please see the Department’s responses.

271. Comment: Commentator asserts that DEP no longer has authority to promulgate rules or proceed with rulemaking activity related to the regulations proposed in Sections 78.15(b) through (g) of the Chapter 78 proposed regulations implementing or applying Sections 3215(b), 3215(c) or 3215(e) of

Act 13 because of the Pennsylvania Supreme Court's decision in *Robinson Township et. al v. Commonwealth*.

Commentator asserts that the December 19, 2013 Pennsylvania Supreme Court's *Robinson* decision enjoined Section 3215(c) and (e). Additionally, Commentator contends that the Commonwealth and DEP in their January 2, 2014 Application for Reconsideration of the *Robinson* decision, acknowledged that Sections 3215(c) and (e) of Act 13 are currently enjoined. Commentator states that the Department, in its Reconsideration Application, requested a remand of this aspect of the *Robinson* decision to ensure that its "ability to protect important public resources is not needlessly eliminated." Commentator asserts that DEP conceded that it no longer has authority to proceed with rulemaking activity related to these enjoined sections or to promulgate proposed Sections 78.15(b) through (g).

Additionally, Commentator argues that *Robinson* held that Sections 3215(c) and 3215(e) are not severable from Section 3215(b) which was enjoined in its entirety citing the following from the *Robinson* decision:

"Moreover, insofar as Section 3215(c) and (e) are part of the 3215(b) decisional process, these provisions are as well incomplete and incapable of execution in accordance with legislative intent. Application of Section 3215(c) and (e) is therefore, also enjoined."

See *Robinson*, OAJC at 159.

Commentator asserts that Section 3215(b)(4) addresses setbacks from blue-lined streams and water bodies and wetlands and allows for waivers of the setbacks provided certain conditions are satisfied by waiver applicants. Commentator contends that Section 3215(c)(6) expressly incorporates subsection 3215(b) by applying it to the public resource identified as "Sources used for public drinking supplies." Commentator concludes that Section 3215(c)(6) is enjoined as it expressly incorporates invalidated Section 3215(b) and cannot reasonably be severed from the Section 3215(b) decisional process.

Commentator further argues that blue-lined streams and water bodies as well as wetlands (the subjects of Section 3215(b) set-back buffers) are identified public resources themselves (e.g. "scenic rivers" or "habitats" of an endangered aquatic species), and may, as well, be or clearly are part of, found upon, integral to, and indispensable or key features of all of the other public resources identified in Section 3215(c). Commentator claims that the consideration of impacts to the public resources identified in Section 3215(c) is incapable of being accomplished or executed "in accordance with the legislative intent" as the legislative intent is for the constitutionally defective waiver provision to apply to the location of all wells with respect to the water body, wetlands, and public drinking supply setback buffers to/on all the public resources identified in Section 3215(c). Commentator further concludes that Section 3215(c) is now incomplete as the location of wells on or in relation to the public resources is a potential, if not an absolutely certain, part of the 3215(b) decisional process and now cannot be accomplished in accordance with the legislative intent. Commentator argues that it would be a rare occurrence if in the preparation of the well site plats to be sent to surface owners such as DCNR and the Game Commission, other public resource managers, and municipalities as part of the well permit notification and comment process (as well as the preparation of the erosion and sediment control plans for accompanying access roads and other infrastructure) that blue-lined streams and water bodies as well as wetlands would not be encountered and that decisions about set-backs and possible waivers would not be implicated. Commentator contends that Section 3215(c) cannot reasonably be severed from the 3215(b) decisional process. Commentator further contends that that process contemplated waivers to

accommodate and recognize optimal development considerations and protection of private property rights in siting wells on public lands and otherwise in relation to public resources.

In like manner, and as section 3215 contemplates the waiver of various set-backs, the development of the criteria to use in conditioning a well permit, providing for optimal development, or protecting private property rights as directed in Section 3215(e) cannot be accomplished in accordance with legislative intent as the constitutionally defective waiver provision, would necessarily operate and apply in the decisional process of conditioning permits. Accordingly, Section 3215(e) cannot stand alone and is now incomplete.

Since the Pennsylvania Supreme Court refused to reconsider the constitutionality of Sections 3215(c) and (e), all revisions to implement or apply these Act 13 provisions – proposed Sections 78.15 (b) through (g) – must be removed from the proposed regulations. (1153)

Response: Please see response to comment 265.

272. Comment: Commentator asserts that DEP no longer has authority to promulgate rules or proceed with rulemaking activity related to any regulations proposed in Sections 78.15(b) through (g) of the Chapter 78 proposed regulations implementing or applying Sections 3215(b), 3215(c) or 3215(e) of Act 13 because of the Pennsylvania Supreme Court’s decision in *Robinson Township et. al v. Commonwealth*.

In accordance with the December 19, 2013 Pennsylvania Supreme Court’s *Robinson* decision and as acknowledged by the Commonwealth and DEP in their January 2, 2014 Application for Reconsideration of the *Robinson* decision, Sections 3215(c) and (e) of Act 13 are currently enjoined. The DEP itself believes that application of these Sections is enjoined. In its Reconsideration Application, the Department requested a remand of this aspect of the *Robinson* decision to ensure that its “ability to protect important public resources is not needlessly eliminated.” Consequently, DEP concedes that it no longer has authority to proceed with rulemaking activity related to these enjoined sections or to promulgate proposed Sections 78.15(b) through (g).

Robinson held that Sections 3215(c) and 3215(e) are not severable from Section 3215(b) which was enjoined in its entirety.

“Moreover, insofar as Section 3215(c) and (e) are part of the 3215(b) decisional process, these provisions are as well incomplete and incapable of execution in accordance with legislative intent. Application of Section 3215(c) and (e) is therefore, also enjoined.”

See *Robinson*, OAJC at 159.

Section 3215(b)(4) addresses setbacks from blue-lined streams and water bodies and wetlands and allows for waivers of the setbacks provided certain conditions are satisfied by waiver applicants. Section 3215(c)(6) expressly incorporates subsection 3215(b) by applying it to the public resource identified as “Sources used for public drinking supplies.” Accordingly, Section 3215(c)(6) is enjoined as it expressly incorporates invalidated Section 3215(b) and cannot reasonably be severed from the Section 3215(b) decisional process.

Moreover, blue-lined streams and water bodies as well as wetlands (the subjects of Section 3215(b) set-back buffers) are identified public resources themselves (e.g. “scenic rivers” or “habitats” of an endangered aquatic species), and may, as well, be or clearly are part of, found upon, integral to, and

indispensable or key features of all of the other public resources identified in Section 3215(c). Simply put, the consideration of impacts to the public resources identified in Section 3215(c) is incapable of being accomplished or executed “in accordance with the legislative intent” as the legislative intent is for the constitutionally defective waiver provision to apply to the location of all wells with respect to the water body, wetlands, and public drinking supply setback buffers to/on all the public resources identified in Section 3215(c). Consequently, Section 3215(c) is now incomplete as the location of wells on or in relation to the public resources is a potential, if not an absolutely certain, part of the 3215(b) decisional process and now cannot be accomplished in accordance with the legislative intent. Pointedly, it would be a rare occurrence if in the preparation of the well site plats to be sent to surface owners such as DCNR and the Game Commission, other public resource managers, and municipalities as part of the well permit notification and comment process (as well as the preparation of the erosion and sediment control plans for accompanying access roads and other infrastructure) that blue-lined streams and water bodies as well as wetlands would not be encountered and that decisions about set-backs and possible waivers would not be implicated. In short, Section 3215(c) cannot reasonably be severed from the 3215(b) decisional process. That process contemplated waivers to accommodate and recognize optimal development considerations and protection of private property rights in siting wells on public lands and otherwise in relation to public resources.

In like manner, and as section 3215 contemplates the waiver of various set-backs, the development of the criteria to use in conditioning a well permit, providing for optimal development, or protecting private property rights as directed in Section 3215(e) cannot be accomplished in accordance with legislative intent as the constitutionally defective waiver provision, would necessarily operate and apply in the decisional process of conditioning permits. Accordingly, Section 3215(e) cannot stand alone and is now incomplete.

Since the Pennsylvania Supreme Court refused to reconsider the constitutionality of Sections 3215(c) and (e), all revisions to implement or apply these Act 13 provisions – proposed Sections 78.15 (b) through (g) – must be removed from the proposed regulations. (1153)

Response: Please see response to comment 265.

273. Comment: The Proposed Rulemaking would add § 78.15(f) in an attempt to implement 58 Pa.C.S. § 3215(c)’s broad mandate that the Department “shall consider the impact of [a] proposed well on public resources” during its review of an application for a permit to drill an oil or gas well. Notably, by its own terms, Section 3215(c)’s mandate regarding public resources is not limited to public resources within a set distance from the proposed well. In contrast, the revised Section 78.15(f) would impose a duty to identify public resources on only those applicants who seek permits to drill wells within 200 feet of such resources;⁴ such applicants would be required to notify the agencies responsible for managing nearby public resources of their permit applications, so that the agencies could comment on, and seek permit conditions which would minimize or eliminate, any anticipated negative impacts the wells might have on nearby public resources.⁵ Section 78.15(f) does not, however, require any disclosure to the Department regarding public resources that are more than 200 feet from a proposed well. Section 78.15(f) is thus inconsistent with 58 Pa.C.S. § 3215(c). The EQB is not empowered to write environmental protections that the General Assembly included in the Oil and Gas Act out of that Act.⁶ Section 78.15(f) should be revised so that the Department is explicitly authorized to consider any impact a proposed well might have on any public resource as Section 3215(c) plainly requires, and, in cases where the Department finds that the proposed well might impact a public resource in a significant and adverse manner, require that it give the agency responsible for managing the public resource an opportunity to propose permit conditions that would avoid or minimize the impact. Further, even if the EQB could unilaterally limit the mandate imposed

on the Department by 58 Pa.C.S. § 3215(c) to only those permit applications concerning proposed wells that were within a specified distance of public resources, Section 78.15(f) fails as a means to protect such resources. The 200-foot distance incorporated into 78.15(f) is obviously insufficient to protect public resources against negative impacts that might result from unconventional gas wells. By way of comparison, the Oil and Gas Act prohibits an unconventional gas well that is within 500 feet of an existing building unless the well operator has obtained a waiver from the building's owner,⁷ presumably to ensure that the building's owner has been given an opportunity to evaluate (and protect the building against) the potential negative impacts from the proposed well. Public resources deserve at least as much protection from potential adverse impacts caused by unconventional wells as do buildings. If the EQB can validly limit the mandate that Section 3215(c) imposes on the Department according to the distance between a proposed well and a public resource, that distance should be at least 500 feet. It is also worth noting that neither Act 13 of 2012 nor Chapter 78 define what a "public resource" is. Leaving this key term undefined creates significant uncertainty as well as an obvious invitation to litigation. The Proposed Rulemaking should include a definition of "public resources" so that the Department, the public, and operators know which resources may be protected under Sections 3215(c) and 78.15(f). We suggest that the Department, in connection with stakeholders, develop guidance regarding how it will consider impacts to public resources in connection with permit applications, and what type of mitigation it will require when it finds that drilling is likely to impact public resources negatively. (1159)

Response: The Department has determined that the public resource impact screening provisions as outlined in Section 78.15(f)-(g) and 78a.15(f)-(g) are reasonable, appropriate and necessary to ensure that the Department has complied with its obligation to protect public resources under Article I, Section 27 of the Pennsylvania Constitution, the Administrative Code of 1929, the 2012 Oil and Gas Act, the Clean Streams Law, the Dam Safety and Encroachments Act, the Solid Waste Management Act and other statutes. Please see the response to comment 265.

The distances to certain public resources identified in Sections 78.15(f)(1) and 78a.15(f)(1) of the final rulemaking are consistent with those used by the Department to consider public resources in well application forms since the oil and gas permitting program was established under the 1984 Oil and Gas Act. The Department has found these distances to be effective for purposes of identifying and considering potential impacts to public resources. However, given the increased size of well sites constructed when enhanced development techniques such as hydraulic fracturing are used, Sections 78.15(f)(1) and 78a.15(f)(2) require these distances to be measured from the limit of disturbance of the well site rather than from the well itself, as was the prior practice. For conventional operations this change will have little to no practical effect given the relatively small size of these conventional sites.

Under Section 3215(c) of the 2012 Oil and Gas Act, the Department has the obligation to consider the impacts of a proposed well on public resources "including, but not limited to" certain enumerated resources when making a determination on a well permit. Based on this provision in the 2012 Oil and Gas Act and the Department's other authority to protect public resources, the Department has the authority to expand the list of public resources to include public resources similar to those listed.

Sections 78.15(f)(1) and 78a.15(f)(1) of the final rulemaking include the public resources listed in 3215(c). Based on comments received, common areas of a school's property or playground and wellhead protection areas were added because these resources are similar in nature to those included in Section 3215(c). Playgrounds and school common areas are frequently used by the public for recreation, similar to parks. Wellhead protection areas are associated with

sources used for public drinking supplies, another listed resource. In further response to comments, wellhead protection areas have been clarified by including a cross reference to 25 Pa. Code §109.713 and limiting the areas to those classified as zones 1 and 2. Additionally, definitions for the terms “common areas of a school’s property” and “playground” have been added.

Notwithstanding the enumeration of specific public resources in the regulations, the Department will consider the potential impacts to other public resources identified during the permitting process.

To the extent the commentator suggests that additional protections are needed, the Department has developed a comprehensive regulatory scheme, in Chapters 78 and 78a as well as the other regulations, permits and policies implemented by the Department under Pennsylvania’s environmental laws, to regulate oil and gas development activities to ensure protection of public health, safety and the environment. The purpose of these provisions is to identify, consider, and protect public resources.

- 274.** Comment: In regard to section 78.15 Application Requirements, the mandatory notification by those seeking well permits within close proximity of public resources to the appropriate agency is an important first step. (15, 867)

Response: The Department acknowledges this comment.

- 275.** Comment: Section **78.15(f)**: The term “resource agency” is used but not defined. We presume that it is to mean “a state agency, a municipality, a private entity, or some other entity?” In Section 78.15 (f) (2) the term “public resource agency” is used but again not defined. Do these two terms have the same meaning? (415)

Response: In the final rulemaking, the Department added a definition of “public resource agency” to §§ 78.1 and 78a.1.

- 276.** Comment: We recommend the following proposed revision to § 78.15(f).

§ 78.15 Application Requirements

(f) An applicant proposing to drill a well conduct one or more new Oil and Gas Operations, or to expand one or more existing Oil and Gas Operations (including but not limited to well drilling) at a location listed in paragraph (1) shall notify the applicable resource agency, if any, in accordance with paragraph (2) and provide the information in paragraph (3) to the Department in the well permit application.

(1) This subsection applies if the proposed surface location of the well any portion of the surface footprint of a new Oil and Gas Operation, or an expansion to an existing Oil and Gas Operation is located:

- (i) In or within ½ mile (2,640 feet) of a publicly owned park, forest, game land or wildlife area.
- (ii) In, within, or within view of the corridor of State or National wild or scenic rivers.
- (iii) Within ¼ mile (1,320 feet) of a National natural landmark.
- (iv) In a location that will impact other critical communities. For the purposes of this subparagraph, other critical communities means special concern species, High Quality or Exceptional Value Waters, national recreational areas, or lands within the boundaries of the National Wildlife Refuge System, the National System of Trails, or the National Wilderness Preservation System.

(v) Within ¼ mile (1,320 feet) of a historical or archeological site listed on the Federal or State list of historic places.

(vi) Within 4,000 feet of a water well, surface water intake, reservoir or other water supply extraction point used by a water purveyor or a storm drain that discharges to within 4,000 of any of the above.

(2) The applicant shall notify the public resource agency responsible for managing the public resource identified in paragraph (1), if any. The applicant shall forward by certified mail a copy of the plat identifying the proposed location of the full footprint of the new Oil and Gas Operation, or expansion to an existing Oil and Gas Operation and information in paragraph (3) to the public resource agency at least 30 business days prior to submitting its permit application to the Department. The applicant shall submit proof of notification with the permit application. From the date of notification, the public resource agency has 30 business days to provide written comments to the Department and the applicant on the functions and uses of the public resource and the measures, if any, that the public resource agency recommends the Department consider to avoid or minimize probable harmful impacts to the public resource where the new or expanded Oil and Gas Operation is located. The applicant must provide a response to the Department to the comments adopting the mitigation measures proposed by the public resource agency or proposing equally or more protective alternative measures.

(3) After the public resource agency comment period is complete, the applicant shall include the following information on forms provided by the Department and submit the forms with the well permit application in accordance with § 75.15(a):

(i) An identification of the public resource.

(ii) A description of the functions and uses of the public resource.

(iii) A description of the measures proposed to be taken to avoid or mitigate impacts, if any.

(iv) Proof that the public resource agency was notified and provided 30 business days to comment.

(iv) A copy of the public resource agencies comments, and a response to each comment.

(4) The information required in paragraph (3) shall include any portion of the public resource that may be affected by full footprint of the new Oil and Gas Operation, or an expansion of an existing Oil and Gas Operation. (1143)

Response: The Department has determined that the public resource impact screening provisions as outlined in Section 78.15(f)-(g) and 78a.15(f)-(g) are reasonable, appropriate and necessary to ensure that the Department has complied with its obligation to protect public resources under Article I, Section 27 of the Pennsylvania Constitution, the Administrative Code of 1929, the 2012 Oil and Gas Act, the Clean Streams Law, the Dam Safety and Encroachments Act, the Solid Waste Management Act and other statutes. Please see the response to comment 265.

To the extent the commentator suggests that §§78.15 and 78a.15 apply to all oil and gas operations; please see response to comment 266.

To the extent the commentator suggests that the distances in §§ 78.15(f)(1) and 78a.15(f)(1) be extended, please see response to comment 273.

To the extent the commentator suggests that the list of public resource in §§ 78.15(f)(1) and 78a.15(f)(1) be expanded to include additional resources, please see response to comment 273.

To the extent that the commentator suggests adding certain waters of the Commonwealth to the list of public resources, Sections 78.15(f) and 78a.15(f) have not been expanded because protection of these waters is achieved through other provisions in Chapters 78 and 78a, as well as implementation of other water permitting programs administered by the Department

through other environmental laws and regulations. Specifically, § 78.15(b.1) and 78a.15(b.1) require additional consideration during the well permit application review process for any watercourse or any high quality or exceptional value body of water or any wetland one acre or greater in size. Importantly, Chapters 78 and 78a contain many provisions, including the requirements related to erosion and sediment control, surface water discharges, waste management, onsite processing, protection of water supplies, water management planning, secondary containment, well construction, and site restoration that ensure protection of waters of the Commonwealth.

The Department has amended §§ 78.15(f)(2) and 78a.15(f)(2) in the final rulemaking to allow public resource agencies 30 days to comment on the impacts to public resources.

277. Comment: § 78.15(f)(1)(i)-(vi) – Commentator suggests that all distance requirements under Section 78.15 (f) be stipulated as distances from the edge of the well pad and not “the proposed surface location of the well.” Surface facilities associated with activities on the well pad may pose more potential for offsite impacts than the well itself. (1062, 1133)

Response: The Department amended §§ 78.15(f)(1) and 78a.15(f)(1) in the final rulemaking. Given the increased size of well sites constructed when enhanced development techniques such as hydraulic fracturing are used, §§ 78.15(f)(1) and 78a.15(f)(1) require these distances to be measured from the limit of disturbance of the well site rather than from the well itself, as was the prior practice. For conventional operations this change will have little to no practical effect given the relatively small size of these conventional sites. Additionally, the Department added a definition of “limit of disturbance” in the final rulemaking in §§ 78.1 and 78a.1.

278. Comment: The protection of Public Resources was directly addressed by the Supreme Court decision, and we believe Sections 78.15(f) and (g) should be redrafted. We maintain that the Department should expand upon on the list of, and analysis required for, identified Public Resources, and that there should be a presumption of permit conditions or denial where analysis determines probable impact. These standards should be mandatory for both conventional and unconventional operators. (997)

Response: The Department has determined that the public resource impact screening provisions as outlined in Section 78.15(f)-(g) and 78a.15(f)-(g) are reasonable, appropriate and necessary to ensure that the Department has complied with its obligation to protect public resources under Article I, Section 27 of the Pennsylvania Constitution, the Administrative Code of 1929, the 2012 Oil and Gas Act, the Clean Streams Law, the Dam Safety and Encroachments Act, the Solid Waste Management Act and other statutes. Please see the response to comment 265.

Please see response to comment 273.

279. Comment: 78.15 (f)(1): This section states that the applicant is to contact the resource agency if the well is within 200 surface feet of a well. The 200 feet from a well will often not take you off of the well pad. Consider changing the well to well site or well pad. (1006)

Response: Please see response to comment 277.

280. Comment: § 78.15 Public Resources: We recommend consideration of additional named Public Resources that have been designated through agency review and public processes including Exceptional Value and High Quality Waters, Wild and Wilderness Trout Streams, Exceptional Value

Wetlands, and Pennsylvania Scenic Rivers as designated under the Pennsylvania Scenic Rivers Act of 1982.

In light of modern technology and large-scale unconventional operations, we encourage the Department to also consider increasing the 200-foot radius currently utilized for many of the public resources listed.

We recommend including in the draft proposal a definition of “discrete area” in § 78.15(f)(4) and specification of who will make the determination.

We recommend that the draft proposal include the Department’s consideration of the impact of a proposed well on a public resource and the requirement for the Environmental Quality Board to develop regulation criteria for the department to utilize for conditioning a well permit based on its impact to the public resources.

We recommend that the Department expressly states that it has the sole authority to condition or deny a permit if it makes a determination that there will be “probable harmful impact” to a public resource. (1031, 997a, 1142)

Response: The Department has determined that the public resource impact screening provisions as outlined in Section 78.15(f)-(g) and 78a.15(f)-(g) are reasonable, appropriate and necessary to ensure that the Department has complied with its obligation to protect public resources under Article I, Section 27 of the Pennsylvania Constitution, the Administrative Code of 1929, the 2012 Oil and Gas Act, the Clean Streams Law, the Dam Safety and Encroachments Act, the Solid Waste Management Act and other statutes. Please see the response to comment 265.

To the extent the commentator suggests adding certain waters of the Commonwealth to the list of public resources; please see response to comment 274.

To the extent that the commentator suggests extending the distances in §§ 78.15(f)(1) and 78a.15(f)(1), please see the response to comment 273.

The Department declines to define the term “discrete area” at this time. If the need for further clarification becomes apparent during implementation of this provision, the Department will develop guidance to address any issues identified.

Sections 78.15(g) and 78a.15(g) have been amended to clarify the criteria the Department will consider when deciding whether to condition an oil or gas well permit based on impacts to public resources.

To the extent that the commentator recommends “that the Department expressly states that it has the sole authority to condition or deny a permit if it makes a determination that there will be ‘probable harmful impact’ to a public resource,” the Department declines to make this change. Additional clarity to is not needed because the Department has the obligation to consider the impacts to public resources based on the information provided by the applicant and public resource agencies and determine using the criteria in §§ 78.15(g) and 78a.15(g) whether any permit conditions are necessary to prevent a probable harmful impact.

281. Comment: The proposed provisions concerning protection of public lands are so weak that they do no good. For example, the proposed rules require drillers to give notice to state resource agencies

only if a proposed gas well is within 200 or less feet of a public land. Consequently, for example, the Department of Conservation and Natural Resources would not be notified of a gas well drilled within 201 feet of a state park, though a well that close, of course, to a state park would impact the state park and its visitors.

By contrast, the proposed rules require notice of a proposed gas well within 1,000 feet of private water well. Both distance requirements for simply notice are much too small.

A standard distance for notice should be used for all circumstances, and I recommend at least 2,500 feet. We know that gas can migrate that distance when mistakes are made in gas drilling. And so people and agencies deserve 2,500 feet for notice. (1055)

Response: To the extent that the commentator suggests extending the distances in §§ 78.15(f)(1) and 78a.15(f)(1), please see the response to comment 273.

282. Comment: Expanding distances around proposed surface locations. The proposed 200 feet distance from these sites is inadequate as degradation from noise, light, and air pollutants that extend beyond such a boundary. The 1000 feet distance from a drinking water source is inappropriate. Penn State University notes that homeowners receive notification by certified mail of unconventional wells within 3000 feet of their water wells or springs. As taxpayers, public lands belong to us. To safeguard the public health, the distance should be one kilometer or more as evidenced by the Duke study. [78.15(f)(1)] (15, 867, 1098)

Response: To the extent that the commentator suggests that the distances in §§ 78.15(f)(1) and 78a.15(f)(1) should be expanded, please see response to comment 273.

To the extent that the commentator suggests greater setbacks, the provisions in this rulemaking in §§ 78.15(f) and 78a.15(f) are not setbacks. The distances in these provisions define an area that requires coordination with public resource agencies and additional consideration during the permit review process. These provisions do not prohibit drilling activities within these defined areas.

In Section 3215(a) of the 2012 Oil and Gas Act, the General Assembly established setbacks prohibiting the drilling of oil and gas wells within certain distances from buildings and drinking water wells. For a conventional well, this distance is 200 feet; for an unconventional well, this distance is 500 feet. Additionally, unconventional wells may not be drilled within 1000 feet of a public water supply. To the extent the commentator suggests that the General Assembly should extend these setbacks or provide setbacks for particular facilities or resources that change should be made through an amendment to the 2012 Oil and Gas Act.

Section 3211(b)(1) of the 2012 Oil and Gas Act requires notice to users of water supplies within 3,000 feet of a proposed unconventional well. To the extent the commentator suggests that the General Assembly should increase that area of notification that change should be made through an amendment to the 2012 Oil and Gas Act.

283. Comment: It would be appropriate to add certain waters, streams and wetlands to 78.15(f)(1). Does the list of locations under this paragraph adequately protect all of this Commonwealth's natural resources? (1099)

Response: In the final rulemaking, the Department did not expand the list of public resources in §§ 78.15(f)(1) and 78a.15(f)(1) to include additional water resources because protection of

these waters is achieved through other provisions in Chapters 78 and 78a, as well as implementation of other water permitting programs administered by the Department through other environmental laws and regulations. Specifically, § 78.15(b.1) and 78a.15(b.1) require additional consideration during the well permit application review process for any watercourse or any high quality or exceptional value body of water or any wetland one acre or greater in size. Importantly, Chapters 78 and 78a contain many provisions, including the requirements related to erosion and sediment control, surface water discharges, waste management, onsite processing, protection of water supplies, water management planning, secondary containment, well construction, and site restoration that ensure protection of waters of the Commonwealth.

284. Comment: 78.15(f)(1) This section states that the applicant is to contact the resource agency if the well is within 200 surface-feet of high priority habitats. To be effective this distance provision must be measured from the edge of disturbance from the well site, not measured from the actual well(s) as many well sites are large, with actual wells centrally located. Assessing risk of resource disturbance from actual well locations may not be predictive of either the actual exposure to disturbance, including that associated with supporting staging areas and access roads, or are locations for storage and transport of toxic chemicals. (1134)

Response: Please see response to comment 2909.

285. Comment: The 200 foot radius utilized for many of the resources listed in § 78.15(f)(1) is a carryover from the existing regulations, which were not developed in contemplation of unconventional well operations. Given the ruling of the Supreme Court, the Department should consider increasing setback distances where needed to protect functions and uses of public resources to account for the scale of operations at well sites. (997a)

Response: Please see responses to comments 273 and 277.

286. Comment: § 78.15 (f)(1)(i) - We recommend the DEP add the following language (in bold italics), “in or within 200 feet of a publicly owned or administered park, forest, game land or wildlife area.” Adding “or administered” would address a subset of management situations in a variety of units and affiliated areas within the National Park System, as we explain in more detail below. We also recommend the notification requirements be greater than 200 feet. We recommend 1,000 feet as the notification distance from the edge of the well pad. At this distance there is a reasonable potential for subsurface impacts from gas migration associated with possible over pressuring of the annulus, as well as potential surface impacts to natural sounds and night skies, wildlife, viewshed and other resources within National Park System units and affiliated areas.

We also recommend language clarifying that any property acquired and/or developed with federal grant assistance from the Land and Water Conservation Fund (LWCF) is subject to LWCF Act Section 6(f)(3) restrictions to outdoor recreation uses in perpetuity unless such uses are approved by the National Park Service pursuant to the LWCF post-completion regulations at 36CFR59.3. Each LWCF grant-assisted site is encumbered by a Section 6(f)(3) boundary identifying the property subject to these provisions. The LWCF 6(f)(3) restricted areas may or may not include all property within the formal boundary of the public outdoor recreation/park area in question. For the Commonwealth, the governor-appointed LWCF State Liaison Officer is Ms. Lauren Imgrund, of the Department of Conservation and Natural Resources (DCNR) whose responsibility is to ensure that all LWCF 6(f)(3) restricted property throughout the Commonwealth, including all state and local lands, are used for public outdoor recreation purposes pursuant to the Act and implementing regulations. DCNR can provide more information on LWCF funded areas within the

Commonwealth subject to these restrictions. More information on LWCF funded lands is provided below.

(1062, 1133)

Response: To the extent that the commentator suggests language that clarifies that land acquired with grant assistance from the LWCF is subject to the LWCF Act, the Department declines to make this suggested change as it is not appropriate to restate such federal requirements in this rulemaking.

To the extent that the commentator suggests extending the distances in §§ 78.15(f)(1) and 78a.15(f)(1), please see response to comment 273.

287. Comment: The Proposed Regulations should establish stronger protections of public resources. § 78.15 of the Proposed Regulations addresses well permit application requirements. On January 16, 2014, the League of Women Voters submitted detailed comments regarding this section. We generally support the LWV comments, both because they are premised on the assumption that

environmental rights trump property rights in Pennsylvania, and because they recognize that “economic development related to oil and gas extraction... [should not come] at the expense of tourism related to a natural recreation areas.”

Specifically, we support the LWV comments with respect to “expanding distances around proposed surface locations,” *see* § 78.15(f)(1) and including conditions in the permit for cumulative as well as site specific modifications to avoid and mitigate impacts to public resources *see* § 78.15(g). The LWV comments are correct and consistent with *Robinson Township*, where they state that the DEP should not bear the burden of proving that the conditions it places on well permitting are necessary to protect against a probable harmful impact to a public resource. Rather, the applicant should bear the burden of showing that the DEP’s conditions will not protect against a probable harmful impact of a public resource. Again, *Robinson Township* stands for the proposition that in Pennsylvania, environmental rights are fundamental rights on par with individual rights. Environmental rights trump property rights or any other right granted under the General Assembly’s plenary powers to promote the public convenience or the general prosperity. (1070)

Response: The Department has determined that the public resource impact screening provisions as outlined in Section 78.15(f)-(g) and 78a.15(f)-(g) are reasonable, appropriate and necessary to ensure that the Department has complied with its obligation to protect public resources under Article I, Section 27 of the Pennsylvania Constitution, the Administrative Code of 1929, the 2012 Oil and Gas Act, the Clean Streams Law, the Dam Safety and Encroachments Act, the Solid Waste Management Act and other statutes. Please see the response to comment 265.

To the extent that the commentator suggests extending the distances in §§ 78.15(f)(1) and 78a.15(f)(1), please see response to comment 273.

Sections 78.15(g) and 78a.15(g) have been amended to clarify the criteria the Department will consider when deciding whether to condition an oil or gas well permit based on impacts to public resources.

Relating to the applicable burden of proof, please see Section 3215(e) of the Oil and Gas Act of 2012 which states that the Department has the burden of proving that a well permit condition imposed to protect a public resource is necessary to protect against a probable harmful impact of the public resource.

288. Comment: How are all of the distance standards included in 78.15(f) measured? The final-form regulation should specify if the measurements are from the edge of the well pad or from some other fixed point. (1099)

Response: The Department amended §§ 78.15(f)(1) and 78a.15(f)(1) in the final rulemaking. Given the increased size of well sites constructed when enhanced development techniques such as hydraulic fracturing are used, §§ 78.15(f)(1) and 78a.15(f)(1) require these distances to be measured from the limit of disturbance of the well site rather than from the well itself, as was the prior practice. For conventional operations this change will have little to no practical effect given the relatively small size of these conventional sites. Additionally, the Department added a definition of “limit of disturbance” in the final rulemaking in §§ 78.1 and 78a.1.

289. Comment: The PADEP grants itself broad, unquestioned power with the ability to deny permits based on species of special concern or cultural resources not defined in regulation. Passage of this portion of regulation will essentially allow PADEP to bypass laws that were created to keep its

governing ability in check. Passage of this proposed regulation will create a state of chaos between industry and all state agencies, which will subsequently push for arbitrary species or resources to be the reason for denying permits with no due legislative process. I recommend removing this provision. (450, 460)

Response: The Department has considered this comment and declines to make the suggested change. The Department has determined that the public resource impact screening provisions as outlined in Section 78.15(f)-(g) and 78a.15(f)-(g) are reasonable, appropriate and necessary to ensure that the Department has complied with its obligation to protect public resources under Article I, Section 27 of the Pennsylvania Constitution, the Administrative Code of 1929, the 2012 Oil and Gas Act, the Clean Streams Law, the Dam Safety and Encroachments Act, the Solid Waste Management Act and other statutes. Please see the response to comment 265.

This section outlines a process for considering the impacts to public resources, coordinating with public resources and determining when well permit conditions are necessary given the criteria outlined in §§ 78.15(g) and 78a.15(g).

290. Comment: All distances for notification or set back distances need to be one half mile to two miles, given the experience from the explosion and fire at the chevron well pad in Greene County this year. The heat, light, and fumes from flares cover great distances. The diesel trucks have now been shown to be the primary source of air pollution problems from drilling and hydro-fracking. Fumes from holding ponds also pollute the neighborhood. So, no ponds should be allowed. Or, they should be covered with a fume control system. (1053)

Response: To the extent that the commentator suggests extending the distances in §§ 78.15(f)(1) and 78a.15(f)(1), please see response to comment 273.

To the extent that the Commentator suggests that additional requirements are needed for emergency response, other sections of the regulatory framework for well development activities address obligations related to emergencies, including Section 78a.55(i), which contains comprehensive emergency response requirements for unconventional well sites.

To the extent that the commentator suggests greater setbacks, please see response to comment 282.

291. Comment: Unconventional wells should never be permitted less than 1mile from any school or college. (806)

Response: To the extent that the commentator suggests greater setbacks, please see response to comment 282.

Please note that the Department amended these provision in the final rulemaking and added common areas of a school's property or playground and wellhead protection areas to the list of resources in §§ 78.15(f)(1) that trigger additional consideration during the permit review process. Common areas of a school's property and playground were added to this list because these resources are similar in nature to those included in Section 3215(c) of the 2012 Oil and Gas Act. Playgrounds and school common areas are frequently used by the public for recreation, similar to parks. Additionally, definitions for the terms "common areas of a school's property" and "playground" have been added.

Notwithstanding the enumeration of specific public resources in the regulations, the Department will consider the potential impacts to other public resources identified during the permitting process.

292. Comment: Permitting the drilling and operation of unconventional drilling between 9 pm and 7 am within 1 mile of residential neighborhoods or homes needs to end completely as the stress this places on families who cannot sleep is uncalled for. (806)

Response: Regarding noise, see response to comment 2913.

To the extent that the commentator suggests greater setbacks, please see response to comment 282.

293. Comment: Compressor stations for unconventional gas wells must not be permitted less than one mile radius from family homes or farms. (806)

Response: Permitting compressor stations is outside the scope of this rulemaking.

294. Comment: The current regulations provide for a buffer between drilling activities and “solid blue line” streams, as classified in the US Geologic Survey. Protecting “solid blue line” streams alone, however, is not enough. The National Wildlife Federation states that more than half of Pennsylvania’s 83,000 miles of streams flow intermittently or are headwaters (source: http://www.nwf.org/pdf/State-Fact-Sheets/Pennsylvania_WeakeningTheCleanWaterAct.pdf), which is to say that these water bodies are not insignificant. Existing laws, such as the Clean Streams Law, guarantee the protection of all Pennsylvania waterways, including ephemeral and intermittent streams; Chapter 78 should do the same. Intermittent streams provide unique habitat and play an important ecosystem role. Also, because they carry less flow, intermittent streams are more easily harmed by smaller quantities of pollutants. (929)

Response: Sections 78.15(b.1) and 78a.15(b.1) require additional consideration during the well permit application review process for any watercourse or any high quality or exceptional value body of water or any wetland one acre or greater in size.

Importantly, Chapters 78 and 78a contain many provisions, including the requirements related to erosion and sediment control, surface water discharges, waste management, onsite processing, protection of water supplies, water management planning, secondary containment, well construction, and site restoration that ensure protection of waters of the Commonwealth.

295. Comment: Set back from a road right-of-way: Neither equipment nor storage facilities related to a gas well shall be built within three hundred feet of state or municipal right-of-way. This would include but not limited to storage tanks, compressors, water separators above ground section of high pressure lines. There are too many gas line and equipment too close to the roadways in Crawford County. One that I am familiar with is a site in Richmond Twp. where all the equipment lies next to the Township road and 30 feet from an occupied dwelling. There have been minor gas leaks before and if there would be a major one the people that live nearby will be extremely affected. The equipment has no protection from any out of control motorized vehicles. There was an accident in Richmond Twp. that occurred on Route 408 in close vicinity of Maplewood road whereas a vehicle damaged high pressure lines. (860)

Response: To the extent that the commentator suggests greater setbacks, please see response

to comment 282.

- 296.** Comment: We'd like to see any and all gas Drilling Operations; including gathering lines, pipelines and transportation operations, prohibited within a mile from all schools, churches, bus stops, parks and hospitals as well as any public place used for congregational purposes. We'd also like to see these same listed operations banned from all State Forests and State Game Lands. We would like to see the department put a halt to mountain-top removal. (862)

Response: To the extent that the commentator suggests greater setbacks, please see responses to comments 282 and 291. A moratorium on drilling activities on state forest and state game lands is outside the scope of this rulemaking. Mountain-top removal is also outside the scope of this rulemaking.

- 297.** Comment: Pennsylvania's Act 13 covers the regulations that guide the gas and oil industries drilling/fracking into the ancient radioactive Marcellus Shale. This highly industrial activity imposed statewide by ACT 13 should not be allowed to put our children in harm's way.

In 2011 Gov. Torn Corbett and the General Assembly cut \$1 billion from state education funding leaving district education budgets on shaky ground and clouding judgement. Gas lease deals can promise replacement money. And we are seeing gas drilling corporations getting DEP permits to drill next to Public Schools.

But can you believe that DEP does not have a single regulation that deals with drilling/fracking near schools, daycare centers, hospitals, senior living centers or any vulnerable population. No special monitoring or testing is required:

- not the soil where children will play sports and roll in the grass
- not the water susceptible to methane or chemical migration
- not for the air from diesel trucks, or equipment fumes or well flaring
- and not for any possible chemical contact by students or the teaching staff.

Thousands of industrial compounds have never been tested for their risk to human health and no driller is required to reveal what chemicals they are using or when. NO ONE is required to warn parents or to monitor or test. Risk Assessments haven't been performed.

We know many of these chemicals are carcinogenic or neurotoxic. The Marcellus shale layer is radioactive and radon can escape every time a well is drilled. Radon is the second most common cause of lung cancer says the American Lung Association.

No trained health expert is required. No toxicologist or even special training for school nurses is mandatory. No school safety protocols or evacuation plans are suggested or discussed. Who will provide lifelong care for teachers or children if they are harmed?

Our most vulnerable populations should not be used as a shield by the drilling concerns. Neither the Department of Health nor our hospitals provide public health information on fracking. We don't send our children to school to expose them to industrial chemical risks. Currently drillers can follow the same rules for fracking near my outhouse or barn that they use for fracking next to any elementary school. A set back of a few hundred feet. nothing more to protect our children, not one single rule.

According to Penn Environments' study in 2011 there are over a hundred day care centers and fourteen schools within a mile of current drilling activity. From January 2008 to June 2010 alone, DEP recorded 241 violations of environmental regulations at Marcellus wells within two miles of a day care facility, and 40 violations within two miles of a school – and these numbers don't include traffic safety violations by tanker trucks. Who pays for the schools: property owners, taxpayers. Heck, the largest checks I write each year are for property tax and school tax. Why permit endocrine disruptors and radiation and carcinogen exposure to harm our children? Research shows a link from toxic exposures to autism, diabetes, asthma, heart disease, even psychotic behavior.

Who writes that check? Right now establish a one mile set back from schools. Enforce 10 year monitoring of air and water near drilling sites. Fund a certified health examiner on site while these industrial processes are happening on already approved sites near a school. Delay or deny drilling or compressor start dates until school health and safety plans, evacuation plans, and monitoring protocols that include certified daily air and water tests are established.

And include indemnification language that will ensure lifetime health care for the harmed. As the Pa Supreme Court (p. 57) just ruled on December 19, 2013:

To describe this case simply as a zoning or agency discretion matter would not capture the essence of the party's fundamental dispute regarding Act 13. Rather at its core, this dispute centers upon an asserted vindication of citizens' rights to quality of life on their properties and in their hometowns. Insofar as Act 13 threatens degradation of air and water, and of natural, scenic, and esthetic values of the environment, with attendant effects on health, safety, and the owners' continued enjoyment of their private property. The citizens' interests as a result, implicate continued enjoyment of their private property. The citizens' interests as a result implicate primary rights and obligations under the Environmental Rights Amendment. Article I, Sec. 27.

By any responsible account, the exploitation of the Marcellus Shale Formation will produce a detrimental effect on the environment, on the people, their children, and future generations, and potentially on the public purse, perhaps rivaling the environmental effects of coal extractions. (933)

Response: To the extent that the commentator suggests greater setbacks, please see responses to comments 282 and 291.

To the extent that the Commentator suggests that additional requirements are needed for emergency response, other sections of the regulatory framework for well development activities address obligations related to emergencies, including Section 78a.55(i), which contains comprehensive emergency response requirements for unconventional well sites.

To the extent that the commentator suggested that additional protections are needed, Chapters 78 and 78a, as well as other regulations, permits and policies implemented by the Department under Pennsylvania's environmental laws, establish a comprehensive regulatory scheme for oil and gas well development activities to ensure protection of public health, safety and the environment. The purpose of these provisions is to identify, consider, and protect public resources. This rulemaking is consistent with the constitution, applicable statutes and provides appropriate protects of public health, safety and the environment as well as public natural resources.

- 298.** Comment: Marcellus Outreach Butler, MOB, is also a partner in the Protect Our Children Coalition that was formed in reaction to the alarming proliferation of gas activity being conducted near schools. Though our group is opposed to drilling until it can be proven safe, we nonetheless join this

coalition because it is the ethical and moral thing to do to protect our most valuable resource, our children.

Children are especially vulnerable to the hazardous effects of toxins transmitted in water and air pollution from natural gas activity for the following reasons. Their respiratory, immune and nervous systems are still developing. They have less ability to detoxify dangerous chemicals compared to adults and they spend greater amounts outdoors and are, therefore, exposed to sustained, low levels of chemicals for long periods of time.

We do not fully know the ramifications of such exposure, especially how they effect in combination with one another. We currently have a well site being prepared in the Connoquenessing borough of our county that is 1,900 feet from Connoquenessing Elementary School, as well as the nearby municipal park.

Maps contained with the Geological Survey Bulletin 873, of the United States Department of interior, published in 1936 demonstrate that numerous wells were drilled in the Little Creek field where the school is and those wells would be located. The Survey notes the many hundred abandoned wells, all trace of which have disappeared, and yet no more concern is accorded to the fact that the proposed wells will occur in a known pin cushion that surrounds an elementary school with a student population in kindergarten through grade six of over 270. There is no difference whether the structure is a school or whether it's a tool shed.

And Connoquenessing Elementary School not the only school in Butler with children that it will be putting children at risk. We had a well flare 900 feet, which, I believe you saw a photo of earlier, this summer at the Summit Elementary School. Another well was proposed to be replaced very close to the Moraine Elementary School in Prospect, PA. In Jackson Township, my township, the MarkWest Bluestone Processing Plant is operating 1.2 miles from the Seneca Valley Secondary School Campus, with approximately 4,000 students in three school buildings. They're building another adjacent plant and another one is planned next year. All within the same distance from this school campus.

These plants are not aggregated for purposes of EPA air quality standards. So we need to look to the DEP to protect our children. We request that DEP, therefore, include in its regulations that no drilling or gas-related, activity occur within a one-mile district of any school. (1107)

With respect to your regulations, I have the following general comments, though, in addition to this comment about schools. The public are excluded from your permitting process. Only people with water supplies within 1,000 feet are notified that there's even going to be drilling. People wake up and find out there is a drill pad coming next to their house, unbeknownst to them beforehand. You need to elicit the comments of the public. And, of course, they have to be notified in order to comment.

We are happy that you are looking at abandoned well issues, but it is not sufficient. (1107)

Response: To the extent that the commentator suggests greater setbacks, please see responses to comments 282 and 291.

To the extent that the commentator suggests greater public comment on well permit applications, please see the response to comment on §§ 78.15(a) and 78a.15(a).

299. Comment: Suggested Changes:

General provisions.

- A. No well pad may be located in areas where the existing slope exceeds fifteen percent as defined in Section 1.
- B. No grading may occur to create a bench for development on slopes greater than 15 percent.
- C. No development may be sited within 100 vertical feet of a ridgeline.
- D. No development may occur within the viewsheds of scenic overlooks, scenic roadways (such as community gateways, roads through state parks or wild areas, and roads identified as scenic byways), recreational trails, scenic waterways, and other locally (at the county or municipal level) identified natural, historical and cultural amenities.
- E. Determination of Adverse Affects on Ridgelines. The director shall determine whether the proposed location of development could adversely affect a ridgeline or viewshed for the purpose of administering this chapter based upon elevation of the proposed development and the location, slope, and visibility of the development in relationship to surrounding topography.
- F. Visibility Determination. If the director determines that the project cannot be viewed from any designated feature, because of its relationship to surrounding topography or existing vegetation, then the project will be cleared for further processing pursuant to the code. If the determination was made based on existing vegetation coverage, then the property owner or developer, prior to the issuance of a permit, shall be required to execute and record in the county recorder's office a use restriction, in a form approved by county counsel, requiring the existing covering vegetation to be maintained, or replaced with equivalent vegetation, by the owner or the owner's successors, so as to prevent the project from being viewed from any designated feature. (1016)

Response: To the extent that the commentator suggests a prohibition of drilling activities in certain areas, please see response to comment 282.

The Department declines to add certain viewsheds to the list of public resources in §§ 78.15(f)(1) and 78a.15(f)(1).

300. Comment: Impacts from natural gas and oil infrastructure

The proposed rulemaking does not fully consider all infrastructures when analyzing for impacts from oil and gas operations on public resources. In the proposed Section 78.15 (f) only the well and access road is considered for impacts to a public resource. The gathering pipeline, pit or open impoundment, soil stockpile area, and any area cleared of existing vegetation or where land use has changed or is impacted should also be analyzed for potential detrimental impacts. These impacts can occur a significant distance from the disturbance such as development of gas wells and related infrastructure near and adjacent to state parks and forest lands, national parks and the Wild and Scenic Delaware River, or high quality streams protected as special protection waters.

According to the Nature Conservancy, pipeline construction associated with natural gas wells in the Marcellus in Pennsylvania will increasingly impact the environment. Significant clearing of open lands and forest and the crossing of streams and disturbance of wetlands by the gathering and transmission pipelines cause degradation of soils and loss of vegetative and forest cover, erosion and sedimentation and degrading stream impacts.

Stream crossings require stream bank clearing and riparian area disturbance and are a routine source

of sediment and other construction related pollution to waterways despite permitting requirements. The long periods of time the lines are under construction, the areas excavated and under active disturbance for long distances and on steep slopes, and the clearing, grading, and trench cutting done in a sequence that leaves these areas susceptible to erosion before re-vegetation is accomplished, results in substantial environmental impact to both land and water.

The average shale gas well with infrastructure will clear approximately 7.4 acres of land directly and will cause indirect forest impacts from new edges of 18.5 acres, with a total 25.9 acres of direct and indirect impacts from each well. The thousands of gathering lines at a larger diameter than for shallow gas wells, perhaps even larger and operating at greater pressure than interstate transmission lines required to move gas from the well to transmission lines will affect between 120,000 and 300,000 acres in Pennsylvania, an area that is larger than the amount expected from all the other parts of the typical gas well (pads, roads, etc.) combined according to the Nature Conservancy study. About half of these pipeline impacts are expected to occur in currently forested areas. These forested areas will experience habitat value loss; “interior” forest species habitat could be eliminated on 360,000 to 900,000 acres, depending on the build out scenario. The report points out that this is far greater than the combined forest interior impacts of all other energy types examined in their report. (1156)

Response: Please see response to comment 266.

- 301.** Comment: We support the provision which will require permit applicants to consider the impact of a well site on public resources, including parks, water supplies, and protected species. Tourism is a significant economic driver in our watershed. The Laurel Highlands, Great Allegheny Passage bike trail, and Youghiogheny River draw visitors from all over the world. The consideration of state parks, protected species, natural amenities, and tourism generating features is welcomed. (943)

Response: The Department acknowledges this comment.

- 302.** Comment: The proposed regulations are not adequate to protect the environment and public health in Pennsylvania. To begin to protect Pennsylvania from the harmful effects of extracting this type of energy resource, DEP should provide leadership by zoning using a statewide screen filter, more strongly regulating, and taxing the fracking (unconventional well) industry. I urge DEP to:

Protected Land Consideration

Our landscapes and ecosystems are precious resources that should be managed for the benefit of all, not just for the profit of a few. The current regulations regarding protected areas are woefully inadequate to protect our natural resources.

I suggest that DEP stop issuing drilling permits until it implements a statewide screening system (as states have done to determine siting for disposal of low-level radioactive waste) to determine areas that could be considered for drilling for natural gas as follows. Eliminate from consideration for drilling in all areas mentioned in Subsections 78.15(c) through (f) while also eliminating from drilling the following areas:

- a. Protected land, including federal (e.g., national forests, wildlife refuges, historical and archaeological areas), state (e.g., parks, forests, wildlife/game management areas), county and local parks and protected areas, private conservation land, lands under a conservation easements, and land enrolled in the PA Clean and Green Tax program.
- b. Public drinking water supplies, perennial and ephemeral streams, wetlands, and vernal pools.

- c. Land with known or suspected federal or state endangered or threatened species or species of conservation concern in PA.
- d. Require a buffer of at least 0.75 mile around these sensitive areas. We know that in improper drilling situations, drilling fluid can migrate almost 0.5 mile (2,500 ft.). There should be at least a 0.25 mile buffer around that minimal potential migration area for protection of sensitive areas. A buffer of 1 mile would be much better where feasible.

Without these provisions, DEP cannot claim as in Section F, Benefits that “The proposed process for identifying and considering the impacts to public resources will ensure that any probable harmful impacts to public resources will be avoided or mitigated while providing for the optimal development of oil and gas resources.” These regulations need to be strengthened to effectively provide this benefit to lands of natural resource, conservation, and public recreation value.

In addition, municipal governments should have the right to zone areas for natural resource extraction within their jurisdiction. I applaud the Pennsylvania Supreme Court December 2013 decision restoring this right to municipalities. (140)

Response: To the extent that the commentator suggests a prohibition of drilling activities in certain areas, please see response to comment 282. The Department has considered this comment and declines to make the suggested amendments to the final rulemaking. The Department believes the revisions to Chapters 78 and 78a are consistent with the Constitution and applicable statutes, and provide appropriate protections for public health and safety.

303. Comment: 78.15(f)(1). Application Requirements. - We recognize that Sullivan County is home to some of the most scenic vistas and viewsheds in our region. In addition, every county within the Northern Tier has public lands that may be subject to exploitation. These public lands and more, are home to threatened and endangered species, critical communities, species of special concern, scenic vistas and viewsheds, high quality and exceptional value streams and wetlands, and are well known for recreational opportunities and support regional tourism.

Public resources, such as parks may be affected by the development of a nearby pad. 200 feet is just too short of a distance for notification. Resource agencies need to be made aware of nearby pads such that they may provide input to either DEP or the operator for matters of public safety. For example, it is now customary that the operator locates a truck crossing sign near the access road approach area. Should a very busy park be located nearby, within 600 feet they may want to suggest that the operator place a yellow flashing light in addition to the sign to alert park visitors who may be unfamiliar with the industry associated heavy and oversized loads. Thus, there needs to be an extension from 200 feet to 600 feet.

Regarding notifications:

78.15(f)(1) This subsection applies if the proposed surface location of the well is located:

- (i) in or within 600 feet of a publically owned park, forest, game land or wildlife area.
- (iii) within 600 feet of a national natural landmark
- (v) within 600 feet of a historical or archeological site listed on the Federal or State list of historic places.

New provision:

The poor siting of a well pad along the Loyalsock Trail [permit# 113-20208] at some points within 30 feet [as measured on Google Earth] of the cleared well pad area indicates the need for better planning. A gem of Sullivan County, the Loyalsock Trail provides outdoor enthusiasts with recreational opportunities that support Sullivan County's tourism and the local economy. Emphasis on ensuring the trail experience and most enjoyed Canyon Vista for instance, is a very important concern among many folks in the Northern Tier Region and beyond. This is a primary example of why we are recommending an additional provision in section 78.15(f)(1). There needs to be a mechanism in place where county planning offices are able to submit comment regarding pad and infrastructure placement whether or not county zoning may apply.

The Northern Tier Region is home to the Endless Mountains. Our Counties, such as Sullivan County have scenic vistas and viewsheds which are valuable assets contributing to regional tourism and the local economy. Thus, protecting vistas and viewsheds are very important to a county such as Sullivan County. Because of that, Sullivan County's Planning and Community Development Department has a great deal of data regarding their vistas and viewsheds. It is important to note that DCNR also has considerable information on viewsheds and vistas. Agencies such as DCNR and Sullivan County through the use of available technology are able to plot well site and facility locations and analyze data indicating the effects on the viewshed and propose better siting that adequately, appropriately and reasonably mitigate, minimize, avoid or eliminate those effects. Additionally, further consideration needs to be given to areas such as Tioga County's Pine Creek Gorge, the Pennsylvania Grand Canyon of which 12 miles have been designated as a National Natural Landmark. The 200 feet measure is simply too inadequate to sufficiently protect such a splendid and nationally recognized area. The siting of well pads, pipelines and facilities within the viewsheds can have a dramatic effect upon whether people still consider that place as special. That effect can have a dramatic effect upon the region's tourism and related economy. Thus, we recommend this additional provision:

An applicant proposing to drill a well, place a pipeline or any facility at a location that is deemed to be in or within one mile of a designated vista or viewshed's lookout point or trail location shall notify both the applicable resource agency and the appropriate county planning office in accordance with paragraph (2) and provide the information in paragraph (3) to the Department in the well permit application. The applicable resource agency and/or county planning office may provide suggestions as warranted to mitigate the effects on the vista and viewshed such as moving the location beyond the ridgeline. The Department needs to consider both comments and mitigation suggestions in regards to issuing such a location permit.

Please note, Penn State University Department of Landscape Architecture students and Professor Brian Orland lead a workshop in Marcellus Landscape Design during December 2013, in Sullivan County. The students provided demonstrations on how Marcellus sitings are able to be done using landscape design and thus preserving our vistas.

New Provision - Creation of Buffer Zones:

Buffer zones (BZ) are created to ensure the royalty owners maximum exploitation while ensuring the public's maximum enjoyment on publically owned lands. This is not a restriction, but rather a simple buffer zone which will provide a measure that will allow the public's enjoyment coexisting with resource extraction. Buffer zones will create a sense of harmony and eliminate unnecessary conflicts. These buffer zones are small enough to provide industry with flexibility, predictability and consistency while providing a measure of consideration and respect for the community at large. It is within these buffer zones that mitigation measures are taken to ensure that the both the public and industry have equal access and coexist within the shadow of each other.

These areas will need to be classified in such a manner that DEP has a method to track them within their system to ensure that buffer zones are designated and indicated on the permit applications. Special scenic areas, such as waterfalls, glens, vistas, nationally recognized features and Commonwealth recognized ecological resources within Commonwealth lands managed for recreational and wildlife management purposes may have a Unique Buffer Zone (UBZ) applied. These areas need to be designated. Certain trail areas, such as those that are nationally recognized need to be designated in parts as scenic corridors. (SC) These areas also need to have a method of designation within the DEP permitting system. In determining designations, there needs to be a public participation component. These buffer zones are minimal zones, the operator can very well choose to further respect the public access to these resources and propose mitigation measures within a greater buffer zone distance.

- A buffer zone of 600 feet applies to:
 - Perimeters: publically owned parks, wild, natural or environmentally sensitive areas
 - Buildings on public lands
 - Trails (300 feet on each side)
 - Camping areas
 - Natural national landmarks
 - Historic sites listed on the Federal or State list of historic places
- Within these buffer zone areas, mitigation efforts shall be at a minimum as follows:
 - During all drilling, fracturing and completion operations sound barriers aesthetically designed with consideration to the surroundings shall be erected. The sound barriers shall be able to substantially suppress noise to 45 decibels at either the publicly owned land property border or in cases where the activity is within publicly owned lands 45 decibels at the nearest building or permanent camping area. Natural ambient noise levels are an important aspect of the public land recreational experience.
 - Where necessary, trails need to be relocated an adequate distance from the industry activity to ensure a pleasurable experience. Consideration needs to be made for dust, noise; proximity to possibly dangerous events and ensuring the site is sufficiently secured from access by unauthorized individuals. Trails shall be relocated in such a way that the hiking experience is not diminished and further, that both parties have maximum access to their activity pursuits.
 - When necessary, in order to afford a more pleasant camping experience, consideration shall be given to noise levels during the drilling, fracturing and completion operations. This consideration may involve mitigation such as abandonment of the established primitive camping area and the creation of a new area with at a minimum, a like for like exchange of facilities such as rest rooms, etc. In such cases, the public agency is responsible for the new primitive camping area selection with operator agreement. Costs incurred in the process of abandonment and creation of the new primitive camping area is at the operator's expense. The operator as an option may choose not to do site mitigation when the natural ambient noise levels are attained.
 - In all designated camping areas special considerations need to be taken regarding lights during drilling, fracturing, work over rig, and any other night work activity. Ideally, lighting such as "Lunar" non-glare lighting directed at the work area is preferable to typical overhead directional lighting that sends light as much as over a thousand feet

beyond the work area. Operators shall take appropriate measures to avoid any unnatural lighting in all designated camping areas.

- All permanent equipment on a producing well site shall be housed in such a manner to suppress noise to the point that the pre-development natural ambient noise levels are attained at the well pad perimeter.
- Once the well pad is hosting producing wells, trees and tall native plants that are customarily found within the immediate area shall be planted near the well pad perimeter in an adequate manner to camouflage the well pad. Plants shall be of an appropriate height to camouflage well pad equipment upon planting. In forested areas the ideal is that the well pad is adequately camouflaged so that it is not readily visible.
- A unique buffer zone of 1000 feet (500 feet on each side) applies to:
 - Scenic and natural features
 - Designated scenic corridor
- Within the unique buffer zone areas, mitigation efforts shall be at a minimum as follows:
 - Sound barriers aesthetically designed with consideration to the surroundings shall be erected in order to suppress noise to either 45 decibels or natural ambient noise levels which ever may be greater.
 - When necessary, the operator shall take adequate mitigation measures to enhance the public enjoyment experience within areas of scenic and natural features, and also designated scenic corridors. Such measures for an example would be to provide continual adequate access to those scenic and natural areas that may be hampered with a well pad location. Measures may extend from adjusting the well pad location/size to building a new trail to create a similar public access and experience to the designated scenic and natural feature or scenic corridor.
 - Particular attention shall be paid to disrupted scenic viewsheds. This may involve the establishment of a new vista overlook location, with accompanying trail or other actions that would adequately provide for an opportunity for the both the public and industry to coexist. Mitigation may involve slight pad relocation to beyond the ridgeline. This does not mean that the industry does not work within the viewshed, but rather it means that the industry gives careful consideration to the aesthetic value of such areas and makes every effort to adequately camouflage or enhance these areas.
- The 45 decibel limit is not created lightly. Ambient noise testing has indicated that our rural areas are quiet having ambient noise tests results at 35 decibel levels. Noise experts have noted that reaching 40-45 decibel levels are adequate in rural areas and the industry is able to achieve such levels with reasonable effort. 45-50 decibel limits are more prescribed in suburban areas. 50-55 decibel limits are prescribed in urban areas. Prior to Act 13, the only industries that were able to widely utilize 60 decibel limits were the FAA and the military. It is important to note that this 'prescribed standard' in Act 13 has now been overruled by the Commonwealth's Supreme Court, based in part on the Environmental Rights Amendment. Prior to Act 13 operators were advising that they were designing facilities to meet 45 decibel limits, so it is able to be done. It has been noted in "The World Health Organization (WHO)'s document entitled "Guidelines for Community Noise" that 50 decibels creates moderate annoyance outdoors during both daytime and evening timeframes.

- Public lands having wild or natural areas and areas considered environmentally sensitive of three square miles or less in size shall not have surface disturbance, all resource exploitation shall be accomplished through subsurface activities such as through horizontal drilling from a wellbore based in an area beyond the three square mile area.
- Well pad design shall incorporate more than the average number of wells than are typically planned on private land well pads. The goal; maximum exploitation with minimal disturbance. (660a)

Response: Please see response to comment 3019. Regarding noise, please see response to comment 2913. To the extent the commentator suggests extending the distances in §§ 78.15(f)(1) and 78a.15(f)(1), please see response to comment 273. The Department otherwise considered this comment and declines to make the recommended amendments. The Department believes the revisions to Chapters 78 and 78a are consistent with the Constitution and applicable statutes, and provide appropriate protections for public health and safety.

- 304.** Comment: I believe that no drilling or fracking should be allowed in or near our parks and forests. DEP's current proposal in the Chapter 78 revisions requires companies to notify relevant agencies when applying for permits within 200 feet of a public resource. This distance and low hurdle for applicants is woefully inadequate to protect public resources from the impacts and nuisances of fracking and flaring. I believe DEP should prohibit drilling on and at least a half mile around key public resources including publicly owned parks, forests, game land or wild life areas, national natural landmarks, or historical or archaeological sites. These special areas belong to the public, provide significant ecological, recreational, and economic benefits, and should therefore be preserved for the enjoyment of present and future generations. (186, 242a, 629, 950)

Response: To the extent the commentator suggests prohibiting drilling activities in certain areas, please see response to comment 282.

- 305.** Comment: Increase the setback for new wells near a publicly-owned park, forest, game land, or wildlife area. Two hundred feet is simply not enough space to protect our parks from fracking impacts, including air and water contamination, wildlife habitat fragmentation, and disruption of pristine viewsheds. A setback of at least half a mile would provide stronger protections. (119, 650, 651, 653, 655-658, 205a, 219a, 255a, 278a, 304a, 663-675, 678, 680-684, 687, 688, 692-694, 697, 701, 703-706, 710, 711, 713, 717-723, 726-728, 733, 735-736, 744a, 746, 747, 750-752, 755-757, 759, 762-767, 769, 771, 775, 778-780, 789-791, 796-797, 803, 805, 811, 813, 815-818, 825, 826, 828-830, 834-839, 960-969, 1020-1027, 1096)

Response: The extent that the commentator suggests extending the distances in §§78.15(f)(1) and 78a.15(f)(1), please see response to comment 273. To the extent that the commentator suggests greater setbacks, please see response to comment 282.

- 306.** Comment: In the past four decades, I have witnessed many changes in technology and concerns for the environment and safety as it applies to the conventional wells of western Pennsylvania. It has been through new technologies that this business has remained alive. The additional costs of both this technology and the adherence to environmental guidelines have cut into the potential profitability of developing oil and gas reserves. The Department of Environmental Protection is attempting to put additional restraints on the development of conventional oil and gas reserves that are not justified by a cost to benefit ratio. A good share of the work takes place in remote areas not shared by the general public and the DEP wants to treat these areas like they are public parks. The Department of Environmental Protection should be working with the conventional well operators

and not creating situations that make the operator work unreasonable. The fate of the industry depends on that. (610)

Response: There is a significant need to update the regulations that apply to conventional well operations. Statutory changes resulting from the passage of Act 13 of 2012 as well as environmental protection gaps in the Department's current regulatory requirements necessitate modest, common sense revisions. The Department believes that these modest regulatory revisions are necessary and appropriately tailored to the purposes served.

307. Comment: I understand that the proposed regulations could fail to protect our state and national parks from known impacts of fracking, including air and water contamination, wildlife habitat fragmentation, and destruction of our parks' beautiful view sheds. For example, the regulations would allow wells to be drilled just 200 feet away from our parks, and they fail to properly address Pennsylvania's 250,000 "orphaned or abandoned" wells. We need to strengthen, not weaken, regulations, so as to conform to the mandate of the Commonwealth's constitution: ARTICLE I, SECTION 27. ADDED BY AMENDMENT OF MAY 18, 1971 Natural Resources and the Public Estate. [Source: 1971 Pa. Laws 769] (659)

Response: The process outlined in §§ 78.15 and 78a.15 ensures that the Department has the information necessary to consider the impacts to public resources, including coordination with public resource agencies, and determine whether well conditions are needed to prevent a probable harmful impact. This process ensures that the Department fulfills its constitutional and statutory obligations. The Department believes the revisions to Chapters 78 and 78a are consistent with the Constitution and applicable statutes, and provide appropriate protections for public health and safety.

308. Comment: Please be very careful with what you allow near our national parks. (679)

Response: The Department acknowledges this comment.

309. Comment: After visiting Allegheny National Forest a number of times and witnessing the impact of drilling we are opposed to any further drilling on state lands. The negatives far outweigh the positives for the environment and the people. The beneficiaries will not be the above entities. The impacts of drilling are permanent and no matter how stringent the regulations or strict the enforcement of the regulations, will not prevent the continued degradation of land, water and other aspects of the environment. (690, 691, 1052)

Response: To the extent that the commentator suggests prohibiting drilling in certain areas, please see response to comment 282.

310. Comment: Pittsburgh is already having negative effects from fracking in that our water supplies are being tainted in increased levels of bromine. We do not want further destruction, ESPECIALLY not in our parks and public lands. Please protect these vital areas in our state! (712)

Response: The Department acknowledges this comment.

311. Comment: The DEP acknowledges that public resources are a major economic contributor to Pennsylvania Therefore, it is absolutely necessary that the strictest regulations are put into place to protect these resources. These regulations should also extend into the other areas of the gas drilling industry such as pipelines, compressor stations, gate and metering stations, dehydration stations etc. DEP'S current proposal in the Chapter 78 revisions requires applicants to notify appropriate

agencies when applying for permits within 200 feet of a public resource. I highly urge DEP to increase this distance to at least a half mile around public resources including publicly owned parks, forests, game land or wild life area, national natural landmarks, or historical or archaeological sites. These areas must be protected and preserved so present and future generations may be able to enjoy them. I live near Frances Slocum State Park in Luzerne County. There are already vast stretches of land that have been clear-cut for pipelines very near the park. I can't bear the thought to think that well pads or open pits, etc. can next be placed so close to this State Park if stricter regulations are not put in place. (848)

Response: Please see the response to comments 266.

- 312.** Comment: The setbacks proposed by the provisions of 200 feet of publicly owned lands and wildlife areas and historical and natural landmarks are simply token distances for the department to tell the citizens of PA that they are indeed regulating the drilling of new wells. The distance of 1000 feet from a private water well has been proven so many different times to be totally inadequate that the 200-foot distance is a moot point. DEP isn't prepared to have water provided to the whole of Pennsylvania once their water has been contaminated which it surely will be if this industry is allowed to continue with such woefully poor regulations. The problem of water contamination MUST be solved. The only reasonable solution to this destructive, catastrophic industry is a total ban of any of its activities in Pennsylvania. This is the only true and accurate way that we can be sure our water, air and land will not be polluted for us and for future generations. (864)

Response: Please see response to comment 282.

- 313.** Comment: I respectfully urge you to prevent any fracking development on any of our state or National Park land in PA. If we don't we will only learn once again, to our sorrow, that we have lost what can't be replaced. (935)

Response: Please see response to comment 282.

- 314.** Comment: I likewise support the provision which will require permit applicants to consider the impact of a well site on public resources, including parks, water supplies, and protected species. Tourism is a significant economic driver in my area. The Laurel Highlands, Great Allegheny Passage bike trail, and Youghiogheny River draw visitors from all over the world. The consideration of state parks, protected species, natural amenities, and tourism- generating features is appreciated. (919, 943)

Response: The Department acknowledges this comment.

- 315.** Comment: I don't think it's possible to mitigate the burden that this industry perpetrates on the environment. I don't see anything in these proposed regulations to adequately defend our woodlands and their residents. I don't know if these regulations apply to our state forests and conservation districts but we should stop ALL unconventional drilling in those places. (1003)

Response: Please see response to comment 282.

- 316.** Comment: Section 78.15(f)(1)(i) -This should be restated as "within a publicly owned park, forest, game land or wildlife area. As proposed, this is the potential taking of private property owners rights and their ability to develop their property if the owner so chooses to. (411)

Response: These provisions outline an area around the listed public resources that require additional consideration as part of the permitting process.

317. Comment: 78.15(f)(1)(i) - We recommend revisions to clarify language on the Department's definition of a wildlife area. This implies it is different from a forest game lands or park. There are several federal wildlife refuges in Pennsylvania but there are also 2,000,000 acres of "Important Bird Areas" in Pa. These areas are not in any regulation that could be interpreted as a wildlife area. (1174)

Response: The Department declines to define publicly-owned wildlife area at this time. If the need for further clarification becomes apparent during implementation of this provide, the Department will develop guidance to address any issues identified.

318. Comment: Please do not allow fracking in our state parks and state forests. These lands are the taxpayer's, NOT Governor Corbett's! (647)

Response: To the extent the commentator suggests prohibiting drilling activities in certain areas, please see response to comment 282.

319. Comment: Please do not allow fracking close to our state, county, and national parks and recreation areas. (48a, 716, 732, 740, 742, 773)

Response: To the extent the commentator suggests prohibiting drilling activities in certain areas, please see response to comment 282.

320. Comment: We love our parks! We work hard to keep them clean and unmolested. Please give them the protection they deserve! (745, 749, 773)

Response: The Department acknowledges this comment.

321. Comment: Please do not allow fracking in state forests and state parks. These are places for everyone to go enjoy on vacation, not for one crappy money grubbing company to destroy the water with toxic pollution and ruin it forever!! Please tell the fracking companies No. get lost! They don't create any jobs; all the well pads are completely empty of people after they are done drilling. They just create environmental destruction! (748)

Response: To the extent the commentator suggests prohibiting drilling activities in certain areas, please see response to comment 282.

322. Comment: This isn't what our parks are for! No Windmills, no fracking!!(776)

Response: Please see response to comment 282.

323. Comment: Please keep our parks for what they are supposed to be used for, and do not allow fracking to destroy them. (781, 831)

Response: To the extent the commentator suggests prohibiting drilling activities in certain areas, please see response to comment 282.

324. Comment: Oil and gas wells have no place in Pennsylvania's Parks and forests. (788)

Response: To the extent the commentator suggests prohibiting drilling activities in certain areas, please see response to comment 282.

325. Comment: Don't allow Pa. parks to be ruined by big oil and gas. (793)

Response: To the extent the commentator suggests prohibiting drilling activities in certain areas, please see response to comment 282.

326. Comment: State and National parks are meant for outdoor recreation and introducing gas drilling will raise potential risks to these public properties. The intent of public space is to reserve it for current and future use. Exploiting resources was not the intent. (820)

Response: To the extent the commentator suggests prohibiting drilling activities in certain areas, please see response to comment 282.

327. Comment: I am totally against all fracking in our state parks and land. These lands belong to the Pennsylvania citizens and are not for sale for private consumption under privately held companies. I am for a full closure of any industrial practices on these public lands. I feel that we need quiet space, somewhere to see unscathed earth/land and a place to allow our water, air, soil, birds, animals, and just nature practice the code of nature. Leaving it untracked and undisturbed is what these lands were intended to do and why it was set aside.

At the least, I am concerned about the existing and potential impacts to Pennsylvania's state and national parks from increased hydraulic fracturing. (219a)

Response: To the extent the commentator suggests prohibiting drilling activities in certain areas, please see response to comment 282.

328. Comment: I would just like to make an appeal concerning drilling/fracking, in our national forests and parks. Those areas are about as hallow as can be. They should be left in the natural state and preserved. They are not about making greedy money. They are our natural resources to be protected, preserved and respected. Just think about it and anyone with a true love of nature and a compassionate moral heart would leave drilling and fracking to other land, not our precious forest and parks. (800)

Response: To the extent the commentator suggests prohibiting drilling activities in certain areas, please see response to comment 282.

329. Comment: Do not allow fracking in Pennsylvania's state parks and state game lands. I, as a Pennsylvania resident, know how these companies are destroying land and water quality in the areas that they are already extracting gas from. Our state parks belong to us, the citizens of Pennsylvania, and as our elected officials, it is your duty to protect these areas for us. (832)

Response: To the extent the commentator suggests prohibiting drilling activities in certain areas, please see response to comment 282.

330. Comment: There should be no drilling on public lands which should be protected for future generations.(45)

Response: To the extent the commentator suggests prohibiting drilling activities in certain areas, please see response to comment 282.

331. Comment: Buffer strips of 200 feet around all state properties. This has the potential for any public agency involved to stop or at least greatly slow the permitting process down. (627, 4681 – 4682)

Response: To the extent the commentator suggests prohibiting drilling activities in certain areas, please see response to comment 282. To the extent that the commentator suggests that the process in §§ 78.15 and 78a.15 will slow permitting, please note that §§ 78.15(f)(2) and 78a.15(f)(2) gives public resource agencies a limit of 30 days to provide comments.

332. Comment: The further we keep the fracking process from the borders of our public lands, i.e. State parks and other recreational areas, the better for everyone! We only have one chance to do the right thing, and that is to preserve as much of our land as possible. Thank you for listening. (827)

Response: To the extent the commentator suggests prohibiting drilling activities in certain areas, please see response to comment 282.

333. Comment: Stop fracking, or at least apply more stringent regulations, before it's too late and park waters become polluted and national treasures are lost. (1032)

Response: The Department drafted this final rulemaking to provide the needed protection for public health, safety and the environment.

334. Comment: The production of natural gas on nearby lands could harm Pennsylvania's national parks in two main ways. First are direct environmental impacts. The water quality in the parks – and especially in the three parks along the Delaware River – could be harmed if there are wastewater spills close to nearby waterways. Contamination of the Delaware River, in particular, would have far-reaching consequences that could degrade the drinking water supply for some 15 million citizens in the region.² Air quality at any one of Pennsylvania's parks can be negatively impacted by fracking development, which emits more pollutants than traditional oil and gas extraction methods. Finally, increased development near parks fragments the habitats of park wildlife that move across park borders.

The second type of impacts center around the visitor's enjoyment of national parks. As with any tourism-based economy, visitation, and repeat visitation, depends on the quality of the experience. Where there is industrial development too close to parks, the visitor experience suffers. Visitors travel to parks in order to escape the pressures of modern life, including industrial development. However, visitors to parks near fracking activities may experience air and water pollution, industrial noise from compressors, trucks and other equipment, the visual intrusion of oil rigs and lighted equipment on scenic or historic viewsheds, and traffic and congestion on otherwise rural roads. Industrialization of our park landscapes is already harming parks amid the drilling booms in the Rocky Mountain West. The experience of visiting North Dakota's rural Theodore Roosevelt National Park has been significantly degraded, and now visitors have to deal with heavy traffic, air quality warnings and nighttime gas flares. It's an experience Pennsylvania needs to prevent at the national parks in the Commonwealth. (1096)

Response: To the extent the commentator suggests prohibiting drilling activities in certain areas, please see response to comment 282.

To the extent that the commentator suggests that additional protections are needed for waters of the Commonwealth, please see the response to comment 274.

335. Comment: I am not sold to begin with on the safety of Hydro-fracturing and feel that our parks are the last refuge that a person or their family can go for a nice inexpensive vacation and should not be exposed to this whole type of dirty energy and it's operation especially on land that is the public's. (158a)

Response: To the extent the commentator suggests prohibiting drilling activities in certain areas, please see response to comment 282.

336. Comment: I have no problem using NG over coal or oil. However, the extraction will bear a cost long after the benefits will be exhausted. Let's not pass the cost of environmental cleanup and health issues to the population, but rather incur accordingly. We need to curtail unrestricted development and control it reasonably with an eye to the future. There are safer ways to extract NG that will not incur a massive social and financial cost. Primarily, we should restrict completely all extractions in our parks. PA is the only state in the US that does not charge an extraction fee. That alone is harmful to the future of PA. (841)

Response: To the extent the commentator suggests prohibiting drilling activities in certain areas, please see response to comment 282.

337. Comment: The regulation at § 78.15(f)(1)(i) requires the applicant to notify the applicable resource agency if a well is located "in or within 200 feet of a publicly owned park, forest, game land or wildlife area." The examination of impacts to public resources should include impacts from the full footprint of all activities encompassed in the new proposed definition for Oil and Gas Operations. The newly defined term Oil and Gas Operations should be used to make the full scope of the review obligation clear. Moreover, given that the science of conservation biology indicates that edge impacts (changes in light, moisture, etc.) protrude at least 300 feet into adjacent forest systems, the 200-foot buffer that triggers notification is inadequate and has no basis in either ecological or biological science. We recommend the addition of other public natural resources entitled to protection under Article 1, Section 27, of the Pennsylvania Constitution. (1143)

Response: To the extent the commentator suggests this provision should extend to all oil and gas activities, please see response to comment 266. The Department believes the revisions to Chapters 78 and 78a are consistent with the Constitution and applicable statutes, and provide appropriate protections for public health and safety.

338. Comment: § 78.15(f)(1) (ii) We recommend the Department provide a definition or additional clarifying language to the phrase "corridor of a state or national scenic river". (639, 1099, 1137, 1140, 1147, 1174)

Response: The Department declines to define the term at this time. The term "corridor of a state or federal national scenic river" is a term that is currently a component of the well permit application process. As part of the current well permit application process applicants must identify whether the proposed well is within the corridor of state or national scenic river. This is a detailed process that requires looking at maps developed by the Department of Conservation and National Resources and the National Park Service. For these reasons, it is more appropriate to develop guidance in policy. Accordingly, to the extent that more guidance is needed beyond what is already provided in the well permit application materials, the Department will provide any needed guidance.

339. Comment: § 78.15(f)(1)(ii) - We recommend that the language be changed from "in or within the corridor of a state or national scenic river" to "*in or within the corridor of a state designated scenic*"

river or a unit of the National Wild and Scenic River System” to more accurately reflect the range of potential designations. (1062, 1133)

Response: The Department considered this comment and declines to make the suggested change. Please see response to comment 338.

340. Comment: 78.15 Subsection (f)(1)(ii) should further define the term “corridor”, or used an alternate term that is further defined.

The concept of a river corridor is subject to varying interpretations. See, e.g., Federal Emergency Management Agency, available at www.training.fema.gov%2FEMIWeb%2Fedu%2Fdocs%2Ffmc%2FChapter%252014%2520-%2520River%2520Corridor%2520and%2520Watershed%2520Mgmt.pdf&ei=HYf6UrLkK4Lf0gGFp4GYCA&usg=AFQjCNFVrQDAFkRSip0OgTH1HZ0n8_DMrQ&sig2=u2q78vsVZ7jEFJi9YkKuuw (Last accessed February 11, 2014). Considering the protective nature of this regulation, we suggest that the term “corridor” be defined in the broadest possible terms to ensure that resource agencies are given sufficient notice of any oil and gas operations. (852a)

Response: Please see response to comment 338.

341. Comment: § 78.15(f)(1)(iii) – National Natural Landmark – We recommend the notification distance be 1,000 feet from the edge of the well pad. As noted above, at this distance there is a reasonable potential for subsurface impacts from gas migration associated with possible over pressuring of the annulus, as well as potential surface impacts to natural sounds and night skies, wildlife, viewsheds, and other resources. (1062, 1133)

Response: Please see responses to comments 273 and 277.

To the extent that the Commentator suggests that more protections are needed in this rulemaking to ensure protection of water supplies during drilling activities, Chapter 78 and Chapter 78a currently contain requirements that ensure that the well will be constructed and operated to prevent gas, oil, brine, completion and servicing fluids, and other fluids or materials from entering fresh groundwater. These robust well construction standards are coupled with the mechanical integrity assessment requirements which require quarterly inspections to ensure the continued integrity of operating wells. Well construction standards are outside the scope of this rulemaking.

342. Comment: Section 78.15(f)(1)(iii) states that critical communities “means special concern species. “Although neither the term “critical communities” nor “special concern species” are in any way defined in Chapter 78, it seems that the EQB is attempting to inappropriately merge two very different concepts into one for purposes of triggering the notice requirement under § 78.15(f). We suspect that critical communities is intended to refer to critical habitat as that term is defined under the *Endangered Species Act of 1973*, 16 U.S.C. §§ 1531 *et seq.*, and that the reference to special concern species is referring to that term as defined in the DEP’s *Policy for Pennsylvania Natural Diversity Inventory (PNDI) Coordination During Permit Review and Evaluation*. Assuming that is the case, treating PNDI as equivalent to the *Endangered Species Act* is inappropriate as the standards for PNDI are vague, undeveloped and significantly different from the *Endangered Species Act*. It is rather arbitrary for the EQB, absent any direction from the General Assembly and absent vetting the processes, procedures and standards of PNDI through full regulatory review and scrutiny in accordance with the *Regulatory Review Act*, 71 P.S. §§ 745.1 *et seq.*, to take a DEP Policy and make it equivalent to a Federal standard for purposes of state well permit applications. We recommend that

this subparagraph be revised to solely reference impact to a critical habitat or species as defined in the *Endangered Species Act*. (1140)

Response: The Department has determined that the public resource impact screening provisions as outlined in Section 78.15(f)-(g) and 78a.15(f)-(g) are reasonable, appropriate and necessary to ensure that the Department has complied with its obligation to protect public resources under Article I, Section 27 of the Pennsylvania Constitution, the Administrative Code of 1929, the 2012 Oil and Gas Act, the Clean Streams Law, the Dam Safety and Encroachments Act, the Solid Waste Management Act and other statutes. Please see the response to comment 265.

Under Section 3215(c)(4) of the 2012 Oil and Gas Act, the Department has a legal obligation when reviewing a well permit application to consider the impacts to public resources including “other critical communities.” The phrase “other critical communities” is defined in the final rulemaking to mean species of special concern identified through the Pennsylvania Natural Diversity Inventory (PNDI) consistent with the Department’s past practices and policies. Under Section 3274 of the 2012 Oil and Gas Act, the Environmental Quality Board has the authority to promulgate regulations necessary to implement the statute.

The Department’s well permit application materials and its “Policy for Pennsylvania Natural Diversity Inventory (PNDI) Coordination During Permit Review and Evaluation,” Doc. No. 021-0200-001 establish a process that has been and continues to be in use by well permit applicants to identify and consider species of special concern. The final rulemaking codifies this process and is consistent with the Department’s long-standing use of PNDI to fulfill its responsibility to consider impacts on species of special concern when issuing permits under various environmental statutes.

In response to comments, the final rulemaking amends the definition of “other critical communities” to clarify that this term applies only to those species of special concern that appear on a PNDI receipt. Also in response to comments, the Department removed the provisions in the draft-final rulemaking relating to specific areas within the geographical area occupied by a threatened or endangered species and significant non-species resources. These changes were to ensure that the definition reflects the existing PNDI process.

The process for consideration of public resources in Sections 78.15 and 78a.15 makes appropriate use of information available in the PNDI database from the public resources agencies with the authority, knowledge, and expertise to identify and protect species of special concern. Sections 78.15(f) and 78a.15(f) outlines a reasonable and appropriate process that provides important information to the Department to evaluate potential impacts and to assess the need for additional conditions in the well permit using the criteria in Section 78.15(g) and 78a.15(g).

343. Comment: DEP does not have the authority to protect special concern species in Section 78.15(f)(1)(iv). DEP’s proposed revisions to Section 78.15(f)(1)(iv) would create an expanded, new, open-ended, confusing and unnecessary consultation and administrative determination process for its consideration of well permit conditions to protect public resources, and at the same time would impose new legal obligations, applicable throughout the Commonwealth, on well operators to take actions to protect habitats of hundreds of what the DEP terms “special concern species,” which species are neither threatened nor endangered. With respect to these non-threatened and non-endangered species, the proposal would easily result in the addition of tens of millions, possibly

hundreds of millions, of dollars in unneeded and unjustified survey and mitigation costs for an indeterminate number of species that are neither threatened nor endangered. (1153)

Response: Please see response to comment 342.

344. Comment: Section 78.15(f)(iv) pertaining to “special concern species:” 1) does not conform to the intention of the legislature and 2) the DEP/EQB has not been delegated the statutory authority to promulgate a regulation about the habitat of such a “species”. (1153)

Response: Please see response to comment 342.

345. Comment: § 78.15(f)(1)(iv) Suggested amendatory language: in a location that will impact critical habitats of State or Federal threatened or endangered species. (1147)

Response: Threatened and endangered species and their critical habitat are addressed in §§ 78.15(d) and 78a.15(d).

346. Comment: Commenter states that PADEP’s proposed rule would equate “critical communities” with “special concern” species, which is not supported by fact or law and would have substantial repercussions on well permitting under the Oil and Gas Act. (1153)

Response: Please see response to comment 342.

347. Comment: DEP’s proposed revisions in paragraph (f)(1) would create new and unauthorized obligations related to “special concern species” without an adequate basis in fact or law. DEP and other resource agencies have acknowledged that the term “special concern species,” despite being defined in DEP’s new PNDI Policy, Doc. No. 021-0200-001, has no generally accepted standard definition either by law or in the scientific community. In fact, special concern species are generally understood to mean all categories of species, whether threatened or endangered, which are protected under the Endangered Species Act and comparable state laws, or rare, candidate, and even undetermined species that are simply of interest to the scientific community. DEP cannot recklessly wade into species law without statutory authority or scientific consensus. DEP has no authority or jurisdiction to impose well permit conditions for the protection of species under Act 13 or elsewhere. (1135)

Response: Please see response to comment 342.

348. Comment: The term critical community needs to be better defined. The Pennsylvania Game Commission (PGC) currently lists species of special concern, threatened species, and endangered species which all should be considered critical communities and covered under a Pennsylvania Natural Diversity Inventory (PNDI) review which is already required by DEP for permitting purposes and mentioned in 78.15d. A critical community should also refer to any critical and unique habitats that support threatened and endangered species along with species of special concern or at a minimum the critical communities currently have these species present. (1170)

Response: In response to comments, the final rulemaking amends the definition of “other critical communities” to clarify that this term applies only to those species of special concern that appear on a PNDI receipt. Also in response to comments, the Department removed the provisions in the final rulemaking relating to specific areas within the geographical area occupied by a threatened or endangered species and significant non-species resources. These changes were to ensure that the definition reflects the existing PNDI process.

349. Comment: Section 78.15(f) should be revised to state the following:

(f) An applicant proposing to drill a well at a location listed in paragraph (1) shall notify the applicable resource agency, if any, in accordance with paragraph (2) and provide the information in paragraph (3) to the Department in the well permit application.

(1) This subsection applies if the proposed surface location of the well is located:

(i) in or within 200 feet of a publicly owned park, forest, game land or wildlife area.

(ii) in or within the corridor of a state or national scenic river.

(iii) within 200 feet of a national natural landmark.

(iv) in a location that will impact ~~[other]~~ the critical habitat of state or federal threatened or endangered species.~~[communities]~~

(v) ~~[For the purposes of this section other critical communities means special concern species.]~~

~~[(vi)]~~ within 200 feet of a historical or archeological site listed on the Federal or State list of historic places.

(vi) ~~[(vii)]~~ in the case of an unconventional well, within 1000 feet of a water well, surface water intake, reservoir or other water supply extraction point used by a water purveyor.

(1135)

Response: Please see response to comment 342. Threatened and endangered species and their critical habitat are addressed in §§ 78.15(d) and 78a.15(d).

350. Comment: 78.15(f)(1)(iv) - This should be removed all together as there is generally limited evidence or insufficient data to determine a special concern species and should not fall upon the operator to determine this. (411)

Response: Please see response to comment 342.

351. Comment: Section 78.15(f)(1)(iv)-- It is not the express language or the intent of Act 13 to impose oil and gas development restrictions based on undefined and unknown “other critical communities.” Section 3215(c)(4) refers to habitats of rare and endangered flora and fauna and other critical communities. The Department’s proposal in 78.15(f)(iv) equates other critical communities with special concern species without an adequate basis in fact or law, nor any rational ecological basis for equating “communities” with individual “species.” The first sentence should be revised to properly focus on the well-established concept of critical habitats of threatened and endangered species, and the second sentence should be deleted.

In addition, we have concerns about the selection, listing and public participation process for special concern species.

- The term “special concern species” has no legislative or regulatory definition in Pennsylvania law.
- The Department has no statutory authority with respect to any species, and no authority to define, designate or list any plant or animal as a special concern species.
- No State or Federal agencies have used rulemaking to designate any species as “special concern species” in Pennsylvania.

Suggested amendatory language:

(iv) in a location that will impact critical habitats of State or Federal threatened or endangered species (1057, 1103, 1174)

Response: Please see response to comment 342.

352. Comment: § 78.15(f)(1)(iv) It is not the express language or the intent of Act 13 to impose oil and gas development restrictions based on undefined and unknown “other critical communities.” Section 3215(c)(4) refers to habitats of rare and endangered flora and fauna and other critical communities. The Department’s proposal in 78.15(f)(iv) equates other critical communities with special concern species without an adequate basis in fact or law, nor any rational ecological basis for equating “communities” with individual “species.” The first sentence should be revised to properly focus on the well-established concept of critical habitats of threatened and endangered species, and the second sentence should be deleted. In addition, the commentator has significant concerns about the selection, listing and public participation process for special concern species. The term “special concern species” has no legislative or regulatory definition in Pennsylvania law. The Department has no statutory authority with respect to any species, and no authority to define, designate or list any plant or animal as a special concern species. No State or Federal agencies have used rulemaking to designate any species as “special concern species” in Pennsylvania. The commentator suggests the following amendatory language: “(iv) in a location that will impact critical habitats of State or Federal threatened or endangered species.” (1137)

Response: Please see response to comment 342.

353. Comment: Section 78.15(f)(1)(iv): The Act 13 section, 3215(c)(4), wherein the term “critical communities” appears is unchanged from and carried forward from the 1984 Oil and Gas Act or what was Act 223. Act 223 was signed by the Governor in December 1984. The original inventory itself, the terminology, and the concept of “species of special concern in Pennsylvania” first appeared in 1985 with the publication of a Carnegie Museum of Natural History Special Public, No. 11 Volume titled “*Species of Special Concern in Pennsylvania*.” In short, the Pennsylvania legislature did not intend in 1984 to have a term mean something that did not exist in 1984, and the Department should not pretend that it did. In keeping with other legislative enactments, the reasonable interpretation to the Act 223 phrase is that the legislature intended it to cover the habitat of a properly designated threatened or endangered species and nothing more. (81, 419)

Response: Please see response to comment 342.

354. Comment: § 78.15(f)(1)(iv) - This section requires an operator to notify the applicable resource agency if the well location will impact “other critical communities,” which is then defined to mean “special concern species.” Section 3215 (c)(4) of the Oil and Gas Act of 2012 requires the department to consider the impact of the proposed well on habitats of rare and endangered flora and fauna and “other critical communities,” which is not defined in the statute. There is no legal basis or indication of legislative intent for the department to determine that “other critical communities” equates to “special concern species” nor is there any rational ecological basis for equating “communities” with “individual species.” The term “special concern species” has no legislative or regulatory definition and no state agency has been given legislative authority to designate “special concern species,” or to require that such species be protected through regulation or permit condition. Consequently, it is recommended that the term “special concern species” be removed from this section. If the department feels compelled to define “other critical communities” in the regulation, it is recommended that the last sentence in this subsection be changed to read, “For the purposes of this subparagraph, other critical communities means the habitat of species formally proposed for inclusion on the list of Threatened and Endangered Species.” (866, 124a)

Response: Please see response to comment 342.

355. Comment: § 78.15(f)(1)(iv) – Comments assert that the DEP is without the authority to “designate species or condition well permits based on species apart from the ‘habitat’ of species that have otherwise been properly designated by the governing resource agency.” Unfortunately, this assertion was left unsubstantiated. The allegation seems to be that DEP does not have the authority to regulate animal species, and therefore may not establish well permit application standards that consider the proximity of certain animal species to the proposed well site. This allegation fails to consider that under *Robinson Township*, the ERA applies to “Pennsylvania’s public natural resources,” and these include “not only state-owned lands, waterways, and mineral reserves, but also resources that implicate the public interest, such as ambient air, surface and groundwater, wild flora and fauna (including fish).” *Robinson Township* at 36 [emphasis added]. The DEP’s purpose is to enforce the ERA and other Pennsylvania environmental laws. Regulating “fauna (including fish)” is undoubtedly within the scope of the DEP’s authority. (1070)

Response: The Department acknowledges this comment.

356. Comment: Section 78.15(f)(1)(iv): *References to the Habitat of a “Species of Special Concern” Should be Deleted to Avoid Potential Confusion with “Critical Communities”*

The proposed Section 78.15(f)(1)(iv) attempts to regulate the habitats of “species of special concern” without clearly delineating the meaning of the term. Operators will incur an expanse in time and resources for processing permit applications with the proposed requirements related to the habitats of such species. The board should provide further clarity and distinction between the terms “critical communities” and “species of special concern” (or “special concern species”) to reduce ambiguity in how an operator is to comply with the proposed provision. In maintaining the language from Section 205(c) of the Oil and Gas Act of 1984 (“Act 223”) in the enacted Act 13, which expressly included the term “critical communities,” it appears the Pennsylvania Legislature did not intend for the amended statutory provision, Section 3215(c), to include the term “species of special concern” or “special concern species.” “Critical communities” and “species of special concern” (or “special concern species”) are distinct terms. There is no scientific community or agency consensus or express statutory definition from which to garner a meaning of the term “species of special concern” (or “special concern species”). Without such consensus or an established definition, it is difficult to use the proposed provision as an effective compliance tool. The regulated community is left with substantial questions as to how any such list is generated, what criteria are used to generate such a list, and no insight into how the Department will manage the list as it relates to permit conditions. The Board should continue its commitment to requiring operators to evaluate potential impacts to “critical communities” as a permit application requirement, set forth in Section 3215 of Act 13. The proposed Section 78.15(f)(iv) should be modified by deleting the reference to “special concern species.” (1085, 1164)

Response: Please see response to comment 342.

The Department disagrees that coordination with public resource agencies to consider impacts to other critical communities will impose an economic hardship on oil and gas operators. These operators are currently required to identify the habitats of special concern species where the proposed well site or access road will be located and describe measures proposed to be taken to avoid or mitigate impacts to special concern species. The applicant must provide a PNDI receipt with the well permit application and, if a potential impact is identified, the applicant must notify the applicable public resource agency. The applicant should also be consulting with the agency to identify appropriate avoidance and/or mitigation measures. As this is an existing well permit application component necessary to comply with applicable constitutional

and the statutory requirements, this final rulemaking does not impose any new financial burden.

357. Comment: 78.15(f)(1)(iv) requires applicants to notify certain parties if the proposed surface location of the well is located in a location that will impact “other critical communities.” For the purposes of this subparagraph, “other critical communities” means “species of special concern.” What is EQB’s authority to define “other critical communities” as “species of special concern”? In addition, it is unclear what the scope of species of special concern can be, how a species becomes a species of special concern, how this provision will be implemented, and the costs associated with complying with this provision. For these reasons, we ask EQB to provide a more detailed explanation of the rationale for this subparagraph, why it is needed, how it will be implemented, why it is legal, and why it is consistent with the intent of the General Assembly and Act 13. (1099)

Response: Please see response to comments 342 and 356.

358. Comment: 78.15(f): We have significant concerns about this section. Act 13 did not include language or express intent to impose oil and gas development restrictions based on undefined and unknown “other critical communities.” The Department’s proposal in 78.15(f)(iv) equates other critical communities with special concern species without an adequate basis in fact or law, nor any ecological basis for equating “communities” with individual “species.” In addition, the term “special concern species” has no legislative or regulatory definition in Pennsylvania law; the Department has no statutory authority to define, designate or list any plant or animal as a special concern species; and lastly, no State or Federal agencies have used rulemaking to designate any species as “special concern species” in Pennsylvania. As such, the language should be modified to focus on the well-established concept of critical habitats of threatened and endangered species. We support the suggested MSC’s suggested amendatory language: “(iv) in a location that will impact critical habitats of State or Federal threatened or endangered species.” (1071)

Response: The Department has determined that the public resource impact screening provisions as outlined in Section 78.15(f)-(g) and 78a.15(f)-(g) are reasonable, appropriate and necessary to ensure that the Department has complied with its obligation to protect public resources under Article I, Section 27 of the Pennsylvania Constitution, the Administrative Code of 1929, the 2012 Oil and Gas Act, the Clean Streams Law, the Dam Safety and Encroachments Act, the Solid Waste Management Act and other statutes. Please see the response to comment 265.

Please see response to comment 342.

359. Comment: Proposed regulation Section 78.15(f)(iv) pertaining to “species of special concern” (i) does not conform to the intention of the legislature and (ii) the DEP/EQB has not been delegated the statutory authority to promulgate a regulation about the habitat of such species.

Additionally, there is no consensus in the scientific community, or even among the Pennsylvania agencies responsible for the protection of species, as to the definition or criteria by which any species would be considered to be of “special concern.” Proposed regulation Section 78.15(f)(iv) pertaining to “species of special concern” (i) does not conform to the intention of the legislature and (ii) the DEP/EQB has not been delegated the statutory authority to promulgate a regulation about the habitat of such species. (634)

Response: Please see response to comment 342.

360. Comment: Section 78.15(f)(1)(i)-(iv): *Further Clarification on Phrases Used for Notification Requirements Would be Helpful*

The proposed language regarding notifications operators must issue under § 3211(b)(2) of Act 13 could benefit from further clarification. The proposed language of § 78.15(f)(1)(i)-(vi) maintains that if an operator is drilling in or within 200 feet of a publicly owned park, forest, game land or wildlife area; in or within the corridor of a state or national scenic river; within 200 feet of a national natural landmark; in a location that will impact other critical communities (meaning special concern species); within 200 feet of a historical or archeological site listed on the federal or state list of historic places; or, within the case of an unconventional well, within 1,000 feet of a water well, surface water intake, reservoir or other water supply extraction point used by a water purveyor it must provide additional notifications. To ensure proper understanding of these requirements, we recommend the Board provide a definition or additional clarifying language for the phrase “corridor of a state or national scenic river.” We further recommend revising the first sentence and deleting the second sentence of § 78.15(f)(1)(iv) to align the regulation with the language in Act 13, § 3215(c)(4), which refers to habitats of rare and endangered flora and fauna and other critical communities. To create such alignment, it is suggested that the reference to special concern species be deleted from 78.15(f)(iv). See the following comment on “special concern species.” (1085)

Response: The Department declines to define the term at this time. The term “corridor of a state or federal national scenic river” is a term that is currently a component of the well permit application process. As part of the current well permit application process applicants must identify whether the proposed well is within the corridor of state or national scenic river. This is a detailed process that requires looking at maps developed by the Department of Conservation and National Resources and the National Park Service. For these reasons, it is more appropriate to develop guidance in policy. Accordingly, to the extent that more guidance is needed beyond what is already provided in the well permit application materials, the Department will provide any needed guidance.

In response to the commentator comment of special concern species, please see response to comment 342.

361. How would any such list be generated? Will environmental special interests be effectively making it up for DEP by challenging every application with form letter objections based on the possible existence of some relatively rare but non-threatened plant? What criteria will be used to determine whether there is an impact to these species and to mitigate it? This is a recipe for unending uncertainty, which is what is killing New York. I urge you to revise the proposed regulations to eliminate this and other unwarranted extensions of legislative authority. (196, 866)

Response: Please see response to comment 342.

362. Comment: DEP has way overstepped its boundaries with reference to public resources and special concern species. Act 13 and the Oil & Gas Act of 1984 both addressed “critical communities,” yet DEP has attempted to equate those to “Species of Special Concern.” That is a false equivalency in that there is no true regulatory definition of species of special concern, a term first coined in a Carnegie Museum book of 297 species. The PA Natural Heritage Program uses this loose term to list 1,616 “species” (some are communities, landforms and geologic features). Clearly DEP has unilaterally expanded the intent, maybe by a factor of 5.5.(404)

Response: Please see response to comment 342.

363. Comment: The obligations related to “special concern species” result in a process which could be never ending, costly, and possibly without authority or benefit. The electronic notifications, submittals, and reporting creates a burden for small producers which do not have access for such transactions. Hard copy submittals need to be permitted and over time most producers at their own discretion can choose to submit information electronically. (998)

Response: Please see responses to comments 342 and 356.

364. Comment: Currently, in the Commonwealth of Pennsylvania both federal and state listed threatened and endangered species are fully protected. We are very much committed to our public resources and environment and will continue to support this standard. However, establishing the term “special concern species” in well permitting has no basis. There is no legislative or regulatory definition for such a species category in the Commonwealth and there never has been, which raises questions about how any such list is generated, what criteria are used to determine whether there is an impact to these species and how DEP proposes to mitigate impacts to such species. The proposed rule creates tremendous uncertainty about a permit applicant’s obligations. (1145)

Response: Please see response to comment 342.

365. Comment: We support the Department’s inclusion of Species of Special Concern in the consideration of “other critical communities,” and also recommend adding “Rare and Significant Ecological Features” to this review (as referenced in the Department’s Policy for Pennsylvania Natural Diversity Inventory Coordination During Permit Review and Evaluation). (997a)

Response: The Department acknowledges this comment. Please see response to comment 342.

366. Comment: Section 78.15(f) proposes to equate “critical communities” with “special concern species” without an adequate basis in fact or law. That term is undefined by state or federal statute or regulation. No federal or state agencies have utilized the rulemaking process to designate any species as “special concern,” and there is no rational ecological basis for equating the term “communities” to “species.” This raises substantial questions about how any such list is generated, what criteria are used to determine whether there is an impact to these species, and why/how the DEP would develop well permit conditions to mitigate impacts to such species. To the extent the term is intended to refer to certain species on the Pennsylvania Natural Diversity Inventory (PNDI) database, such designation is not done by rulemaking. Accordingly, DEP is seeking to create a binding regulatory requirement in excess of its statutory authority and jurisdiction without following required rulemaking procedures. The proposed rule creates tremendous uncertainty about a permit applicant’s obligations with regard to an ever-changing and undefined list, to which there is no public access. The provision places Pennsylvania at a serious competitive disadvantage with respect to other states. The reference to “special concern species” should be eliminated. (1174)

Response: Please see response to comment 342.

367. Comment: The introduction of new terms and conditions for the protection of some species and habitats that have not been fully vetted and formally listed is inappropriate. Although the intentions are good, the Department is overstepping its bounds in this section. (606, 606a)

Response: Please see response to comment 342.

- 368.** Comment: DEP’s proposed addition to consider and mitigate impacts to “special concern species” during the well permit process raises both legal and practical concerns because: 1) those species have never been designated as such under rulemaking by any government agency; 2) the number of such species in the PNDI database is three times as many as the threatened and endangered species combined; and 3) DEP’s proposal would instantly elevate protections for hundreds of such species to the status of threatened and endangered species without any opportunity for public review.

This proposal defies all principles of administrative law and rule making protections and is beyond DEP’s statutory authorization under Act 13. (413a)

Response: Please see response to comment 342.

- 369.** Comment: The language related to the protection of public resources, including the definition of a species of special concern is ambiguous and should be revised to clarify what constitutes a public resource and what activities may be considered a harmful impact. (1113, 1118, 1120, 1115a, 1176-1188)

Response: The Department added a definition of “other critical communities” in the final rulemaking. Additionally, the Department clarified the criteria it will consider when deciding whether to impose well permit conditions in §§ 78.15(g) and 78a.15(g).

- 370.** Comment; Requiring industry to potentially gain clearance for **Species of Special Concern** may significantly limit our development opportunities and/or create costly mitigation solutions which would be in conflict with Section 3215(e) as it pertains to ensuring oil and gas development and property owner rights. If the Department’s goal is to protect the Commonwealth’s resources as they specifically relate to Threatened, Endangered or Species of Special Concern, then Industry has the right to know the locations of such resources in order to avoid or mitigate any potential impacts.(123, 123a, 883a, 940)

Response: Please see responses to comments 342 and 356.

- 371.** Comment: Special concern species. Act 13 (section 3215(c)) limits the Department’s authority to consider impacts only to “habitats of rare and endangered flora and fauna and other critical communities” when reviewing well permit applications. However, section 78.15(f)(iv) of the Chapter 78 revisions equates the term “critical communities” to a much broader category of “special concern species,” which the Department’s May 25, 2013 PNDI policy defines as those that are not listed as threatened or endangered. Proposed section 78.15 complicates rather than clarifies the well permit application review by ignoring the limitation on the Department’s Act 13 authority. And the proposal exceeds the Department’s statutory authority because special concern species are not critical communities because, by definition, special concern species cannot be included in other classifications due to limited evidence and insufficient data. (1172)

Response: Please see response to comment 342.

- 372.** Comment: 78.15(f)(1)(v) “...within 1000 feet of a water well...water supply extraction point used by a water purveyor”. -- It is suggested that the language be revised to state within a 1000 feet of a [public (non-residential/non-private)] water well and [public (non-residential/non-private)] water purveyor to clarify that this section refers to community water sources. (1057)

Response: The Department has determined that the public resource impact screening provisions as outlined in Section 78.15(f)-(g) and 78a.15(f)-(g) are reasonable, appropriate and necessary to ensure that the Department has complied with its obligation to protect public resources under Article I, Section 27 of the Pennsylvania Constitution, the Administrative Code of 1929, the 2012 Oil and Gas Act, the Clean Streams Law, the Dam Safety and Encroachments Act, the Solid Waste Management Act and other statutes. Please see the response to comment 265.

Under Section 3215(c)(4) of the 2012 Oil and Gas Act, the Department has a legal obligation when reviewing a well permit application for an unconventional well to consider the impacts to public resources including “sources used for public drinking water supplies” Section 3215(a) provides that public drinking water supplies include water wells, surface water intakes, reservoirs, or other water supply extraction points used by a water purveyor. Section 3213 of the 2012 defines “water purveyor” as the owner or operator of a public water system as defined in the Pennsylvania Safe Drinking Water Act or any person subject to the Water Rights Law. Accordingly, the Department has a statutory obligation to consider the impacts of a proposed well of public drinking water supplies used by water purveyors as that term is defined in the 2012 Oil and Gas Act.

The language and requirements outlined in §§ 78.15 and 78a.15 the Department mirrors these statutory obligations. Any change to these provisions should be to the 2012 Oil and Gas Act.

Because this is not a statutory requirement when reviewing a conventional well permit the Department has amended the definition of “public resource agency” in 78.1 and deleted the reference to water purveyors.

373. Comment: § 78.15(f)(1)(v) – Historical or archaeological site - We believe the notification distance should be greater than 200 feet. Five hundred feet is likely not a great enough distance when there are vibration and other construction effects that may disturb or undermine the structural integrity, and historic and visual character of such a site. For purposes of notification we again recommend 1,000 feet for these and the reasons cited in our comment above at § 78.15 (f)(1)(i). (1062, 1133)

Response: Please see response to comment 273.

374. Comment: Known as chapter 78 of PA code Act 13, the Oil and Gas law passed in 2012. There are no provisions in the oil and Gas act to protect any Archaeological and Historical sites. The drilling companies should hire a certified archaeologist to do surveying before any well pads, compressor stations, impoundment ponds, pipelines and roads leading to the well pads to determine that they are not destroying any archaeological sites and historical sites.

I recommend a provision be adopted in the Oil and Gas act to protect these sites for myself and all the people in PA. All well pads, compressor stations, impoundment ponds, pipelines and roads leading to well pads be a minimum of 500 ft near sites. (988)

Response: The Department has determined that the public resource impact screening provisions as outlined in Section 78.15(f)-(g) and 78a.15(f)-(g) are reasonable, appropriate and necessary to ensure that the Department has complied with its obligation to protect public resources under Article I, Section 27 of the Pennsylvania Constitution, the Administrative Code of 1929, the 2012 Oil and Gas Act, the Clean Streams Law, the Dam Safety and Encroachments Act, the Solid Waste Management Act and other statutes. Please see the response to comment 265.

Section 3215(c) of the 2012 Oil and Gas Act requires the Department to consider the impacts to public resources when making a decision on a well permit, including historical and archeological sites. In §§ 78.15(f) and 78a.15(f), these sites are listed as public resources that trigger additional consideration as part of the well permit review process.

To the extent that the commentator suggests that these provisions apply to all oil and gas operations, please see the response to comment 266.

375. Comment: Section 78.15(f)(1)(vi) - This should be removed all together as this notification is already required under Act 13. (411)

Response: Please see response to comment 372.

376. Comment: I would like to see more regulations and changes concerning liability with the distance from a gas pad to water wells being increased to 1 mile from the 2500' present limit. I am seeing more water issues farther than 2500' that can possibly be attributed to gas drilling/fracking. And I would like to see more studies showing that any kind of methane migration, whether background, shallow, biogenic, thermo genic may be moved into the aquifer after the disturbances of gas drilling and fracking. (9)

Response: Section 3218(c) of the 2012 Oil and Gas Act provides the area for presumptive liability. To the extent that the commentator suggests extending that presumptive area, that change should be a legislative change to the 2012 Oil and Gas Act. Moreover, the presumption of liability provisions are outside the scope of this rulemaking.

377. Comment: DEP's proposed revisions in paragraph (f)(2) would result in significant costs related to operations on public lands because the revisions do not comply with Pennsylvania law and do not contain a process for respecting private property rights of oil and gas owners. In contrast to the process established under Pennsylvania property law rights, the proposed regulations create a burdensome and open-ended process in which discussion (due regard) is abandoned. Instead the process bypasses that discussion in favor of vesting in the DEP the unilateral right to impose operating conditions. Specifically, the regulations allow the surface owner to simply communicate its concerns to the DEP. The give and take of the established due regard process is eradicated because, under the proposed regulations, the DEP becomes the judge of what the operating conditions should be on public lands. Not only is this a remarkable usurpation of private property rights in the face of the legislature's express protection of same, but the proposed regulations are without any limit as to what concerns the resource agencies might submit, what constitutes a "harmful impact" under the regulations, or what the limits of mitigation might be. The proposed regulations are not even tied to the standard of "reasonable use" which has been a part of Pennsylvania Common Law for over 100 years and which, by virtue of extensive practice in the conventional oil and gas fields, is marked by established practices. The following amendments are suggested to section (f)(2):

(1)The applicant shall notify the public resource agency responsible for managing the public resource identified in paragraph (1), if any. The applicant shall forward by certified mail a copy of the plat identifying the proposed location of the well, well site and access road and information in paragraph (3) to the public resource agency at least 15 days prior to submitting its well permit application to the Department.

(a) With respect to surface landowners who are also the public resource agency to be notified, the notification required by Section 3211 (b.1.), provided it includes the information

prescribed by this subsection, satisfies the notification requirements of this subsection. With respect to subsection (f) (vi) above, the notification requirements of this paragraph only apply if the applicant has not previously notified the applicable resource agency pursuant to the applicant's use of the PNDI process. The applicant shall submit proof of notification with the well permit application.

(b) From the date of notification, the public resource agency shall have 15 days to provide written comments to the Department and the applicant regarding [on the functions and uses of the public resource and] the measures, if any, that the public resource agency recommends the Department consider to avoid or minimize probable harmful impacts to the public resource where the well, well site and access road is located. Any such comments shall include a statement to the Department verifying that the resource agency, where it is the surface owner, has consulted with the applicant with respect to any proposed mitigation measures prior to the submission of such comments to the Department. Public resource agencies shall also provide the Department with relevant portions of underlying instruments or agreements that reflect operational constraints to which the parties have agreed for the mitigation of impacts to public resources. The applicant may provide a response to the Department to any such comments.

(3) The applicant shall include the following information in the well permit application on forms provided by the Department:

- (i) an identification of the public resource.
- (ii) [a description of the functions and uses of the public resource;]
- [(iii)] a description of the measures proposed to be taken to avoid or mitigate impacts, if any.

(4) The information required in paragraph 3 shall be limited to the discrete area of the public resource that may be affected by the well, well site and access road. (1135)

Response: The “due regard process” does not apply to these provisions. The “due regard process” pertains to the relationship between surface and subsurface owners. The Department has constitutional and statutory obligations to consider and protect public resources that are separate and unrelated to the property issues between surface and subsurface owners. The provisions in §§ 78.15 and 78a.15 establish a process for the Department to consider and protect public resources from the impacts of a proposed well and coordinate with public resource agencies to fulfill these obligations. These provisions function to provide the Department with information necessary to enable the Department to conduct its evaluation of potential impacts and to review the information in the context of the criteria outlined in §§ 78.15(g) and 78a.15(g), and to determine whether permit conditions are necessary to prevent a probable harmful impact.

The Department has considered the suggested amendments and declines to make those changes to these provisions.

378. Comment: Subsection (f): This section provides applicable jurisdictional agencies the opportunity to submit comments to the Department, including any recommendations to avoid or minimize impacts, during a 15-day time frame. It should be recognized by the PA DEP that “public resources” include those lands as defined by the term, “Submerged Lands on the Commonwealth” which are Commonwealth Property under waterways designated by the PA State Legislature as Public Highways. The PA DEP has issued and continues to issue Permits to drill non-vertical wells through such Commonwealth lands and to Hydraulically fracture those lands without first determining if the

applicant has either obtained a Submerged Lands License Agreement for a drilled pipe to develop a non-vertical well or determining if the applicant has obtained a valid lease to Hydraulically Fracture this Commonwealth Property.

All lands under waterways declared to be “Public Highways” are Commonwealth Property. In Lycoming County, for example, such waterways include Beaver Run, Cedar Run, Harris Run, Larry’s Creek, Little Pine Creek, Loyalsock Creek, Lycoming Creek, Mill Creek, Mill Run, Muncy Creek, Otter Run, Pine Creek, Plunketts Creek, Susquehanna River, Tombs Run, Trout Run, Upper Pine Bottom Run, and Wallis Run. These Commonwealth lands might consist of thousands of acres in individual counties—for example, the six waterways in Bradford County designated as “Public Highways” are very large waterways and the acreage of Commonwealth land in the beds of these waterways is estimated to be greater than 25,000 acres. At the normal lease payment of Commonwealth land of \$4,000.00 per acre, the lands under the waterways in Bradford County alone might produce 100 million dollars in revenue from leasing of these lands.

It is recommended that the regulations mandate that:

1) The PA DEP revoke all drilling permits issued that authorize drilling a non-vertical well through or hydraulic fracturing of commonwealth lands under waterways designated as “Public Highways”.

2) The PA DEP shall not accept any permit application to drill a non-vertical well through or to Hydraulic Fracture lands under waterways designated as “Public Highways” until the applicant leases such lands or obtains a Submerged Lands License Agreement. (92)

Response: To the extent that the commentator suggests adding submerged lands of the commonwealth to the list of public resources in §§ 78.15(f)(1) and 78a.15(f)(1), the Department declines to make that change because protection of this property is achieved through other provisions implemented by the Department.

To the extent that the commentator suggests amendments to the permitting provisions, those comments are outside the scope of this rulemaking. Also please note that the well permit does not convey any property rights. Further, the well permit is conditioned on the permittee’s compliance with all applicable law.

379. Comment: The proposed regulations allow for a public resource agency to receive notice of, and submit comments about, a proposed well permit that would affect its resources. The regulations, however, do not require the DEP to respond to those comments. To ensure that comments are adequately considered and that public resources are fully protected, the regulations should require the DEP to respond to comments submitted by public resource agencies. (19, 21, 23, 26, 90, 142, 165, 189, 192, 391, 938, 946, 958, 1005, 938a)

Response: The Department has considered this comment and declines to require Department response in this rulemaking.

380. Comment: The DEP should respond to comments received about a permit that may affect an important public resource. (Section 78.15(d)). (19, 21, 23, 26, 90, 142, 165, 180, 189, 192, 391, 429a, 609, 843, 851, 938, 946, 951, 958, 1005, 1019, 1089, 938a, 1229)

Response: The Department has considered this comment and declines to require Department response in this rulemaking.

- 381.** Comment: In regard to section 78.15 Application Requirements, the mandatory notification by those seeking well permits within close proximity of public resources to the appropriate agency is an important first step. (1098)

Response: The Department acknowledges this comment.

- 382.** Comment: Extending the 15-day period for the public resource agency recommendations to the department. This is an inadequate timeframe for a comprehensive review, analysis, and response. The national park review should be the minimum standard used to protect Pennsylvania's public sites. [78.15 (f) (2)] (15, 867)

Response: The Department has amended §§ 78.15(f)(2) and 78a.15(f)(2) in the final rulemaking to allow public resource agencies 30 days to comment on the impacts to public resources.

- 383.** Comment: § 78.15(f)(2) The Commentator recommends that the Department revise this paragraph to reflect the situation where a public resource agency is also the surface landowner. Additionally, the Commentator recommends that the Department clarify that the public resource agency shall have 15 calendar days to provide written comments to the Department and the applicant.

The Commentator suggests the following amendatory language:

(2) The applicant shall notify the public resource agency responsible for managing the public resource identified in paragraph (1), if any. The applicant shall forward by certified mail a copy of the plat identifying the proposed location of the well, well site and access road and information in paragraph (3) to the public resource agency at least 15 days prior to submitting its well permit application to the Department. The applicant shall submit proof of notification with the well permit application. From the date of notification, the public resource agency shall have 15 calendar days to provide written comments to the Department and the applicant on the functions and uses of the public resource and the measures, if any, that the public resource agency recommends the Department consider to avoid or minimize probable harmful impacts to the public resource where the well, well site and access road is located. The public resource agency shall also provide the relevant portions of any records indicating pre-existing agreements, whether leases, surface use agreements or others, between the agency and the applicant that reflect mitigation measures already adopted for the protection of public resources that may be affected by the proposed well. The applicant may provide a response to the Department to any such comments. With respect to surface landowners who are also a public resource agency to be notified, the notification contained in Section 3211(b)(1), provided it includes the information required by this subsection, satisfies the notification requirements of this subsection. (1137, 1147)

Response: The Department considered this comment and declines to make the suggested amendments to these provisions. Any agreements between well permit applicants and public resource agencies made prior to the submission of the well permit application may be provided as part of this process. Further, the timeframes apply to calendar days in this section.

- 384.** Comment: 78:15 Subsection (f)(2) should extend the comment period for resources agencies, and require that the Department respond to those comments.

Subsection (f)(2) should not limit the resource agency's response to the proposal to recommending mitigation measures. Subsection (f)(2) appears to limit the resource agency's mitigation measures to

locational comments – that is, comments on “where the well, wells site and access road is located.” The resource agency’s comments should not be limited in this manner. Depending on the aspect of the resource threatened, there may be other considerations that are more effective mitigation measures other than locational changes, such as limiting when operations occur during the year, altering hours the operation, erecting noise barriers, limiting light pollution, altering truck routes, etc. The resource agencies should, and one could argue must, be able to submit comments as necessary to propose mitigation of any impact to public trust resources under its jurisdiction.

In addition, as recognized by the National Environmental Policy Act, any legitimate consideration of options to prevent or mitigate harm to the environment and public health and welfare by a proposed government action (issuance of a permit) must entail consideration of a “no action” alternative. In the case of public resources held in trust by public agencies, there may be occasions where the attributes of the resource are so valuable that the responsible agency would be compelled to recommend a “no action” alternative to protect the resource, that is, permit denial. Subsection (f)(2) should recognize this potential by expressly providing, or at the very least not limiting, what comments the resource agency provides to the Department in order to minimize or avoid harm to the resource.

Subsection (f)(2) allows the permit applicant to respond to any mitigation measures recommended by the resource agency, but imposes no obligation on the agency responsible for making the decision that will allow the impact. Subsection (f)(2) should require, in this particular circumstance where public resources are at risk, that the Department document its response to the resource agency’s comments. Such a requirement will not only ensure that the Department has considered the resource agency’s comments, but will enhance transparency in the Department’s decision making by allowing the public to understand why the Department did or did not concur with the resource agency’s concerns. (852a)

Response: The Department agrees that the public resource agency’s comments should include recommendations for the Department to consider that will avoid, minimize or otherwise mitigate impacts to the public resource. The Department disagrees that the language in this section limits public resource agencies’ ability to comment in the manner described by the commentator. Further, the Department declines to make the suggested amendment requiring the Department’s response to comments.

385. Comment: 78.15(f)(2). Application Requirements. - The 15 day comment period does not provide public resource agencies a sufficient timeframe for adequate consideration of the public resource and to provide a sufficient response. Municipal governments that may have a municipal park located within the notification range may not have adequate time to respond within the 15 day period. Many municipal governments only meet on a monthly basis to discuss business and determine actions. For example, in the small rural communities located within the Shale region, many Supervisors are only part time and some may only be at the municipal office to review mail at the monthly meeting. 15 days may afford inadequate time in every case to read the letter or formulate sufficient response. Some of the small rural county governments only rely on a small planning staff under whose purview this review and response would be generated. Some counties only have a county planner and no support staff. A 15 day comment period does not permit enough time with the on-going work load to provide for adequate attention and a sufficient response. Finally, with current workloads, the 15 day comment period does not provide state resource agencies such as DCNR with an adequate review period to the depth that would be sufficient to appropriately respond.

78.15(f)(2). 15 Day Public Resource Written Comments – Revised

The applicant shall notify the public resources agency responsible for managing the public resource identified in paragraph (1), if any. The applicant shall notify the appropriate county planning department/s regarding any possible well pad, pipeline or facility that potentially may be sited within locations of scenic vistas/viewsheds. The applicant shall forward by certified mail a copy of the plat identifying the proposed location of the well, well site and access road and information in paragraph (3) to the public resource agency or county planning department at least 30 days prior to submitting its well permit application to the Department. The applicant shall submit proof of notification with the well permit application. From the date of notification, the public resource agency or county planning department shall have 30 days to provide written comments to the Department and the applicant on the functions and uses of the public resource and the measures, if any, that the public resource agency or county planning department recommends the Department consider to avoid or minimize probable harmful impacts to the public resource where the well, well site and access road is located. The applicant may provide a response to the Department to any such comments. The Department needs to consider these impacts and mitigation suggestions when evaluating and issuing the permit. The Department needs to respond to the comments made by the public resource agency or county planning department. (660a)

Response: The Department has amended §§ 78.15(f)(2) and 78a.15(f)(2) in the final rulemaking to allow public resource agencies 30 days to comment on the impacts to public resources.

To the extent that the commentator suggests extending this requirement beyond the well site and access road, please see response to comment 266.

To the extent that the commentator suggests notice to county planning departments, the Department declines to make this amendment as municipalities receive notice under Section 3211(b)(2) of the 2012 Oil and Gas Act and these provisions ensure that applicable public resource agencies receive notice. The Department suggests that municipalities coordinate with county planning department if the county is not the applicable public resource agency.

- 386.** Comment: § 78.15(f)(2) - We are concerned that the “15 day” notification time period outlined in item #3 is insufficient for public resource agencies to provide written comments to the Department. We recommend the language be changed to the following, *“From the date of notification, the public resource agency shall have 30 days to provide written comments to the Department.”* We are concerned that with the sheer number of well permit applications that are likely, our limited staff would be overwhelmed with the complex issues needing evaluation in order to ensure that we fulfill our responsibilities to avoid adverse impacts. Additionally, we suggest the revised regulations read (in bold italics), “The applicant shall forward by certified mail, *return receipt requested...*” The U.S. Postal Service “return receipt requested” card would ensure applicants meet the required proof of notification stipulation in the regulations. (137,188, 660a, 1062, 1133, 1098, 1099, 997a, 1170)

Response: The Department has amended §§ 78.15(f)(2) and 78a.15(f)(2) in the final rulemaking to allow public resource agencies 30 days to comment on the impacts to public resources. Sections 78.15(2) and 78a.15(2) requires notice to be provided by certified mail and the applicant must provide proof of notification. The Department added a new definition of “certified mail” in §§ 78.1 and 78a.1 in the final rulemaking. Accordingly, requiring return receipt requested would not be appropriate.

- 387.** Comment: Section 78.15(f)(2): Consultation with Commonwealth Agencies Managing Public Resources Prior to Submitting a Permit Does Not Address Expedited Permit Process
The proposed provision does not take into account the need for an accelerated permit. Section 78.16

of the current Chapter 78 regulation states: “[I]n cases of hardship, an operator may request an accelerated review of a well permit application.” If the proposed unconventional well for which an operator was seeking a permit was near or on a public resource, the new provision would appear to preclude the operator from being able to request expedited permit review. If the need for an expedited permit review were present, waiting the additional days to reach the Commonwealth would be cumbersome and unnecessary. We ask the Board to revise the proposed language to include a practical method for addressing accelerated permits. Additionally, we suggest that the Board clarify that the public resource agency shall have 15 calendar days to provide written comments to the Department and the applicant. (1085)

Response: The requirements in this section have no impact on an applicant’s ability to request an accelerated review. These provisions require applicants to notify public resources agencies at least 30 days prior to submitting its well permit application to the Department and gives the public resources agency 30 days after receipt of this notification to provide comments. It is the applicant’s responsibility to ensure that this process is timely. To the extent that immediate action is necessary to protect public health or safety, to control pollution or affect other environmental or safety measures, and extraordinary circumstances, the Department will make the appropriate considerations on a case-by-case basis while ensuring compliance with the Department’s constitutional and statutory obligations to protect public resources.

Based on comments received, the Department has amended §§ 78.15(f)(2) and 78a.15(f)(2) in the final rulemaking to allow public resource agencies 30 calendar days to comment on the impacts to public resources.

- 388.** Comment: 78.15(f)(2) includes the phrase “probable harmful impacts,” and 78.15(g) includes the phrase “probable harmful impact.” These phrases are vague. As written, we question if this standard adequately protects this Commonwealth’s natural resources. We suggest that the final- form regulation include criteria that will allow the regulated community to know how the Department will determine if an application poses a probable harmful impact. (1099)

Response: Sections 78.15(g) and 78a.15(g) have been amended to clarify the criteria the Department will consider when deciding whether to condition an oil or gas well permit based on impacts to public resources.

- 389.** Comment: Section 78.15(f)(2) we recommend that the Department revise this paragraph to reflect the situation where a public resource agency is also the surface landowner. Additionally, we recommend that the Department clarify that the public resource agency shall have 15 calendar days to provide written comments to the Department and the applicant.

Suggested amendatory language:

(2) The applicant shall notify the public resource agency responsible for managing the public resource identified in paragraph (1), if any. The applicant shall forward by certified mail a copy of the plat identifying the proposed location of the well, well site and access road and information in paragraph (3) to the public resource agency at least 15 days prior to submitting its well permit application to the Department. The applicant shall submit proof of notification with the well permit application. From the date of notification, the public resource agency shall have 15 calendar days to provide written comments to the Department and the applicant on the functions and uses of the public resource and the measures, if any, that the public resource agency recommends the Department consider to avoid or minimize probable harmful impacts to the public resource where

the well, well site and access road is located. The public resource agency shall also provide the relevant portions of any records indicating pre-existing agreements, whether leases, surface use agreements or others, between the agency and the applicant that reflect mitigation measures already adopted for the protection of public resources that may be affected by the proposed well. The applicant may provide a response to the Department to any such comments. With respect to surface landowners who are also a public resource agency to be notified, the notification contained in Section 3211(b)(1), provided it includes the information required by this subsection, satisfies the notification requirements of this subsection. (1103)

Response: The Department has considered this comment and declines to make the suggested amendment to this rulemaking. Any agreements between well permit applicants and public resource agencies made prior to the submission of the well permit application may be provided as part of this process. Based on comments received, the Department has amended §§ 78.15(f)(2) and 78a.15(f)(2) in the final rulemaking to allow public resource agencies 30 calendar days to comment on the impacts to public resources.

390. Comment: 78.15(f)(2) The 15-day review period is not adequate for jurisdictional resource agencies to develop and provide written comments to the Department regarding possible affects to sensitive and protected public resources in proximity to proposed well sites or access roads. Thirty (30) days is a reasonable time frame for such reviews and is consistent with review times applied to industries other than oil and gas. (1134)

Response: The Department has amended §§ 78.15(f)(2) and 78a.15(f)(2) in the final rulemaking to allow public resource agencies 30 calendar days to comment on the impacts to public resources.

391. Comment: According to § 78.15(f), an applicant proposing to drill a well at a location in or within 200 feet of a publicly owned park, forest, game land or wildlife area, must take additional steps in the application to ensure protection of the public resources. The applicant must provide notice to the appropriate public resource agency responsible for managing the public resource, upon which the resource agency has 15 days to provide written comments to the applicant and DEP on the functions and uses of the public resource and recommended measures to avoid or minimize probable harmful impacts to the public resource where the well, well site, and access areas is located. By hastening the timeframe by which the public resource agency has to provide feedback, the proposed amendments will have the effect of limiting input from public resource agencies and thus limiting the recommendations to mitigate or avoid impacts. We recommend clarifying whether the public resource agency feedback timeframe is based upon business days or calendar days, and increasing the overall length of time available to the public resource agency to prepare recommendations for avoidance or mitigation to at least 30 business days. This will allow the public resource agency sufficient time to evaluate the potential impacts on the resource and provide meaningful recommendations to the applicant and DEP. (1006, 1156, 1157)

Response: The Department has amended §§ 78.15(f)(2) and 78a.15(f)(2) in the final rulemaking to allow public resource agencies 30 calendar days to comment on the impacts to public resources.

392. Comment: § 78.15(f): The Department is required to consider the impacts to public resources when making a determination on a well permit. Jurisdictional Agencies have the opportunity to submit comments to DEP during a 15-day time frame to avoid or minimize impacts. If a jurisdictional agency (JA) believes the impact is so significant to public resources and recommends denial (and not mitigation via special conditions) of the permit, can the Department deny the action directly while

leaving in place the operators appeal process? Suppose the JA needs more time to assess impacts and may require for example, Habitat Evaluation Procedures be applied to assess potential damage, will an extension be automatically granted? We recommend extension language be incorporated into the regulations. What is the threshold test between the operator's *property rights to ensure optimal development of the resources* (§ 321(e) of 58 Pa.C.S.) vs. protection of public resources? This standard cannot be subject to arbitrary and capricious criteria, and certainly not political influence. If protection of public resources is indeed the primary focus of this section, the regulations must include both qualitative and quantitative protocols that will be used in making this permit determination when conflicts are presented to the Department. These criteria and process steps must be incorporated into these revisions. (1063)

Response: To the extent that the commenter suggests that this provision include language that gives the Department the authority to deny a well permit based on the comments submitted by a public resource agency, the Department has discretion to deny a permit to drill or operate a well in only limited circumstances outlined in Section 3211(e.1) of the 2012 Oil and Gas Act. That change should be made to the 2012 Oil and Gas Act.

To the extent that the commenter suggests these provisions provide for an extension, the Department has considered that comment and declines to make that suggested amendment.

In response to the commenter's comment about the criteria considered, §§ 78.15(g) and 78a.15(g) have been amended to clarify the criteria the Department will consider when deciding whether to condition an oil or gas well permit based on impacts to public resources.

- 393.** Comment: There are additional sections of the Chapter 78 regulations which need to be modified to better protect fresh groundwater aquifers and surface sources of public water supplies. The provision in Section 78.15 (f) for a 15 day notification of public water suppliers and requirement for the public water supplier to respond with comments in 15 days is woefully inadequate and places an undue burden of responsibility on the public water supplier. In addition to an increase in the notification periods to at least 30 days, the Department, with or without notice from the public water supplier, needs to proactively identify applicable sensitive delineated SWPZs to the well permit applicant and require the applicant to address any necessary appropriate measures of additional protection. Public water suppliers would need at least 60 days to review and comment on the Department's determinations as provided for in Section 78.15 (g) once made. (852a, 137)

Response: The Department has amended §§ 78.15(f)(2) and 78a.15(f)(2) in the final rulemaking to allow public resource agencies 30 calendar days to comment on the impacts to public resources.

The Department has considered the remainder of this comment and declines to make the suggested changes. The process outlined in this provision is reasonable and appropriate.

- 394.** Comment: In regards to the notification zone and comment period, we have concerns. Many townships function with part time employees and supervisors. In the case of needing to evaluate a public resource in the event of a nearby well site, 15 days is totally inadequate. A minimum reasonable time would possibly be 30 days. A 200' notification zone is inadequate based industry truck traffic alone. We recommend that the PNHP process stand as proposed and that the notification zone and comment period be revised to a more workable solution based on the information provided. (846, 1035)

Response: The Department has amended §§ 78.15(f)(2) and 78a.15(f)(2) in the final

rulemaking to allow public resource agencies 30 calendar days to comment on the impacts to public resources.

To the extent that the commentator suggests extending the distances provided in §§ 78.15(f)(1) and 78a.15(f)(1), please see the response to comment 273.

395. Comment: Increase the time period for public water suppliers to respond with comments to at least 30 and better 60 days after receipt of notices from the Department. (951,1019)

Response: The Department has amended §§ 78.15(f)(2) and 78a.15(f)(2) in the final rulemaking to allow public resource agencies 30 calendar days to comment on the impacts to public resources.

396. Comment: § 78.15(f) – The EQB proposes a process at § 78.15(f) for the DEP to consider the impacts to public resources when making a determination on a well permit. Proposed § 78.15(f) establishes a 15-day timeframe for applicable jurisdictional agencies to provide comment on projects that come within certain distances of certain public resources.

We support the proposal to provide public resource agencies with an opportunity comment on any proposed well permit application to ensure public resources are protected. However, the comment period is too short, the potential impact radius proposed around public resources is too small, and the list of public resources is incomplete. We also recommend notice to the government of each locality in which the resources are located. In addition, the requirements of this provision should apply not only to Oil and Gas Operations associated with unconventional wells (shale gas wells drilled below the Elk Sandstone) but also to those associated with conventional wells.

Under § 78.15(f)(2), resource agencies should be given a minimum of 30 business days for comment on permit applications. (1143)

Response: The Department has amended §§ 78.15(f)(2) and 78a.15(f)(2) in the final rulemaking to allow public resource agencies 30 calendar days to comment on the impacts to public resources.

397. Comment: Allow the public - not the applicant –to determine a description of the function and uses of the public resource required by the permit application. [17.15 (f) (3) (ii)] (1098)

Response: The Department has considered this comment and declines to include this suggested amendment in this rulemaking. Sections 78.15(f) and 78a.15(f) establish a process for the applicant to provide certain information in the permit application and to provide appropriate public resource agencies the opportunity to comment regarding potential impacts to public resources from the proposed oil or gas well drilling. This process ensures that the Department has sufficient information to evaluate whether permit conditions are necessary using the criteria in Sections 78.15(g) and 78a.15(g).

398. Comment: In the case of oil and gas development, we strongly encourage sponsors of oil and gas development proposals to coordinate as early as possible with the Commonwealth's LWCF State Liaison Officer at DCNR to determine the degree to which Section 6(f)(3) restricted property will be involved in any way. This early coordination among all parties will ensure that the required federal compliance process will be followed so that compliance is not conducted as an after-thought by occurring too late in the implementation of the proposals. Early coordination will help to avoid unnecessary delays in securing any required federal approvals if a conversion approval and/or other

federal decisions are required. The NPS and/or PA DCNR may be contacted for more information on the LWCF State and Local Assistance Program (www.nps.gov/lwcf). (1062)

Response: The Department acknowledges this comment.

399. Comment: Section 78.15(f)(3) - Identify and prepare the forms prior to the establishment of this section for review. (411)

Response: The Department plans to have all necessary forms, guidance documents, and procedures available at the effective date of the rule making.

400. Comment: § 78.15(f)(3)(i) & (ii) The Commentator suggests the following amendatory language: “(i) an identification of the public resource, which may include a description of the functions and uses of the public resource. (ii) a description of the measures proposed to be taken to avoid or mitigate impacts, if any. (1137, 1147)

Response: The Department considered this comment and declines to make the suggested amendment. Information related to the functions and uses of the public resources is required as part of the permit application in §§ 78.15(f)(3)(ii) and 78a.15(f)(3)(ii) because this information is necessary for the Department to consider the potential impacts of the proposed well on the public resource and to determine whether permit conditions are necessary using the criteria in §§ 78.15(g) and 78a.15(g).

401. Comment: Section 78.15(f)(3)(ii) -The operator should not be responsible for the determination and functions of public resources. (411)

Response: Please see response to comment 400.

402. Comment: Section 78.15(f)(3) requires the applicant to provide information to the DEP, including (i) identification of the public resources, (ii) a description of the functions and uses of the public resource, and (iii) a description of the measures proposed to be taken to avoid or mitigate impacts. Subsection (4) goes on to limit the required information to the discrete area of the public resource that may be affected by the well, well site access road. “Discrete” is not defined in this section, nor is it defined in § 78.1. If the term is intended to cover only the disturbed area, then the proposed amendment falls far short of protecting the quality of the recreational experience on public lands—which is one of the stated intentions for including this section. (1157)

Response: To the extent that the commentator suggests defining “discrete area”, the Department declines to define that term at this time. If the need for further clarification becomes apparent during implementation of this provision, the Department will develop guidance to address any issues identified.

403. Comment: Recreational uses—such as fishing in a wilderness stream—that are occurring in areas adjacent to the actual well pad should be required to be reported in the application, and to the appropriate public resource agency, so that suitable mitigation measures can be recommended to support the continued use of those recreational resources. We recommend clarifying the geographic area for which an applicant must submit required information under § 78.15(f)(3) and (4), to ensure adequate buffers to protect existing recreational uses. (1157)

Response: Please see response to comment 402.

404. Comment: 78.15(f)(3) should, in addition to the three items listed in the proposed regulation, require that the applicant certify that it has met with any affected public resource agency to discuss the scope of oil and gas operations at least ten days before the public resource agency's deadline for submitting comments about proposed mitigation measure. Such a requirement would ensure that the public resource agency has had an opportunity to become informed about the scope of the proposed oil and gas operations with sufficient time to participate meaningfully in the comment process established by § 78.15(f)(2). It will also ensure an opportunity for discussion between the applicant and resource agency, so that each can share their views on how the operation may affect the resource and what mitigation measures may be appropriate. (852a)

Response: The Department has considered this comment and declines to make the suggested amendment to this rulemaking. Sections 78.15(f)(2) and 78a.15(f)(2) have been revised to increase the time provided to public resource agencies to provide comments to the Department on the impacts to public resources from 15 days to 30 days. This additional time allows municipalities that only meet on a monthly basis the opportunity to respond to a request from an applicant. The additional time also provides public resource agencies with a greater ability to review and to provide meaningful comments and recommendations to the applicant without unduly delaying the permitting process.

405. Comment: Allowing the public, not the applicant, to determine a description of the function and uses of the public resource required by the permit application. [17.15 (f) (3) (ii)] (15, 867)

Response: The Department has considered this comment and declines to make the suggested amendment to this rulemaking. Information related to the functions and uses of the public resources is required as part of the permit application in §§ 78.15(f)(3)(ii) and 78a.15(f)(3)(ii) because this information is necessary for the Department to consider the potential impacts of the proposed well on the public resource and to determine whether permit conditions are necessary using the criteria in §§ 78.15(g) and 78a.15(g). This is in addition to any comments received from the public or applicable public resource agencies during the well permit review process.

406. Comment: 78.15(f)(3)(i)+(ii) - We believe that public resource agencies are in a much better position to provide this information. Suggested language: (i) *An identification of the public resource, which may include a description of the functions and uses of the public resource.* (1174)

Response: Please see responses to comments 400 and 405.

407. Comment: 78.15(f)(4) - We recommend the Department add clarifying language regarding “discrete area.” Suggested Language: (4) The information required in paragraph (3) shall be limited to the discrete and physically separate and distinct area of the public resource that may be affected by the well, well site and access road.(1174)

Response: Please see response to comment 402.

408. Comment: 78.15(f)(4) should not limit the information required under § 78.15(f)(3) to the “discrete area of the public resource that may be affected by the well, well site and access road.” The regulation implies that the only area “affected” by the oil and gas operations is that area directly occupied by the well, well site, and access road. In fact, particularly with public resources, the resources that may be affected by the oil and gas operations could be much broader, especially in the case of public game lands and water wells. The effects of oil and gas operations on wildlife habitat and groundwater aquifers extend well beyond the immediate footprint of the well site and access

road. As such, we request that the Department revise § 78.15(f)(4) to make clear that the permit applicant must submit information about mitigation for all effects of oil and gas operations on public resources. (852a)

Response: The Department has considered this comment and declines to make the suggested amendment to this rulemaking. To the extent that the commentator suggests the public resource consideration provision should apply to all oil and gas operations, §§ 78.15 and 78a.15 establish the well permit application process and are limited to activities associated with well construction and development. The requirements of these sections are designed to address the impacts within the limit of disturbance of the well site. Other activities associated with the oil and gas operations are regulated through various other provisions in Chapters 78 and 78a, or other laws implemented by the Department.

- 409.** Comment: § 78.15(f)(4) The Commentator recommends the Department add clarifying language regarding the term “discrete area”. The Commentator suggests the following amendatory language: “(4) The information required in paragraph (3) shall be limited to the discrete, physically separate and distinct area of the public resource that may be affected by the well, well site and access road.” (1137, 1147)

Response: Please see response to comment 402.

- 410.** Comment: Section 78.15(f)(4) uses the phrase “discrete area” to describe the information required in a well permit application regarding public resources “...that may be affected by the well, well site and access road.” The phrase “discrete area” is an undefined term which should be further explained and quantified. Determination of the “discrete area” must rest with either the Department or a designated resource protection agency and not the applicant. Similarly, in Section 78.15 (g) of the proposed regulations, the language should clearly indicate that the Department has sole authority to condition or deny a permit if it determines that there will be “probable harmful impact” to a public resource. (1142, 997a)

Response: Please see response to comment 402.

To the extent that the commentator suggests that clarifying language is needed to explain that “the Department has the sole authority to condition or deny a permit”, please see response to comment 280.

- 411.** Comment: § 78.15(f)(4) - Regarding the language “The information required in paragraph 3 shall be limited to the discrete area of the public resource that may be affected by the well, well site and access road”, the term “discrete area” is not defined, and is ambiguous. As we note above, the term should be defined in § 78.1. This language does not specify who makes the determination of the area that may be affected by the well, well site and access road. We suggest that the resource agency involved that is most familiar with its resources, should have input as to the area, specific resources and functions that may be affected by the well, well site and access road, and into the measures proposed to avoid or mitigate impacts. We would welcome dialogue with developers to define specific areas of potential impact and seek mutually agreeable measures to avoid or mitigate those impacts. (1062, 1133)

Response: Please see response to comment 402. Also, please note that §§ 78.15(f)(2) and 78a.15(f)(2) specify that public resource agencies may provide comments on the functions and uses of the public resource.

- 412.** Comment: Section 78.15(f)(4). - Paragraph (3) the “discrete area” we are interpreting to be the “limit of disturbance” for lack of a corresponding definition. Based on our interpretation, the applicant’s attention to only the “discrete area” is myopic at best. We’ve had significant experience now to know that the “discrete area” is not the only area of impact near any natural gas well pad, pipeline or facility.

For purposes of public resources, primarily due to the fact that we have plenty to base our experience on private land impacts, we can say with most certainty, limiting the information provided to the “discrete area” is dramatically insufficient. Well pads fluctuate with traffic from low to high volume. The operator’s schedules may coincide with the public’s seasonal visitation frequency with the public resource, thus the operator needs to take this into account and provide for adequate public safety measures. The impact of noise and dust issues beyond well pads and facilities can affect the functions and uses of the public resource for an area hundreds of feet away from the “discrete area”, especially in view of camping. Lookout points for vistas/view sheds can be greatly impacted by well pads, pipelines and other facilities greatly affecting the functions and uses along with enjoyment, greatly beyond the “discrete area.” Namely, a well pad sited [permit# 113-20208] along the Loyalsock Trail along with hikers from our region reporting impacts along the Midstate Trail, strongly indicate reasons for the operator to consider the functions and uses of trails beyond this “discrete area.” Additionally, previously forested, now cleared areas considerably increase the incidence of blow downs in the forest perhaps as much as 100 feet from the “discrete area” which adds to the corresponding fragmentation issues. The applicant needs to indicate what ongoing mitigation efforts will be made to address the additional loss of trees beyond the “discrete area”.

In summary, § 78.15(f) needs to be revised to increase the 200’ notification zone to 600’; create another notification zone of one mile for vistas, viewsheds and within or in one mile for certain trail locations; create a new provision for buffer zones and unique buffer zones; increase the comment period from 15 days to 30 days and include county planning departments, and define the “discrete area” along with expanding the application § 78.15(f)(4) to ensure an adequate detail of submitted information. These revisions provide for opportunities to properly mitigate and avoid siting problems in the future. We recommend these revisions to § 78.15(f). (660a)

Response: To the extent that the commentator suggest extending the distances in §§ 78.15(f)(a) and 78a.15(f)(1), please see response to comment 273.

To the extent that the commentator suggests extending the timeframe for public resource agency comment, the Department is extending this time from 15 to 30 calendar days in §§ 78.15(f)(2) and 78a.15(f)(2).

The Department declines to add notice to county planning departments. The Department declines to make this amendment as municipalities receive notice under Section 3211(b)(2) of the 2012 Oil and Gas Act and these provisions ensure that applicable public resource agencies receive notice. The Department suggests that municipalities coordinate with county planning departments if the county is not the applicable public resource agency.

To the extent that the commentator suggests defining “discrete area”, please see response to comment 402.

- 413.** Comment: Section 3215(e) of Act 13 requires the Department to develop regulatory criteria to condition permits to protect public resources while ensuring optimal oil and gas resource development, and respecting oil and gas owner property rights. However, the proposed regulations in

Chapter 78, Section 78.15 do not adequately implement or address these requirements – the regulatory criteria for conditioning a permit have not been provided, and the draft regulations only frame the Department’s authority to implement the conditions – essentially, “putting the cart before the horse.” If industry is required to avoid or mitigate potential impacts to these resources, the criteria used to assess impacts must be established and provided. (1153)

Response: Sections 78.15(g) and 78a.15(g) have been amended to clarify the criteria the Department will consider when deciding whether to condition an oil or gas well permit based on impacts to public resources.

- 414.** Comment: Act 13 of 2012, Section 3215, limited rather than expanded DEP’s authority to condition well permits for the mitigation of probable harmful impacts to public resources for the following reasons: (1) The list of public resources identified in Act 13 was unchanged from the 1984 Act it replaced with the single exception that it added “sources used for public drinking supplies” as a new public resource. However, Act 13, unlike the 1984 Act, includes the express requirement for the EQB to “develop criteria” in three distinct categories for DEP to utilize and satisfy (a) for conditioning a permit with respect to the resources “identified” in Act 13 based on its impact, (b) for ensuring optimal development of the resource and (c) for respecting property rights of oil and gas owners before it may place a condition on any well permit, and (2) Also, in the public resource protection section of Act 13 the new “Applicability” sub-section 3215(g) states that “Nothing in this section shall alter or abridge the terms of any contract ... or other agreement entered into prior to the effective date...” of the section.

DEP’s proposed rule does not identify any criteria for any of the three required categories and makes no provision to respect pre-existing (pre-2012) contracts and agreements such as deeds, leases, and surface use and coordination agreements between public land surface owners and oil and gas owners. Commentator contends that the proposed regulations are not in conformity with legislative intent and DEP has no authority to promulgate regulations that do not identify and articulate required criteria and that do not make provision for pre-existing contracts and agreements. (1153)

Response: Please see response to comment 413. Any agreements between well permit applicants and public resource agencies made prior to the submission of the well permit application may be provided as part of the well permit application process.

Section 78.15(f) and 78a.15(f) establish a process for the applicant to obtain information from an appropriate public resource agency regarding potential impacts to public resources from the proposed oil or gas well drilling. This process ensures that the Department has sufficient information to evaluate whether permit conditions are necessary using the criteria in Sections 78.15(g) and 78a.15(g).

- 415.** Comment: DEP’s proposed subsection (g) does not implement the requirement of Act 13, Section 3215(e) because it does not provide criteria to allow the DEP to balance the three interests stated in that section of the Act. Suggested amendment to address this comment:

(g) If the proposed well, well site or access road poses a probable harmful impact to a public resource, the Department may include conditions in the well permit to avoid or mitigate those impacts to the public resource’s current functions and uses. The Department shall consider the impact of any potential permit condition on the applicant’s ability to exercise its property rights with regard to the development of oil and gas resources and the degree to which any potential condition may impact or impede the optimal development of the oil and gas resources. The issuance of a permit containing conditions imposed by the Department

~~pursuant to this subsection shall be an action that is appealable to the Environmental Hearing Board. The Department shall have the burden of proving that the conditions were necessary to protect against a probable harmful impact of the public resource.~~ The presence of well sites and the conduct of oil and gas operations on or in the vicinity of Public Resources, as listed in Section 3215 (c), are not in and of themselves an impact or harm requiring or authorizing the imposition of any well permit conditions under Section 3215 (e). Because Section 3215 (e) expressly requires the Department to ensure optimal development of oil and gas resources and directs the Department to respect the property interests of oil and gas owners, mere inconvenience to users of Public Resources will not be the type of harm that may be mitigated by a condition placed on a well permit. When considering conditions to be imposed on well permits, necessary for the protection against probable harm to Public Resources, the Department will take the following steps.

(1) Describe the Public Resource from the list in Section 3215 (c) being considered for protection, as provided by the applicant in response to the question on the permit application and submission of the “Coordination of Well Location with Public Resources.”

Standard of Harm:

(2) Determine if there is clear and convincing evidence to demonstrate that:

(i) there will be permanent or long term (10 or more years) physical harm to the Public Resource from operations authorized by the permit,

(ii) the harm is clearly in excess of the reasonable use standard and

(iii) the harm is more likely than not.

If the harmful impact meets the above criteria, proceed to steps 3 through 5.

Standard of protection:

(3) Consider the minimum necessary measures to mitigate harm, in consultation with the applicant and after consideration of pre-existing agreements between the parties.

(i) Propose the minimum necessary mitigation as a permit condition only if existing mitigations will not address the circumstances.

(ii) Ensure the optimal development of the resource and protection of oil and gas property rights by conducting a thorough analysis of the costs of compliance with any recommended permit condition and the necessity to avoid waste of oil and gas resources through inappropriate locational constraints.

(iv) The issuance of a permit containing conditions imposed by the Department pursuant to this subsection shall be an action that is appealable to the Environmental Hearing Board. The Department shall have the burden of proving that the conditions were necessary to protect against a probable harmful impact of the public resource and that without the permit condition, the activity would not be a reasonable use of the surface.

(1135)

Response: The Department has considered this comment and declines to make the suggested amendment to this rulemaking. Sections 78.15(g) and 78a.15(g) have been amended to clarify the criteria the Department will consider when deciding whether to condition an oil or gas well permit based on impacts to public resources. The Department disagrees that clear and convincing is the applicable standard.

- 416.** Comment: DEP should not be required to consider the rights of the applicants: DEP’s mission is to uphold citizens’ constitutional right to a clean environment. Abrogating these rights through consideration of the rights of applicants would be unconstitutional. (153)

Response: The Department does not agree that considering the rights of applicants abrogates citizens’ rights. Nonetheless, sections 78.15(g) and 78a.15(g) have been amended to clarify the

criteria the Department will consider when deciding whether to condition an oil or gas well permit based on impacts to public resources.

The process outlined in §§ 78.15(f) and 78a.15(f) and the consideration of the criteria outlined in §§ 78.15(g) and 78a.15(g) ensures that the Department fulfills its constitutional and statutory obligations.

417. Comment: We are concerned that in this section the Department created an open-ended process, which lacks clear standards for implementation, and does not properly balance the cost of permit conditions to protect public resources against the benefits of these provisions. We believe that the cost of consultation and mitigation will be orders of magnitude higher than the Department estimates and must be reconsidered. (1071)

Response: Sections 78.15(g) and 78a.15(g) have been amended to clarify the criteria the Department will consider when deciding whether to condition an oil or gas well permit based on impacts to public resources.

Please see the RAF for the final rulemaking to see how the Department considered cost of permit conditions against the benefits of these provisions.

418. Comment: Given the ruling of the Supreme Court, the Department should expressly state in § 78.15(g) that it has the authority and responsibility to condition or deny a permit if it makes a determination that there will be “probable harmful impact” to a public resource. (997a)

Response: In response to the applicability of the Supreme Court’s decision, please see response to comment 265. Please see responses to comments 280 and 392.

419. Comment: The DEP should not compromise its obligation to protect the environment by balancing the citizens’ constitutionally guaranteed right against private interests in oil and gas. These draft regulations do not give proper weight to the DEP’s constitutional obligation to protect the environment s. (Section 78.15(g)) This regulation inappropriately places DEP, whose mission is supposed to be to protect and conserve Pennsylvania’s environment, in the position of balancing protection of important public resources against individual property rights. This is unacceptable. (19, 21, 23, 26, 90, 142, 165, 180, 189, 192, 391, 429a, 609, 843, 851, 938, 946, 951, 958, 1005, 1019, 938a,)

Response: Please see response to comments 2580, 2910, 416 and 418. Additionally, Sections 78.15(g) and 78a.15(g) have been amended to clarify the criteria the Department will consider when deciding whether to condition an oil or gas well permit based on impacts to public resources.

Further, the provisions in §§ 78.15 and 78a.15 establish a process for the Department to consider the potential impact of a proposed well on public resource and to establish whether well permit conditions are necessary using the criteria in §§ 78.15(g) and 78a.15(g) in order to fulfill the Department’s constitutional and statutory obligations.

420. Comment: 78.15(g) – The EQB proposes a process at § 78.15(g) for the PADEP to consider the impacts to public resources when making a determination on a well permit. The proposed regulation at § 78.15(g) authorizes the PADEP to include conditions in the well permit to avoid or mitigate impacts.

We support the PADEP'S ability to include conditions in the well permit to avoid or mitigate harmful impacts to public resources. However, the PADEP should be required to include permit conditions to avoid potentially adverse impacts, and if avoidance is not possible, to mitigate such impacts on the public resource. If adequate avoidance or mitigation cannot be implemented, the PADEP should deny the permit application as authorized under 58 Pa.C.S. § 3211(e.1)(1).

The regulation should take into account the full footprint of the proposed development (including, but not limited to the proposed well site, waste handling facilities, processing facilities, pipeline routes, storage areas, and access road), using the newly defined term "Oil and Gas Operations."

The proposed regulation socializes costs while privatizing profits by imposing the burden of proof on the PADEP to justify permit conditions. The applicant should have the burden of proof in any proceeding challenging either permit conditions imposed by the PADEP in an effort to avoid or mitigate adverse impacts on public natural resources or the denial of a permit.

We recommend the following proposed revision to § 78.15(g).

§ 78.15 Application Requirements

(g) If any portion of the proposed footprint of a new or expanded Oil and Gas Operation poses a potentially significant harmful impact to a public resource, the Department shall include conditions in the well permit to avoid or mitigate those impacts to the public resource's current functions and uses and shall deny the permit if necessary to assure compliance with any law administered by the Department. The Department will consider the impact of any potential permit condition on the applicant's ability to exercise its property rights with regard to the development of oil and gas resources and the degree to which any potential condition may impact or impede the optimal development of the oil and gas resources. However, the Department shall not approve permits without conditions reasonably calculated to avoid or mitigate potentially significant harmful impacts on public resources.

The issuance of a permit containing conditions imposed by the Department under this subsection is an action that is appealable to the Environmental Hearing Board. The applicant has the burden of proving that the Department's decision to impose conditions to protect against a probable harmful impact on the public resource or to deny a permit was arbitrary and capricious, an abuse of discretion, or contrary to law. (1143)

Response: To the extent that the commenter suggests that this provision include language that gives the Department the authority to deny a well permit based on the comments submitted by a public resource agency, please see response to comment 392.

To the extent that the commenter suggests that these provisions apply to all oil and gas operations, please see response to comment 266.

In response to the burden of proof, please see response to comment 418.

421. Comment: 78.15(g) - Who determines the probable harmful impact to a public resource, the Department or the public resource agency? (411)

Response: The Department has an obligation to protect public resources under Article I, Section 27 of the Pennsylvania Constitution, the Administrative Code of 1929, the 2012 Oil and Gas Act, the Clean Streams Law, the Dam Safety and Encroachments Act, the Solid Waste

Management Act and other statutes. Sections 78.15 and 78a.15 establish a process for the Department to identify, consider and protection public resources from the potential impacts of a proposed well and to coordinate with applicable public resource agencies.

422. Comment: § 78.15(g) - If Act 13 Sections 3215(c) and (e) have not been invalidated by the Pennsylvania Supreme Court's decision in *Robinson Twp. et al. v. Commonwealth of Pennsylvania et al.*, and if the EQB may proceed with rulemaking to implement that section, BOCI offers the comments below with respect to regulations that would implement those sections of Act 13. Suggested amendatory language:

(g) Subject to satisfying and complying with the criteria prescribed in subsections (1)-(3), the Department may include conditions in the well permit to avoid or mitigate impacts to the public resource. As prescribed in Section 3215(e)(1) of the act, in determining whether to impose a condition, the Department shall utilize the following three sets of criteria:

1. Criteria for the Department to use for conditioning a well permit based on its impact to public resources identified in § 78.15(f):
 - (i) The permit condition is necessary to protect against probable harm.
 - (ii) As shown by clear and convincing evidence, the harm to the public resource is probable, as opposed to merely possible or speculative.
 - (iii) No permit condition may be more restrictive or limiting with respect to a well, well site or access road than the set-back prescriptions contained in Act 13 unless it is shown by clear and convincing evidence that the existing protections of Act 13, the Clean Streams Law and other applicable statutes are insufficient to protect against the specified harm or unless the applicant consents in writing to the condition.
 - (iv) No permit condition may be more restrictive or limiting with respect to a well, well site, or access road, or activities incident thereto, than the existing measures and protections established and required under Chapter 78, Act 13 or any other applicable statute or regulation unless it is shown by clear and convincing evidence that the existing measures and protections are insufficient to protect against the specified harm or unless the applicant consents in writing to the condition.
 - (v) The nature of the harm to be avoided or mitigated by the permit condition must be clearly described in the terms of a permit condition and permit condition terms must include a description of the expected duration of the probable harm and the duration of the permit condition. Physical construction or site-specific actions required of an applicant as a condition within a permit shall not extend beyond the discrete area or location of the well, well site, or access road unless the applicant consents in writing.
2. Criteria for the Department to use in addition to those in paragraph (1), to ensure optimal development of oil and gas resources:
 - (i) No condition implicating surface activities or operations that results in a commercially unreasonable burden on an applicant may be imposed.
 - (ii) For purposes of conservation and avoiding the waste of recoverable oil and gas resources, no condition that results in alterations to the well design in a way that will reduce the anticipated volume of recoverable gas or oil resources may be imposed.

3. Criteria for the Department to use in addition to those in paragraphs (1) and (2) above, to protect private property rights of oil and gas owners:
- (i) In accordance with subsection 3215(g)(2) of the act, no permit condition where the proposed condition itself alters or abridges the terms of any lease, deed, surface use agreement or similar contract or agreement between a surface owner and subsurface oil and gas owner, or to which they are subject as signatories or successors in interest, may be imposed.
 - (ii) Denial of a well permit is not a prevention, avoidance, or mitigation measure authorized by this section.
 - (iii) No permit condition may be imposed if the effect would deprive the owner of the oil and gas rights of the right to produce or share in the oil or gas underlying a surface tract.
- (h) A decision to impose or not to impose a condition is non-precedential and does not bind the Department or applicant or require either party to adhere to or include the same condition or conditions addressing the same subject matter in any subsequent permits.
- (i) The issuance of a permit containing conditions imposed by the Department pursuant to this subsection shall be an action that is appealable to the Environmental Hearing Board.
- (j) In accordance with subsection 3215(g)(1) of the act, § 78.15(d), (f), & (g) are not applicable to a well proposed to be drilled on an existing well site for which at least one well permit has been issued prior to [effective date]. (1147)

Response: The Department has considered this comment and declines to make the suggested amendments to this rulemaking. Please note that Sections 78.15(g) and 78a.15(g) have been amended to clarify the criteria the Department will consider when deciding whether to condition an oil or gas well permit based on impacts to public resources. Additionally, Sections 78.15(g) and 78a.15(g) have been revised to remove the language regarding the Department's burden of proof upon appeal of a condition necessary to protect a public resource. Section 3215(e) of the 2012 Oil and Gas Act states that the Department has the burden of proving that a well permit condition imposed to protect a public resource is necessary to protect against a probable harmful impact of the public resource. The Department disagrees that clear and convincing is the applicable standard. The revisions to §§ 78.15(g) and 78a.15(g) ensure that the Department meets its constitutional and statutory obligations to protect public resources.

423. Comment: Section 78.15(g) requires the operator to protect public resources, but the regulations do not provide the criteria for protecting the public resources. (639)

Response: Please see response to comment 413.

424. Comment: 78.15(g) Application requirement – Since this provision is codifying Act 13, we only reiterate that the Department needs to place conditions on the well permit as necessary to adequately provide for avoidance or mitigation of impacts to public resources guaranteeing the public's access and enjoyment to the pre-development functions and uses. Consideration needs to include the time period of the operator's Marcellus experience along with their compliance record being relevant aspects for such permit conditions. (660a)

Response: Sections 78.15(g) and 78a.15(g) have been amended to clarify the criteria the Department will consider when deciding whether to condition an oil or gas well permit based on impacts to public resources. One such criteria is compliance with all applicable statutes and regulations.

425. Comment: Section 78.15(g) is written in such a way as to require the Department to consider the impact of permit conditions on the applicant's ability to exercise its property rights to ensure optimal development of resources even if the Department determines that the well or access road will have an adverse impact on a public resource. This may result in the Department being unable to impose conditions to prevent or mitigate harm. The places the Department directly in opposition to its mission, "to protect Pennsylvania's air, land, and water from pollution and to provide for the health and safety of its citizens through a cleaner environment". As long as DEP's conditions do not constitute a taking of private property, the agency is obligated to condition permits in a manner that protects public resources, optimal development for the public, not the operator. This distinction needs to be made clear from the outset to avoid legal parsing of the intent of the regulation by operators. (846, 1109)

Response: Please see responses to comments 413, 416, 418 and 419.

426. Comment: § 78.15(g) If Act 13 Sections 3215(c) and (e) have not been invalidated by the Pennsylvania Supreme Court's decision in Robinson Twp. et al. v. Commonwealth of Pennsylvania et al., and if the EQB may proceed with rulemaking to implement that section, MSC offers the comments below with respect to regulations that would implement those sections of Act 13.

The proposed language of this section does not include any criteria, as required by Section 3215(e) of Act 13, for the Department to utilize in the imposition of permit conditions to protect public resources. The quality of the evidence required for the Department to determine that harm to a public resource is probable and impose a condition in the permit should be clear and convincing evidence.

The Commentator suggests the following amendatory language:

"(g) Subject to satisfying and complying with the criteria prescribed in subsections (1)-(3), the Department may include conditions in the well permit to avoid or mitigate impacts to the public resource. As prescribed in Section 3215(e)(1) of the act, in determining whether to impose a condition, the Department shall utilize the following three sets of criteria:

(1) Criteria for the Department to use for conditioning a well permit based on its impact to public resources identified in § 78.15(f):

(i) The permit condition is necessary to protect against probable harm.

(ii) As shown by clear and convincing evidence, the harm to the public resource is probable, as opposed to merely possible or speculative.

(iii) No permit condition may be more restrictive or limiting with respect to a well, well site or access road than the set-back prescriptions contained in Act 13 unless it is shown by clear and convincing evidence that the existing protections of Act 13, the Clean Streams Law and other applicable statutes are insufficient to protect against the specified harm or unless the applicant consents in writing to the condition.

(iv) No permit condition may be more restrictive or limiting with respect to a well, well site, or access road, or activities incident thereto, than the existing measures and protections established and required under Chapter 78, Act 13 or any other applicable statute or regulation unless it is shown by clear and convincing evidence that the existing measures and protections are insufficient to protect against the specified harm or unless the applicant consents in writing to the condition.

(v) The nature of the harm to be avoided or mitigated by the permit condition must be clearly described in the terms of a permit condition and permit condition terms must include a description of the expected duration of the probable harm and the duration of the permit condition. Physical construction or site-specific actions required of an applicant as a condition within a permit shall not extend beyond the discrete area or location of the well, well site, or access road unless the applicant consents in writing.

(2) Criteria for the Department to use in addition to those in paragraph (1), to ensure optimal development of oil and gas resources:

(i) No condition implicating surface activities or operations that results in a commercially unreasonable burden on an applicant may be imposed.

(ii) For purposes of conservation and avoiding the waste of recoverable oil and gas resources, no condition that results in alterations to the well design in a way that will reduce the anticipated volume of recoverable gas or oil resources may be imposed.

(3) Criteria for the Department to use in addition to those in paragraphs (1) and (2) above, to protect private property rights of oil and gas owners:

(i) In accordance with subsection 3215(g)(2) of the act, no permit condition where the proposed condition itself alters or abridges the terms of any lease, deed, surface use agreement or similar contract or agreement between a surface owner and subsurface oil and gas owner, or to which they are subject as signatories or successors in interest, may be imposed.

(ii) Denial of a well permit is not a prevention, avoidance, or mitigation measure authorized by this section.

(iii) No permit condition may be imposed if the effect would deprive the owner of the oil and gas rights of the right to produce or share in the oil or gas underlying a surface tract.

(h) A decision to impose or not to impose a condition is non-precedential and does not bind the Department or applicant or require either party to adhere to or include the same condition or conditions addressing the same subject matter in any subsequent permits.

(i) The issuance of a permit containing conditions imposed by the Department pursuant to this subsection shall be an action that is appealable to the Environmental Hearing Board.

(j) In accordance with subsection 3215(g)(1) of the act, § 78.15(d), (f), & (g) are not applicable to a well proposed to be drilled on an existing well site for which at least one well permit has been issued prior to [effective date].”(1137)

Response: See response to comment 422.

427. Comment: 78.15(g) – The proposed regulations in Chapter 78 Section 15 do not establish the criteria

for conditioning a permit and simply allocate authority to implement changes to the Department. This counteracts Section 3215(e) of Act 13 which requires the Department to establish criteria to guard public resources while protecting oil and gas resource development and respecting oil and gas owner property rights.

Act 13 already establishes the standard for the disturbance of critical communities and habitat for rare and endangered flora and fauna. An attempt is being made to equate rare and endangered species with special concern species; however the nature of the special concern species is such that there is insufficient data to identify it as critical. The industry is obligated to protect endangered and threatened species as identified by the Department. Requiring an additional consultation through the Pennsylvania Natural Heritage Program, adds a redundant step that inhibits the progress of the application process. Protection is already established through Act 13 and this proposed regulation does nothing more than to put an additional burden on the industry without improving the current practice or increasing environmental protection. The applicant shall demonstrate due diligence by submitting proof of notification and consultation with any resource demonstrating the investigation of the presence of threatened or endangered species and their habitat. If it is determined that the construction of a well site or access road will have a negative impact on the species or their habitat, a plan should be required outlining the measures that will be taken to prevent or minimize the effect on the species and or habitat.

Given the nature of oil and gas operations, activity may take place on or near public resources. The Department should follow Section 3215(e)(1) when determining whether to impose a condition on the permit. A condition may not be imposed unless the Department can provide evidence of probable harm to a public resource and can demonstrate that existing measures are insufficient to prevent harm. In order to ensure optimal development of an oil or gas resource, a condition may not be imposed if it causes excessive financial burden, and or reduces the anticipated recoverable resources. The condition may not be imposed if it in any way alters the terms of any lease, deed, surface use agreement, or similar contract between a surface owner and subsurface oil and gas owner. (1103)

Response: Please see responses to comments 413, 416, 418 and 419.

428. Comment: 78.15(g): The proposed language of this section does not include any criteria, as required by Section 3215(e) of Act 13, for the Department to utilize in the imposition of permit conditions to protect public resources. The quality of the evidence required for the Department to determine that harm to a public resource is probable and impose a condition in the permit must be clear and convincing. As such, Commentator supports MSC's suggested amendatory language for this section. (1071)

Response: Please see responses to comments 413, 416, 418 and 419. The Department disagrees that clear and convincing is the applicable standard.

429. Comment: 78.15(g) – Commentator has concerns about how the Department will determine and adopt compensatory mitigation for loss of public resources. We recommend that the Department be required to consult with the state or federal agencies that oversee the specific public resource in question. For national wildlife refuges, the Service must determine the mitigation, whereas the National Park Service should be consulted for national parks and scenic rivers. (1134)

Response: Sections 78.15(f) and 78a.15(f) establish a process for well applicants to notify applicable state and federal public resources agencies and provide those public resource agencies the opportunity to submit comments to the Department on functions and uses of the

applicable public resources and any mitigation measures recommended to avoid, minimize or otherwise mitigate probable harmful impacts.

430. Comment: 78.15(g): Requiring the Department to consider the impact of its permit on “*optimal*” development of the oil and gas resources is profoundly improper. The requirement for optimality turns the Department into the agent of the applicant. How is the Department supposed to evaluate what is “optimal” for the applicant? What is the standard for “optimality”? Is the Department required by this provision of the rule to simply take the well operator’s word for what is “optimal”? The word ‘optimal’ must be stricken. (869a)

Response: Please see response to comment 413. Use of the term “optimal development” comes from Section 3215(e) of the 2012 Oil and Gas Act and remains one of the 5 criteria the Department will consider prior to conditioning a well permit when there is the potential for impacts to public resources. The Department declines to define “optimal development of the resources” in the rulemaking. If the need for further clarification becomes apparent during implementation of this provision, the Department will develop guidance to address any issue identified. There are additional revisions to this section of the rulemaking to ensure that the Department meets its statutory and constitutional obligations related to protection of public natural resources.

431. Comment: In subsection (g) and elsewhere throughout these regulations, the Department has developed what appears to be a new standard for when an applicant must propose mitigation measures: when the proposed action poses a “probable harmful impact.” In other contexts, applicants must propose to mitigate harm to public resources when the proposed action “may cause harm” to the resource. As the Department is aware, the difference between the two standards is material. In the first instance under the new standard, the Department and public would not be able to insist on mitigation unless the harm was considered “probable” before the permit decisions has been made. In the second instance, the more cautionary term “may” would impose the burden on the applicant to minimize impacts of its action by incorporating mitigation measures into its planning process, and make it easier for the agency to impose conditions that will protect vulnerable public resources. The commentator strongly urges the agency to cease what seems to be a constant effort to shift burdens off of the industry and onto the Department and public when it comes to conservation of our public resources. The applicant should be required to propose mitigation when its development “may pose a harmful impact” on public resources.

Further, subsection (g) should be revised to require that the Department consider the potential long-term impacts of oil and gas activities on public resources alongside the property rights of permit applicants. Although Act 13 requires the Department to consider the effects of any permit conditions on the applicant’s property rights, the Pennsylvania Constitution requires that the Commonwealth “conserve and maintain” Pennsylvania’s public natural resources. Pa. Const. Art. I, § 27. As written, the regulation creates the risk that the Department will place undue emphasis on the desires of permit applicants and insufficient weight on the constitutionally guaranteed environmental rights of Pennsylvania’s citizens, including those of “generations yet to come.” Pa. Const. Art. I, § 27. If the Department deems it necessary to repeat in its regulations what is already a legislative requirement by explicitly referencing private property interests, then the Department should also explicitly reference its constitutional obligations under Pa. Const. Art. I, § 27 as trustee for Pennsylvania’s public resources. (852a)

Response: Sections 78.15(f)(3)(iii) and 78a.15(f)(3)(iii) require well permit applicants to include a description of any measures to be taken to avoid, minimize or otherwise mitigate impacts to public resources. Applicants should coordinate with applicable public resource

agencies prior to submitting well permit applications to address and resolve any potential impacts that may occur during drilling activities at the well site or access road. Any resolutions should be included in the well permit application.

Under these provisions, the Department must consider the impact of a proposed well on public resources based on information provided during the application review process from the applicant and any applicable public resource agencies. The Department has the authority to include permit conditions after consideration of the criteria in §§ 78.15(g) and 78a.15(g) in order to meet its constitutional and statutory obligations to protect public resources.

Please also see response to comments 418 and 421.

- 432.** Comment: The well permit applicants should not be given permits where threatened or endangered species grow, live, or thrive. The oil and gas operators should have already been consulting with the Pennsylvania Natural Heritage Program as well as any other agency that regulates the protection of our ecosystem. Taking further and even more restricted steps to protecting our ecosystem is an absolute necessity as the violations that the operators are incurring have not been a rare occurrence in our State.

The DEP is required by the Pennsylvania Constitution to protect the public's right to a clean environment. The proposed regulations provide that even though the DEP determines that a proposed well will have a probable adverse impact on a public resource, the DEP still cannot impose conditions that will prevent or mitigate that harm without first considering the impact of the condition on the individual mineral right owner's ability to "optimally" develop his or her oil and gas rights. This regulation inappropriately places the DEP, whose mission is supposed to be to protect and conserve Pennsylvania's environment, in the position of balancing protection of important public resources against individual property rights. Furthermore, it inappropriately, and potentially illegally, elevates the "optimal" development of oil and gas over the protection of important public resources against likely adverse impacts. These draft regulations do not give proper weight to the DEP's constitutional obligation to protect the environment. So long as the DEP's actions do not affect a taking of private property, the DEP should be obligated to take whatever actions are necessary to condition permits in a manner that protects important public resources. (19, 21, 23, 26, 90, 142, 165, 189, 192, 391, 938, 946, 958, 1005, 938a)

Response: Please see responses to comments 2580, 2910, 413, 416, 418, 419, 430 and 432.

- 433.** Comment: Requiring that operators consider the impact of a well site on public resources (Section 78.15 f, g) is a step in the right direction. When Consol Energy applied for permits to drill unconventional wells at the Beaver Run Reservoir site, the Municipal Authority of Westmoreland County (MAWC) did not have "the opportunity to submit comments to the Department (of Environmental Protection), including any recommendations to avoid or minimize impacts" Under the threat of a lawsuit, MAWC allowed Consol Energy to exercise mineral rights granted in a prior lease for conventional oil and gas extraction. And judging from the photo to the right, the Pennsylvania Department of Environmental Protection (DEP) imposed few if any conditions on the placement of well pads and impoundments. Even with the proposed pre-permitting requirement, Kurt Klapkowski explained in a Webinar on the proposed standards presented in December, 2013 (referring to Section 3215(e) of 58 Pa.C.S.) that a "balancing test" must be applied "to consider the rights of the operator to actually access the resource." He added, "Conditions cannot be so difficult, expensive or stringent to eliminate all rights of access to the resource."

Others have disagreed with the need to *balance* the rights of the public and the rights of the gas industry in the case of public water sources and their arguments may carry more weight now that the PA Supreme Court has handed down a decision on 58 Pa.C.S. (Act 13)---especially since the decision was based on the Environmental Rights Amendment of the Constitution of the Commonwealth of Pennsylvania which guarantees among other rights, the right of the public to pure water.

Rather than a ‘balancing test,’ I urge DEP to consider the following advice offered in 2010 in “Pre-Permitting and Site Assessment Consideration –Developing the Marcellus Shale,” by the Pennsylvania Environmental Council:

“Special consideration should be given to well operations that occur in proximity to water bodies (natural or man-made) that are utilized for drinking water (e.g. reservoirs and lakes) where even one individual adverse impact can have tremendous, perhaps irreparable, economic and social cost. Concepts used in other regulatory programs such as the Surface Mining Conservation and Reclamation Act, where areas are deemed unsuitable of extraction when in proximity to large scale water supplies, may be appropriate for oil and gas controls.” Appealing to common sense, I call on PA DEP to institute pre-permitting consideration of impacts on public water resources which will ensure that the right of the public to pure water outweighs the industry’s right of access to a resource that is clearly not as necessary for life as clean drinking water. (402)

Response: The Department has amended § 78a.15(f)(1) to include zones 1 or 2 of a wellhead protection area as part of a wellhead protection program approved under § 109.713 as well as public water supplies within 1000 feet. Wellhead protection areas were added because these resources are similar in nature to those included in Section 3215(c). Wellhead protection areas are associated with sources used for public drinking supplies, another listed resource. These provisions function to provide the Department with information necessary to enable the Department to conduct its evaluation of the impacts, to review the information in the context of the criteria outlined in Section 78.15(g) and 78a.15(g), and to determine whether permit conditions are necessary to ensure compliance with the Department’s constitutional and statutory obligations. Please see responses to comments 2580, 2910, 413, 416, 418, 419, 430 and 432.

434. Comment: Including conditions in the permit for cumulative as well as site specific modifications to avoid and mitigate impacts to public resources. The Constitutional rights of Pennsylvanians should take precedence over the optimal development of oil and gas resources. It should not be the Department's burden of proving that the conditions were necessary to protect against a probably harmful impact of the public resource. It should be the industry's responsibility to prove their actions will not be harmful and their executives should be held them financial and criminally responsible for damages to public resources. 78.15 (g) (15, 867)

Response: Please see responses to comments 2580, 2910, 413, 416, 418, 419, 430 and 432.

435. The DEP should modify the proposed regulation in order to take into account the current state of the law, notably the Pennsylvania Supreme Court's decision of December 2013, based on the application of the Environmental Rights Amendment.

Under the proposed language in § 78.15 (g), the DEP cannot impose conditions to preserve a public resource without considering the impact of the operator's ability to "optimally" develop his or her oil and gas rights. This provision is directly at odds with the recent decision of the Pennsylvania Supreme Court's case "Robinson Township" of December 2013. Perversely, this provision does not allow the State to accomplish its duty to protect public resources, as a trustee, in violation of the Environmental Rights Amendment.

Moreover, during an appeal, this proposed section states that the DEP has the burden of proving that the conditions were necessary to protect against a probable harmful impact of the public resource. This provision also violates the Environmental Rights Amendment. The Pennsylvania Supreme Court highlighted the fact that this type of provision would invite the DEP to articulate necessary conditions as minimal standards that an applicant would accept without litigation. The Court specifically stated that "viewed in terms of the constitutional mandates, this is topsy-turvy." Thus, the DEP must modify this section, as was stated during the webinar of January 3rd, 2014, in order to reverse the burden of proof during such appeals. Additionally, municipalities and residents should be able to introduce these appeals in order to take into account the "local interest". (1161)

Response: Please see responses to comments 413, 416, 418, 419, 430 and 432.

436. Comment: Section 78.15(g): This clause does not identify the quality of the evidence that would be required to determine if an impact amounted to a probable harmful impact or not. A requirement that the quality of the evidence should be clear and convincing should be made part of any rule. If the Department adopts and applies such an evidentiary standard or criteria it will have gone a long way in satisfying the requirements to respect private property rights and allowing for the optimal development of the oil and gas resources. Decisions will likely be well considered and reasoned. It should be remembered that responsible regulation includes measures to conserve or use, and not waste, mineral resources. Moreover, appeals of determinations using such an exacting standard by either operators or others would likely be reduced and reversal of such determinations on appeal even less likely. (81, 419)

Response: The Department disagrees that a clear and convincing standard is appropriate. Sections 78.15(f) and 78a.15(f) establish a process for the applicant to provide information in the well permit application about the public resource and any avoidance, mitigation or minimization measure and for the public resource to provide comments. This process ensures that the Department has sufficient information to evaluate whether permit conditions are necessary using the criteria in Sections 78.15(g) and 78a.15(g).

Please also see responses to comments 413, 416, 418, and 419.

437. Comment: Section 78.15 discusses the actions that must be taken if the well will be located in an area which will impact endangered species, or will pose a “probable harmful impact to a public resource.” The actions, which include submitting a plan that shows how the impact will be lessened or mitigated, are unacceptable. No permit should be given to an operator who is proposing to install a well in these sensitive areas. I find it especially egregious that section 78.15 (g) contains the following wording: “The Department shall consider the impact of any potential permit condition on the applicant’s ability to exercise its property rights with regard to the development of oil and gas resources and the degree to which any potential condition may impact or impede the optimal development of the oil and gas resources.” The DEP’s mandate should be to protect the environment. It is in no way obligated to “be fair” to the landowner/operator, and requiring it to be so would cause a conflict of interest. (108)

Response: Regarding protection for threatened and endangered species, please see previous responses to comments generally relating to §§ 78.15(d) and 78a.15(d). The revisions to §§ 78.15(g) and 78a.15(g) in the final rulemaking ensure that the Department meets its constitutional and statutory obligations to protect public resources. Please also see responses to comments 413, 416, 418, 419 and 430.

438. Comment: If the proposed well, well site or access road poses a probable harmful impact to a public resource, the Department may include conditions in the well permit to avoid or mitigate those impacts to the public resource’s current functions and uses to protect against a probable harmful impact of the public resource.

Recommendation: Long term probable harms of pipelines and pipeline infrastructure caused by deforestation and ROW maintenance may pose a more permanent probable harm than access roads. Pipelines should be included for their probable harmful impact. (118)

Response: To the extent the commentator suggests extending these provisions to pipelines, please see response to comment 266.

439. Comment: § 78.15(g) – This section fails satisfy the legislative intent of Section 3215 (e) of the Oil and Gas Act of 2012. The statute required the development of criteria for the purposes of conditioning permits, ensuring optimal development of oil and gas resources, and respecting property rights of oil and gas owners. No such criteria are proposed. It is recommended that this section be deleted from the rulemaking until the department develops, through the formal rulemaking process, criteria that meet the intent of the statute. (124a)

Response: Sections 78.15(g) and 78a.15(g) have been revised to include criteria related to conditioning permits in the final rulemaking to ensure that the Department meets its constitutional and statutory obligations to protect public resources. Please also see responses to comments 413, 416, 418, 419 and 430.

440. Comment: § 78.15(g) – we have concerns about how DEP will decide mitigation for impacts to public resources? We recommend that the Department be required to consult with the agency that oversees the public resource in question. (1006)

Response: Sections 78.15(f) and 78a.15(f) establish a process for well applicants to notify applicable state and federal public resources agencies and provide those public resource agencies the opportunity to submit comments to the Department on functions and uses of the applicable public resources and any mitigation measures recommended to avoid, minimize or

otherwise mitigate probable harmful impacts. Please see responses to comments 413, 416, 419, 430 and 431.

- 441.** Comment: Include conditions in the permit for cumulative as well as site specific modifications to avoid and mitigate impacts to public resources. The Constitutional rights of Pennsylvanians should take precedence over the optimal development of oil and gas resources. It should not be the Department's burden of proving that the conditions were necessary to protect against a probably harmful impact of the public resource. It should be the industry's responsibility to prove their actions will not be harmful and their executives should be held financially and criminally responsible for damages to public resources. **78.15(g)** (1098)

Response: Please see responses to comments 413, 416, 418, 419, 430 and 431.

- 442.** Comment: I applaud the addition of the proposed Subsection (g). This addition will help maintain the integrity of Act 13 Section 3215(e), which directs the Board to promulgate regulations for the Department to condition a well permit based on its impact to public resources. The only part of this proposed change I see fault with is the potential for the well permit applicant to under-identify public resource impacts. Hopefully, all applicable jurisdictional agencies provide the needed amount of oversight to curtail potential under-identification of public resource impacts submitted by an applicant. (625)

Response: The Department acknowledges the comment.

- 443.** Comment: Initially, Section 3215(e) of Act 13 requires the Department to develop regulatory criteria that protect public resources while ensuring optimal oil and gas resource development and respecting oil and gas owner property rights. However, the proposed regulations in Chapter 78 Section 15 do not adequately implement/address these requirements - the regulatory criteria for conditioning a permit has not been provided and the draft regulations only frame the Department's authority to implement the conditions. If industry is required to avoid or mitigate potential impacts to these resources, the criteria used to assess impacts must be established and provided.

In addition, requiring industry to potentially gain clearance for Species of Special Concern may significantly limit our development opportunities and/or create costly mitigation solutions which would be in conflict with Section 3215(e) as it pertains to ensuring oil and gas development and property owner rights. If the Department's goal is to protect the Commonwealth's resources as they specifically relate to Threatened, Endangered or Species of Special Concern, then Industry has the right to know the locations of such resources in order to avoid or mitigate any potential impacts. (638, 638a, 798)

Response: Please see responses to comments 413, 416, 418, 419. In response to the comments relating to special concern species, please see responses to comments on §§ 78.15(f)(1)(iv) and 78a.15(f)(1)(iv). Specifically, please see response to comment 342.

- 444.** Comment: DEP's PNDI Policy and proposed changes to Chapter 78 for the consideration of well permit conditions to mitigate impacts to public resources ignore the status of the oil and gas mineral owner as the holder of the dominant estate.

The "public resources" provision in Act 13 was already adopted by the legislature (in the Oil and Gas Act of 1984) at the time of the PA Supreme Court's decision in *Belden & Blake Corp. v. DCNR* in 2009. In that case, the Pennsylvania Supreme Court affirmed the concept that any reconciliation of surface owner disputes, whether a private person or public entity, is through

negotiation. Belden & Blake makes clear that a public surface owner cannot unilaterally impose conditions on the oil and gas operator.

In contradiction of Belden & Blake, the last paragraph of 78.15 would allow the state to unilaterally impose permit conditions foregoing negotiation between the dominant tenant and the public surface owner. Regardless of its authority under Act 13 to “consider” impacts to public resources, DEP does not have unbounded authority to disregard well-established principles of Pennsylvania property law. Accordingly, DEP may not create a rule that allows public agencies to circumvent their limitations under the guise of protecting public resources.

The Pennsylvania Supreme Court has already spoken to this precise question:

A subsurface owner’s rights cannot be diminished because the surface comes to be owned by the government, or any other party with statutory obligations, regardless of their salutary nature. That is, whatever its admirable obligations to the public, as concerns the owner of private property, the government and its agencies must be held to the same standard as any other surface owner. DCNR may seek additional conditions because of its mandate, but it has no authority to impose them unilaterally without compensation. Case 969 A.3d at 532-33.

Chapter 78 may not be used to create a permitting process that directly undermines these principles. (413a)

Response: The principles discussed by the commentator do not apply to these provisions. These principles pertain to the relationship between surface and subsurface owners. The Department has constitutional and statutory obligations to consider and protect public resources that are separate and unrelated to the property issues between surface and subsurface owners. The provisions in §§ 78.15 and 78a.15 establish a process for the Department to consider and protect public resources from the impacts of a proposed well and coordinate with public resource agencies to fulfill these obligations. These provisions function to provide the Department with information necessary to enable the Department to conduct its evaluation of potential impacts and to review the information in the context of the criteria outlined in §§ 78.15(g) and 78a.15(g), and to determine whether permit conditions are necessary to prevent a probable harmful impact.

445. Comment: The DEP is required by the Pennsylvania Constitution to protect the public’s right to a clean environment. The proposed regulations provide that even though the DEP determines that a proposed well will have a probable adverse impact on a public resource, the DEP still cannot impose conditions that will prevent or mitigate that harm without first considering the impact of the condition on the individual mineral right owner’s ability to “optimally” develop his or her oil and gas rights. This outrageous regulation inappropriately places the DEP, whose mission is supposed to be to protect and conserve Pennsylvania’s environment, in the position of balancing protection of important public resources against individual property rights. Furthermore, it inappropriately, and potentially illegally, elevates the “optimal” development of oil and gas over the protection of important public resources against likely adverse impacts. These draft regulations do not give proper weight to the DEP’s constitutional obligation to protect the environment. So long as the DEP’s actions do not affect a taking of private property, the DEP should be obligated to take whatever actions are necessary to condition permits in a manner that protects important public resources.

There must be sweeping changes in staffing, regulations, and enforcement in order to protect Pennsylvania’s citizens from future harmful effects of unconventional drilling. It is recommended that protective, strong rules must have enforcement mechanisms like a DEP staff that is big enough

to do its job. The DEP staff regulating the gas industry is at least 105 positions too small. Instead of subsidizing a multibillion-dollar profitable industry, the money should be used to enforce strict rules and regulations that are needed to protect people and the natural environment. (810)

Response: Please see responses to comments 2580, 2910, 413, 416, 418, 419 and 430.

446. Comment: Requiring the department to consider the impact of its permit on “*optimal*” development of the oil and gas resources is profoundly improper. This turns the department into the agent of the applicant. How is the department supposed to evaluate what is “optimal” for the applicant? The word “optimal” must be stricken. (869)

Response: Please see responses to comments 413, 416, 418, 419 and 430.

447. Comment: The current permitting process imposes the burden of proof on PADEP. This is an upside down approach. This burden should be borne by the applicant, those who stand to gain the profit from the venture. The current system requires significant investment by PA taxpayers who have nothing to gain and much to lose as the industry moves onto public lands and into rural neighborhoods. The applicant must have the burden of proof in any challenge of PADEP decisions, and all permit decisions made by PADEP must place public interest over corporate profits. (1078)

Response: Please see responses to comments 413, 416, 418, 419.

448. Comment: The DEP should frame its response as conditions to mitigate the impacts rather than giving priority to the mineral rights owner’s ability to “optimally” develop his rights. To not do so will be a failure of the DEP to perform its duty to protect the public’s constitutional right to a clean environment and protection of resources for future generations. (1089, 1229)

Response: Please see responses to comments 413, 416, 418, 419 and 430.

449. Comment: The majority State Game Lands (SGLs) were purchased by sportsmen for hunting, trapping, and fur taking opportunities which mineral development activities could represent a recreational loss, especially during the hunting seasons. Specific wildlife and associated habitats are maintained on SGLs to promote wildlife use, by both game and non-game species. Would the Department consider impacts to sportsmen during the hunting seasons from mineral extraction activities? (1170)

Response: Sections 78.15(f)(1)(i) and 78a.15(f)(1)(i) include game lands as a public resource that triggers additional review during the well permit application process. Through the process outlined in these provisions the Department must consider the impacts of the proposed well on the functions and uses of such game lands which would include the impacts to sportsmen during hunting season.

450. Comment: 78.15(g) - The proposed language of this section does not include any criteria as required by Section 32.15(e) of Act 13 for the Department to utilize in the imposition of permit conditions to protect public resources. The quality of the evidence required for the Department to determine that harm to a public resource is probable and impose a condition in the permit should be clear and convincing evidence. Suggested Language: (g) Subject to satisfying and complying with the criteria prescribed in subsections (1)-(3), the Department may include conditions in the well permit to avoid or mitigate impacts to the public resource. As prescribed in Section 3215(e)(1) of the act, in determining whether to impose a condition, the Department shall utilize the following three sets of criteria: (1) Criteria for the Department to use for conditioning a well permit based on its impact to

public resources identified in § 78.15(f): (i) - The permit condition is necessary to protect against probable harm. (ii) - As shown by clear and convincing evidence, the harm to the public resource is probable, as opposed to merely possible or speculative. (iii) - No permit condition may be more restrictive or limiting with respect to a well, well site or access road than the set-back prescriptions contained in Act 13 unless it is shown by clear and convincing evidence that the existing protections of Act 13, the Clean Streams Law and other applicable statutes are insufficient to protect against the specified harm or unless the applicant consents in writing to the condition. (iv) - No permit condition may be more restrictive or limiting with respect to a well, well site, or access road, or activities incident thereto, than the existing measures and protections established and required under Chapter 78, Act 13 or any other applicable statute or regulation unless it is shown by clear and convincing evidence that the existing measures and protections are insufficient to protect against the specified harm or unless the applicant consents in writing to the condition. (v) - The nature of the harm to be avoided or mitigated by the permit condition must be clearly described in the terms of a permit condition and permit condition terms must include a description of the expected duration of the probable harm and the duration of the permit condition. Physical construction or site-specific actions required of an applicant as a condition within a permit shall not extend beyond the discrete area or location of the well, well site, or access road unless the applicant consents in writing. (2) Criteria, additional to those in paragraph (1), to ensure optimal development of oil and gas resources: (i) - No condition implicating surface activities or operations that result s in a commercially unreasonable burden on an applicant may be imposed. (ii) - For purposes of conservation and avoiding the waste of recoverable oil and gas resources, no condition that results in alterations to the well design in a way that will reduce the anticipated volume of recoverable gas or oil resources may be imposed. (3) Criteria, in addition to those in paragraphs (1) and (2) above, to use for respecting private property rights of oil and gas owners: (i) - In accordance with subsection 3215 (g) (2) of the Act, no condition on well permits where the proposed condition itself alters or abridges the terms of any lease, deed, surface use agreement or similar contract or agreement between a surface owner and subsurface oil and gas owner or to which they are subject as signatories or successors in interest may be imposed. (ii) - Denial of a well permit is not a prevention, avoidance, or mitigation measure authorized by this section.(iii) - No permit condition may be imposed if the effect would deprive the owner of the oil and gas rights of the right to produce or share in the oil or gas underlying a surface tract. (h) A decision to impose or not to impose a condition is non-precedential and does not bind the Department or applicant or require either party to adhere to or include the same condition or conditions addressing the same subject matter in any subsequent permits. (i) The issuance of a permit containing conditions imposed by the Department pursuant to this subsection shall be an action that is appealable to the Environmental Hearing Board. (j) In accordance with subsection 3215(g)(1) of the act, § 78.15(d), (f), & (g) are not applicable to a well proposed to be drilled on an existing well site for which at least one well permit has been issued prior to [effective date]. (1174)

Response: The Department has considered this comment and declines to make the suggested amendments to this rulemaking. Please note that Sections 78.15(g) and 78a.15(g) have been amended to clarify the criteria the Department will consider when deciding whether to condition an oil or gas well permit based on impacts to public resources. Additionally, Sections 78.15(g) and 78a.15(g) have been revised to remove the language regarding the Department’s burden of proof upon appeal of a condition necessary to protect a public resource. Section 3215(e) of the Oil and Gas Act of 2012 states that the Department has the burden of proving that a well permit condition imposed to protect a public resource is necessary to protect against a probable harmful impact of the public resource. The revisions to §§ 78.15(g) and 78a.15(g) ensure that the Department meets its constitutional and statutory obligations to protect public resources.

451. Comment: 78.15 - Section 78.15(g) replicates, in part, the language of Act 13 Section 3215(e) which

recognizes the oil and gas owners' property rights to develop the oil and gas resources. However, Section 3215(e) also requires the EQB to develop criteria for the DEP to utilize in the imposition of any permit conditions to protect public resources while respecting those property rights and ensuring optimal development of those resources. DEP has not proposed any such criteria. The rule thus fails to comply with Act13, which requires the EQB develop these criteria in this rulemaking. (1174)

Response: Please see response to comments 413, 419, 430 and 431.

452. Comment: Regarding Chapter 78 Section 15 Regulations: Initially, Section 3215(e) of Act 13 requires the Department to develop regulatory criteria that protect public resources while ensuring optimal oil and gas resource development and respecting oil and gas owner property rights. However, the proposed regulations in Chapter 78 Section 15 do not adequately implement/address these requirements - the regulatory criteria for conditioning a permit has not been provided and the draft regulations only frame the Department's authority to implement the conditions. If industry is required to avoid or mitigate potential impacts to these resources, the criteria used to assess impacts must be established and provided. (123, 123a, 883a, 940)

Response: Please see response to comments 413, 419, 430 and 431.

453. Comment: Harrisburg Area Clean Water Action represents over 120,000 different people in PA and one of the conveners of the PA Campaign for Clean Water, which is 140 different organizations in PA.

This presentation emphasis on what is right and wrong, what people have called morality. In the past five years, I have gotten to know many people in shale country in Pennsylvania. More and more families have lost their drinking water to shale gas drilling in Pennsylvania.

We have the hardest time here in Pennsylvania even getting the Department at Environmental Protection to keep track of how many families have lost their water because of shale gas drilling. Eventually hard work and the journalism of Laura Legere eventually told us there was over families that have totally lost their water.

There's a basic situation here. Who is the government Supposed to be protecting? Is it supposed to be protecting the Interests of the industry to develop or is it supposed to be protecting the interests of the people?

The way the regulations are many times designed, one could say that the interests of industry are being served. The DEP should not compromise its obligation to protect the environment by balancing the citizens' constitutionally guaranteed right for Clean Water against the private interests of oil and gas. The DEP is required by the Pennsylvania Constitution to protect the public's right to a clean environment.

The proposed regulations provide even though the DEP determines that a proposed well will have a probable adverse impact on a public resource, the DEP still cannot impose conditions that will prevent or mitigate that harm without first considering the impact of the condition on the individual mineral right owner's ability to optimally develop his or her oil and gas rights. This regulation inappropriately places DEP, whose mission is supposed to be to protect conserve Pennsylvania's environment in the position of balancing projection of important public resources against individual Property rights.

Furthermore, it inappropriately and potentially illegally elevates the optimal development of oil and

gas over the protection of important public resources against likely adverse impacts. These draft regulations do not give proper weight to the DEP's constitutional obligation to protect the environment. So long as the DEP's actions do not affect a taking of private property, DEP should be obligated to take whatever actions are necessary to condition permits in a manner that protects important public resources. (1000)

Response: Please see responses to comments 2580, 2910, 413, 416, 418, 419 and 430.

- 454.** Comment: Standard for reviewing well permit applications: According to Act 13, Section 3215(e)(1), the EQB must develop regulatory criteria for conditioning well permits based on impacts to public resources and to ensure optimal development of oil and gas resources and respecting the property rights of oil and gas owners. The Chapter 78 revision, while creating a burdensome and open-ended process by which applicants must consult with other Commonwealth agencies before well permits will be issued, nevertheless fails to propose any regulatory criteria for the eventual imposition of permit conditions that might be imposed as a result of this process. The proposed rule must clearly articulate the standards and criteria for imposing such conditions on well permits.

Section 3215(e)(2) of Act 13 requires the Department to prove that any conditions it imposes in well permits are necessary to protect against a "probable harmful impact of the public resources." The rule, however, fails to implement this requirement of Act 13, because it does not establish a clear and convincing evidentiary standard that the Department must meet to condition a well permit to protect against probable harm to public resources.

An operator's application for a permit for a well that may affect public resources will require resolution of the above issues and related complicated problems including obtaining clearance letters from resource agencies such as the Pennsylvania Fish and Boat Commission and the Pennsylvania Game Commission. This process is time consuming and costly. Section 78.15 will have far reaching impacts and significant public interest. EQB will not have met its obligation under Act 13 if it proposes this preliminary draft as written. (1172)

Response: Please see responses to comments 413, 416, 418, 419, 422, 430 and 431.

To the extent that the commentator suggests that the process of coordinating with public resource agencies and resolving potential impacts prior to submitting an application is costly, this process adds few additional costs from the process that currently exists as part of the existing well permit process.

§ 78.17 Permit expiration and renewal

- 455.** Comment: In regard to 78.17, we recommend that permit renewals be electronically posted for public access consistent with the recommendation for all permit applications. (15, 1098)

Response: Permit renewals are currently posted on the Department's website.

- 456.** Comment: It is recommended to extend the life of a permit from one year to two or preferably three years. (606, 606a, 1113, 1118, 1120, 1167, 1115a, 1176-1188)

Response: In accordance with 58 Pa.C.S. § 3211(i), well permits issued for drilling wells under this chapter shall expire one year after issuance unless operations for drilling the well are commenced within the period and pursued with due diligence or unless the permit is renewed

in accordance with the regulations of the Department. The Department does not have explicit authority to extend the initial permit beyond the one year statutory limit without a permit renewal application filed by the applicant. Therefore, the proposed one-year initial permit term followed by a potential two-year permit renewal term is retained in the final-form rulemaking. The Department believes that three years from the time of permit issuance is an adequate time limit for drilling a well.

457. Comment: 78.17. Permit renewal - We support the provision to notify all entities as required to be notified pursuant to section 3211(b)(2) of the Act. Since permits are not always renewed the nearby residents have no other way of knowing the operator's intentions. Circumstances may change such that a resident may want to contact the operator with questions or DEP regarding specific concerns regarding the permit. Therefore, the residents as stipulated by the Act need to be notified accordingly. We fully support this provision as written and recommend its adoption. (660a)

Response: The Department acknowledges the comment.

458. Comment: We propose that the Environmental Quality Board (EQB) add language to the proposed text of Chapter 78 to allow oil and gas owners/operators to amend PADEP-approved drilling permits by lengthening laterals without having to restart the permitting process. Assuming no other deviations from the approved permit would occur; owners/operators could continue to pursue unleased properties after receiving a permit to drill from the PADEP. Such a permitting mechanism to lengthen a horizontal gas well lateral would allow owners/operators to maximize the ability to remove as much of the oil and gas resources as possible from a single well pad, thereby minimizing the environmental footprint on the surface. In addition, such a permitting mechanism would reduce the permitting burden on PADEP permitting staff resources. The envisioned permitting mechanism would simply be administrative in nature. (1167)

Response: A mechanism currently exists to permit the lengthening of lateral wellbores. Operators may submit a permit application to "Deepen" a permitted well. Because the deepening/lengthening of a wellbore meets the definition of an "Alteration" pursuant to 58 Pa.C.S. § 3203, specific statutory requirements such as submission of a plat and notification of interested parties are required.

§ 78.18 Disposal and enhanced recovery well permits

459. Comment: We support the addition of 78.18 - Disposal and enhanced recover well permits to the proposed regulations. However, we suggest these relatively new hazards be examined with greater scrutiny consistent with environmental impact studies of the National Environmental Policy Act (NEPA). (15, 1098)

Response: The Department acknowledges the comment. Section 78.18(d) of the final-form rulemaking makes the well site requirements for surface facilities explicitly applicable to underground injection control (UIC) well sites. Section 78a.18 of the final-form rulemaking contains a cross-reference to section 78.18, as injection wells are "conventional wells" by definition under the 2012 Oil and Gas Act.

Subsurface concerns with UIC wells are beyond the scope of this rulemaking. Further, the Department notes that the Commonwealth does not have primacy for the UIC program in Pennsylvania; that authority lies with EPA Region III. The EPA program regulations are authorized by the Safe Drinking Water Act and are designed to protect all underground sources of drinking water from all waste injection activities. Any suggestion that UIC wells be

subject to the authority of the National Environmental Policy Act, a federal statute, should be directed to EPA.

- 460.** Comment: Prohibit use of disposal injection wells in PA due to the history of abandoned gas and oil wells. (475)

Response: Subsurface concerns with UIC wells are beyond the scope of this rulemaking. Further, the Department notes that the Commonwealth does not have primacy for the UIC program in Pennsylvania; that authority lies with EPA Region III. The EPA program regulations are authorized by the Safe Drinking Water Act and are designed to protect all underground sources of drinking water from all waste injection activities.

- 461.** Comment: 78.18. Disposal and enhanced recovery well permits - Presently, the Commonwealth has a limited number of such wells. However, the EPA is moving forward with the issuing of a number of UIC permits. It is true the industry is having water disposal issues. We do need to be able to dispose of concentrated un-recyclable flowback and produced waters in the best methods that are respectful of the environment. Such methods will require containment and perhaps even on-site processing. The Department needs to be anticipating more UICs and have appropriate environmental measures and safeguards in place. We therefore, support this provision and recommend its adoption as written. (660a)

Response: The Department acknowledges the comment. Section 78.18(d) of the final-form rulemaking makes the well site requirements for surface facilities explicitly applicable to underground injection control (UIC) well sites. Section 78a.18 of the final-form rulemaking contains a cross-reference to section 78.18, as injection wells are “conventional wells” by definition under the 2012 Oil and Gas Act.

Subsurface concerns with UIC wells are beyond the scope of this rulemaking. Further, the Department notes that the Commonwealth does not have primacy for the UIC program in Pennsylvania; that authority lies with EPA Region III. The EPA program regulations are authorized by the Safe Drinking Water Act and are designed to protect all underground sources of drinking water from all waste injection activities.

- 462.** Comment: These laws and regulations need to cover Class II Disposal Injection wells also. As unconventional Marcellus drilling increases in PA, there will be more need to disposal of frac flowback, produced fluids, liquid from drill cuttings and other liquid waste from oil and gas operations.

Very few of the rules provide protection to citizens who must live near disposal injection wells, as the rules already partially protect those living near Marcellus drilling operations. (1064, 1101)

Response: The Department acknowledges the comment. Section 78.18(d) of the final-form rulemaking makes the well site requirements for surface facilities explicitly applicable to underground injection control (UIC) well sites. Section 78a.18 of the final-form rulemaking contains a cross-reference to section 78.18, as injection wells are “conventional wells” by definition under the 2012 Oil and Gas Act.

Subsurface concerns with UIC wells are beyond the scope of this rulemaking. Further, the Department notes that the Commonwealth does not have primacy for the UIC program in Pennsylvania; that authority lies with EPA Region III. The EPA program regulations are

authorized by the Safe Drinking Water Act and are designed to protect all underground sources of drinking water from all waste injection activities.

463. Comment: Disposal injection wells will cause high pressure underground for many years, unlike unconventional gas drilling operations using fracking that takes place during a matter of days or weeks. Because Class II Disposal injection wells will operate for many years, people living near injection wells need even MORE protection than those living near Marcellus wells. An injection well operates at high pressure for a long time. Marcellus wells are fracked under high pressure for only a short period of time. The injection well's high pressure for years means a longer time frame when water contamination or other damages are likely to occur. Language that will provide protections and rights for those living near Class II Disposal injection wells needs to be incorporated into the regulations and laws. (1064, 1101)

Response: The Department acknowledges the comment. Subsurface concerns with UIC wells are beyond the scope of this rulemaking. Further, the Department notes that the Commonwealth does not have primacy for the UIC program in Pennsylvania; that authority lies with EPA Region III. The EPA program regulations are authorized by the Safe Drinking Water Act and are designed to protect all underground sources of drinking water from all waste injection activities.

464. Comment: Since Class II Disposal injection wells operate for many years, the setback distance needs to be larger than for unconventional horizontal gas wells. The Area of Review for those wells should not extend beyond the boundary of the surface tract on which the well operator has permission to construct the disposal well. Owners of drinking water wells within 1 mile of the disposal injection well should receive notice of well construction. (1064, 1101)

Response: The Department acknowledges the comment. The amendments to the UIC well provisions of Chapter 78 were not intended to represent a sweeping overhaul of the UIC program in Pennsylvania but rather to clarify that all containment practices and onsite processing associated with disposal and enhanced recovery wells had to comply with the requirements of Chapter 78. For that reason, broad amendments to the current UIC program are beyond the scope of the current rulemaking.

The Department also notes that the Commonwealth does not have primacy for the UIC program in Pennsylvania; that authority lies with EPA Region III. The EPA program regulations are authorized by the Safe Drinking Water Act and are designed to protect all underground sources of drinking water from all waste injection activities.

465. Comment: Since I once worked for Schlumberger Well Services I have some insight into this industry.

We in our neighborhood are presently involved in fighting a Class II-D injection well for hazardous frac waste within 100's of feet of our homes and private water supplies. My first recommendation would be for setbacks similar to a Class I disposal well. We all know that frac fluid should be considered a hazardous waste and not a residual waste. "HazMat", (Hazardous Materials), has to respond to clean up any spills or accidents. Words on paper do not make this toxic, possibly radioactive stew benign (Halliburton Loophole). Not only does this through us into an industrial zone, but also threatens our water, air, quality of life, property values, as well as the Counties tax base on our homes. Having this toxic brew flowing under our properties without our permission should be illegal. Living in a "Brown Zone", not by our own choice, is not only alarming but renders our properties worthless as well. How can this be legal?

Physical location of all wells, Marcellus and injection, should be a strong point in the consideration of the new regulations. Water sources, loss of air quality and property values all hinge on the particular location of a Marcellus or injection well.

Areas of review for injection wells should reside solely within the property lines of the property owner/lessee reaping the moneys from said well.

Monitoring wells should be a requirement for all injection wells so as to monitor fluid flow and pressure in the confinement zone. (1072)

Response: The Department acknowledges the comment. The amendments to the UIC well provisions of Chapter 78 were not intended to represent a sweeping overhaul of the UIC program in Pennsylvania but rather to clarify that all containment practices and onsite processing associated with disposal and enhanced recovery wells had to comply with the requirements of Chapter 78. For that reason, broad amendments to the current UIC program are beyond the scope of the current rulemaking.

The Department also notes that the Commonwealth does not have primacy for the UIC program in Pennsylvania; that authority lies with EPA Region III. The EPA program regulations are authorized by the Safe Drinking Water Act and are designed to protect all underground sources of drinking water from all waste injection activities.

§ 78.19 Permit application fee schedule

- 466.** Comment: 78.19 – The PADEP’s application fee schedule for conventional wells varies based on well depth, from \$250 to \$1,950 for conventional wells and \$900 to \$3,000 for unconventional wells. The proposed fee schedules, and explanatory information preceding the proposed rule do not explain how the EQB developed the fee amounts, or how these amounts bear a reasonable relationship to the cost of administering § 78 permits as required by the statute (58 Pa.C.S. § 3211(d)).

(58 Pa.C.S. § 3211(d)) Permit fee.--Each application for a well permit shall be accompanied by a permit fee, established by the Environmental Quality Board, which bears a reasonable relationship to the cost of administering this chapter.

We request that the EQB provide justification for each fee schedule to ensure that there are sufficient funds to hire and retain qualified professional staff to process the permits, hire experts, conduct site inspections, and ensure compliance. More specifically, we request that the EQB provide information to show the number of full time equivalent (FTE) professionals (by discipline) needed to carefully review each permit application, hire experts when needed, and cover the cost of pre-application site visits, and ensure compliance once the permit is issued. The cost of that review should be divided by the average number of permits processed each year.

The process and cost to amend a permit should be clarified.

Please also explain if the permit processing fee includes funds for inspection and enforcement, or how those funds are provided to ensure adequate funds and personnel are in place to implement the compliance program. By comparison, in 2009, the BLM increased its well permit application fee from \$4,000 per well to \$6,500 per well after reviewing the cost just to review and issue A Permit to Drill (APD). (USDOJ, BLM, *BLM Will Collect \$6,500 Processing Fee for Each New Oil and Gas Drilling Permit Application* (Nov. 4, 2009),

http://www.blm.gov/wo/st/en/info/newsroom/2009/november/NR_11_04_2009.html (press release). (1143)

Response: In accordance with section 78.19(f), the Department recently prepared and presented to the Board a 3-Year Regulatory Fee and Program Cost Analysis Report (Report). The Report served as the basis for a final-form rulemaking, published in the *Pennsylvania Bulletin* and effective on June 14, 2014. (44 Pa.B. 3517). That rulemaking raised the permit fee for an unconventional vertical well to \$4,200 and for an unconventional non-vertical well to \$5,000. These permit fees, along with impact fee money from Act 13 of 2012 fund the entire operation of the Office of Oil and Gas Management, which is responsible for Statewide oil and gas conservation and environmental programs to facilitate the safe exploration, development and recovery of oil and gas reservoirs in this Commonwealth in a manner that will protect this Commonwealth's natural resources, the environment and public health, safety and welfare.

467. Comment: Impact Fees and Royalties: Increase permits fees and create an escrow account to protect against damages, e.g., two times the value of a home to owners whose wells are damaged by drilling activities. In addition, implementing a fair royalty structure could supply needed funds for:
- a. Much needed increase in staffing at DEP for enforcement of regulations, continuing to identify and map abandoned wells, and making well location and fracturing chemical information available on the DEP website.
 - b. Research funding—To investigate:
 - i. What are the impacts of water is taken out the ecosystem through fracking?
 - ii. What are the cumulative effects of gas and oil drilling, including public health, biodiversity conservation, and ecosystem function?
 - iii. What technologies can improve environmental protection and public health in the fracing process?
 - a. Site remediation in instances of land and water contamination where drillers cannot pay or cease operations. (140)

Response: Well permit fee increases are beyond the scope of this rulemaking.

468. Comment: The permit application fee schedule (78.19) is inadequate and should be significantly increased. They should be based not only on depth of the well bore, but the number and length of horizontal bores from each vertical bore. [17.19 (a)] Consider additional fees for multiple fracking of a well given increased risk and the inclusion of premium fees related to evolving technologies such as “super fracking.” (855, 1098)

Response: See response to comment 466.

§ 78.21 Opportunity for objections and conferences; surface landowners

469. Comment: Section 78.21: This section references Section 3215 of Act 13 of 2012. Section 3215 was recently struck down by the PA Supreme Court. In light of the court's decision, the proposed regulations need to be adjusted accordingly? Also, the reference to Section 3215 appears in other places in the proposed regulations, and as such the same question applies. (415)

Response: The Pennsylvania Supreme Court enjoined the application and enforcement of

only certain subsections and paragraphs of Section 3215 of the Oil and Gas Act. The remainder of Section 3215 is valid under the Court’s ruling. The Department has amended this rulemaking to reflect the Court’s holding. See response to comment 265.

§ 78.51 Protection of water supplies

- 470.** Comment: **78.51(c)** – The presumption for liability exclusion in 78.51(c) for pollution related to developing the well pad should be removed. The presumption for water contamination liability should apply to the entire well development process including the well pad development. This exclusion would make an opening for disagreement on what part of the process caused the problem which could shift the burden of proof unfairly back onto the surface rights owner. (167)

Response: Section 3218(c) of the 2012 Oil and Gas Act (58 Pa.C.S. § 3218(c)) establishes the presumption of liability. The presumption encompasses situations in which the water supply is within 1,000 feet of a conventional well or 2,500 feet of the unconventional well bore, and the pollution takes place within six months for a conventional well or twelve months for an unconventional well from the later of several listed activities, not including well pad development or well site construction activities. The Board does not have authority to expand the scope of the statutory presumption to include these activities.

- 471.** Comment: The proposed amendments states, “That the presumption of liability established in 58 PA C.S. § 3218(c) (relating to protection of water supplies) does not apply to pollution resulting from well site construction activities.” This revision gives the oil and gas industry special treatment. Also, far too many actions can be hidden under the phrase of “well site construction activities.”

Operations on and near a well pad occur in a mix of actions and timing before during and after well sites are built before during and after drilling and fracking. Furthermore, sites are often modified during and after tracking. No one can separate the effects of “construction activities” from other effects. Also, separating out construction allows one company to attempt to blame another for harm associated with a well operation. This delays and may make it impossible for a harmed citizen to seek redress. (938, 938a)

Response: See response to comment 470.

- 472.** Comment: **78.51** – We support regulatory improvements for water supply protection; however, we are concerned that the proposed regulatory language is insufficient to protect the health of residents who may be adversely affected by contamination of water supplies and that the proposed regulation conflicts with the statute at 58 Pa.C.S. §3218.

58 Pa.C.S. §3218 Protection of Water Supplies requires the operator to restore water quality at least to the standards established under the Pennsylvania Safe Drinking Water Act, or to a higher standard if the water quality exceeded the Pennsylvania Safe Drinking Water Act standards before the pollution occurred:

(a) General rule. --In addition to the requirements of subsection (c.1), a well operator who affects a public or private water supply by pollution or diminution shall restore or replace the affected supply with an alternate source of water adequate in quantity or quality for the purposes served by the supply. The department shall ensure that the quality of a restored or replaced water supply meets the standards established under the act of May 1, 1984 (P.L.206, No.43), known as the Pennsylvania Safe Drinking Water Act, or is comparable to the quality of the water supply before it was affected by the operator if that water supply exceeded those standards. The

Environmental Quality Board shall promulgate regulations necessary to meet the requirements of this subsection. [emphasis added].

Under no circumstances should the PADEP allow an operator to restore a water supply to a drinking water quality that does not meet the Pennsylvania Safe Drinking Water Act standards. Furthermore, the majority of documented water quality violations are related to PADEP or Conservation District issued notices related to erosion and sediment control. There is no basis to exempt these construction activities from requirements to protect water supply.

We recommend the following proposed revisions to § 78.51(c) and (d):

§ 78.51. Protection of water supplies.

* * * * *

(c) Within 10 calendar days of the receipt of the investigation request, the Department will investigate the claim and will, within 45 calendar days of receipt of the request, make a determination. If the Department finds that pollution or diminution was caused by the well site construction, drilling, alteration or operation activities or if it presumes the well operator responsible for polluting the water supply of the landowner or water purveyor under section 3218(c) of the act (relating to protection of water supplies), the Department will issue orders to the well operator necessary to assure compliance with this section.

(d) A restored or replaced water supply includes any well, spring, public water system or other water supply approved by the Department, which meets the criteria for adequacy as follows:

* * * * *

(2) Quality. The quality of a restored or replaced water supply will be deemed adequate if it meets the standards established under the Pennsylvania Safe Drinking Water Act (35 P. S. §§ 721.1—721.17). If, prior to pollution, a water supply was of a higher quality than required under Pennsylvania Safe Drinking Water Act standards, the restored or replaced water supply shall meet the pre-pollution quality of the water. In no case shall the quality of the water supplied for restoration or replacement of water polluted by the operator fall below the quality of the water supply that existed before the pollution occurred. (1143)

Response: Regarding erosion and sediment control violations, Section 78.51 does not exempt such activities from regulation. However, these activities are not included within the statutory presumption under the 2012 Oil and Gas Act. See response to comment 470. Also, the Department does not agree with the suggested language provided by the commentator but has revised §§ 78.51(d) and 78a.51(d) to provide clarification and greater consistency with the 2012 Oil and Gas Act.

473. Comment: Perhaps the most damaging of all the newly proposed revisions to the rules under Chapter 78 is the section that requires developers to improve the water quality in areas on which they operate. To force by law a company to improve the water quality to drinking water standards regardless of the pre-activity condition of the water is unprecedented in any other industry, anywhere in the country.

Mandating such a requirement would without a doubt turn off the vast majority of investment dollars and seriously jeopardize the potential future growth within the Commonwealth. I am certain that the DEP is aware that ground water conditions are impacted by a number of factors. Both legacy and current actions or operations in each instance combine to create the pre-drilling conditions of the ground and well water. Insisting that oil and gas companies concede to correct all water quality issues from all sources in an attempt to leave each area they wish to work in at drinking water cleanliness levels is truly unreasonable and will as a result greatly limit the areas in which any developer will target to drill. The DEP's attempt to implement such rules does so to the

detriment of the citizens of the State and by extension the entire nation as it relates to its economic and security health. Leaving water quality the same or better as it was prior to the drilling activity MUST remain the standard and is the only reasonable path forward. (433)

Response: The only operators required to restore or replace a water supply are those who the Department has found to have affected the water supply “by pollution or diminution.” See 58 Pa.C.S. § 3218(a). Should an operator be found liable for “pollution or diminution” based on the statutory presumption under subsection 3218(c), subsections 3218(d)(1)(i) (conventional wells) and (2)(i) (unconventional wells) allow operators to rebut the presumption of liability where “the pollution existed prior to the drilling or alteration activity as determined by a predrilling or prealteration survey....” For this reason, the Department encourages operators to conduct predrill surveys for all water supplies within the presumption of liability area for a wide-ranging set of compounds and elements. In many instances, operators are able to show that the water supply was not impacted by drilling, alteration, or operation of a well through such surveys.

Where the Department makes a positive water supply impact determination, the Department would be derelict in its duties if it allowed operators to provide replacement drinking water that by its own standards is not fit to drink simply because the pre-existing water supply was poor. Given the need to provide replacement water based on the positive impact determination, the additional cost borne by operators is limited to the incremental cost of providing Pennsylvania Safe Drinking Water Act standards water as compared to the previous poor quality, not the difference between providing no water at all and meeting the previous poor quality.

474. Comment: With regard to the RAF, it fails to address the cost and impact of the DEP’s proposed interpretation with regard to Subsection 78.51(d)(2) that operators would be required to restore a water supply to a minimum of SDWA standards. RAF (19). The estimated costs for the oil and gas industry to treat private water supplies to comply with such a stringent restoration requirement could be enormous since many private water supplies do not meet SDWA standards for reasons unrelated to oil and gas industry operations. (1137)

Response: The Department would be derelict in its duties if it allowed operators to provide replacement drinking water that by its own standards is not fit to drink simply because the pre-existing water supply was poor. Given the need to provide replacement water based on the positive impact determination, the additional cost borne by operators is limited to the incremental cost of providing Pennsylvania Safe Drinking Water Act standards water as compared to the previous poor quality, not the difference between providing no water at all and meeting the previous poor quality.

The Department encourages operators to conduct predrill surveys for all water supplies within the presumption of liability area for a wide-ranging set of compounds and elements. In many instances, operators are able to show that the water supply was not impacted by drilling, alteration, or operation of a well through such surveys.

475. Comment: Requiring an operator to restore an affected water supply to Pennsylvania Safe Drinking Water Act standards is reasonable and opponents of this requirement have not offered any evidence that such a requirement would be unduly burdensome on industry operators. The Board must include this requirement in the final rulemaking.

Section 3218(a) of Act 13 states that when a “well operator affects a public or private water supply by pollution or diminution” the well operator “shall restore or replace the affected water supply with an alternate source of water adequate in quantity and quality for the purposes served by the water supply,” and the Department must “ensure that the quality of a restored or replaced water supply meets the standards established under...the Safe Drinking Water Act.” The Board is required to promulgate the regulations necessary to meet this requirement. (1152)

Response: The Department acknowledges the comment.

476. Comment: We urge the board to amend Chapter 78 to require oil and gas operators to similarly describe the extent to which their operations might pollute or diminish nearby underground or surface water sources and also identify how the well operator will replace a water supply if pollution or diminution does occur. This permit application requirement would allow the Department to fulfill its obligation to protect groundwater and surface water by denying permits or augmenting permits with special conditions for drilling activity that may be likely to cause water pollution and ensure that well operators are able to meet their duty to provide a replacement water supply where pollution or diminution does occur. (1152)

Response: The statutory language in 58 Pa.C.S. § 3218(c) alleviates the need for an operator to describe how they may pollute or diminish a water supply because the well operator is automatically presumed responsible for pollution or diminution of a water supply within a prescribed distance and time frame from well development activities. Operators are also required to post bonds to ensure compliance with the drilling, water supply replacement, restoration, and plugging requirements contained in the 2012 Oil and Gas Act. Additionally, the Department believes the revisions to Chapters 78 and 78a are consistent with the Pennsylvania Constitution and applicable statutes and provide reasonable protections for public health and safety and the environment.

477. Comment: The proposed revisions to Sections 78.51(b) and 78.51(c) are fundamentally flawed. We commend the Department and the Board for amending Section 78.51(d)(2) to require an operator to provide a replacement water supply that meets Safe Drinking Water Act Standards. However, this requirement is only as effective as the Department’s duty to investigate water supply claims and it’s authority to require the operator to replace an affected water supply. Therefore, Section 78.51(b) and Section 78.51(c) must be amended to include all of the activities listed in the proposed definition of oil and gas operations. (1152)

Response: The Department agrees and has amended the regulatory language to include oil and gas operations in Sections 78.51(b), 78.51(c), 78a.51(b) and 78a.51(c).

478. Comment: 78.51(b) and (c) include “well site construction” in the list of activities which trigger the reporting and investigation activities set forth in Section 3218(b) of Act 13. However, Section 3218(b) does not include “well site construction” as a cause of pollution or diminution of water supply. Some commentators question EQB’s authority to expand the list to include “well site construction,” and other commentators recommend that EQB expand the list to include all activities under the proposed definition of “oil and gas operations.” We ask EQB to provide its authority for expanding the list, and to explain why the activities included in the list adequately protects the environment. (1099)

Response: The Department has broad authority to investigate pollution and require remediation of impacted water supplies under Section 5 of The Clean Streams Law, 35 P.S. § 691.5. The Department has amended the regulatory language to include well site

construction and oil and gas operations in §§ 78.51(b), 78.51(c), 78a.51(b) and 78a.51(c).

479. Comment: The current language in Chapter 78 for the quality of restored water supplies is “did not meet” Safe Drinking Water Act standards, which provides clear guidance to Department staff, operators and the public. The restoration obligation in this section should be clarified that water can be restored to drinking water standards as the maximum, or to below those standards if the water did not meet the standard before drilling activities. Many water supplies are not used for drinking and need not meet the SDWA standard. The new language potentially raises the floor for water quality to at least SDWA, even where water did not meet that standard before drilling operations. This requirement would be unreasonable, costly, potentially impossible to meet, and more stringent than is required of other industries in Pennsylvania.

The following revisions include protections for conventional operators, and to restore the existing and only reasonable standard for the replacement of impacted water supplies. Absent agreement with water supply owners, DEP’s authority to require restored water quality standards is limited to SDWA standards or those standards that the water supply met before being impacted, where those supplies did not meet SDWA standards.

(c) Within 10 calendar days of the receipt of the investigation request, the Department will provide notice to any well owners whose wells are within the area of presumed impact, investigate the claim and will, within 45 calendar days of receipt of the request, make a determination. If the water supply owner and operator reach an agreement with respect to the water supply, the Department is under no further obligation to investigate. If the Department investigates and finds that pollution or diminution was caused by the well site construction, drilling, alteration or operation activities or if it presumes the well operator responsible for polluting the water supply of the landowner or water purveyor under section [208(c)] 3218(c) of the act [(58 P. S. § 601.208(c))] (58 Pa.C.S. § 3218(c)), the Department will issue orders to the well operator necessary to assure compliance with this section. The presumption established by 58 Pa.C.S. § 3218(c) is not applicable to pollution resulting from well site construction.

(d) A restored or replaced water supply includes any well, spring, public water system or other water supply approved by the Department, which meeting the criteria for adequacy as follows:
* * *

(2) *Quality.* The quality of a restored or replaced water supply will be deemed adequate if it meets the standards established under the Pennsylvania Safe Drinking Water Act (35 P.S. §§ 721.1—721.17), or is comparable to the quality of the water supply before it was affected by the operator if that water supply ~~[exceeded those]~~ did not meet these standards, or is subject to an agreement between the operator and the water supply owner.
* * *

(g) If the well operator and the water supply owner ~~[user]~~ are unable to reach agreement on the means for restoring or replacing the water supply, the Department or either party may request a conference under section [501] 3251 of the act [(58 P. S. § 601.501)] (58 Pa.C.S. § 3251).

(h) A well operator who receives notice from a landowner, water purveyor or affected person that a water supply has been affected by pollution or diminution, shall report receipt of notice from an affected person to the Department within 24 hours of receiving the notice. Notice shall be provided either electronically through the Department’s website or by telephone by registered Small Businesses. (1135)

Response: Section 3218(a) of the 2012 Oil and Gas Act (58 Pa.C.S. § 3218(a)) establishes a well operator who affects a public or private water supply by pollution or diminution shall restore or replace the affected supply. An agreement between the operator and water supply

owner may not properly address the environmental, health and safety issues created by a water supply being impacted oil and gas operations. The Department is obligated to investigate pollution to the waters of the Commonwealth under the Clean Streams Law (35 P.S. §§ 691.1 *et seq.*. Requiring electronic submission by an operator of a notice they received of an affected water supply will ensure it is properly documented and is routed through the proper channels in a timely manner. Regarding Safe Drinking Water Act standards, please see response to comment 474. Regarding electronic submission of reports and notifications, please see response to comment 219.

- 480.** Comment: We appreciate DEP’s recognition in § 78.51 (b) that well site construction, and related sedimentation pollution, can have serious impacts on water resources, including water supplies. However, the effect of this acknowledgement is diminished by § 78.51(c)—which explicitly exempts pollution resulting from well site construction from the rebuttable presumption established in 58 Pa.C.S. § 3218(c). We understand that there are many sources of sedimentation pollution, and that establishing that sedimentation resulting from a particular well site is the cause of contamination in a water supply may be difficult at times. However, as written, the proposed amendments leave no recourse or remedy for the landowner, water purveyor or affected person suffering pollution or diminution of a water supply as a result of well site construction. We strongly recommend that DEP revisit this section, and clearly state the remedies that are available to the landowner, water purveyor or affected person, if sedimentation from a well site is found to have contaminated a water supply. (1157)

Response: The Department has revised §§ 78.51(b) and 78a.51(b) to include all oil and gas operations as activities which may compel the Department to investigate impacts from said activities. Additionally, section 3218(c) of the 2012 Oil and Gas Act (58 Pa.C.S. § 3218(c)) establishes the presumption of liability. The Department does not have regulatory authority to expand the scope of the statutory presumption to include well site construction. The Department does have the authority to require an operator to replace or restore a water supply impacted by well site construction or other oil and gas operations under The Clean Streams Law (35 P.S. §§641.1-691.1001), The Hazardous Sites Cleanup Act 108 (35 P.S. §6020.101) and The Land Recycling and Environmental Remediation Standards Act 2 (35 P.S. §6026.101 *et seq.*).

- 481.** Comment: The term “operating activities” is undefined and is used here improperly to expand this section beyond the scope of Section 3218 of Act 13, which is limited by Section 3218(b) to “pollution or diminution of a water supply as a result of the drilling, alteration or operation of an oil or gas well.” The term “oil and gas activities” is used throughout the proposed regulations and should be evaluated in each context for the appropriate term. For this section, Commentator believes the first sentence of this provision should remain as it currently stands.

Suggested amendatory language:

(b) A landowner, water purveyor or affected person suffering pollution or diminution of a water supply as a result of the drilling, alteration or operation of an oil or gas well may so notify the Department and request that an investigation be conducted. Such notices should be made to the appropriate Department regional office or by calling the Department’s state wide toll free number 1-800-541-2050. The notice and request must include the following: (1153)

Response: For clarification, a definition for “oil and gas operations” has been included in §§ 78.1 and 78a.1 of the rulemaking. The Department has the authority to investigate pollution of impacted water supplies under Section 5 of The Clean Streams Law (35 P.S.

§§ 691.1-691.1001) regardless of the source or associated activity.

- 482.** Comment: The proposed regulation adds “well site construction” to the list of activities enumerated in §3218(b) of Act 13 that trigger the reporting and investigation activities set forth in §3218(b). The Department has no authority to amend the statutory language and this addition should be stricken.

Suggested amendatory language:

(c) Within 10 calendar days of the receipt of the investigation request, the Department will investigate the claim and will, within 45 calendar days of receipt of the request, make a determination. If the Department’s investigation finds that pollution or diminution was caused by the drilling, alteration or operation activities or if it presumes the well operator(s) responsible under section 3218(c) of the Act, the Department will issue orders to the well operator necessary to assure compliance with this section. The presumption established by 58 Pa.C.S. § 3218(c) is not applicable to pollution resulting from well site construction. (1153)

Response: The Department has the authority to require an operator to replace or restore a water supply impacted by well site construction or other oil and gas operations under The Clean Streams Law (35 P.S. §§ 691.1-691.1001), The Hazardous Sites Cleanup Act 108 (35 P.S. § 6020.101 et seq.) and The Land Recycling and Environmental Remediation Standards Act 2 (35 P.S. § 6026.101 et seq.).

- 483.** Comment: Section 3218(a) of Act 13 requires an operator to restore an affected water supply to Pennsylvania Safe Drinking Water Act standards or “comparable to the quality of the water supply before it was affected by the operator if the water supply exceeded those [water quality] standards (emphasis added).” This language clearly provides two standards, but the Department has correctly recognized only one. While proposed Section 78.51(d)(2) uses the statutory word “exceeded,” the Department has suggested that it is interpreting Act 13 through this regulatory section to require an operator to restore a water supply to a minimum of SDWA standards or to a higher standard if the water supply was better than SDWA standards before drilling – interpreting the word “exceeded” in this context to mean that a particular constituent of the pre-drill water quality was lower than the maximum SDWA standard for that constituent, e.g., pre-drilling level of 1 ppm when the level determined to be safe by SDWA standards is 5 ppm. The Department’s interpretation means that operators would be required to restore the water supply quality to the 1 ppm level rather than the SDWA level.

The Department’s suggested position, that a water source that does not meet the SDWA standard before drilling – i.e., the water quality is worse than the standard – will not be considered “restored” by industry until it meets those standards or better after drilling, is a dramatic departure from current law and is contrary to the accepted and current meaning of the statutory term “exceeded.” In this context, “exceeded” means that a particular constituent of the pre-drill water quality was higher than the SDWA standard for that constituent. The statutory requirement therefore is that operators that impact water supplies must restore those supplies to a maximum of SDWA standards or to the quality of the supply if it did not meet those standards before drilling activities. The existing obligation makes sense because many water supplies do not meet SDWA standards in areas not served by public water utilities and many water supplies are not used for drinking, and restoring water supplies to particular constituent levels lower than those determined to be safe by SDWA standards may not even be possible or, if possible, may be prohibitively expensive.

It is unreasonable to require the oil and gas industry to upgrade private water supply quality, at industry expense, beyond the quality that existed pre-drilling. No other industry is required to do

this, and there is no legal requirement for a Pennsylvania homeowner to treat or upgrade his or her private water supply to SDWA standards. The current language in Chapter 78 provides clear guidance to Department staff, operators and the public and should be retained and, significantly, is consistent with the accepted and current meaning of the term “exceeded” in this context. Nothing in Section 3218(a) demonstrates a legislative intent to change the accepted and current meaning of the term “exceeded.”

Suggested amendatory language:

(2) Quality. The quality of a restored or replaced water supply will be deemed adequate if it meets the standards established under the Pennsylvania Safe Drinking Water Act (35 P.S. §§ 721.1 — 721.17), or is comparable to the quality of the water supply before it was affected by the operator if that water supply did not meet these standards. (1153)

Response: The Department disagrees but has revised the §§ 78.51(d)(2) and 78a.51(d)(2) for added clarity and to improve consistency with the 2012 Oil and Gas Act. If a water supply’s quality was better than Pennsylvania Safe Drinking Water Act standards prior to oil and gas operations, then it needs to be returned to its previous state, *i.e.*, its state prior to being impacted by oil and gas operations. Otherwise, the Department would be allowing operators to degrade a natural resource relied upon as a water supply resource. In regards to water supplies that did not meet Pennsylvania Safe Drinking Water Act standards prior to being impacted by oil and gas operations, the Department would be derelict in its duties if it allowed operators to provide replacement drinking water that by its own standards is not fit to drink simply because the pre-existing water supply was poor. Given the need to provide replacement water based on the positive impact determination, the additional cost borne by operators is limited to the incremental cost of providing Pennsylvania Safe Drinking Water Act standards water as compared to the previous poor quality, not the difference between providing no water at all and meeting the previous poor quality.

484. Comment: Water supplies need greater protection. Rules have to be put into place in order to protect those because water supplies have been impacted (649)

Response: The Department acknowledges the comment.

485. Comment: Commenter supports proposed water quality requirements in Section 78.51 concerning the replacement of water supplies affected by gas drilling. (907)

Response: The Department acknowledges the comment.

486. Comment: In Sections 78.51 (b) and (c), PADEP has added well site construction to the list of oil and gas activities for which persons can claim a diminution of water quality. The commentator notes that the authority to include well site construction is not specified in the statutory language; *i.e.*, the legislature did not direct PADEP to develop regulations to include well site construction. The commentator recommends that the addition of well site construction should be stricken from the proposed regulations. (954)

Response: The Department has determined that well site construction needs to be included because the activity of constructing a well site may cause pollution or diminution to water supplies. The Department has the authority to investigate and require restoration or replacement of water supplies impacted by well site construction or other oil and gas activities under The Clean Streams Law (35 P.S. §§ 691.1-691.1001), The Hazardous Sites Cleanup Act

108 (35 P.S. § 6020.101 et seq.) and The Land Recycling and Environmental Remediation Standards Act 2 (35 P.S. § 6026.101 et seq.). The Department did not include well site construction as an activity that falls under the presumption clause in Section 3218(c) of the 2012 Oil and Gas Act. Section 3218(c) has a defined list of activities subject to the presumption and the Department does not have the authority to expand the scope of the statutory presumption through rulemaking.

- 487.** Comment: 78.51(b) -What is the definition of “operating activities”? 78.51(c) - This should read ‘diminution was caused by the well site construction, well drilling, alteration, etc. to remain consistent with revisions in 78.51(b). 78.51(d)(2) - Clarification needs to be made that if an affected water supply did not meet Pennsylvania Drinking Water Act standards as determined by a pre-drill sample, the replaced water supply must only meet the pre-drill water quality and nothing more stringent. (411)

Response: For clarification, a definition for oil and gas operations has been included in §§ 78.1 and 78a.1 of the rulemaking which replaces the term operating activities. If a water supply’s quality was better than Pennsylvania Safe Drinking Water Act standards prior to oil and gas operations, then it needs to be returned to its previous state, i.e., its state prior to being impacted by oil and gas operations. Otherwise, the Department will be allowing operators to degrade a natural resource relied upon as a water supply resource.

- 488.** Comment: § 78.51 Protection of Water Supplies: § 78.51(b) – We are concerned that units of the National Park System may fall within a category not specifically identified in the draft regulations. The definition of a “water purveyor” appears to only apply to large, municipal-type water suppliers. However, in some units the NPS is responsible for supplying or at least providing water to our visitors and staff. We suggest that this section be revised to refer to all “potable water supplies” rather than limiting the definition to either “well owners” or “water purveyors.” Additionally, we suggest that pollution or diminution of water supplies by any well site activities, including temporary water or other fluid storage, gathering lines or pipelines be included in this section. (1062, 1133)

Response: The definition of Water Purveyor has been revised to include:

- **The owner or operator of a public water system as defined in section 3 of the Pennsylvania Safe Drinking Water Act (35 P.S. § 721.3).**
- **Any person subject to the act of June 24, 1939 (P.L. 842, No. 365), known as the Water Rights Law.**

This definition of water purveyor is consistent with the 2012 Oil and Gas Act.

Language in sections 78.51(b) and 78a.51(b) of the final-form rulemaking have been revised to include well site construction and other oil and gas operations.

- 489.** Comment: Include e-mail notification procedures. [78.51 (b)] (1098)

Response: The Department does not exclude e-mail notification of an investigation request; therefore it is an acceptable means of notification to use. However, the Department recommends calling a Department regional office or statewide phone number to ensure that the request for a water supply investigation gets to the appropriate person in a timely manner.

490. Comment: Regarding 78.51(b), a commentator suggests that neighboring land owners and land management agencies be notified of claims of pollution. Another suggests including e-mail notification procedures. EQB should explain in the Preamble and RAF of the final-form regulation the reasonableness of the notification procedures in this subsection, and explain how the procedures adequately protect public health and safety. (1099)

Response: The Department has explained the reasonableness of the notification procedures in §§ 78.51(b) and 78a.51(b) in the Preamble and RAF of the final form regulation.

491. Comment: We urge the Board to amend Section 78.51(c) to require the Department to investigate reports that drinking water supplies have been adversely affected by oil and gas operations within three days of the Department's receipt of a complaint and make a determination within fifteen (15) days. (1152)

Response: Section 3218(b) of the 2012 Oil and Gas Act (58 Pa.C.S. § 3218(b)) establishes the time frames in which the Department must act upon a request to investigate a water supply complaint. The Board does not have regulatory authority to change the scope of the statutory requirements thus the regulations must reflect what is required by law. However, the Department has developed a policy that does narrow the time frames staff should act upon once receiving notification for a water supply investigation request. The policy language can be found in the document titled "Standards and Guidelines for Identifying, Tracking, and Resolving Oil and Gas Violations" (Document number 820-4000-001 Revised January 17, 2015).

492. Comment: The proposed legislation adds that the presumption of liability does not apply to pollution resulting from well site construction activities. As pollution often results from well site construction activities, notably by the escape of methane and other contaminants from the well bore into groundwater, and the long-term migration of contaminants under-ground, the presumption of liability during the construction phase of drilling should not be excluded. (845, 1161)

Response: The escape of methane and other contaminants from the well bore into groundwater would not be caused by well site construction activities since well site construction activities occur on the surface and preclude the well development activities included in the statutory presumption clause found in Section 3218(c) of the 2012 Oil and Gas Act. The Department does not have regulatory authority to expand the scope of the statutory presumption to include well site construction.

493. Comment: The DEP's duty to investigate water pollution should extend to all oil and gas activities. (Section 78.51(c)). (19, 21, 26, 69, 55, 165, 192, 391, 843, 851, 938, 946, 958, 1005, 938a)

Response: The Department agrees and has added language in §§ 78.51(c) and 78a.51(c) of the final-form rulemaking to include "oil and gas operations" as potential causes of water supply impacts that the Department will investigate.

494. Comment: § 78.51(b)-(c) -- Sections 78.51 (b) and (c) implement Subsection 3218(b) of Act 13; however, the proposed regulation adds "well site construction" to the list of activities enumerated in Act 13 that trigger the reporting and investigation activities set forth in Subsection 3218(b). The Department has no authority to amend the statutory language and this addition should be stricken. No one doubts that the Department can investigate complaints regarding water supplies but this rulemaking should not engraft new language onto the legislative language.

Additionally, as this section of the draft regulations is currently written, it appears that the Department is taking a “guilty until proven innocent” approach. The section should be revised as indicated as suggested below.

The Commentator suggests the following amendatory language:

“(b) A landowner, water purveyor or affected person claiming pollution or diminution of a water supply as a result of drilling, altering or operating oil or gas well may so notify the Department and request that an investigation be conducted. Such notices shall be made to the appropriate Department regional office or by calling the Department’s statewide toll free number (800) 541-2050. The notice and request must include the following:

- (1) The name, address and telephone number of the person requesting the investigation.
- (2) The type, location and use of the water supply.
- (3) Available background quality and quantity data regarding the water supply, if known.
- (4) Well depth, pump setting and water level, if known.
- (5) A description of the pollution or diminution.

(c) Within 10 calendar days of the receipt of the investigation request, the Department will investigate the claim and will, within 45 calendar days of receipt of the request, make a determination. If the Department’s investigation finds that pollution or diminution was caused by the drilling, alteration or operation activities or if it presumes the well operator(s) responsible under section 3218(c) of the act, the Department will issue orders to the well operator necessary to assure compliance with this section. The presumption established by section 3218(c) of the act is not applicable to pollution resulting from well site construction. (1137, 1174, 1147)

Response: See response to comment 486. The Department disagrees with the “guilty until proven innocent” statement. The rulemaking in §§ 78.51(b)-(c) and 78a.51(b)-(c) clearly states the Department’s authority to issue orders necessary to ensure compliance when a determination has been made that an impact to a water supply has occurred as a result of oil and gas operations after an investigation was conducted by the Department or when presumption applies. Furthermore, the presumption in Section 3218(c) of the 2012 Oil and Gas Act does hold the operator responsible for pollution or diminution of a water supply under specifically defined criteria, unless the operator rebuts it in accordance to the defenses provided to the operator in Section 3218(d) of the 2012 Oil and Gas Act.

- 495.** Comment: The Chapter 78 regulations require the DEP to investigate instances of water pollution that occur near oil and gas wells. As part of its investigation, the DEP may determine that water pollution was caused by the “well site construction, drilling, alteration or operation activities.” This set of activities is much more limited than the list of activities defined as “oil and gas activities” in Act 13. To ensure maximum protection of water resources, the DEP’s investigation should extend to all oil and gas activities. (19, 21, 23, 26, 90, 142, 165, 192, 391, 843, 938, 946, 951, 958, 1005, 938a, 1019)

Response: See response to comment 486.

- 496.** Comment: § 78.51(c) – We suggest that this section also include a requirement that the Department specifically notify, neighboring land owners and/or land management agencies (such as NPS) if a claim of water pollution or diminution has been made so that area water supplies can be checked for similar issues and public health and safety can be maintained. (1062, 1133)

Response: The Department investigates the specific request for a water supply investigation made by the owner or user of the water supply. The Department may expand the scope of the investigation to include neighboring water supplies based upon its determination of the initial investigation. Notifying neighboring land owners and/or land management agencies of all water supply investigation requests received by the Department prior to conducting a scientific study and making a determination based upon the data generated could create unnecessary concern in the community.

497. Comment: EQB amends 78.51(c) to clarify that the presumption of liability established in Section 3218(c) of Act 13 does not apply to pollution resulting from well site construction activities. Some commentators state that the presumption of liability should extend to well site construction activities. We ask EQB to explain how this amendment is consistent with Section 3218(c) of Act 13, and explain why pollution from well site construction should be exempt from the presumption of liability as established in Section 3218(c) of Act 13. (1099)

Response: See response to comment 470.

498. Comment: § 78.51(c): Exclusion of “well site construction” from the rebuttable presumption of liability for contaminating a water supply is an outrageous loophole which must be stricken. This is contrary to the intent of the statute, and the Environmental Quality Board is both exceeding its authority and making new (and profoundly unfortunate) law with this provision. Who determines whether “well site construction” or some other aspect of oil & gas operations was responsible for contaminating a water supply? What exactly is the boundary between “well site construction” and “well construction”? This provision is simply outrageous and must be stricken. A property owner whose water supply has been contaminated by oil & gas operations does not know or care what the precise boundary is between “well site construction”, “well construction”, “drilling”, “well completion”, or any other of the myriad activities that occur at a well site. There is no sensible reason for excluding any of these activities from a consideration of liability. (869, 869a)

Response: See response to comment 470.

499. Comment: 78.51(c) -- The Department does not have the authority to change that statutory language and should remove “well site construction” from the list of activities that require reporting and investigation. (1103)

Response: See response to comment 486.

500. Comment: Water Supply Restoration Criterion - The language in the proposed changes to 78.51 conceivably requires that an operator restore an affected water supply to an improved quality above that of the pre-drill survey with “the standards established under the Pennsylvania Safe Drinking Water Act.” This is an unreasonable expectation. The mandated restoration criterion for water quality should continue to be the “floor” established by the pre-drill survey. This proposed revision should be tabled in favor of further consideration. (12)

Response: If a water supply’s quality was better than Pennsylvania Safe Drinking Water Act standards prior to oil and gas operations, then it needs to be returned to its previous state, i.e., its state prior to being impacted by oil and gas operations. Otherwise, the Department would be allowing operators to degrade a natural resource relied upon as a water supply resource. In regards to water supplies that did not meet Pennsylvania Safe Drinking Water Act standards prior to being impacted by oil and gas operations, the Department would be derelict in its duties if it allowed operators to provide replacement drinking water that by its

own standards is not fit to drink simply because the pre-existing water supply was poor. Given the need to provide replacement water based on the positive impact determination, the additional cost borne by operators is limited to the incremental cost of providing Pennsylvania Safe Drinking Water Act standards water as compared to the previous poor quality, not the difference between providing no water at all and meeting the previous poor quality.

- 501.** Comment: Operators should be required to restore contaminated drinking water to a quality that meets Safe Drinking Water Act standards, no matter what the quality of the water prior to drilling. If the quality of a water supply prior to drilling was above these standards, the operator must restore the water to that higher standard; otherwise, good water supplies will be degraded. (5936-6089)

Comment: See response to comment 500.

- 502.** Comment: All water supplies need to match or exceed Safe Drinking Water Act standards. (16, 62, 912)

Response: The Department acknowledges the comment. See response to comment 500.

- 503.** Comment: Pre-drill water testing and the restoration and replacement of contaminated water supplies (Sections 78.51 and 78.52). We learned through DEP’s determination letters that natural gas drilling operations have impacted at least 161 water supplies statewide. The natural gas industry has fought to have water restored to only pre-contamination conditions—even if it is not safe to drink. In addition, DEP leaves it up to the driller to decide when, where, and how to conduct water quality tests before drilling starts. (17, 18, 19a, 72, 73, 79, 100, 102, 125, 160, 161, 162, 169, 402, 475, 477, 564, 565, 609, 632, 635, 787, 843, 865, 884, 886, 891, 912, 919, 930, 938, 943, 947, 492a, 1030, 1030a, 1039, 1064, 1066, 1068, 1073-1077, 1079-1082, 1084, 1101, 1102, 938a, 1168, 1142, 1148, 1158, 7521 – 8362, 4582 - 5484)

Response: See response to comment 500.

- 504.** Comment: DEP should require: Operators to restore contaminated drinking water to a quality that meets Safe Drinking Water Act standards, no matter what the quality of the water prior to drilling. If the quality of a water supply prior to drilling was above these standards, the operator must restore the water to that higher standard; otherwise, good water supplies will be degraded. (17, 18, 19a, 72, 73, 79, 100, 102, 125, 160, 161, 162, 169, 402, 475, 477, 564, 565, 609, 632, 635, 787, 842, 843, 865, 884, 886, 891, 912, 919, 930, 938, 943, 947, 492a, 1030, 1030a, 1039, 1064, 1066, 1068, 1073-1077, 1079-1082, 1084, 1101, 1102, 938a, 1161, 1168, 1142, 1158, 4582 – 4584, 4584 – 4650)

Response: See response to comment 500.

- 505.** Comment: **“Better than Standard”:** I agree with the DEP’s Technical Advisory Board, which states that it is “unreasonable to require the oil and gas industry to upgrade private water supplies, at industry expense, beyond that which existed pre-drilling.” Nonetheless, this is precisely what was proposed under Act 13 and in DEP’s newly-published regulations. Such an unnecessary double-standard, which only applies to the oil and gas industry, would prove prohibitively costly and will hamstring our industry’s ability to continue strong development in the Commonwealth. (196)

Response: See response to comment 500.

- 506.** Comment: When water supplies are adversely impacted and municipal water is available, it must be

provided and paid for by the operator responsible for the impacts. (1168)

Response: All options for the restoration or replacement of a water supply should be available for consideration by the Department, property owner and the operator.

507. Comment: Drillers, at their own expense, must restore water supplies to safe drinking standards. (845, 886, 1106, 1146, 4744 – 5668, 5782 – 5785)

Response: See response to comment 500.

508. Comment: § 78.51(d)(2) - Suggested amendatory language: *Quality*. The quality of a restored or replaced water supply will be deemed adequate if it meets the standards established under the Pennsylvania Safe Drinking Water Act (35 P. S. §§ 721.1—721.17), or is comparable to the quality of the water supply before it was affected by the operator if that water supply did not meet those standards. (1147)

Response: The Department does not agree with the suggested language provided by the commenter but has revised §§ 78.51(d) and 78a.51(d) to provide clarification and greater consistency with the 2012 Oil and Gas Act.

509. Comment: 78.51(d)(2). Protection of Water Supplies - We support the interpretation as based on Act 13, guaranteeing those with private water supplies, whom had pre-drill tests which were superior to the Safe Drinking Water Act Standards that in the event they are subject to a replaced or restored water supply that the water supply must be comparable to the quality of that superior pre-drill water supply. We support that those water supplies, as guaranteed by Act 13 which failed to meet SDWAS that those water supplies are to be replaced or restored to SDWAS. Homeowners of superior private water supplies whom to no fault of their own had their water quality impacted by the industry should not be further penalized with an inferior restored or replaced water supply as compared to their pre-drill test. The inconvenience, worry and additional stress placed on a family necessitates that they be justly compensated with the same superior water quality their pre-drill test reveals. Much in the same way, the inconvenience, worry, and additional stress placed on a family, requires that those water supplies that did not meet SDWAS, as just recompense for the inconvenience need to be restored or replaced to SDWAS. The operator is addressing the water supply; therefore, it is the responsible action to do so entirely.

Obviously, there are some considerations that need to be made in regards to the restored or replacement supply. First, we recommend that the Department assign a key person to assist the family. The affected homeowner ideally, will interact with this key person rather than the Operator. This person may act as either an Ombudsman or a Liaison between all parties and assist the affected homeowner. The reason for this key person is to ease homeowner stress and eliminate an adversarial situation that may have resulted from the water quality impairment. The idea is to assist the homeowner, advocate on behalf of the homeowner and have the situation resolved as quickly and as free from stress as possible. This person needs to have knowledge of water standards and treatments and be able to understand the homeowner's budgetary and other concerns.

In regards to superior supplies that are restored with a water treatment system, the homeowner needs to have input into the treatment methods employed. The Ombudsman or Liaison needs to be able to communicate the pros and cons of each treatment method made available. Some treatment methods, such as those that add salt to the treatment process may be a health concern with some and thus, a potassium treatment may be preferred. The homeowner needs to have direct input through the Ombudsman or Liaison as to what their preferences may need to be. Any reasonable preference

shall be deemed acceptable. The homeowner has been inconvenienced enough, through no fault of their own. They previously had a superior water supply. Operators state that it is the rare event that water supplies are impacted. Therefore, as compared to the costs of drilling a gas well, the costs involved with providing a treatment system in a home is a reasonable expense that must be borne by the Operator. In the case of the home treatment system, it is the Operator's responsibility to bear all installation, operation and maintenance expenses associated with the meeting the pre-drill superior water supply quality. Additionally, a separate electric meter needs to be placed on the home as the Operator needs to be responsible for any additional electricity consumed due to the home treatment plant.

In regards to a homeowner with a superior pre-drill water supply who happened to have a home treatment system already employed, it is the responsibility for the Operator to maintain and operate any additional treatment to what they may have had pre-drill. For example, perhaps the homeowner had a pre-drill sediment filter on their home treatment system. Should the homeowner determine they will continue with the sediment filter, operational and maintenance expenses will be borne by the homeowner? However, if their previous water system was damaged or is not compatible with the new treatment plant, it is the Operator's responsibility to bear the costs of installation. Regardless of the system particulars regarding what options the homeowner may be responsible due to pre-drill treatment; it remains to be the responsibility of the Operator to bear the entire amount of any additional electricity consumed by a home treatment plant.

In regards to a homeowner with a superior pre-drill water supply that is placed on a public water supply, the Ombudsman or Liaison needs to be able to communicate effectively with the affected homeowner regarding any concerns they may have regarding the public supply. There are folks that may have allergies/immune system issues with chlorine in a water supply. There are several ways that this may be addressed in a home. The Ombudsman or Liaison needs to be able to listen to the suggestions from the homeowner since when folks have such health issues they are acquainted with what may be needful and more than likely will consult their medical doctor or specialist. The Ombudsman or Liaison needs to be able to communicate to the Operator that the certain device/s are needed and that this additional expense will also be borne by the Operator due to a present health condition. The Ombudsman or Liaison needs to be able to communicate with the affected homeowner and provide information as to the new water supply and how the connection will occur. The Operator is responsible for all costs incurred with connection and the purveyor's monthly or quarterly billings.

In regards to a homeowner's water supply that failed to meet SDWAS pre-drill, the Ombudsman or Liaison needs to explain the pre-drill deficiency to the homeowner. Educational materials shall be provided. The homeowner needs to be able to understand what the health effects are that may be attributed to such water quality. The homeowner needs to be provided with materials that explain the manner in which that particular deficiency may be addressed through treatment, the costs involved with that particular treatment and the maintenance costs involved. The Ombudsman or Liaison needs to determine whether the homeowner may be able to afford the treatment for the pre-drill deficiency. The Operator is responsible for the installation of the pre-drill deficiency corrective measure. The homeowner is responsible for supplies and maintenance of the corrective measure. For example, if the pre-drill test reveals coliform in the water supply and the homeowner chose an ultraviolet light as treatment, the costs of the future light replacement is borne by the homeowner. The original light is the responsibility of the Operator. Often there are a variety of treatment options available to the homeowner. The homeowner needs to determine which treatment they prefer, but they also have to indicate to the Ombudsman or Liaison that they understand the maintenance schedule and can afford it. Once the Ombudsman or Liaison has indicated that the homeowner can afford the selected treatment method, then the operator needs to address the remaining deficiencies

with treatment. The Operator is responsible for the entire system installation and only the maintenance and operational expenses of those deficiencies caused by the Operator's impact to the supply. The homeowner is responsible for the maintenance and operational expenses related to any pre-drill deficiency. Regardless of the system particulars regarding what options the homeowner may be responsible; it remains to be the responsibility of the Operator to bear the entire amount of any additional electricity consumed by a home treatment plant.

In regards to a water supply that did not meet SDWAS and is being replaced by a public water supply, the Ombudsman or Liaison needs to be able to explain the deficiencies in the pre-drill supply and the manner in which the public supply is superior. The Ombudsman or Liaison needs to be able to communicate with the affected homeowner and provide information as to the new water supply and how the connection will occur. The Operator is responsible for all costs incurred with connection and the purveyor's monthly or quarterly billings.

Finally, the Operator is responsible for the maintenance and operation of a home treatment plant indefinitely, forever. These treatment plants are very involved when the water has been very impacted. Expenses involve monthly electric, maintenance and other operational expenses. Such an expensive system may deter a potential buyer of the home in the future, which will result in the present owner losing money on perhaps their largest investment and due to no fault of their own. Thus, the Operator is responsible for these expenses for as long as the home shall stand and be inhabited.

In the case of the home that is connected to a public water system, the Operator needs to be responsible for these monthly or quarterly costs for as long as the home is owned by the affected homeowner or an immediate member of their family.

Any homeowner that enters into an agreement with the Operator outside of this process must provide a written statement to the Department as provided by their attorney verifying that they have entered into an agreement with the Operator outside of this process and they have used a privately contracted attorney. This is to ensure that no homeowner is unreasonably coerced into waiving their right to their water quality as guaranteed by Act 13. The Department shall retain this letter in the respective determination file.

When private water supplies are affected by an Operator, the affected homeowner's water supply must be restored or replaced to SDWAS or to the superior supply they had previously enjoyed. That is the spirit of Act 13's guarantee to the homeowners. The letter of the law needs to comply with that spirit. With consideration of these particulars C.O.G.E.N.T. recommends this provision whereby our water supplies restored or replaced supplies meet the objectives as defined by Act 13. (660a)

Response: Sections 78.51(d)(1) and 78a.51(d)(1) state the operators' obligations with regard to the reliability, cost, maintenance, and control of the restored or replaced water supply. The Department does assign specific staff to a water supply investigation based upon assigned territories and the nature of the request. Department staff will investigate the water supply and relay their findings to the water supply user/owner and provide all relevant materials to them. Those personnel are responsible for ensuring that the laws and regulations of the Department under their jurisdiction are applied and enforced. They will also answer any questions fielded to them that are relevant to the investigation.

However, it is not the role of Department field staff to act in the capacity of ombudsman or a liaison between all parties. The Department always advises affected parties to hire an

environmental consultant and/or lawyer whose expertise is in environmental law to represent them on their behalf if they do not understand the circumstances involving their case and the potential consequences.

510. Comment: The DEP should require drilling company operators to restore contaminated drinking water to a quality that meets Safe Drinking Water Act standards, no matter what the quality of the water prior to drilling. (37, 51, 70, 99, 102, 148, 193, 199, 200-385, 405, 406, 488, 494, 560, 595, 596, 909, 916, 956, 1033, 1047, 1058, 1083, 1088, 1102, 7521 – 8362)

Response: See response to comment 500.

511. Comment: Drillers must mitigate any wells contaminated within a reasonable distance of any drilling operation. Drillers should be responsible for land and stream cleanup caused by any of their water transporting needs. (40)

Response: The Department acknowledges the comment. The presumption of liability in section 3218(c) of the 2012 Oil and Gas Act does hold the operator responsible for pollution or diminution of a water supply under specifically defined criteria, including within a reasonable distance, unless the operator rebuts it in accordance to the defenses provided to the operator in section 3218(d) of the 2012 Oil and Gas Act. All parties, including oil and gas operators, are responsible for remediating any pollution to the environment as a result of their activities.

512. Comment: Drilling operators must be required to restore the water they use to condition it was in before they used it. (41, 46)

Response: See response to comment 500.

513. Comment: 78.51(d)(2) – The quality of the restored or replaced water supply will be deemed adequate if it meets the standards established under Pennsylvania Safe Drinking Water Act or is comparable to the quality of the water supply before it was affected by the operator if the water supply exceeded (did not meet these) standards. My comment is related to pollutants that are determined to be a nuisance and are detected above background concentrations and for which there are no drinking water standards. If a pollutant does not have a standard to be exceeded but is detected in the water supply above background and it is considered a nuisance then the background concentration of this pollutant should be the level to which it is restored to. This commentator recommends this section read “The quality of restored or replaced water supply will be deemed adequate if it meets the standards established under the Pennsylvania Safe Drinking Water Act or is comparable to the quality of water supply before it was affected by the operator if the water supply exceeded these standards or exceeded the background concentration and is determined to be a nuisance under the Clean Streams Law.” It could further be edited to include “and/or affects the aesthetic quality of the water supply.” (74)

Response: The rulemaking requires that at a minimum Pennsylvania Safe Drinking Water Act standards have to be met. Most nuisance contaminants are considered secondary contaminants which do have maximum contaminant levels established under the Pennsylvania Safe Drinking Water Act. The Department does reserve the right to use other recognized drinking water standards that may not be listed in the Pennsylvania Safe Drinking Water Act, including but not limited to the Pennsylvania Statewide health standards found in 25 Pa. Code Chapter 250 and also the United States Environmental Protection Agency’s Health Advisories for drinking water. In these circumstances the Department needs to prove that these contaminants are a result of oil and gas operations to require operators to restore

said contaminants to the chosen standard. Therefore, the Department does recommend that homeowners take their own predrill water samples and have them analyzed by a Pennsylvania-accredited independent laboratory if they wish to bolster a claim that their water has been impacted by oil and gas operations.

514. Comment: § 78.15(d)(2) – We agree with TAB’s interpretation that “exceeded”, as the term is used in Section 3218(a) of Act 13 and used by the DEP in its proposed Section 78.51(d)(2), refers to an operator’s requirement to restore an affected water supply to its pre-drilling conditions, when that water supply did not meet Safe Drinking Water Act standards (SDWA) prior to drilling. The DEP’s proposed contrary interpretation that operators would be required to improve each and every water supply to a minimum of SDWA standards is unreasonable since it is well documented that many private water supplies do not meet SDWA standards for water quality parameters for reasons unrelated to oil and gas industry operations. It is also impractical to require operators to restore an affected water supply to pre-drilling conditions for individual parameters that were better than SDWA standards. In some cases the private water well will have had no pre-drilling samples taken or in other cases the pre-drilling sample may not be sufficient to reflect natural variability in water quality. The cost to implement treatment technologies to achieve such uncertain pre-drilling conditions for individual parameters, even if possible, may be prohibitively expensive. Such a requirement has not been imposed upon any other industry and it would be unfair to impose it solely upon the oil and gas industry. We accept the responsibility to address impacts to water supplies that may have been caused, but it is unreasonable for the DEP to require that the oil and gas industry address contamination in water supplies unrelated to oil and gas industry operations, as no other industry in Pennsylvania has been held to such a standard.

We suggest the following amendatory language:

“(2) Quality. The quality of a restored or replaced water supply will be deemed adequate if it meets the standards established under the Pennsylvania Safe Drinking Water Act (35 P. S. §§ 721.1—721.17), or is comparable to the quality of the water supply before it was affected by the operator if that water supply did not meet those standards.” (1103, 1137, 1147, 1174)

Response: See response to comment 483.

515. Comment: § 78.51(d)(2) should be clarified to read that replacement for water supplies shall meet the greater of the two applicable standards. (997a)

Response: See response to comment 500.

516. Comment: My biggest concern is how do we know that § 78.51 - Protection of water supplies will be enforced? What we’ve seen so far is that it hasn’t in part because of the influence of the gas companies themselves. (98)

Response: All legitimate requests for a water supply investigation are acted upon by the Department and based upon the investigation’s determination; all applicable laws are enforced by the Department.

517. Comment: Tainted water wells are restored to meet the Safe Drinking Water Act standards. (104)

Response: See response to comment 500.

518. Comment: Damaged water supplies must be restored to minimum safe drinking water standards.

(Section 78.51) This has not always been done in upstate Pennsylvania and many residents have moved away from towns with severely polluted water. Many others have lost their health permanently, unable to leave their houses. People cannot live without reliable water. Not only do they need this for drinking and cooking but also for bathing and laundry. The regulation for restoring and replacing safe drinking water supplies is Act 13 (the new Oil and Gas Act). This regulation provides that the replaced water should be at or above the standard of the previous water supply and not be watered down by changes. (111)

Response: See response to comment 500.

519. Comment: Well water in the area of drilling should be tested before industry drilling. Any water source which is altered should be restored to the highest drinking standard. All data should be easily available publicly in one place and all data must be standardized. I know what I think “freshwater” is, but you must define it. (114)

Response: Section 3218(c) of the 2012 Oil and Gas Act (58 Pa.C.S. § 3218(c)) establishes the presumption of liability for water pollution onto an operator. The presumption encompasses situations in which the water supply is within 1,000 feet of a conventional well or 2,500 feet of the unconventional well bore, and the pollution takes place within six months for a conventional well or twelve months for an unconventional well for certain well development activities. While the Department does not mandate a predrill survey of water supplies, presumption incentivizes an operator to conduct predrill water supply surveys, so they may have a defense to rebut presumed responsibility. If an operator chooses not to take a predrill water supply sample, they will not have a defense against presumption or, if presumption does not apply, they will not be able to refute the Department’s sample results that show contaminants at levels higher than the maximum contaminant limits allowed by the Pennsylvania Safe Drinking Water Act standards. The Department only provides redacted private water supply data to protect the privacy and rights of the property owners. The Department defines the terms fresh groundwater, well development impoundments and water sources for water that is not characterized as wastewater being utilized by the industry for well development.

520. Comment: Since I rely on well water, Section 78.51 is of great concern to me. A family whose water supply has been affected by drilling should receive water they can safely drink. Providing safe drinking water is the minimum that regulation should provide and should not be watered down by changes. Getting drilling companies to take responsibility for this has been a challenge. I know people who are on their third year without drinkable water, and the companies have been absolved of responsibility by DEP. (129)

Response: See response to comment 500.

521. Comment: The main concern is the DEP proposing the industry “replace” a water supply to Safe Drinking Water Act (SDWA) Standards, or better, even when the results of Pre-Drill testing of the water supply show the water did not meet these standards in the first place. There are many challenges in the Commonwealth in regards to private water wells - especially the lack of construction standards. Our experience with pre-drill testing and several studies independent of natural gas development demonstrate that a large number of private water wells are poorly constructed, many contain iron, manganese, coliform and methane, and many do not meet the criteria of the Safe Drinking Water Act. Until such time as the Pennsylvania legislature passes legislation to require property owners to properly construct private water wells, and ensure they meet the Safe Drinking Water Act, it is unreasonable for the DEP to require the industry to restore a

private water supply to better standards than originally existed. We are requesting that if the operator impacts a water supply, the DEP requires replacing the water supply to the pre-drill test results. (123, 123a, 123b, 638, 638a, 798, 883, 940)

Response: See response to comment 483.

522. Comment: I've been very disappointed to learn about situations like Dimock where DEP and federal regulators have done such a poor job of protecting our citizens from the devastating effects of poorly controlled resource extraction. As such I strongly feel that DEP should require industry to restore contaminated drinking water to federal clean water standards and bypass the obvious delaying/obfuscating tactics by industry when they argue for previously degraded standards. Also, when a local drinking water supply is compromised, the industry responsible SHOULD be required to pay for trucking in safe water, as had originally been approved for places such as Dimock. (135)

Response: See response to comment 500.

523. Comment: Please keep PA's waterways safe for wildlife and people. Mandate the restoration of water to PA drinking water standards. (149)

Response: See response to comment 500.

524. Comment: Our water should meet Safe Drinking Water standards--period. Exempting drilling companies makes no sense. Neither does injecting known poisons into the ground! (185)

Response: See response to comment 500.

525. Comment: DEP must stipulate that water supplies be restored to PA Safe Drinking Water standards or higher if the water quality was higher prior to drilling - as established in ACT 13. In the interim, residents whose water supplies have been affected by drilling must receive water they can drink and use for household tasks, safely. (399, 470)

Response: See response to comment 500.

526. Comment: Companies must be required to restore water to drinking water standards, if their operations contaminate water supplies. Fines must be increased and imposed more readily. (400, 401)

Response: See response to comment 500. The Department's enforcement policy can be found on the Department's website in the document titled "Standards and Guidelines for Identifying, Tracking, and Resolving Oil and Gas Violations" (Document number 820-4000-001) (Revised January 17, 2015).

527. Comment: Our Organization has always made great strides to preserve and protect surrounding water supplies and over the past 39 years have had minimal issues. The proposed rule would actually require producers to do the impossible and restore any affected water supplies to better quality (meeting or exceeding standards established under Pennsylvania's Safe Drinking Water Act) than the areas water courses are capable of providing. Most rural residents in South Western PA obtain their water from wells which straight out of the ground and before treatment do not meet the minimum standards. 78.51 will prove to be an unbearable burden on both conventional and unconventional producers by requiring them to implement and forever bear the cost of water treatment systems for affected water purveyors.

This rule will also place producers on the defensive; it could serve as incentive for fraudulent water claims on behalf of purveyors who are discontented with the quality of their existing water supply. The net effect of the way this rule is currently written will be unnecessary and unethical exposure of the producer to bogus claims. It makes it possible for a producer to be held liable for simply developing in an area where the water table does not meet the minimum of the PA safe Drinking Water Act. Previous regulation required a producer to restore water in like quantity and like quality which has served Pennsylvania's residents flawlessly throughout the years. How can the Department expect a producer to restore a water source in any given area better than existed prior to site development? In many Pennsylvania water wells iron is a very prevalent mineral which is not the result of Oil and Gas drilling but the Coal industry. (416, 418)

Response: See response to comment 483.

528. Comment: The proposed amendments clarify that the presumption of liability established in 58 Pa.C.S. § 3218(c) (relating to protection of water supplies) does not apply to pollution resulting from well site construction activities.

Act 13 established a new provision that specifies a restored or replaced water supplies must meet the standards in the Pennsylvania Safe Drinking Water Act (35 P. S. §§ 721.1-721.17) or be comparable to the quality of the water supply before it was affected if that water was of a higher quality than those standards. This section is proposed to be amended to reflect this statutory language.

It is appreciated that PA DEP has clarified that well site development was added to the language under presumption of liability. The District would also like to encourage PA DEP to establish standard pre-drill water testing parameters and reporting to landowners. (566)

Response: The Department acknowledges the comment. Section 3218(c) of the 2012 Oil and Gas Act (58 Pa.C.S. § 3218(c)) establishes the presumption of liability. The Department does not have regulatory authority to expand the scope of the statutory presumption to include well site construction. The Department does have the authority to require an operator to replace or restore a water supply impacted by well site construction or other oil and gas operations under The Clean Streams Law (35 P.S. §§641.1-691.1001), The Hazardous Sites Cleanup Act 108 (35 P.S. §6020.101) and The Land Recycling and Environmental Remediation Standards Act 2 (35 P.S. §6026.101 et seq.) which is reflected in the rulemaking in § 78.51(c) with the following language, "If the Department finds that pollution or diminution was caused by oil and gas operations... the Department will issue orders to the well operator necessary to assure compliance with this section." The Department has a fact sheet of recommended parameters for pre-drill water samples and can be found on it's website in the document titled, "PA-DEP Recommended Basic Oil and Gas Pre-Drill Parameters" (Document number 8000-FS-DEP4300 Revised 4/2014). The Department outlines its sample reporting to landowners in the document titled "Standards and Guidelines for Identifying, Tracking, and Resolving Oil and Gas Violations" (Document number 820-4000-001 Revised January 17, 2015).

529. Comment: The requirement to replace water to a condition better than it was prior to drilling is punitive, unfair and open to miss-use. This is an example where overregulation can hurt our ability to compete with other regions of the country. (606, 606a)

Response: See response to comment 483.

530. Comment: The waters sources surrounding my hunting camp in Howe Township, Forest County were polluted with benzene as a result of fracking an O&G well 990 feet away. No letters were sent to property owners by the driller prior to drilling. Despite the “presumption”, DEP was ineffectual in getting replacement water. When asked about suing the driller, the response was “we don’t have the budget.” A replacement water well was drilled for six camps. After a few months, the driller cut off the power supply. DEP should require drillers to post a bond, assuring a permanent supply of water that meets Safe Drinking Water Standards. (631)

Response: Section 3218(a) of the 2012 Oil and Gas Act establishes a well operator who affects a public or private water supply by pollution or diminution shall restore or replace the affected supply. Section 3218(c) of the 2012 Oil and Gas Act establishes the conditions for presumption. Sections 78.51(d) and 78a.51(d) establish the responsibilities of an operator who impacts a water supply: to provide restored or replaced water that is reliable; at no additional cost; that can be easily maintained and with as much control and accessibility as exercised over the previous water supply. Section 3225 of the 2012 Oil and Gas Act conditions the bonds of oil and gas operators upon “faithful performance of all drilling, water supply replacement, restoration, and plugging requirements of this chapter.”

531. Comment: Section 78.51(2) Quality - the quality of a restored or replaced water supply will be deemed adequate if it meets the standards established under the Pennsylvania Safe Drinking Water Act (35 P.S. Sections 721.1-721.17) or is comparable to the quality of the water supply before it was affected by the operator if that water supply exceeded those standards.

We agree that if an operator impacts water quality, the operator is responsible for restoring or replacing the water supply. However, the operator should only be responsible for restoring or replacing an impacted water supply to the quality of the water supply before it was affected by the operator. (639)

Response: See response to comment 483.

532. Comment: Section 78.51(2) should be changed to say: “The quality of a restored or replaced water supply will be deemed adequate if it meets the standards established under the Pennsylvania Safe Drinking Water Act and is comparable to the quality of the water supply before it was affected by the operator if that water supply exceeded those standards.” (846, 1109)

Response: See response to comment 483.

533. Comment: Section 78.51 - DEP has confirmed that drilling has caused at least 160 cases of water contamination. Yet a lack of testing and data allow operators to maintain that pollution does not exist, or that they did not cause it. Homeowners are often left not only to bear the burden of proof, but also to fend for themselves in securing safe drinking water. Pollution or degradation caused by well site construction should not be given an exception from the presumption of liability; soil erosion, sedimentation, and chemical and fuel leaks can all degrade water quality. (853)

Response: See response to comment 480

534. Comment: I understand this section to mean if my private water supply was a superior supply to the safe drinking water standards predrill then it needs to be returned to that superior level, not just safe. By means of example, if my pre-drill chloride level is at 100 mg/l, and safe drinking water standard level of chloride is 250 mg/l, and my post drilling water supply chloride levels rise to 600 mg/l, I expect that this section will require the industry to return my water supply back to a chloride level of

100 mg/l, not 250 mg/l. If something happens to the quality of my water as a result of drilling, it is only fair and just that the quality of my water be put back to the same high quality that existed before drilling. If the industry or environmental groups feel this language is ambiguous as written, then the DEP needs to make it clearer in its language perhaps by listing examples as given above. (870)

Response: See response to comment 500.

535. Comment: Protection of water supplies - As a professional geologist, I have conducted hundreds of investigations relating to the development and use of residential, industrial and community water supplies within the Commonwealth of Pennsylvania. This state is one of the few in the United States that has no drilling and construction standards for new and existing residential water supplies. Past proposed legislation in Pennsylvania has not been successful in affording the residents of the Commonwealth assurance that proper practices and guidelines are followed to minimize the risk of drinking water contaminants. Without this legislation in place, it is unreasonable for the Department to expect industry to be obligated to restore water supplies back to applicable safe drinking water standards if the supply did not previously meet these standards or possibly an improved water quality. The proposed restoration standards should be made to meet “pre-drilling” or “baseline” water quality. (880)

Response: See response to comment 483.

536. Comment: Private water supplies in Wyoming County, as well as, the Northern Tier Region have experienced gas migration issues. We support the interpretation as based on Act 13, guaranteeing those with private water supplies, whom had pre - drill tests which were superior to the Safe Drinking Water Act Standards [SDWS] that in the event they are subject to a replaced or restored water supply that the water supply must be comparable to the quality of that superior pre-drill water supply. We support water supplies, as guaranteed by Act 13, which failed to meet SDWS that those water supplies are to be replaced or restored to SDWS. The inconvenience, worry and additional stress placed on a family necessitates that they be justly compensated with the same superior water quality their pre-drill test reveals or when deficient to the SDWS accordingly. The operator is addressing the water supply; therefore, it is the responsible action to do so entirely. (660a)

Response: The Department acknowledges the comment.

537. Comment: Another glaring deficiency in the proposed regulation relates to the Department’s duty to investigate water pollution. The proposed chapter 78 regulations require the Department to investigate a claim and determine whether the pollution or a diminution of a water supply was “caused by well site construction, drilling, alteration, or operation activities.” This is particularly alarming because this set of activities is much more limited than the activities included in the definition of oil and gas operations in the proposed regulations. The Department wants to define Oil and Gas operations to include: well location assessment, seismic, operations, construction, drilling, hydraulic fracturing, completion, production, operation, alteration, plugging, site restoration, water withdrawals, residual waste processing, water and other fluid management and storage used exclusively for the development of oil and gas wells; construction, installation, use, maintenance and repair of oil and gas pipelines, natural gas compressor stations, and natural gas processing plants or facilities performing equivalent functions; construction, installation, use, maintenance and repair of all equipment directly associated with activities; and finally earth disturbance associated with oil and gas exploration, production, processing, or treatment operations or transmission facilities.

Despite the fact that all of the activities included in the definition of Oil and Gas may be relevant to the Department’s investigation or have the potential to cause or contribute to the pollution of a

water supply, the Department wants to limit its investigation to only 4 of those activities. This proposed revision is fundamentally flawed and must be revised to include all of the activities included in the definition of Oil and Gas Operations. (887)

Response: The Department has revised §§ 78.51(b) and 78a.51(b) to include all oil and gas operations as activities which may compel the Department to investigate impacts from said activities under this Chapter. The Department also has the authority to conduct investigations for pollution for any oil and gas activity under the Air Pollution Control Act (35 P.S. §§ 4001 et seq.), The Clean Streams Law (35 P.S. §§ 691.1 et seq.), The Hazardous Sites Cleanup Act (35 P.S. § 6020.101 et seq.), the Solid Waste Management Act (35 P. S. §§ 6018.101 et seq.) and The Land Recycling and Environmental Remediation Standards Act 2 (35 P.S. § 6026.101 et seq.). The Department believes that the final rulemaking addresses the commenters concerns.

538. Comment: Require the toxic waste water be restored by the driller to Safe Drinking Water Act standards. DO NOT leave the water testing time and place in the hands of the drillers. (865)

Response: Wastewater treatment standards are determined by the disposal facilities' permit and the rules and regulations of the Department governing the activity.

539. Comment: Section 78.51(2) Quality - the quality of a restored or replaced water supply will be deemed adequate if it meets the standards established under the Pennsylvania Safe Drinking Water Act (35 P.S. Sections 721.1-721.17) or is comparable to the quality of the water supply before it was affected by the operator if that water supply exceeded those standards. We agree that if an operator impacts water quality, the operator is responsible for restoring or replacing the water supply. However, the operator should only be responsible for restoring or replacing an impacted water supply to the quality of the water supply before it was affected by the operator. (908)

Response: See response to comment 483.

540. Comment: 78.51 The proposed amendments state, “That the presumption of liability established in 58 Pa.C.S. § 3218(c) (relating to protection of water supplies) does not apply to pollution resulting from well site construction activities.” Presumption should apply to site construction activities. Over 161 letters of determination have been sent out by the DEP indicating that water sources were contaminated by fracking. In just 2 years, from 2008 to 2010, the DEP recorded 241 violations of environmental regulations at well sites within 2 miles of day care centers and 40 violations within 2 miles of schools. “States are playing roulette with public health”. According to Nadia Steinzor of Earthworks Fererar et al. of the University Of Pittsburgh School Of Public Health noted that, “Fracking doesn’t only impact health when mistakes are made, it also impacts health when everything goes right. The results are alarming. Community members reported 59 health impacts and 13 stressors from the Marcellus Shale development. They complained of rashes and sores, headaches, and changes in vision, diarrhea, and nausea, shortness of breath, and loss of sleep.” And yet, instead of proposing meaningful regulation that would provide some small measure of increased protection for human health, we see minor changes in detail that will be of little real benefit to the public. (912)

Response: See response to comment 470.

541. Comment: 78.51 Subsection (c) should not limit the presumption of liability in Section 3218 of Act 13.

Subsection (c) of the regulation states that “The presumption established by 58 Pa.C.S. § 3218(c) is

not applicable to pollution resulting from well site construction.” We urge the Department to eliminate this narrow interpretation of a provision intended to favor protection of public resources.

The Department’s interpretation is not consistent with the statutory language in subsection (c), which does not expressly exclude activities related to well site construction. The presumption of liability in subsection (c) holds the well operator liable for pollution of private water supplies based on two and only two events: that the pollution occurred a set distance from an oil or gas well, and within a specified period of time from well drilling or alteration operations. The statutory provision does not also contain a requirement that the presumption only applies to a limited set of well-related activities.

We recognize that Section 3218 as a whole contains some ambiguities. Subsection (a), for example, states the “general rule” that a well operator shall be liable for restoration or replacement of a water supply that has been “affected” by pollution or diminution. This provision does not contain any limits on what well-related activities for which the operator may be held liable. Presumably, a well operator or his contractors may engage in a wide range of well-related activities that could result in pollution and, thereby, would cause the operator to incur liability under subsection (a). In comparison, subsection (b), relating to the Department’s obligation to investigate, makes reference to pollution resulting from “drilling, alteration or operation” of a well. While the language obligating the Department to investigate appears narrower than the language imposing liability on the operator, that same section goes on to provide two independent bases for Department to issue a corrective order: that the pollution was caused by drilling, alteration or operation of a well, *or* that the presumption under subsection (d) applies. Considering that the general rule on liability is more expansive than the events that necessarily trigger a Department investigation, it is reasonable for the Department to conclude that the presumption was not intended to be limited only to drilling, alteration or operation of a well, particularly when the plain language of subsection (d) does not so limit the presumption of liability.

As a matter of public policy, the Department should seek to interpret the provision broadly and not narrowly. The Department must recognize that individual property owners will always be at a disadvantage in these circumstances. They will rarely have the money to compete with the resources wielded by multi-national oil and gas companies. The General Assembly recognized that by enacting a provision intended to protect the public, and not the industry engaged in mineral development. As an agency obligated to protect the environment and public health and safety, the Department should strive to give effect to that protection and not narrow it by imposing through regulation a limit on the protection afforded drinking water supplies.

We urge the Department to take the side of groundwater and the public by deleting its proposed language narrowly interpreting the presumption of liability in Section 3218 of Act 13. (852a)

Response: See response to comment 470 regarding expansion of the presumptive liability conditions. See response to comment 480 regarding the provisions addressing water supply replacements.

542. Comment: To take a company at their insistence of operating “in good faith” and “being a good neighbor” is not enforceable by either the Department or the water consumer, and the track record of every single operator’s actions in Pennsylvania shows these statements are distractions and have no factual basis. I again use the example of WPX’s contamination in Donegal Twp. For over a year the company has taken no steps to find a permanent solution for the well water they contaminated and has in public meetings obfuscated the truth by saying there has never been a case of water contamination because of fracking, an irrelevant statement in this case. I regularly see similar

examples of unethical behavior. I will highlight the operator Chevron in Redstone, Springhill and Dunbar townships in Fayette County. Additionally, in my attendance of meetings I REGULARLY listen to gas drilling companies use false information as points of pressure. For example, at a meeting in Delmont Twp., Westmoreland County, a Huntley and Huntley landsman told a room of prospective lessors that if they did not sign a lease to fill out Huntley and Huntley's units they would take the gas anyway. The Commonwealth does not have forced pooling in the Marcellus formation, making this point not only misleading and coercive but also downright intimidation. These are just a few examples of the behavior exhibited by companies profiting from this extraction. Clearly, public health is not a priority. (919, 943)

Response: The Department acknowledges the comment.

543. Comment: Water quality is closely tied to property value and a homeowner with better than average water should have a right to maintain that quality of the property. Also, water quality standards are always being revised; a property with better quality water will more likely meet the new standards. This advantage should not be lost through the fault of the oil or gas facility operator. (938, 938a)

Response: See response to comment 500.

544. Comment: Please continue to protect our drinking water use, be diligent to the effects of natural gas drilling. If fracking is determined to be a safe energy solution, gas company operators should be required to restore any contaminated drinking water supply to safe standards. (1013)

Response: The Department acknowledges the comment.

545. Comment: Where municipal water is available, this must be provided and paid for by the operator if there is issue of water contamination. (1030, 1030a)

Response: See response to comment 506.

546. Comment: Act 13 guarantees us that our water supplies in the event of an impact are permanently replaced at either the superior pre-drill water quality we had, or in case of a supply not meeting SDWAS that the supply is restored to SDWAS. (1035, 1037, 1048)

Response: See response to comment 500.

547. Comment: § 78.51. Protection of Water Supplies: Act 13 specifies a restored or replaced water supplies must meet the standards in the PA Safe Drinking Water Act (35 P.S. §§ 721.1- 721.17) or be comparable to the quality of the water supply before it was affected if that water was of a higher quality than those standards.

The proposed regulations indicate that remediated or replaced water supplies must meet all mandates of PA Safe Drinking Water Act. However, if a public water supply routinely provided drinking water which exceeded MCL's values prior to any drilling or landscape altering practices, these enhanced drinking water conditions must be fully maintained at the same level of measurement with all costs incurred by the operators that altered the existing quality of drinking water. In addition, water quality parameters for which no MCL's exist but which are documented by the water purveyor before drilling activities must also be maintained with all costs incurred by the operators that altered the existing quality of drinking water. Leaving this door open to discussion by operators will lead to a debate regarding treatment level requirements and unanticipated associated costs. Clearly the burden-of-proof and costs should be placed on the operator to achieve pre-existing conditions with no additional cost incurred by the supplier and

users of the public water supply Failure to achieve pre-drilling drinking water conditions may represent an increased public health risk for residents and special populations within the community. (1063)

Response: See response to comment 500.

- 548.** Comment: The Proposed Regulations should establish stronger protections of water supplies: § 78.51 of the Proposed Regulations address protection for water supplies. § 78.51(d)(2) provides that “the quality of a restored or replaced water supply will be deemed adequate if it meets Pennsylvania Safe Drinking Water [standards]... or is comparable to the quality of the water supply before it was affected by the operator if that water supply [did not initially meet the Pennsylvania Safe Drinking Water standards].” Dozens of commentators have offered the view that well operators should be required to restore *all* contaminated water supplies to Pennsylvania Safe Drinking Water Act standards. For example, on January 9, 2014, Carol J. Ward of Ardmore, PA submitted comments in support of this view, and described the devastating effects brought about by industry-related water contamination. Furthermore, the Duke University Nicholas School of the Environment has published a series of peer-reviewed studies which suggest that the problem of water contamination caused by hydraulic fracturing operations in northeastern Pennsylvania is far more commonplace and widespread than had been known previously. I support Ms. Ward’s comments, as well as the many other comments that were consistent with her comments in this regard. Previously contaminated water supplies, are legacy costs of the industrial exploitation that the ERA was adopted to address. Seeking the assistance of industrial actors such as drilling operators to manage them is a reasonable exercise of the DEP’s authority. (1070)

Response: See response to comment 500.

- 549.** Comment: Operators should restore or replace water supplies they affect; however. We believe the oil and gas industry should not be tasked with addressing water well contamination unrelated to oil and gas activities. It appears that the proposed language in 78.51(d)(2) deviates from the existing Chapter 78 language and the Department’s long-standing position that an operator has to restore affected water supplies to meet the Pennsylvania Safe Drinking Water Act (“PSDWA”) standards or to a quality that is comparable to the quality of the water supply before it was affected by the operator, if that water supply did not meet those standards (*See* 25 Pa. Code 78.51(d)(2)). Many Pennsylvania water supplies do not currently and have not historically met the PSDWA standards (Pennsylvania does not provide private water well drinking standards).

We agree with TAB’s interpretation of the word “exceeded” in Act 13, § 3218(a). This interpretation is that “exceeded” refers to an operator’s requirement to restore an affected water supply to its pre-drilling conditions when that water supply did not previously meet PSDWA standards prior to drilling. Further, § 3218(a) of Act 13 requires the Department to assure any restored or replaced water supply meets PSDWA standards or is “comparable to the quality of the water supply before it was affected by the operator if the water supply exceeded those standards.” (58 P.S. § 3218) The word “comparable,” meaning capable of or suitable for comparison, assures operators and landowners have the flexibility to derive at an approximate equivalent for the affected water supply when that supply did not meet PSDWA standards prior to drilling. The use of this term infers sufficient flexibility is required of the supporting regulation. To help achieve this flexibility and align with Act 13, we proposes the Board rewrite the provision to state: “The quality of a restored or replaced water supply will be deemed adequate if it meets the standards established under the Pennsylvania Safe Drinking Water Act (35 P. S. §§ 721.1-721.17), or is comparable to the quality of the water supply before it was affected by the operator.” (1085)

Response: See response to comment 483.

550. Comment: Under 78.51 Protection of Water Supplies, a “restored or replaced” water supply should meet PA Safe Drinking Water Act standards, despite industry lobbying for otherwise. And it should certainly match the quality of water prior if it exceeded those standards (78.51(2)). (1089, 1229)

Response: The Department acknowledges the comment.

551. Comment: Given the significant threat and consequences of water contamination, investigate incidents as soon as possible within the 10-day period following a request. Applicability should include well site construction given the consistently documented problems related to improper casing and regulatory needs delineated by STRONGER. [78.51 (c)] (855, 1098)

Response: The Department has developed a policy that does narrow the time frames staff should act upon once receiving notification for a water supply investigation request. The policy language can be found in the document titled “Standards and Guidelines for Identifying, Tracking, and Resolving Oil and Gas Violations” (Document number 820-4000-001 Revised January 17, 2015).

552. Comment: 78.51(d)(2) implements a new provision provided in Act 13 that specifies that a restored or replaced water supply must meet the standard in the Pennsylvania Safe Drinking Water Act (35P.S. §§ 721.1-721.17) or be comparable to the quality of the water supply before it was affected if that water exceeded than those standards. We raise concerns regarding the reasonableness and cost of such requirements, and question whether the proposed regulation goes beyond what was envisioned by the General Assembly. We ask EQB to explain how it will enforce this requirement to conform to the intent of the General Assembly and Act 13. (1099)

Response: The Department has revised the §§ 78.51(d)(2) and 78a.51(d)(2) for added clarity and to improve consistency with the 2012 Oil and Gas Act. If a water supply’s quality was better than Pennsylvania Safe Drinking Water Act standards prior to oil and gas operations, then it needs to be returned to its previous state, i.e., its state prior to being impacted by oil and gas operations. Otherwise, the Department would be allowing operators to degrade a natural resource relied upon as a water supply resource. In regards to water supplies that did not meet Pennsylvania Safe Drinking Water Act standards prior to being impacted by oil and gas operations, the Department would be derelict in its duties if it allowed operators to provide replacement drinking water that by its own standards is not fit to drink simply because the pre-existing water supply was poor. Given the need to provide replacement water based on the positive impact determination, the additional cost borne by operators is limited to the incremental cost of providing Pennsylvania Safe Drinking Water Act standards water as compared to the previous poor quality, not the difference between providing no water at all and meeting the previous poor quality.

553. Comment: I’m very concerned about water as well as the air. Because we all live downstream, and there is no way that this cannot impact all of us in such an inherently negative way. We can see what’s happening in some other countries where clean water has to be purchased and it is considered a commodity that is restricted as opposed to something that belongs to everybody. It’s a very disturbing future for the state of PA unless something is really happened. It is not possible to reclaim the contaminated water. It can be stored. It can be done in a closed-loop system, but it cannot be restored to clean water. The truth is we don’t have a lot of water. We don’t have enough water to do that for any length of time.

So we people have to use common sense. One of the principles that are very important is the precautionary principle. That means the person who says that there is no problem with this should prove that there is no problem. (1127)

Response: The Department acknowledges the comment.

554. Comment: The language should be revised to require a water supply affected by an operator to be restored or replaced to meet the quality and quantity of water that existed prior to well development activities. (1113, 1118, 1120, 1115a, 1176-1188)

Response: The Department disagrees but has revised the §§ 78.51(d)(2) and 78a.51(d)(2) for added clarity and to improve consistency with the 2012 Oil and Gas Act. If a water supply's quality was better than Pennsylvania Safe Drinking Water Act standards prior to oil and gas operations, then it needs to be returned to its previous state, i.e., its state prior to being impacted by oil and gas operations. Otherwise, the Department would be allowing operators to degrade a natural resource relied upon as a water supply resource. In regards to water supplies that did not meet Pennsylvania Safe Drinking Water Act standards prior to being impacted by oil and gas operations, the Department would be derelict in its duties if it allowed operators to provide replacement drinking water that by its own standards is not fit to drink simply because the pre-existing water supply was poor. Given the need to provide replacement water based on the positive impact determination, the additional cost borne by operators is limited to the incremental cost of providing Pennsylvania Safe Drinking Water Act standards water as compared to the previous poor quality, not the difference between providing no water at all and meeting the previous poor quality.

555. Comment: In the past DEP's Technical Advisory Board correctly stated it is "unreasonable to require the oil and gas industry to upgrade private water supplies, at industry expense, beyond that which existed pre-drilling." Yet this is precisely what has been proposed by the DEP in these Chapter 78 amendments. This double standard only applies to the oil and gas industry and would prove costly and be a detriment to the industry. If the DEP were to collectively analyze pre-drill water results it would be aware that in a large number of instances water has historically contained increased levels of metals, methane and other constituents. This has nothing to do with the oil and gas industry; however, it would be obligated to correct the problem. (1145)

Response: See response to comment 483.

556. Comment: We support the water supply restoration standard in subsection 78.51(d)(2).

We support the Department's revision to § 78.51(d)(2), which requires that water supplies be restored either to Pennsylvania Safe Drinking Water Act standards, or if applicable, to a higher quality if such higher quality existed prior to oil and gas operations. If oil and gas operations cause deterioration of an individual's water quality, the responsible companies that profit from extraction of the resource that led to the pollution are properly responsible for ensuring that all residents who were harmed by the diminished water quality have water that meets government safety standards. Consequently, we support the Department's application of Safe Drinking Water Act standards to water supplies adversely affected by oil and gas operations. We also support, as a matter of policy and fundamental fairness, the Department's position that persons who had water quality that exceeded drinking water standards have a right to expect that water quality will be maintained and not adversely affected by oil and gas operations. Among other things, such a policy recognizes the economic value of a clean, drinkable water supply to persons who are fortunate enough to have

such a water supply on their property.

We do suggest one small change in the wording of § 78.51(d)(2) to eliminate ambiguity. We suggest revising this section to read,

“The quality of a restored or replaced water supply will be deemed adequate if it meets the standards established under the Pennsylvania Safe Drinking Water Act (35 P. S. §§ 721.1—721.17), or is comparable to the quality of the water supply before it was affected by the operator if the quality of that water supply exceeded Pennsylvania Safe Drinking Water Act standards.” (852a)

Response: The Department has revised the §§ 78.51(d)(2) and 78a.51(d)(2) for added clarity and to improve consistency with the 2012 Oil and Gas Act.

557. Comment: The Proposed Rulemaking would revise Section 78.51(d) to provide that a restored or replaced water supply that “exceeded” Pennsylvania Safe Drinking Water Act standards even before the supply was impacted by gas drilling would be adequate if it is “comparable” in quality to the pre-drilling water supply. In this context, the term “exceeded” is unclear: it could mean either that the water was better in quality (presumably, meaning that it contained fewer mineral salts and/or other contaminants) than water meeting the minimums established by the Safe Drinking Water Act, or it could mean that the levels of contaminants in that water are greater than those specified by that Act. An earlier proposal to revise Section 78.51(d), which used the term “did not meet” in place of “exceeded,” was significantly less ambiguous. (1159)

Response: See response to comment 556.

558. Comment: 78.51(d)(2) - The proposed change in § 78.51(d)(2) sets a standard that is impossible to achieve in many cases. Act 13 provides at Section 3218(a) that: “The department shall ensure that the quality of a restored or replaced water supply meets the standards established under the act of May 1, 1984 (P.L.206, No.43), known as the Pennsylvania Safe Drinking Water Act, or is comparable to the quality of the water supply before it was affected by the operator if that water supply exceeded those standards.” It is unclear how the term “exceeded” is to be applied in this context. The long-standing policy of the Department has been to require that a replacement water supply meet only those PSDWA quality standards that the water supply met prior to being impacted. This policy is only logical, as in many areas of the Commonwealth; naturally occurring groundwater simply does not meet all secondary MCLs. An alternate interpretation of the term “exceeded” might require a replacement water supply to meet criteria that were better than (i.e., a lower concentration) PSDWA criteria, if that condition existed prior to the water supply being impacted. As an illustration of the problem with this alternate interpretation, consider a situation where an oil and gas operator impacts the water quantity from a water supply spring because of ground disturbance related to site construction. A groundwater well that is drilled to replace the spring supply meets all PSDWA primary and secondary standards but a number of dissolved constituents (calcium, magnesium, alkalinity, sulfate and potassium) have higher levels than the spring water previously utilized. It is very unlikely that water produced from a water supply well will ever have the low levels of many dissolved constituents that are found in spring water. Groundwater from deeper rocks generally contains higher levels of minerals than water found at shallower depths. In many cases, even replacing a spring water supply with public water would not meet the proposed standard under this alternate interpretation, as many public water supplies have higher levels of certain dissolved minerals than many spring water sources. Using this alternate interpretation of the term “exceeded” cases would create situations where replacement of an unreliable and unhealthy spring water source with a more reliable and safer groundwater or public water source would not be permitted. We believe it is essential that the Department clarify through regulation that it intends to interpret the

statutory language in a manner consistent with its past practice. Suggested language: The problem discussed above can be solved by simply eliminating the proposed change to Subsection 78.51(d)(2) and using the current regulatory language. (1174)

Response: See response to comment 483.

559. Comment: Do the current changes mean that the water quality prior to drilling exceeded the standards of the PA Safe Drinking Water Act that the supply would have to be restored or replaced to the standards that exceeded the Act? If that is the case, I am in agreement, but if it means that the industry can come in and replace or restore my water to something less than what I had before, I am not in agreement. (1228)

Response: See response to comment 500.

560. Comment: Presumption of Liability - Presumption should apply to not only site construction but all oil and gas activities. (609)

Response: See response to comment 470.

561. Comment: The use of “lab error”, “naturally occurring”, “migration from preexisting salt or coal mines or vertical wells” by the DEP in their findings must be followed up by no less than three hydrogeologic tests that are tier 3. (806)

Response: The Department acknowledges the comment.

562. Comment: Water supply restoration standards - Section 78.51(d)(2). Section 3218 of Act 13 requires an operator to restore an affected water supply to Pennsylvania Safe Drinking Water Act standards or “comparable to the quality of the water supply before it was affected by the operator if the water supply exceeded those standards” (emphasis added). Section 78.51(d)(2) adopts the statutory word “exceeded.” The Department has suggested that it is interpreting Act 13 and this regulatory section to require an operator to restore a water supply to a minimum of SDWA standards.

The Department’s position is a dramatic departure from current law, which simply requires operators to restore affected water supplies to their pre-drilling condition. Many water supplies do not meet SDWA standards in areas not served by public water utilities because there is no legal requirement for a Pennsylvania homeowner to treat his or her private water supply to SDWA standards. We believe it is unreasonable to require the oil and gas industry to upgrade private water supplies, at industry expense, beyond that which existed pre-drilling. No other industry is required to do this. (1172)

Response: See response to comment 483.

563. Comment: Under Section 78.51, I would suggest that Tier 3 quality water be required for water replacement. On that same subject, it is well known that there is widespread damage caused by the gas industry to water supplies in Pennsylvania. At least 161 such incidents have already been identified. The reason there isn’t more information about this problem is because of the industry’s common practice of forcing residents to sign non-disclosure agreements before reparations are made. It is also known that industry and the DEP have taken away water replacements without the consent of affected residents. These practices must stop. The new regulations must require industry to replace water supplies in perpetuity or end replacement only with the consent of the affected residents. (823)

Response: See response to comment 500.

564. Comment: Notification must be given to all drinking water supply owners between 30 days and 60 days before the date a well is spudded, so that they can conduct their own pre-drilling certified water testing. (1064, 1101)

Response: The Department acknowledges the comment.

§ 78.52 Predrilling or prealteration survey

565. Comment: The DEP should establish standards to protect people in drilling areas with mandatory Pre-drilling and After Drilling regulations throughout the state of PA. (13, 976, 976a)

Response: Section 3218(c) of the 2012 Oil and Gas Act (58 Pa.C.S. § 3218(c)) establishes the presumption of liability for water pollution onto an operator. The presumption encompasses situations in which the water supply is within 1,000 feet of a conventional well or 2,500 feet of the unconventional well bore, and the pollution takes place within six months for a conventional well or twelve months for an unconventional well for certain well development activities. While the Department does not mandate a predrill survey of water supplies, the presumption incentivizes an operator to conduct predrill water supply surveys so they may have a defense to rebut presumed responsibility. If an operator chooses not to take a predrill water supply sample, they will not have a defense against presumption or, if presumption does not apply, they will not be able to refute the Department's sample results that show contaminates at levels higher than the maximum contaminate limits allowed by the Pennsylvania Safe Drinking Water Act standards.

566. Comment: 78.52 – We support regulatory improvements for water supply protection, sampling, and notification. However, we are concerned that while the proposed regulation at § 78.52 requires a predrilling or prealteration survey (water sampling) and testing by an independent Pennsylvania-accredited laboratory, it does not specify what tests must be run by the lab. The regulation also does not specify a minimum radius of investigation for the survey work.

We recommend that the proposed regulation be revised to include a comprehensive, specific list of tests to be performed in order to collect the data needed to verify if contamination from Oil and Gas Operations occurred. The regulation should also make it clear that the PADEP will follow the same recommendations issued to operators when it conducts testing in response to homeowner complaints and subsequent investigations. We recommend that the lab test for specific common oil and gas operational chemicals and pollutants, for the additives planned for use in hydraulic fracturing fluids, toxic volatiles (benzene, toluene, xylenes), the components of natural gas (e.g., methane, ethane) and toxic volatiles from the formation water (benzene, toluene, xylenes), salts and relevant inorganic contaminants. (If the EQB rejects this recommendation, we ask that the EQB respond to the request set forth in Appendix A with respect to Abandoned and Orphaned Well Identification.)

Table 1 below compares the list of contaminants potentially linked to hydraulic fracturing found in groundwater near Pavillion Wyoming, (D.C. DiGiulio, et al., USEPA, Office of Research and Development, *DRAFT: Investigation of Ground Water Contamination near Pavillion, Wyoming., Ada, OK* (2011)) with test parameters recommended by the Colorado Oil and Gas Association (COGA) (Colorado Oil and Gas Association (COGA), *Voluntary Baseline Groundwater Quality Sampling Program, Example Sampling and Analysis Plan* (2011) (developed in cooperation with

the Colorado Oil and Gas Conservation Commission)), and test parameters recommended by the New York State Department of Environmental Conservation (NYSDEC) in their proposed regulations at 6 NYCRR § 560.5(d)(1). Each of the parameters listed on the following page should be mandatory minimum testing requirements.

Table 1: The three columns indicate whether the constituent was either elevated or detected at Pavillion WY (DiGuilio et al 2011), recommended for sampling by COGA (2011), or recommended by NYSDEC in proposed 6 NYCRR § 560.5(d)(1).			
Constituent	Elevated concentration or detectable at Pavillion	COGA Listed	NYSDEC
pH	X	X	X
Specific conductance	X	X	X
Total Dissolved Solids		X	X
Alkalinity	X	X	
Bromide		X	
Barium			X (2)
Chloride		X	X
Sulfate		X	
Nitrate and nitrite (N)		X	
Phosphorus		X	
Arsenic	(1)		(2)
Boron		X	
Calcium		X	
Iron		X	X
Magnesium		X	
Manganese		X	X
Potassium	X	X	
Selenium		X	
Sodium		X	X
Strontium		X	
Gross alpha/beta			X
Methane	X	X	X
Ethane	X	X	X
Propane	X	X	
Benzene	X	X	X
Toluene	X	X	X
Ethylbenzene	X	X	X
Xylene	X	X	X
Trimethylbenzenes	X		
Isopropanol	X		
Diethylene glycol	X		
Triethylene glycol	X		
Tert-butyl alcohol	X		
Gasoline range organics	X		
Diesel range organics	X		
Naphthalene	X		
(1) Arsenic was noted in drilling fluids at Pavillion and was detected but not an exceedance in groundwater.			
(2) Arsenic and barium were found in wells at Dimock, PA ²⁴			

Sampling measured exclusively from the vertical portion of the well does not account for the potential for contamination from the horizontal wellbore. For example, significantly higher methane concentrations have been found in water wells within a kilometer (0.62 miles) from Marcellus wells. (S.G. Osborn, et al., *Methane Contamination of Drinking Water Accompanying Gas-Well Drilling and Hydraulic Fracturing*, Proc. of the Nat'l Academy of Sciences pnas:1100682108 (2011)). Additionally, vertical movement of fluids is possible from the area of the shale that receives a hydraulic fracturing treatment, and eventually, all wells that lie above developed gas plays may have a potential for contamination.

Therefore, we recommend that the operator sample all wells and springs within at least one mile from the edge of the well pad or a minimum of 1,000' from any point along the horizontal wellbore, whichever is greater. The analysis must account for the movement of gas as well as fluids. Although these distances exceed the 2,500' distance for purposes of applying the statutory presumption, the additional sampling is essential to building scientific understanding of affected resources in oil and gas development areas and to inform future statutory changes to pre-drilling requirements, particularly as emerging research indicates that contaminants move greater distances than previously assumed.

We recommend the following proposed revision to § 78.52(c).

§ 78.52. Predrilling or prealteration survey.

* * * * *

(c) The survey shall be conducted by an independent [certified] Pennsylvania-accredited laboratory. A person independent of the well owner or well operator, other than an employee of the accredited laboratory, may collect the sample and document the condition of the water supply, if the accredited laboratory affirms that the sampling and documentation is performed in accordance with the laboratory's approved sample collection, preservation and handling procedure and chain of custody.

(1) The following list of sample data must be collected and laboratory test parameters must be evaluated by a Pennsylvania-accredited laboratory: static water level (when possible) pH, specific conductance, total dissolved solids (TDS), alkalinity, bromide, barium, chloride, sulfate, nitrate and nitrite (N), phosphorus, arsenic, boron, calcium, iron, magnesium, manganese, potassium, selenium, sodium, strontium, gross alpha/beta, methane, ethane, propane, benzene, toluene, ethylbenzene, xylene, trimethylbenzenes, Isopropanol, diethylene glycol, triethylene glycol, tert-butyl alcohol, gasoline range organics, diesel range organics, naphthalene and other polycyclic aromatic hydrocarbons (PAHs), and all other chemicals planned to be used in hydraulic fracturing operations or drilling. The Department may require additional sample data to be collected and additional lab tests to be run. The Department shall follow these survey requirements when conducting follow up testing in response to complaints of diminution of water quality or quantity and in its subsequent investigations.

(2) Prior to site disturbance for a new well or new spud for an existing Oil and Gas Operation, the owner or operator must make all reasonable attempts, with the landowner's permission, to sample and test, at the owner's or operator's expense, all water wells, domestic supply springs, and water wells and springs that are used as water supply for livestock or crops, that are within one mile from the edge of the well pad or a minimum of 1,000' from any point along the horizontal wellbore, whichever is greater. (1143)

Response: Section 3218 of the 2012 Oil and Gas Act establishes the requirements for pre-drill water supply surveys. Subsection (c) establishes a presumption of liability for an operator who impacts a water supply located within a certain distance from the wellbore and within a certain timeframe. Subsection (d) allows an operator to rebut the presumption by proving that “the pollution existed prior to the drilling, stimulation or alteration activity as determined by a predrilling or prealteration survey...”

The Department believes that the General Assembly chose to place the risk of not conducting a predrill survey on operators, who might not be able to rebut a presumption of liability if a water supply is not sampled prior to drilling or a particular substance is not tested for in the samples the operator takes. By failing to establish predrill water quality, the operator opens itself up to liability for any failure to meet drinking water standards in any water supply located within the presumption’s radius for any substance found in the water supply.

567. Comment: The response times for DEP to investigate claims of pollution are too long. DEP should conduct investigations within 15 days. Affected persons should be provided with mechanisms for submitting their own evidence. (153)

Response: The Department has developed a policy that narrows the time frames staff should act upon once receiving notification for a water supply investigation request. The policy language can be found in the document titled “Standards and Guidelines for Identifying, Tracking, and Resolving Oil and Gas Violations” (Document number 820-4000-001 Revised January 17, 2015).

568. Comment: The Department should still accept hard copies or electronic means for the sample results submittal to accommodate small, conventional operators. In addition, the language still needs to be clear that results are not due into Department until the operator has received every laboratory analysis completed as part of the site survey.

Suggested amendatory language:

(d) An operator electing to preserve its defenses under sections 3218(d)(1)(i) and 3218(d)(2)(i) of the act shall provide a copy of all the sample results taken as part of the complete well site survey to the Department by electronic means or other approved format determined by the Department within 10 business days of receipt of all sample results taken as part of the all samples taken as part of the survey for that well site. The operator shall provide a copy of any sample results to the landowner or water purveyor within 10 business days of receipt of the sample results. Survey results not received by the Department within 10 business days, including those submitted as described above with regard to batch submissions, may not be used to preserve the operator’s defenses under sections 3218(d)(1)(i) and 3218(d)(2)(i) of the act. (1153)

Response: The Department believes that requiring electronic submission of the survey results is the only way to efficiently store and manage large volumes of water sample data it receives on a daily basis. The Department did change the rulemaking language to say survey results.

Changes to the statutory language are outside the scope of this rulemaking.

569. Comment: The proposed regulation does not specify the parameters for the pre drill testing of a resident’s water quality. All drillers should have to use a consistent list of parameters for pre-drill water testing, which the DEP must establish before the proposed regulatory changes are adopted.

Accredited laboratories should have clear guidelines regarding the parameters of testing in order to avoid different results. Standards of testing should be clearly articulated. The present wording could lead drillers to conduct testing without including all the contaminants for which a resident should be concerned. The parameters should be as comprehensive as possible, but at a minimum, match what the DEP uses when it conducts full contamination investigations and to ensure that complete baseline data is available. (1161, 1168)

Response: The Department believes that the General Assembly chose to place the risk of not conducting a predrill survey on operators, who might not be able to rebut a presumption of liability if a water supply is not sampled prior to drilling or a particular substance is not tested for in the samples the operator takes. By failing to establish predrill water quality, the operator opens itself up to liability for any failure to meet drinking water standards in any water supply located within the presumption's radius for any substance found in the water supply.

570. Comment: Comprehensive predrilling testing of nearby water supplies should be required by the drillers and made public. (10, 99, 102, 104, 470, 494, 560, 461, 949, 1030, 1030a, 1047, 1148, 1161, 7521 – 8362)

Response: See response to comment 566.

571. Comment: It is important that the provisions in 78.52 dealing with pre-drill water testing ensure that affected homeowners are treated fairly and that they and DEP have enough information to determine whether operators are responsible for any changes in water quality. A lack of data on contaminants like methane, ethane and benzene means that responsibility for contamination can be avoided and left unaddressed, as evidenced by the resolution to some of the 161 water contamination cases. (886)

Response: The Department acknowledges the comment.

572. Comment: The Department should provide landowners with the option to conduct their own predrilling survey, within a reasonable timeframe and subject to the same constituent parameter and laboratory accreditation requirements applicable to well operators, for submission to the Department. Any such survey provided it meets the Department's applicable guidelines and demonstrates that that pollution did not exist prior to drilling or alteration activity, should maintain the presumption established by 58 Pa.C.S. § 3218(c) except if the presumption is rebutted pursuant to 58 Pa.C.S. § 3218(d) (1)(ii through (v) and (d)(2)(ii) through (v). (997a)

Response: Property owners are encouraged to take their own predrill surveys. The Department has a Fact Sheet titled, "PA-DEP Recommended Basic Oil and Gas Pre-Drill Parameters" (Document Number 8000-FS-DEP4300, Rev. 4/2014) for property owners. Operators have to take predrill samples if they wish to use them to rebut presumption.

573. Comment: DEP must strictly regulate and control how pre-drill data and testing is done on water supplies. All pre-drill water supply data should be available to the public through an online platform, while protecting property owner's privacy. (16, 62, 912, 1168)

Response: The Department requires a qualified third party to collect the samples and Department accredited laboratories to perform the analysis. The Department only provides redacted private water supply data to protect the privacy and rights of the property owners.

574. Comment: There should be more transparency surrounding pre-drilling water testing. The public should be able to access the pre-drill water testing data (perhaps online to protect privacy) and the DEP's parameters for testing. (24)

Response: The Department only provides redacted private water supply data to protect the privacy and rights of the property owners. The Department has a Fact Sheet titled, "PA-DEP Recommended Basic Oil and Gas Pre-Drill Parameters" (Document Number 8000-FS-DEP4300, Rev. 4/2014) for homeowners. DEP's testing parameters are available to the public.

575. Comment: I have repeatedly tried to have baseline regional ground and surface water testing done before drilling in order to establish a reference point. To date this hasn't been done and it must be done. Also, the testing of ground and surface water for purposes of restoring it to its prior condition needs to include testing for emerging contaminants which are done by the USGS. The intent is to protect PA's current and future residents. (68)

Response: Property owners are welcome to take their own predrill surveys. The Department has a Fact Sheet titled, "PA-DEP Recommended Basic Oil and Gas Pre-Drill Parameters" (Document Number 8000-FS-DEP4300, Rev. 4/2014). Emerging contaminants are not related to oil and gas well development activities.

576. Comment: Consistent, intensive pre-drill water tests should be required by all drilling companies according to requirements stringently outlined by the DEP. Pre-drill data should be made public as should the chemicals used in the gas drilling process. This would facilitate the medical community in the treatment of gas related emergency contaminations and illnesses. (104)

Response: Section 3218(c) of the 2012 Oil and Gas Act (58 Pa.C.S. § 3218(c)) establishes the presumption of liability for water pollution onto an operator. The presumption encompasses situations in which the water supply is within 1,000 feet of a conventional well or 2,500 feet of the unconventional well bore, and the pollution takes place within six months for a conventional well or twelve months for an unconventional well for certain well development activities. Presumption incentivizes an operator to take predrill water samples so they may have a defense to rebut presumed responsibility. The Department does not provide predrill data to the public, unless all identifying information is redacted, in order to protect the privacy and rights of the property owners. Chemicals used to stimulate unconventional wells are available on FracFocus' website www.fracfocus.org/

577. Comment: Section 78.52, Pre-drilling water testing is another concern I have. We need consistent baseline testing with comprehensive standards established by DEP. It should not be up to the drilling company to decide. These standards should contain contaminants that often indicate that drilling is responsible for water contamination: dissolved methane, BTEX, barium, chloride, strontium, etc. This baseline testing is so critical if those of us on wells have water contamination after drilling begins. (129, 635, 930)

Response: See response to comment 565.

578. Comment: When a homeowner's water is impacted, baseline monitoring should be required. It should be done prior to drilling. It should be made available to the general public so that we can adequately have our well water tested to ensure that there is no contamination because of the fracking process. So the monitoring should be done in advance. It should be done by certified labs. It should include no trade secrets and it should include no contaminants that we've seen in other

people's drinking waters like methane, methane benzenes, a full range, which will be in our technical comments. It should identify existing and working wells in advance prior to drilling and fracking. (845)

Response: Property owners are encouraged to take their own predrill surveys. The Department has a Fact Sheet titled, "PA-DEP Recommended Basic Oil and Gas Pre-Drill Parameters" (Document Number 8000-FS-DEP4300, Rev. 4/2014).

579. Comment: All drillers to use a consistent list of parameters for pre-drill water testing, which DEP must establish before the proposed regulatory changes are adopted. The parameters should be as comprehensive as possible, but at a minimum match what DEP uses when it conducts full contamination investigations and to ensure that complete baseline data is available.

All drillers make pre-drill data available to the public, while protecting individual homeowners' privacy, through an online platform, which DEP must establish before the proposed regulatory changes are adopted. (17, 18, 19a, 72, 73, 79, 100, 102, 125, 148, 160, 161, 162, 169, 193, 199, 402, 405, 406, 471, 475, 564, 565, 626, 787, 843, 853, 865, 884, 886, 891, 922, 947, 492a, 1030, 1030a, 1039 1058, 1064, 1068, 1073-1077, 1079-1082, 1083, 1084, 1089, 1101, 1102, 1158, 4582 - 4584, 4584 – 4650, 1229)

Response: Section 3218(c) of the 2012 Oil and Gas Act (58 Pa.C.S. § 3218(c)) establishes the presumption of liability for water pollution onto an operator. The presumption encompasses situations in which the water supply is within 1,000 feet of a conventional well or 2,500 feet of the unconventional well bore, and the pollution takes place within six months for a conventional well or twelve months for a unconventional well for certain well development activities. The presumption incentivizes an operator to take predrill water samples so they may have a defense to rebut presumed responsibility. The Department does not provide predrill data to the public, unless all identifying information is redacted, in order to protect the privacy and rights of the property owners.

580. Comment: All drillers should be required to use a consistent list of parameters for pre-drill water testing. The parameters should be as comprehensive as possible, but at a minimum match what DEP uses when it conducts full contamination investigations and to ensure that complete baseline data is available. All drillers must make pre-drill data available to the public, while protecting individual homeowners' privacy, through an online platform, which DEP must establish immediately. (5936-6089)

Response: See response to comment 579.

581. Comment: Subsection 78.52(c) should be revised to clarify that the laboratory does not need to conduct the survey itself, but simply analyze the samples collected. This section could be misinterpreted as stating that only laboratory employees can perform the survey.

We suggest the following amendatory language:

(c) The analyses of a pre-drill sample of the water supply shall be completed by an independent Pennsylvania accredited laboratory. A person independent of the well owner or well operator, other than an employee of the accredited laboratory, may collect the sample and document the condition of the water supply, if the accredited laboratory affirms that the sampling and documentation is performed in accordance with the laboratory's approved sample collection, preservation and handling procedure and chain of custody. (1137, 1147, 1174)

Response: The language is clear that someone independent of the operator and laboratory may collect the water samples provided they are qualified to do so.

582. Comment: Any well driller who conducts a pre-drilling drinking water supply survey to protect himself should have to include a test for methane. (1064, 1101)

Response: There are no required parameters for water sampling because a predrill sample is not required to be taken by the operator. If the operator chooses not to take predrill samples, they are severely limiting a defense against presumption.

583. Comment: I'm concerned about adequate water testing. The EPA should establish a comprehensive list of pre-drill water testing parameters that match what will be used in a contamination investigation. The data from this testing should be made available online to the public. (163)

Response: The Department cannot respond to comments directed towards the EPA.

584. Comment: DEP should proactively establish standards for pre-drill testing (185, 187, 400, 401, 595)

Response: Title 25 Chapter 78 Section 52 does establish standards for predrill testing for when an operator chooses to conduct a predrill survey as a defense against presumption.

585. Comment: DEP must stipulate that pre-drill testing be comprehensive and that the standards for pre-drill testing include dissolved methane, barium, bromide, strontium, chloride, and BTEX. Water is our most precious resource. When we contaminate it, it is lost for decades. Results must be available to the owner and public. It happens every time. When a resident is pictured and quoted in a newspaper story with a brown glass of water insisting they had not been having/using this kind of water prior to drilling, we have come to know the next line from the company, "There is no certainty that this is from drilling." (399)

Response: See response to comment 565.

586. Comment: EQB's proposals for water testing and the restoration and replacement of contaminated water supplies (Sections 78.51 and 78.52) are inadequate. Concerning water testing to determine pre-drill baseline data for water quality of private and public water sources, I call on DEP to establish a consistent and comprehensive list of parameters -- comprehensive enough to match with what DEP uses when it investigates contamination -- and to make that data available to the public through an online platform that protects individual homeowners' privacy. Since 2011, we have employed a third party to assess the water quality of Beaver Run Reservoir. That testing is useful only to the extent that the parameters tested for are comprehensive enough to establish the absence of pollutants produced in shale gas extraction activities. (402)

Response: Section 3218(c) of the 2012 Oil and Gas Act (58 Pa.C.S. § 3218(c)) establishes the presumption of liability for water pollution onto an operator. The operator is presumed to be responsible for any impacts to a water supply within a prescribed distance and timeframe of drilling activities. Unless the operator can provide a defense provided under Section 3218(d) of the 2012 Oil and Gas Act (58 Pa.C.S. § 3218(d)) to rebut the presumption of liability, they are responsible for the restoration or replacement of the impacted water supply. An extensive predrill water supply survey is the best defense an operator can have to rebut presumption or an investigation by the Department. Operators have the option on how much money they wish to spend conducting predrill surveys. A lack of data is not a defense for operators. The

Department does not provide predrill data to the public, unless all identifying information is redacted, in order to protect the privacy and rights of the property owners.

587. Comment: 78.52(e)(1) – This also needs to include a person representing surface landowner/water supply owner, such as a tenant or caretaker. A general question is why can't a valid water survey/sample be used/taken to preserve an operator's defense up until the point of the beginning of operations? There is no scientific basis for a time frame to be put on the validity of water sample results and should be based on when the sample was taken, not when results have been received (We are aware the 10 day standard has been set in Act 13). A suggestion would be to require the test results to be sent to the Department and landowner within 10 business days but should still be allowed to preserve an operator's defense based on sample date. (411)

Response: The Department has changed the rulemaking language to allow all sample results pertaining to the well of concern to be submitted to the Department by the operator 10 days prior to commencement of drilling of the well. The Department believes that this change allows this portion of the regulation to strike an appropriate balance between being reasonable and protective of public health and safety and the environment. The Department does not believe that it is appropriate to accept sample results as predrill samples after oil and gas activity has begun.

588. Comment: The language in b, c, d, and f seems to indicate that the survey is for a singular water supply. Although we understand that DEP intends to allow batch reporting (submission of all sampling of water supplies done per well pad at one time) it is not clear in the regulation that submitting a single survey with the complete batch of sample results preserves the presumption.

Suggested amendatory language:

(d) An operator electing to preserve its defenses under sections 3218(d)(1)(i) and 3218(d)(2)(i) of the act shall provide a copy of all the sample results taken as part of the survey to the Department, and may submit those results in one batch submission per well pad by electronic means in a commonly utilized format determined by the Department within 10 business days of receipt of all the sample results taken as part of the survey for a particular well pad. The operator shall provide a copy of any sample results to the landowner or water purveyor within 10- business days of receipt of the sample results. Surveys received by the Department within 10 business days, including surveys submitted as described above with regard to batch submissions, may be used to preserve the operator's defenses under sections [208(d)(1)] 3218(d)(1)(i) and 3218(d)(2)(i) of the act. (1135, 1137, 1174)

Response: The Department agrees. The language to the rulemaking has been amended to allow for an entire survey to be submitted at once.

589. Comment: Mandatory pre-testing of water of all springs or wells in or near drilling areas prior to drilling. Mandatory explanation of the water testing results that are given to the landowner with total explanation of said results with safe drinking water parameters fully explained to the property owner and residence on said tract of land being drilled. (492)

Response: The Department does not mandate predrill water supply sampling. The Department will explain any results of samples the Department has taken.

590. Comment: Pre-drilling testing should be conducted by non-industry associated labs and should include testing for Bromides, Toluene, Benzene, Salt Levels, and Arsenic, Methane both Biogenic and Thermogenic, Bacteria, Styrene, Strontium, Barium, Glycol, Phenol, and Cadmium. (843, 1068)

Response: The Department requires that an independent Pennsylvania-accredited laboratory be used for surveys when an operator chooses to conduct a predrill water supply survey. See response to comment 565.

591. Comment: 78.52(f)-(g) The rule should provide for a time frame for response and action by the landowner once notice has been provided, so that operators may proceed with operations knowing that access was refused.

Suggested amendatory language:

(g) Refusal shall be presumed if the operator does not receive a response within 30 business days of confirmed receipt. (1137, 1147, 1153, 1174)

Response: The Department disagrees with the proposed change to the regulatory language, as there may be a number of reasons why a property owner is unresponsive and it is not appropriate to presume in all cases that it signifies access refusal. The Department does believe it is acceptable for operators to document their efforts to secure access and make decisions on how to proceed based on the best available information, but attempting to codify this process is not consistent with the intent of this section of the regulations.

592. Comment: I highly urge the DEP to make all drillers conduct pre-drill water testing and air testing at sites and not at the cost of the property owners or those living within the area. I highly recommend this testing be completed by a neutral 3rd party that has no ties to the gas industry or even the DEP. If water should become contaminated after drilling has occurred it should be up to the driller to pay the costs to return the water quality to the highest standards available for drinking water. (848, 909)

Response: Section 3218(c) of the 2012 Oil and Gas Act (58 Pa.C.S. § 3218(c)) establishes the presumption of liability for water pollution onto an operator. The presumption encompasses situations in which the water supply is within 1,000 feet of a conventional well or 2,500 feet of the unconventional well bore, and the pollution takes place within six months for a conventional well or twelve months for an unconventional well for certain well development activities. While the Department does not mandate a predrill survey of water supplies, presumption incentivizes an operator to conduct predrill water supplies surveys, so they may have a defense to rebut presumed responsibility. The Department requires that an independent Pennsylvania-accredited laboratory be used for surveys when an operator chooses to conduct a predrill water supply survey. The operator is responsible to pay all costs to replace or restore water supplies, if found to be liable under presumption or the Department determines that the operator is responsible for the impact.

593. Comment: I am here to submit comment as an investigative journalist for the nonprofit news organization Public Herald, and as the co-director of the documentary on fracking, *Triple Divide*.

My comments today will focus on section § 78.52 of the proposed rulemaking regarding pre-drill testing or pre-alteration surveys.

On February 23rd, 2012 a resident of Windham Township in Wyoming County called in a water complaint to DEP stating their drinking water had changed since drilling occurred. The call is

documented in DEP water complaint files under the number 287194. A month later, DEP responded, conducting post-drill tests of the water supply.

During the testing the resident voiced concern to DEP about drinking their water. DEP field staff stated in the complaint file, “I further explained [to the property owner] I am not making an assessment whether the water is safe to drink. I explained that sampling I will conduct is an attempt to determine if changes were the result of drilling activity.”

Post-drilling test results by DEP found elevated levels of iron, Manganese, and Aluminum. Arsenic tested at 0.463mg/L per liter, 46 times above the safe level for human consumption.

The investigation notes stated that pre-drill test results found no detectable levels of methane in the drinking water. Whereas, post-drill tests found methane above DEP’s alert levels and in some cases at 14,000ug/L per liter, approaching explosive levels for a home.

These tests all proved the drinking water supply had changed from pre-drilling conditions. However, DEP concluded that natural gas drilling did not impact this drinking water supply.

This story is not uncommon. So far, there have been over 60 fracking complaints in Wyoming County submitted to DEP. Here’s what happened in a few of them: Complaint number 282615 found explosive levels of methane at 30.6 mg/L; Complaint number 297422 saw contamination after fracking; Complaint number 282558 found methane at 25.8mg/L after fracking. Yet these complaints with legitimate pre-drill data were poorly investigated by DEP in Wyoming County and received non-impact determination letters.

In *Triple Divide* we spend nearly 15 minutes to show how DEP mishandled pre-drill testing.

In April 2011, Chesapeake energy experienced a blowout at the Atgas 2h well in Leroy Township, Bradford County. Chesapeake hired SAIC who studied 7 residential water wells near the blowout, which included pre-drill water tests for each well.

In October 2011, SAIC sent DEP their conclusions which showed water well named RW04, 1,200 feet directly downhill from the blowout, had a tenfold increase in methane, and other contaminants; and ethane and arsenic that were not found in the pre-drill tests showed up in post-drill tests.

Regarding this well’s significant change in water quality after the blowout, Chesapeake concluded that their own pre-drill water test did not reveal the well’s true water quality and that the water quality was always this way, before the drilling.

In the final consent order, DEP neglected to address the failed pre-drill test scenario and allowed Chesapeake Energy to go unquestioned.

A decision like this not only changes the water quality history of the state, but it establishes pre-existing conditions that can be used by industry in other cases.

For multiple predrill tests to go through a DEP certified lab, and later be discarded by the industry draws into question the validity baseline data as a whole.

Scott Perry has been aware of these cases long before these hearings were scheduled, he’s aware of the pre-drill scandal, yet has done nothing in these updates to correct it at DEP.

In conclusion, based on science available to DEP and to the EQB board, section § 78.52 on pre-drill testing is a failure to both the resources of Pennsylvania, and to the Americans who have protected these resources for decades prior to fracking. If you do not change this section by including specific testing parameters, and exactly how many pre-drill tests represent a drinking water supply, more Pennsylvania residents will go unprotected not by the result of failed science, but by a criminal negligence on your part to establish comprehensive laws based on available data. In essence, your lack of action is forcing more residents to drink contaminated water by no fault of their own. Use the science, study the data, and change this section to protect Pennsylvania drinking water resources for generations to come.

Investigation Description:	The complainant called the District Office and I returned the call. The complainant is concerned with their pre-drill test results. They had an independant consultant advise them to immediately contact the Department because the Methane Level had increased to 1.41 mg/L from non-detect. I requested the pre-drill results to review from Chesapeake Appalachia.				

(849)

Response: See response to comment 566.

594. Comment: We would like all current and future water quality tests to be done by an independent lab to include the required certification as well. We do not think it is appropriate to have the lab of

choice be selected by the operator; therefore we'd like to see the DEP put a halt to this policy. (862)

Response: The Department requires that an independent Pennsylvania-accredited laboratory be used for surveys when an operator chooses to conduct a predrill water supply survey.

595. Comment: A pre-drilling test is necessary to determine that water quality has not been affected by drilling. (886, 891, 4744 – 5668)

Response: See response to comment 565.

596. Comment: The DEP must be required to proactively establish standards for pre-drill testing of the water in impacted areas using impact fees with cost burdens to be the responsibility of the drilling company. A fund needs to be established to handle future problems that may be generated by the driller. (916)

Response: See response to comment 565. Also, operators are required to bond their operations to ensure, among other things, water supply replacement.

597. Comment: A more complete suite of parameters must be established for baseline testing in order to protect the health of Pennsylvania residents; this suite should be the standard used by all drilling companies across the Commonwealth. A pre-drill test for e-coli and coliform will give the water user important data, but is not testing for parameters that would indicate contamination from industrial activity. Instead, testing for radioactivity, barium, strontium, and commonly used chemicals in the drilling, hydraulic fracturing and completion processes of a well is critical for accountability and for the protection of public health. In a November 2013 meeting with Department of Environmental Protection's (DEP) Oil and Gas staff in Harrisburg, DEP acknowledged water contamination cases are the most serious issue the Department faces. It is also a massive public health risk and as such, DEP should require operators to obtain ample baseline data in order to protect water supplies and public health. (919, 943)

Response: See response to comment 565.

598. Comment: Pre-drill Water Testing --All pre-drill water quality testing should be conducted by a certified third-party professional operator, and made available to the landowner.

Testing should be conducted a minimum of 3 times for of water quantity and quality during low, high and average hydrological conditions.

A consistent list of parameters including at least the following measures: Analyte (Inorganic)
Analyte (Trace Metal) Analyte (Organic)
Alkalinity,
Barium
Chloride Calcium
Conductivity Iron
Hardness Magnesium Analyte
Hydrocarbons (benzene, ethane, methane)
Microbiology (Total Coliform/E.coli)
Oil and Grease Manganese,
pH

Potassium
Radionucleotides (alpha and beta)
Residue - Filterable and Non Filterable
Sulfate Sodium
Strontium
Total Dissolved Solids
Total Suspended Solids

The above list of items for the test is from the document, “PA-DEP Recommended Basic Oil & Gas Pre-Drill Parameters” (<http://elibrary.dep.state.pa.us/dsweb/Get/Document-91717/8000-FS-DEP4300.pdf>).

Note that DEP water resource specialists such as Swistock and advisors from Local County and the USDA consistently recommend 3 water tests to represent high, low and average conditions because in PA, the water table and chemistry can change greatly. Also, 3 water tests are needed to stand up in court. The short time of presumed liability makes it easy for a company to avoid responsibility for damage to a water supply because forces that impact water take time to emerge. In such cases, a court case is likely to require at least 3 sample times to prove good water quality existed prior to operations. Families have lost cases in court because they did not have 3 tests; the drilling company paid for only one test. The necessary battery of tests is too expensive for the average homeowner, but 3 water tests per home is a small cost for a multimillion dollar well operation. (938, 938a)

Response: See response to comment 565.

- 599.** Comment: In the section on pre-drilling or pre-alteration survey, it should indicate that testing and analysis should be done for the full array of drilling chemicals, heavy metals and other substances from below the surface, both for the predrilling water tests and for subsequent water tests. The full and complete results of these predrilling and subsequent tests should become public knowledge in general, and shall certainly be provided to the residents living on the properties under consideration within 30 days. (945)

Response: See response to comment 565.

- 600.** Comment: § 78.52 (c): It is our opinion that clarification is needed regarding the role of the certified laboratory. “Report” and “survey” should be stricken from any reference to the lab so that it can’t be misconstrued that the laboratory is required to prepare the summary report, which in our case is prepared by a consultant. We also take issue with the caveat that a third-party consultant (“person independent of the well owner or well operator”) must be vetted by an accredited laboratory to collect water samples. It is the laboratories primary function to analyze the samples, not to collect the samples, and especially not to conduct a site investigation and document environmental conditions. Those functions are a necessary part of the “survey” and are best left to professional environmental consultants. Sub-section 78.52(c) should be revised to clarify that the laboratory does not need to conduct the survey itself, but simply analyze the samples collected. This section could be misinterpreted as stating that only laboratory employees can perform the surveys.

Our suggested amendatory language:

The analysis of pre-drill samples shall be completed by an independent accredited laboratory. The sample may be collected by either a technician employed by the accredited laboratory or an independent third-party consultant/contractor. Sample collection, preservation, and documentation must be performed in accordance with approved and recognized protocol

developed with the cooperation and approval of the accredited laboratory. (952)

Response: The rulemaking language states that a person independent from the well operator and not employed by the laboratory may collect the samples and do a site assessment of the water supply. It also states the third party person collecting the sample must comply with the laboratory's approved sample collection, preservation, and handling procedure and chain of custody, which is mandated by the Pennsylvania Safe Drinking Water Act requirements. There is no requirement for the third party person to be vetted by the laboratory. If the third party person collecting and submitting the samples to the accredited laboratory fails to follow the laboratory's approved sampling and documentation protocol, the laboratory must reject the samples. The Department does the analysis of the survey results as part of their investigation whenever the operator provides water supply samples as a defense.

601. Comment: § 78.52 (d): We support the open and transparent exchange of drinking water quality information among the property owners and the Department. With that being said, we suggest that the 10-day report requirement for pre-drill analytical data should be reconsidered since this timeframe could potentially impair the quality and completeness of the submitted data. We also take issue with the cross-reference of "sample results" and "survey results"....these are two distinct products. Providing sample (analytical) results to the Department within the 10-day timeframe is possible but will not provide the Department with a full set of data relative to site conditions. Providing a full survey report, inclusive of the laboratory sample results and the consultants observations and conclusions, within the 10-day timeframe is much more difficult to achieve given the amount of work and the degree of detail that goes into preparing a summary / survey report. It would be better to either restrict the 10-day reporting requirement specifically to laboratory analytical reports / results or to propose language wherein the operators are required to provide full summary reports to the property owner within 10-days of receiving them from the consultant (or lab, if so capable) and to the Department upon request after receiving a complaint. (952)

Response: The Department has changed the rulemaking language to specify that all the samples results must be submitted within the required 10 business day time frame.

602. Comment: § 78.52 (e): Relative to the above comments, there is an abrupt change in language whereas "sample results," "survey results," and "report" are used interchangeably. This creates uncertainty in what exactly is to be provided to the Department and to the property owner in the prescribed time frame. (952)

Response: See response to comment 601.

603. Comment: All drillers make predrill available data to the public along with the placement of well pads, compressor stations and where the pipelines are going to be placed. (988)

Response: The Department does not provide predrill data to the public, unless all identifying information is redacted, in order to protect the privacy and rights of the property owners.

604. Comment: Before drillers begin drilling, they should be required to do baseline testing (with results released to the DEP and to the public) of the surrounding water supplies, so that they cannot later wrongly claim that water contamination was probably there before they drilled. (1033)

Response: See response to comment number 565.

605. Comment: This regulation needs to be clearer about what "a predrilling or pre-alteration survey" is.

For example, is it one test? Two or maybe four tests conducted during different seasons, given that seasonal high groundwater tables fluctuate? I spent two years interviewing Pennsylvanian's whose water has been contaminated since nearby oil and gas drilling. I did so professionally. As a journalist, for an investigation that led to the documentary Triple Divide. Evidence from our findings, also in the film, deal with all of the key provisions of this proposed regulation. Here's what we found regarding predrill testing and surface water protection:

Predrill tests conducted on private water supplies by operators before drilling and tracking have been allowed to be dismissed during water contamination investigations by the state. The documentary Triple Divide covers two such cases, but in our investigations we found others. In one case, a predrill test was dismissed because it was a "one-time" test rather than a series of tests. Another predrill test failed to protect a water supply owner because her complaint came six months after the new well was drilled.

The industry has been allowed to provide an alternate source of water for some impacted homeowners 'off the books.' DEP makes the determination that the company "is not responsible" for the polluted water supply and the case is not counted as part of the total number of water contamination cases in the state - even though they have a predrill test that shows their water was clean before drilling.

Predrill testing is all the documentation there is to protect Pennsylvania water supplies, and the proposed regulations under section 78.52 need to be made more specific and robust.

As your summary for these regulations aptly points out, "Pennsylvania has more water resources than any other state except Alaska." That's right! We do! I mean, we don't learn that in school and I can't remember where I first heard that - but Pennsylvania has more freshwater resources than another other state...except Alaska. America is rapidly losing its fresh water sources as demonstrated by California Gov. Jerry Brown's drought emergency declaration just days ago, and the chemical spill in Charleston, West Virginia that's contaminating its way to the Gulf of Mexico. We live in a time when water has become the reason for wars across the world. And here, in Pennsylvania, pristine, fresh water bubbles out of the ground all over this state, so much that we take it for granted.

The summary regulation stats: "One focus of this regulation is to protect the vast water resources throughout Pennsylvania." But in my opinion, this regulation no more protects the vast water resources throughout our Commonwealth than a "heavy-duty" cardboard box will protect donuts from a black bear.

And I can't leave without failing to mention that right now, DEP and the administration of this state are fighting to prevent citizens from deciding where oil and gas drilling and fracking happen in their own communities. The state is literally trying to usurp our right to regulate development where we live. This is the worst abomination of all - a totalitarian attempt to limit the freedom, democracy and independence that was fought for and drafted into the United States Constitution right here in Pennsylvania. And to that, all I can say is, "Citizens, it's time to rewrite the Constitution of this Commonwealth to include the inalienable rights of all communities to govern themselves and to establish the rights of Nature herself, without whom we would not exist." (977a)

Response: See response to comment 566.

- 606.** Comment: 78.52(d) – "...shall provide a copy of the results...within 10-business days of receipt of the results". -- It is suggested that the language be revised to allow for the submittal of the results

within 30-days after the spud date of the first well on the pad to allow for all the pre-drill samples to be as a single package.

(g) – “The operator of an unconventional well must provide written notice to the landowner or water purveyor indicating that the presumption established under section 3218(c) of the act (58 Pa.C.S. § 3218(c) -- The proposed language is taken verbatim from Act 13. Either referencing the appropriate sections or deleting it would make it simpler and easier to read. (1057)

Response: In regards to § 78.52(d), the Department disagrees and has changed the rulemaking language to require all sample results to be submitted within 10 business days prior to commencement of drilling of the well. In regards to § 78.52(g), the Department believes that the new requirement for unconventional operators to provide written notice to a landowner or water purveyor that their rights under presumptions may be void, if they refuse an operator’s request for a predrill survey, is important enough to include it in the new rulemaking language.

607. Comment: § 78.52 We suggest that item (f) in this section be clarified to stipulate that well owner(s) are potentially refusing access to their property by a certified lab and not a well operator as currently stated in 78.52(f). This clarification would make the section consistent with requirements set forth in 78.52(c) requiring surveys by a PA accredited lab. Operators would need a Scientific Research and Collecting Permit should testing in National Park System units be desired or required. The regulatory language should specify that federal permits would be needed if public resources need to be tested. (1062, 133)

Response: The rulemaking language is appropriate because operators decide if predrill samples are to be taken and the accredited laboratory is a representative of the operator by being contracted to perform the work on the operator’s behalf. The federal government needs to decide if federal permits are required to perform work under their jurisdiction.

608. Comment: Owners of drinking water wells should be notified no less than 30 days before well spudding and not more than 60 days before well spudding so that they have time to have their own certified water tests. (1064, 1101)

Response: The 2012 Oil and Gas Act §§ 3211(b-b.1) requires operators to notify owners of water supplies within 1,000 feet of the proposed conventional well location or within 3,000 feet from the proposed vertical well bore of an unconventional well prior to submitting a well permit application to the Department. Proof of notification must be part of the well permit application. The Department has 45 days to approve the permit.

609. Comment: The pre-drilling or pre-alteration survey (78.52) should have consistent parameters for testing, as defined by the DEP. In Bradford County, there has been variability in different operators’ pre-drill testing parameters. As a result, some landowners’ water has been impacted without satisfactory determination of liability due to lack of specific testing to establish a proper baseline. While protecting the privacy of the landowner and referring to the general locales where testing has been done, these test results should be made available to the public through a searchable online database. (1066, 1089, 1229)

Response: Section 3218(c) of the 2012 Oil and Gas Act (58 Pa.C.S. § 3218(c)) establishes the presumption of liability for water pollution onto an operator. The presumption encompasses situations in which the water supply is within 1,000 feet of a conventional well or 2,500 feet of the unconventional well bore, and the pollution takes place within six months for a

conventional well or twelve months for a unconventional well for certain well development activities. While the Department does not mandate a predrill survey of water supplies, presumption incentivizes an operator to conduct predrill water supplies surveys, so they may have a defense to rebut presumed responsibility. If an operator chooses not to take a predrill water supply sample, they will not have a defense against presumption or, if presumption does not apply, they will not be able to refute the Department's sample results that show contaminants at levels higher than the maximum contaminant limits allowed by the Pennsylvania Safe Drinking Water Act standards. Lack of predrill samples is not a defense.

The Department does not provide predrill data to the public, unless all identifying information is redacted, in order to protect the privacy and rights of the property owners.

610. Comment: 78.52(d): The 10-day requirement is too short and will force additional unnecessary costs and that may actually decrease the reliability of the results. Typically these tests take two weeks for lab to run the necessary analysis, notwithstanding the time en route back and forth from the operator and then to the Department. In order for a prudent operator insure compliance with the deadline, it would be forced to have survey analyses "rushed," which typically increases the cost by a magnitude of four and tends to increase the number of lab errors and sample errors as well. Additionally, an unconventional operator would require at least one dedicated Full Time Employee (FTE) to manage this process within the required time frame, and possibly more. The language should be altered to say "10 business days upon receipt of results." In that case, additional language could be added clarifying that an operator cannot break ground until we have confirmed receipt that landowner received the results. (1071)

Response: The rulemaking language has been changed to 10 business days prior to commencement of drilling of the well that is the subject of the survey. The required 10-day prior to commencement of well drilling time frame only requires predrill samples to be taken at an earlier date and not for samples to require expedited analysis by the laboratory.

611. Comment: 78.52(d): Though the Commentator agrees with the concept of informing the Department and the applicable water users, it believes the Board should clearly state an operator has 10 business days from the receipt of the *last* sample result to mail the completed packet of sample results to applicable users. The proposed amendments to subsection (d) establish a new process for submitting predrill sample results to the Department and applicable water users. Under this proposed process, an operator electing to preserve its defenses under 58 P.S. § 3218(d)(1)(i) and (2)(i) shall submit all sample results taken as part of a survey to the Department within 10 business days of receipt of all the sample results taken as part of that survey.

An operator must send a copy of sample results to water users within 10 business days of receipt of such results. Clarifying that operators have 10 days from receipt of the last sample result will allow operators to make one submission while avoiding unnecessary confusion, opportunities for mistaken completeness, and unnecessary expense with no added environmental benefit. (1085)

Response: The Department allows for the operator to submit all sample results taken as part of the survey to the Department within 10 business days of commencement of drilling the well of concern. The Department believes it is prudent for the operator to provide a copy of any sample results to the landowner or water purveyor within 10-business days of receipt of the sample results to ensure that the landowner or water purveyor is informed as quickly as possible to the quality of their water supply as the sample results are made available.

612. Comment: 78.52.(d) Predrilling or pre-alteration survey - Due to the manner in which former farmland has been subdivided, on occasion there are landowners whose private water supplies may be located on adjacent properties. This may happen in the case of both springs and water wells. Generally, the water rights are spelled out in the corresponding deeds. There have been instances where the operator missed sampling a water supply. There have been instances where the owner of the private water supply as stipulated in the corresponding deeds were not provided with the sample results, but rather their neighbor whom owns the property where the private water supply is located was provided the results. There needs to be a mechanism that would provide the owner of the private water supply whose source is on another's property as specified in the deed for them to receive a copy of the sample results. (660a)

Response: The owner of the water supply is responsible to disseminate any information to the water supply's users.

613. Comment: 78.52(g): In order to avoid undue delays from non-responsive landowners, the rule should provide a time frame by which a landowner must respond to an operator's notification of the desire conduct water sampling. The commentator would recommend that a language be added specifying that a landowner must act within 7 days of receipt of intent by certified mail after which, refusal shall be presumed. (1071)

Response: Section 78.52(g) has been stricken because this provision in the 2102 Oil and Gas Act pertains only to unconventional well owners. Section 78a.52(g) does state that "Proof of written notice will be presumed if provided in accordance with section 3212(a) of the act." The Department will accept that the operator has made a good faith effort to provide notification to the property owner if, "Receipt of notice by the surface owner shall be presumed to have occurred 15 days from the date of the certified mailing when the well operator submits a copy of the certified mail receipt sent to the surface owner and an affidavit certifying that the address of the surface owner to which notice was sent is the same as the address listed in the assessment books in the county where the property is located."

614. Comment:

- Expand water testing parameters to petroleum distillates, heavy metals, and radioactivity.
- Designate that costs incurred by individuals to document pre-drilling water quality (as specified by an independent accredited laboratory) are to be passed on to the operator.
- Require all written correspondence related to potential contamination and testing be sent by registered mail. (855, 1098)

Response: The Department does not require predrill testing to be taken by operators. Since the Department does not regulate private water supply, owners of the private water supplies are encouraged to test their own water supply at their own expense. The operator chooses their carrier service provider when corresponding with property owners.

615. Comment: 78.52(g) incorporates Act 13 requirements that unconventional well operators provide written notice to water supply owners that the presumption established in Section 3218(c) of Act 13 may be voided if the landowner or water purveyor refuses to allow the operator access to conduct predrilling or prealteration surveys, provided that the operator submits proof of the notice to the Department. Commentators question how this subsection will be implemented. We believe the clarity of the provision would be improved if a timeframe for a response by the land owner or water purveyor to the written notice was included in the regulation. The regulation should also clarify when a landowner or water purveyor is deemed to have refused access for survey purposes. (1099)

Response: Section 78.52(g) has been stricken because this provision in the 2102 Oil and Gas Act pertains only to unconventional well owners. Section 78a.52(g) does state that “Proof of written notice will be presumed if provided in accordance with section 3212(a) of the act.” The Department will accept that the operator has made a good faith effort to provide notification to the property owner if, “Receipt of notice by the surface owner shall be presumed to have occurred 15 days from the date of the certified mailing when the well operator submits a copy of the certified mail receipt sent to the surface owner and an affidavit certifying that the address of the surface owner to which notice was sent is the same as the address listed in the assessment books in the county where the property is located.”

616. Comment: Include standards for pre-drill water quality baseline testing. (1106)

Response: See response to comment 565.

617. Comment: The Department should establish a minimum list of parameters that a well operator must test for when performing a predrilling or prealteration survey of water supplies to preserve defenses under 58 Pa.C.S. §§ 3218(d)(1)(i) and 3218(d)(2)(i).

Section 78.52 establishes conditions for an operator that conducts predrilling or prealteration surveys of drinking water supplies, including the use of state certified laboratories. The regulation does not address any minimum list of parameters for which the water samples must be analyzed. Establishing a minimum list of parameters has merit. First, and most importantly, it would assist the Department in making a causation determination by providing analysis of the same parameters that the Department uses after a complaint of pollution has been made. Second, it would provide a level of consistency across Pennsylvania, which is a principle generally supported by the industry. Third, it would allow the data to be used for other educational purposes such as compiling a picture of groundwater quality throughout Pennsylvania. Finally, it would eliminate uncertainty for drinking water supply owners. PennFuture recommends that the Department establish a minimum list of parameters that a well operator must test for when performing predrilling or prealteration surveys of water supplies similar to the parameters that the Department tests for when it investigates allegations that oil and gas operations have polluted a water supply. (852a)

Response: See response to comment 565.

618. Comment: Ground, surface, and well water in proposed drilled areas must be tested prior to drilling, using consistent, comprehensive parameters established before these regulations are adopted. The entire report of any water analysis must be available to landowners and the general public: no tested elements can be excluded from a report. Testing of the water should be continued long after the drilling process is completed. The reasoning behind this is that Pennsylvania continues to suffer from adverse water conditions due to fractured rock of the coal mining era. (1146)

Response: See response to comment 565.

619. Comment: The accredited laboratory often times does not oversee the environmental technicians collecting the samples. The commentator does not believe the accredited laboratory can truly affirm that the sampling was performed in accordance with the laboratory’s approved procedures. Cabot suggests this requirement be struck from Chapter 78. (1167)

Response: It is the obligation of those individuals taking the samples to meet the laboratory’s standards for sample collection, preservation, and chain-of custody and to prove it through documentation.

620. Comment: Tier -3 testing of water wells and streams on private property must be done before, during, and after production of a well. The testing must be done for every homeowner within no less of a one mile radius for the entire length of each and every horizontal well bore. The hydrogeological test company must be the choice of these homeowners, and the entire fee must be paid by the oil and gas company. All results must be delivered first to the homeowners without exception. (806)

Response: See response to comment 565.

621. Comment: Under § 78.52(c), EQB proposes to require predrill or prealteration surveys to be performed by independent “Pennsylvania accredited” laboratories. The existing language only requires that the laboratory be “certified.” Notably, 58 Pa.C.S. § 3218(e) states that an operator seeking to preserve its defenses under the section needs to “retain an independent certified laboratory to conduct a predrilling or prealteration survey of the water supply.” The General Assembly clearly did not seek to restrict survey work to solely Pennsylvania certified laboratories. Although the EQB does not define the term “accredited” it is presumably attempting to grant some element of control/discretion to DEP to grant official authorization or status to laboratories that perform this work. The Proposed Regulation does not describe the process for getting such an accreditation or what standards will apply. It is unclear why the EQB is attempting to impose this new standard that inappropriately creates a higher standard than that required by the statute for routine work that can be performed by numerous laboratories all across the United States. (1140)

Response: Pa. Code Title 25 Chapter 252 are the regulations for laboratory accreditation and requires that laboratories be accredited under the Chapter to generate data and perform analysis used to comply with an environmental statute listed in § 252.3, which includes the Oil and Gas Act. There are out of state laboratories accredited under Chapter 252 that may be used by an operator.

622. Comment: Existing and proposed § 78.52(d) require that predrilling or prealteration surveys be submitted to the DEP within 10 business days of receiving the results or the survey may not be used to preserve the operator’s defense that it is not responsible for the pollution. This strict bright-line rule is both arbitrary and unnecessarily punitive, especially considering that the statute does not expressly or impliedly impose such a harsh evidentiary rule. Without any rational or legal basis, DEP’s rule requires it to totally disregard valid direct evidence of pre-existing conditions on what can only be described as a “technicality.” Facts are facts and they should not be deemed inadmissible before a complaint is even submitted to the DEP. This prejudicial rule is totally inconsistent with well-established rules of evidence and should be modified.

What does the DEP do with all of these surveys? Where does DEP store them? How does DEP log them to guarantee that an administrative error on their part in receiving, documenting or storing a survey does not unjustifiably prejudice an operator who properly submitted a survey? Why should DEP manage and maintain all of this paperwork for complaints that will never be submitted?

We are not suggesting that operators should not provide a copy of survey results within a reasonable time frame to the landowner or water purveyor as that is important to maintaining good relations at the local level and to minimize complaints at the outset. Also, given the tight timeframes set forth in 58 Pa.C.S. § 3218(b) for the DEP to perform its investigation after a complaint is submitted to it by a landowner or water purveyor, Seneca would agree that operators should have a firm timeframe of 10 days after receiving notice of the complaint from DEP to send a copy of the applicable survey and other relevant evidence to the DEP. However, Commenter does not see the value in providing survey information to DEP in advance of a complaint being submitted, and commenter does not understand

the legal justification for DEP to maintain a procedural rule that requires it to reject sound, valid, relevant, and well-documented evidence simply because it did not receive a copy days, months or even years before a complaint is submitted. Seneca recommends that this rule be modified to require operators to submit surveys to DEP after receiving a demand for the same from DEP in response to a landowner or water purveyor complaint. This change would bring this regulation in line with established evidentiary practices, reduce administrative burdens on the DEP, and appropriately place the record-keeping burden for surveys on the operators, thereby avoiding the potential scenario where an operator is needlessly and unduly prejudiced as the result of an unintended administrative record-keeping error by DEP. (1140)

Response: See response to comment 587. The Department believes that the revisions address the commenters concern.

623. Comment: I'm not familiar to open frack pits. I'm not completely opposed to extracting natural Gas. Given the conditions of natural gas produce less contaminant than Oil or coal. Our need for energy and to eliminate our need for foreign energy, clean energy sources such as solar and wind must be developed and can help with our energy supply. A requirement of predrill testing and the restoration of drinking water supplies to safe and /or improve standards. This should not be a financial burden to the gas industry. (1009)

Response: The Department acknowledges the comment.

624. Comment: Any well driller who conducts a pre-drilling drinking water supply survey to protect himself should have to include a test for methane. A majority of well water contamination that results from drilling is caused by methane. (1064, 1101)

Response: The Department acknowledges the comment.

§ 78.52a Area of review

625. Comment: 78.52a(a) – The new language of this section sets forth requirements related to identification of abandoned and orphaned wells and has generated significant interest from the regulated community. Subsection (a) requires operators to identify orphaned and abandoned wells in proximity to the vertical and horizontal well bore prior to hydraulically fracturing a well. While some commentators suggest that this requirement should apply to all new wells, not just those that are hydraulically fractured, others believe that EQB lacks statutory authority under Act 13 to impose the requirements of this section on operators. We ask EQB to provide its authority for this requirement and explain how the requirement aligns with the intent of the General Assembly and Act 13. We also ask EQB to explain in the Preamble and RAF of the final-form regulation why this new section is reasonable, how it protects public health and the environment, and how the benefits outweigh any costs. (1099)

Response: The Department disagrees that it lacks statutory authority for the requirements in this section. Importantly, Chapters 78 and 78a are promulgated under the authority of both the 2012 Oil and Gas Act and the Clean Streams Law as well as several other environmental laws. Please see the response to comment 2464.

Sections 78.52a and 78.52a address potential communication between existing wells and hydraulic fracturing activities. Communication events pose a substantial threat to waters of the Commonwealth and pose a risk to public health, safety and the environment.

Under section 401 of the Clean Streams Law, it is considered unlawful for any person or municipality to put or place into any of the waters of the Commonwealth, or allow or permit to be discharged from property owned or occupied by such person or municipality into any of the waters of the Commonwealth, any substance of any kind or character resulting in pollution. Any such discharge is declared to be a nuisance. Section 402 of the Clean Streams Law authorizes the promulgation of regulations that are necessary to avoid such pollution.

Under the 2012 Oil and Gas Act, Section 3202 of Act 13 expresses the General Assembly's intent to permit development of oil and gas resources "consistent with protection of the health, safety, environment and property of Pennsylvania citizens." Under section 3217 (relating to protection of fresh groundwater and casing requirements), a well operator must control brines produced from drilling to aid in protection of fresh groundwater. This section is also concerned with preventing the migration of gas or fluids into sources of fresh groundwater. Section 3259 (relating to unlawful conduct) states that it shall be unlawful for any person to conduct an activity related to drilling for or production of oil and gas in any manner as to adversely affect public health, safety, welfare or the environment. Finally, section 3274 provides the authority for the EQB to promulgate regulations to implement this chapter.

Accordingly, both the Clean Streams Law and the 2012 Oil and Gas Act provide the Department the statutory authority for these provisions to minimize the impacts of hydraulic fracturing activities communicating with existing wells.

The final rulemaking requires operators to document due diligence either prior to drilling, stimulation, or with the permit application, dependent upon the anticipated timing of stimulation activities, and offers a procedure for doing so. Additionally, specified monitoring of the highest-risk well sites (potential conduits) will allow identification of communication incidents and greatly curtail the potential for environmental degradation. Addressing this particular issue has been supported by STRONGER, and comports with the Act, which intends that oil and gas wells be constructed in such a way to prevent gas and other fluids from entering sources of fresh groundwater.

When communication incidents are not observed immediately, the extent of the environmental impacts may be more severe. Remediation activities are costly and may require operators to finance projects over the course of several years. Depending on when the incident is noted, future wells may be drilled that are not considerate of open communication pathways - these wells may have to be abandoned prematurely or certain frac stages may have to remain unstimulated, thus reducing the economic value of the new well and the efficiency of resource recovery. The final rulemaking strikes a reasonable balance between the costs of conducting surveys and monitoring abandoned wells and the benefit associated with avoiding communication incidents.

- 626.** Comment: The abandoned and orphaned well identification requirement in this section is an unreasonable administrative and operational burden that is disproportionate to any perceived benefit. Thousands of conventional and unconventional wells have been hydraulically fractured over the years without Department-mandated abandoned well identification procedures and without significant environmental impact. Operators have conducted their own due diligence over the years to ensure precautions were taken to avoid potential well communication issues. Operating companies have relied upon both private and public databases as well as best management practices to aid in the identification and location of abandoned wells. PIOGA is not aware that an increase in horizontal drilling and associated high rate/volume stimulation has led to an increased number of cases of

communication with abandoned and orphaned wells. This rule is unnecessary, without any clear environmental benefit, and outside the scope of Act 13.

If a registered well has not been operated in a year and if the well has an inactive status, the well is considered abandoned and the operator must plug the well. Where no responsible party is identified for abandoned or orphan wells, they are plugged utilizing the surcharges from the orphan and abandoned plugging funds through the Well Plugging Program. Although the Commonwealth contracts for the plugging, Pennsylvania's oil and gas industry pays for the work through surcharges over and above the permit fees paid to the Department. Act 13 (Oil and Gas Act, Section 3271) continued the provision for surcharges. The orphan surcharge is \$200 for a gas well or \$100 for an oil well. The abandoned well surcharge is \$50.

The action of permitting, drilling and completing a new conventional or unconventional oil or gas well does not, in and of itself change the status of any orphan or abandoned wells in the vicinity. The Department lacks the statutory authority to shift its responsibility to manage orphan and abandoned to the present day industry.

Operators should have options about when to complete the outlined identification process – whether before permitting the well or before hydraulic fracturing – to allow more operational flexibility.

A landowner questionnaire will create problems. Many landowners will not answer questions or allow access to their properties, especially if they do not benefit from the prospective well. Keep in mind that large production units common in the unconventional industry are not nearly as common in conventional operations, so the obligations and cooperation from adjacent landowners will likely be problematic. In addition, there is a great deal of difference in the scale of drilling and hydraulic fracturing activities between conventional and unconventional operations regarding water usage, downhole pressures and quantities of materials used in the hydraulic fracturing process.

The use of a database that includes active, inactive, orphaned and abandoned wells will rely heavily on the accuracy of the data. If the accuracy of the data (location, well details, etc.) is questionable, then the operator is penalized by assessing inaccurate data, which could potentially significantly change drilling and completion plans for each well. The completion phases of well development should not be interrupted if abandoned and orphaned wells cannot be precisely located or if coordinates cannot be assigned to them. Lastly, to our knowledge the Department generated questionnaire forms have not been made available for review, therefore accurate and complete comments cannot be made on this section. Chapter 78.52a(b)(3) should be completely removed, or at a minimum postponed until the public has an ample opportunity to review and critique the contents of the questionnaire.

Suggested amendatory language:

§ 78.52a. Abandoned and orphaned well identification.

(a) Prior to hydraulically fracturing a conventional oil or gas well, the operator shall identify the location of inactive, orphaned or abandoned wells within 500 feet measured horizontally from the vertical well bore, whose total depth is known or reasonably expected to be less than 500 feet above the shallowest vertical depth to be stimulated as part of the hydraulic fracturing process. Prior to hydraulically fracturing an unconventional oil or gas well, the operator shall identify the location of inactive, orphaned or abandoned wells within 1,000 feet measured horizontally from the vertical well bore, whose total depth is known or reasonably expected to be less than 1,500 feet above the shallowest vertical depth to be stimulated as part of the hydraulic fracturing process. For the

purposes of this section, a gas well is a well which is producing or capable of producing marketable quantities of gas or of gas and oil with a gas-oil ratio of more than 100 MCF per bbl. of oil.

(b) Identification shall be deemed to have been satisfied by conducting the following:

- (1) A review the Department's inactive, orphaned and abandoned well database;
- (2) A review of applicable farm line maps, where accessible.

(c) Prior to hydraulically fracturing a well, the operator shall submit a plat to the Department showing the location and if possible, the GPS coordinates of wells identified pursuant to subsection (b), whose total depth is known to be less than 500 feet for a conventional well and less than 1,500 feet for an unconventional well above the shallowest vertical depth to be stimulated by hydraulic fracturing. The operator may identify on the plat those wells that are identified in the Department's database, but field verification of the identified well has not been confirmed utilizing reasonable investigatory efforts.

(1153)

Response: For an explanation of why the regulation is reasonable, please see response to comment 625.

For matters related to how the benefits of the rulemaking outweigh the costs, please see response to comment 625.

For matters related to the statutory authority of the regulation, please see response to comment 625.

Without an area of review protocol in place, it is not possible to definitively declare how many stimulations have taken place in the state without significant impact. The regulation will require observation at identified, high-risk well sites, thus putting in place some mechanism by which this statement can be considered and possibly applied with a reasonable level of certainty.

The regulation requires operators to document due diligence prior to either drilling, stimulation or with the permit application, dependent upon the anticipated timing of stimulation activities, and offers a procedure for doing so.

Communication with improperly abandoned wells during stimulation has been noted in association with both conventional and unconventional well operations. The incidents have been costly and challenging to resolve and pose risks to both the environment and the public. The threshold of applying a "statistical significance" test is not appropriate in cases where gas and other fluids escape the wellbore and pose such significant risks.

For matters related to protection of public health and the environment, please see response to comment 625.

Under the Clean Streams Law, it is considered unlawful for any person or municipality to put or place into any of the waters of the Commonwealth, or allow or permit to be discharged from property owned or occupied by such person or municipality into any of the waters of the Commonwealth, any substance of any kind or character resulting in pollution as herein defined. Any such discharge is hereby declared to be a nuisance. Oil and gas wells must be constructed, completed, and operated in a way that does not violate the Clean Streams Law.

The proposed “area of review” requirements are considerate of the differences between conventional and unconventional operations. Further modifications have been made to the final-form rulemaking accentuating the contrasts between the two sides of the industry.

The Department acknowledges the existence of uncertainty related to well location and surficial evidence of legacy well sites. The proposed landowner survey is one mechanism that may be beneficial for resolving such uncertainties, as landowners may be aware of the location of such sites on their property. Further, there is no additional expectation for operators to attempt to find and monitor sites that are not in the general vicinity of mapped locations.

The Department disagrees that the landowner survey will not yield valuable information in support of this regulation. However, the Department does acknowledge that clarification is needed and has agreed to make forms and guidance available prior to adoption of the final rule in order to address this concern. Specifically, this issue will be addressed in an area of review guidance document discussing the components of a suitable monitoring plan and the expectations for completing the landowner survey.

The Department acknowledges that clarifying language is necessary regarding acceptable vertical buffer distances between the stimulated interval and identified well sites and has modified the final-form rulemaking language to account for this concern. Out-of-zone fracture growth has been observed and there are implications for the rule that have been considered. Available studies were referenced to develop amended language.

Frac communication risks exist along the entire length of the lateral, but the precise pathway may not be recognized until after an incident. For example, some operators have chosen not to stimulate certain stages after noting communication with a nearby abandoned well. For this reason, the rule requires that well sites within a specified buffer be identified along the entire length of the lateral.

The regulation requires that “GPS” coordinates be provided for all wells identified on the plat. This does not suggest that coordinate data must be surveyed in the field for all locations. For example, only those sites requiring monitoring per the proposed requirements of Section 78.73 for which access has been granted and field identification accomplished must be surveyed in accordance with Section 3211(b) of the 2012 Oil and Gas Act. Acquisition of locational information for other well sites can be accomplished through scanning and digitizing the source map or using existing coordinate data on the source map to approximate the position of the well.

The Department acknowledges that it is important to include other well types in the area of review survey and has revised the final-form rulemaking language to include active, inactive and plugged and abandoned wells.

627. Comment: 78.52a(a). We recommend revising the area of review. Tioga County experienced a serious situation [Guindon – Butters Wells] with an abandoned well issue due to a hydraulic fracturing communication.

(Perilous Pathways: Abandoned Wells Don’t Factor into Pennsylvania’s Permitting Process: <https://stateimpact.npr.org/pennsylvania/2012/10/12/perilous-pathways-abandoned-wells-dont-factor-into-pennsylvanias-permitting-process/>)

This incident caused environmental harm and cost the operator a great deal of time and money.

After the well is spud, the operator of a gas well or horizontal oil well shall identify the location of active, orphaned or abandoned wells within 1,400 feet measured horizontally from the vertical well bore and 1,400 feet as measured at the surface, the entire length of the horizontal bore in accordance with subsection (b). The assessment needs to be entire subsurface depth of above and below the vertical and horizontal well bore in any gas bearing zone.

We realize that this area of review may indeed cover a greater depth than may be at risk by the operator in relationship to the formation in which they are working. However, there is a social responsibility of industry to help identify all wells as it was this industry in general, who created the largely estimated 300,000 orphaned and abandoned wells inventory.

The STRONGER September, 2013 Review [page 51] encouraged the Department to “consider regulations to require operators to evaluate and mitigate potential risk of hydraulic fracturing communication with active, abandoned or orphan wells and other potential conduits that penetrate target formation or confining formations above.” (STRONGER Guidelines Section 9.2.1) Our recommendations, albeit with detailed suggestions align with the STRONGER recommendations.

Additionally, unconventional drillers are not the only drillers utilizing horizontal drilling technology now. During the August, 2013, TAB subcommittee meetings public comment period in State College, a representative from Penneco made comment that his company is now utilizing horizontal drilling in shallow formations. Further review of this idea brings attention to this news article in September, 2013.

<http://www.post-courier.com/business/news/2013/09/22/Horizontal-drilling-fracking-begins-in-old-shallow-oil-and-gas-fields/stories/201309220115>

**Horizontal drilling, fracking begins in old,
shallow oil and gas fields
September 22, 2013 4:00 AM**

As Excerpted:

The newer business, Horizontal Exploration, was designed to profit from technology and services that followed Marcellus operators into Pennsylvania in recent years. Horizontal Exploration has drilled three horizontal, or lateral, wells so far and has permits for another eight in Pennsylvania. It fracked the first well this month and is awaiting results. The wells are about 2,000 feet deep and extend between 3,300 feet and 5,300 feet horizontally. "We think you should be able to do these for \$800,000 to \$900,000 [per well]," Mr. Thompson said. But at the moment, the company is spending about \$1.3 million a pop. It's still toward the bottom of the learning curve, he explained. A Marcellus well, by contrast, can run anywhere from \$4 million to \$10 million. It needs, on average, 5 million gallons of water for fracking. Horizontal Exploration is using only about 120,000 gallons of fluid to frack its shallow wells. The conventional laterals will never produce anywhere near the amount of oil and gas coming out of the deeper Marcellus wells, but

Mr. Thompson is hoping for at least 10 times the bounty of a vertical shallow well and a quicker payback period -- about 18 months, compared to four years.

The Upper Devonian sandstones are thinner than the Marcellus. Some are only 20 feet thick compared with the Marcellus' average thickness of 70 feet or more, said Dan Billman, president of Mars-based Billman Geologic Consultants Inc., which helps companies identify suitable spots to sink both conventional and unconventional wells.

While shale rock is tight and relatively impermeable, sandstone is porous and oil and gas easily flow through its tunnels.

That means the pressure needed to frack it is a fraction of what's required for a deep shale well. And some conventional horizontal wells are designed not to be fracked at all, Mr. Billman said.

One of the earliest horizontal shallow wells in Pennsylvania, with advice from Mr. Billman, was drilled by Freeport-based Phoenix Energy Productions in 2010.

Since then, the company has drilled two more horizontal wells in Washington County and hasn't fracked any of them.

Penneco Oil Company Inc. in Delmont, on the other hand, has been fracking horizontal shallow wells for several years now. It perforates the casing at more than a dozen stages and pumps "off-the-shelf" frack fluid additives into oil and gas formations about 3,200 feet under Greene, Westmoreland and Allegheny counties with

great success, according to Penneco's COO Ben Wallace.

"We hear this from a lot of drillers -- they get called because oil and gas companies look up our completion reports," Mr. Wallace said. Penneco's sandstone wells cost "several million" dollars to complete, Mr. Wallace said, and the company plans to drill about 10 horizontals a year.

Several other companies, such as Warren County-based Pennsylvania General Energy and South Side-based Catalyst Energy have secured permits from the Department of Environmental Protection to drill horizontally in shallow reservoirs.

Shallow, or conventional, drillers report their production annually, not every six months as Marcellus operators must, so the results of these efforts won't be available until next year.

We advocate that the assessment be done after the well is spud as the spud indicates a clear intent that the operator is going to drill that well. Doing the assessment at that point, allows sufficient time to alter their drilling plans if need be [should their plans be within AOR of an active, orphaned or abandoned well]. Rather than incurring the expense of drilling a well they may not be able to safely fracture, they can amend their drilling permit for a modified horizontal well bore.

Let's not forget the goal here, which is to identify active, orphaned and abandoned wells and avoid/prevent an environmental incident. The Operator would only be required to plug the well/s that has been deemed at risk by their hydraulic fracturing operation. The remaining identified wells are to be placed in the DEP inventory of orphaned and abandoned wells waiting plugging. We see this process in a threefold manner; 1- identify the active, orphaned and abandoned wells, 2 – perform a proper risk assessment to determine whether or not the identified active, orphaned and abandoned wells may cause a communication event, 3 – advise the Department of the all wells and plug at risk wells accordingly. The Operator upon identifying at risk well/s could determine to abandon their plans to hydraulically fracture the well and not be responsible for the at risk well/s that would be deemed necessary for plugging. The Operator also has the option of amending the permit for a modification.

All drillers, both conventional and unconventional need to complete the active, abandoned and orphaned well identification process. With some conventional drillers transitioning into the horizontal drilling method, it is even more imperative that the conventional drillers complete an adequate assessment to avoid future environmental impacts. (660a)

Response: Although it acknowledges exceptions may exist, the Department has retained the proposed distances in the final-form rulemaking. These distances are generally considerate of development spacing in the state and the known differences between the area of the reservoir stimulated and the well's effective drainage area.

For matters related to which well sites must be monitored because of vertical proximity to the stimulated interval, please see response to comment 626.

For matters related to the inclusion of other well types in the area of review survey, please see response to comment 626.

The Department acknowledges the comment and has modified the regulatory language to require that the area of review survey take place either prior to drilling, stimulation or permitting, dependent upon the anticipated timing of stimulation activities. This change will allow for avoidance measures to be implemented in an effort to mitigate risk.

Plugging an identified well is a potential risk mitigation strategy available to an operator and this practice has been applied historically. However, assuming that all identified wells in the survey have not been plugged or pose equivalent risks, and mobilizing plugging equipment to

each site to re-enter wells is beyond the scope of a reasonable regulation aimed at suitably addressing risk. By monitoring well sites appropriately, an assessment can be made regarding the potential for environmental impact and corrective actions employed should an unanticipated communication event occur.

628. Comment: The location coordinates for a large number of wells that may exist in the Department's database are likely derived from sources other than field GPS coordinates. Some coordinates may have been derived from old maps. For a variety of reasons, a well with latitude/longitude coordinates in the Department's database may not be visible on the ground, perhaps because the coordinates are inaccurate, or possibly because the well does not exist.

It seems appropriate that any wells which appear on the Department's database should be identified, provided their total depth extends below the interval that could reasonably be influenced by hydraulic fracturing. A vertical isolation distance of 1,500 feet above the zone to be perforated or isolated for hydraulic fracturing in an unconventional well and 500 feet above the zone to be perforated or isolated for hydraulic fracturing in any other well is a reasonable isolation distance that exceeds the normally expected vertical growth of induced fractures.

A requirement to consult "applicable farm line maps, where accessible" in order to identify wells lacks the clarity required for a regulation. There are many sources of information on old wells in Pennsylvania, including many reports by state agencies, as well as privately owned maps and records maintained by various operators. If the Department's database could be sufficiently enhanced, a review of the database should be an adequate obligation for well identification. A partnership effort between industry and state government seems an appropriate method of compiling available data on historical oil and gas wells.

Because of the generally higher rate, volume and pressure used in hydraulic fracturing of the Marcellus and other deep shale, constructing a more comprehensive database of historical deep wells (those that penetrate to a depth at least 1,500 feet above the Marcellus Shale) would be a priority. It is hoped that with good cooperation, this could be accomplished within a few months, as the state's current database for this set of deeper wells is believed to be nearly complete.

Enhancement of the shallow well database will require significantly more work, time and expense, and is likely a multi-year project.

The proposed language in Subsection 78.52a(b)(3) would require submission of a questionnaire to landowners requesting information on orphaned or abandoned wells on forms provided by the Department. It is unclear how responses to such questionnaires would be directed and what obligations might fall on operators to verify information received. There is far too much uncertainty related to this provision to support it as a regulatory requirement. The requirement to use a questionnaire should be eliminated.

Additionally, the oil and gas industry's identification of abandoned and orphaned wells will benefit from further development of the Department's database, and should be postponed until the database and map viewer system is improved. Accordingly, the Department should consider a phased implementation of this new section.

Suggested amendatory language:

§ 78.52a. Well identification prior to hydraulic fracturing

- (a) Prior to hydraulically fracturing an unconventional well, the operator shall identify in accordance with subsection (b) the location of active, inactive, plugged, orphaned or abandoned

wells within 1,000 feet measured horizontally from the surface projection of any portion of the wellbore whose total depth is known or reasonably expected to be less than 1,500 feet above the shallowest vertical depth to be perforated or isolated for hydraulic fracturing. Prior to hydraulically fracturing a conventional well, the operator shall identify the location of active, inactive, plugged, orphaned or abandoned wells within 500 feet of the well bore whose total depth is known or reasonably expected to be less than 500 feet above the shallowest vertical depth to be perforated or isolated for hydraulically fracturing.

(b) Identification shall be deemed to have been satisfied by conducting a review of the Department's database for active, inactive, plugged, orphaned and abandoned wells.

(c) Prior to hydraulically fracturing a well, the operator shall submit a plat to the Department showing the location and GPS coordinates of wells identified pursuant to subsection (b) whose total depth is known or reasonably expected to be less than 1,500 feet, in the case of an unconventional well or 500 feet, in the case of any other well, above the shallowest vertical depth to be perforated or isolated for hydraulic fracturing. The operator may notify the Department of any wells that are identified on the Department's database but which have not been located on the ground using reasonable efforts.

(d) This subsection shall become effective [six months] from final publication in the Pennsylvania Bulletin. (1103, 1137, 1147)

Response: For matters related to well site locational uncertainty, please see response to comment 626.

The Department currently maintains and makes available a list of orphaned and abandoned sites that have not been plugged. The location of plugged wells are available in PA*IRIS/WIS. Existing databases are being expanded upon by the Department as historical analog source maps become available and as time permits. Companies in possession of such maps may share them with the Department, if they so choose, in order to facilitate development of a more comprehensive reference database over time. It should also be noted that the Department has modified the regulatory language to broaden the historical maps and database sources that could be referenced during the area of review survey. However, the revised language recognizes that not all operators may have access to the same sources.

For matters related to which well sites must be monitored because of vertical proximity to the stimulated interval, please see response to comment 626.

For matters related to the value of the landowner questionnaire, please see response to comment 626.

629. Comment: 78.52a(a) -- It seems appropriate that any wells which appear on the Department's database should be identified, provided their total depth extends below the interval that could reasonably be influenced by hydraulic fracturing. A vertical isolation distance of 1,500 feet above the zone to be perforated or isolated for hydraulic fracturing in an unconventional well and 500 feet above the zone to be perforated or isolated for hydraulic fracturing in any other well is a reasonable isolation distance that exceeds the normally expected vertical growth of induced fractures. (1103)

Response: For matters related to which well sites must be monitored because of vertical proximity to the stimulated interval, please see response to comment 626.

For matters related to sources that should be referenced when completing the area of review survey, please see response to comment 628.

630. Comment: Delete the requirement in 78.52a(a) for operators of vertical oil wells to conduct a survey prior to stimulation of the vertical oil well. (1135)

Response: The "area of review" requirements are considerate of the differences between conventional and unconventional operations. Further modifications have also been proposed accentuating the contrasts between both sides of the industry.

631. Comment: § 78.52a(a) - It is suggested that language is added to include a 6 month effective date to allow for wells already permitted but not yet completed. (124a)

Response: The survey must be completed prior to either drilling, permitting or stimulation, dependent upon the anticipated timing of stimulation, and will not apply to wells that are partially drilled at the time of promulgation.

632. Comment: The commentator supports a rule that requires reasonable diligence to identify active, inactive, plugged, abandoned, and orphaned wells prior to hydraulic fracturing. The DEP's proposal, however, would lead to open-ended obligations for identifying these wells. (196, 1137)

Response: For matters related to the inclusion of other well types in the area of review survey, please see response to comment 626.

The Department has agreed to make forms and clarifying guidance available prior to adoption of the final rule in order to address this concern. Specifically, this issue will be addressed in an area of review guidance document discussing the components of a suitable monitoring plan and the expectations for completing the landowner survey.

633. Comment: Subsection (a) should be changed to require that the survey be conducted before site construction rather than hydraulic fracturing.

Subsection (a) ties the identification of abandoned and orphaned wells to hydraulic fracturing of the well. We suggest that it would be better to have any abandoned and orphaned wells identified before site construction so as to ensure that well operators have as much advance notice as possible to inform well placement, or prepare mitigation measures should placement appear that it will affect abandoned or orphaned wells. (852a)

Response: For matters related to the timing of the area of review survey, please see response to comment 627.

634. Comment: I support the requirement for a survey of orphan and abandoned wells. I would like to express my strong support for the new provisions requiring those constructing an unconventional gas well to do a survey for orphan and abandoned wells. This is long overdue and commendable. The Oil & Gas Industry's opposition to this provision is disgraceful. (869a)

Response: The Department acknowledges the comment.

635. Comment: Onsite identification of old wells should be required and need to be sealed. Any additional precautions must be taken. (10, 16, 46, 62, 67, 163)

Response: For matters related to well plugging prior to hydraulic fracturing, please see response to comment 627.

636. Comment: § 78.52a needs to be expanded to fully protect human health and safety and stay on par with other oil and gas states. When active drilling activity communicates with abandoned or orphaned wells significant threats to human health and the environment can occur. (1165)

Response: By monitoring the highest risk sites, any environmental impacts and potential health effects can be greatly curtailed and addressed by the operator completing stimulation activities.

637. Comment: Identification of orphaned and abandoned gas and oil wells (Section 78.52a). This is an important change and should be supported. About 200,000 abandoned wells exist statewide. As drilling spreads and intensifies, so does the chance of accidents, blowouts, and pollution from the intersection of new wells with old ones. DEP should expand these changes and require operators to: Identify existing wells before site and well construction and drilling (not just fracking), so that the location of a new well can be changed if needed.

Plug and seal or otherwise appropriately address abandoned and orphaned wells according to state safety standards prior to well site construction. The state lacks funding to address the large number of old wells, so drillers should be responsible for preventing pollution of adjacent water wells and air pollution from accidents when they occur. (17, 18, 19a, 70, 72, 73, 79, 99, 102, 125, 160, 161, 169, 193, 199, 200-385, 406, 471, 475, 492a, 494, 560, 564, 565, 626, 632, 635, 842, 843, 865, 884, 912, 918, 922, 926, 938, 947, 1039, 1058, 1068, 1083, 1088, 1102, 1148, 7521 – 8362, 4582 – 4584)

Response: For matters related to the timing of the area of review survey, please see response to comment 627.

For matters related to well plugging prior to hydraulic fracturing, please see response to comment 627.

638. Comment: Comment: I support the provision in section 78.52a. It is very important to identify the location of existing wells and to plug and seal abandoned/orphaned wells before site and well construction and drilling. This makes drillers responsible for footing the costs of sealing old wells, not the state. (24, 102, 104, 405, 406,)

Response: For matters related to the timing of the area of review survey, please see response to comment 627.

For matters related to well plugging prior to hydraulic fracturing, please see response to comment 627.

639. Comment: Identifying active, inactive, plugged, abandoned and orphaned wells prior to hydraulic fracturing may be something that the industry can work with the DEP, but not to the level of the proposed regulations as that may lead to non-ending obligations on behalf of the industry for wells that are not ours.(123, 638, 638a, 123a, 798, 123b, 883, 940)

Response: For concerns related to the open-ended characterization of the rule, please see response to comment 632.

640. Comment: I live in Southern Butler County, which was heavily drilled in the past. Many abandon wells exist in the area. Unplugged wells and abandon wells are a source of methane migration. A pre-fracking survey needs to occur to identify orphan or abandon wells prior to drilling on any site. The drilling company should be required to plug orphan or abandoned wells before drilling. Unfortunately, this occurred because of lax regulation and oversight in the past. Let's not continue to make the same mistakes. (129)

Response: For matters related to well plugging prior to hydraulic fracturing, please see response to comment 627.

641. Comment: This is a redundancy and has no relationship to public health, safety, and the environment. These are things that operators have already done and are doing as standard practice when surveyors are sent out to the proposed site. The only thing I can see that would change is, now PADEP would require the operator to identify, through several means, including a questionnaire to the surface owner. The added time in the field for surveying along with the added expense of searching for absent surface owners and all other related administration for this section would drive up the cost of each proposed well. * Only require the GPS shots of the orphaned wells. (145)

Response: For matters related to the current application of due diligence by operators, please see response to comment 626.

642. Comment: Survey for all other nearby (within 1 mile of a planned well, say) wells (oil, gas, water, or other), map them, test their casing and cement for leaks, and put all well information on the web. Forbid new drilling or fracking if there are any wells nearby with faulty casing or cement. (156)

Response: For matters related to the dimensions of the area of review, please see response to comment 627.

Water supply wells are addressed under existing laws and regulations, including the presumptive liability and setback language of the Act.

The Department has modified the regulation to require a visual assessment of each well's integrity. The requirements are consistent with the Department's current requirements for assessing operating wells for mechanical integrity, i.e., visual inspections for escaping gas and fluids, and severe corrosion.

The current regulation requires that altered wells be properly plugged by the operator completing stimulation activities. Until the altered well is adequately addressed, the operator will not be permitted to continue stimulation activities. Existing regulations require quarterly mechanical integrity assessments at all operating wells in the state and annual reporting of any leaks identified. Per the current regulations, gas venting to the atmosphere is not prohibited, but rather must be done safely. Further, gas and any fluids sourced from below the surface casing are not permitted to be discharged into fresh groundwater and defective casing/cement must be addressed.

643. Comment: Abandoned wells near drilling operations should not only be identified but plugged. PA's estimated two hundred thousand abandoned and orphaned wells (and this is a conservative estimate) are inherited from conventional drilling operations. According to DEP's own report on methane migration from oil and gas wells, these old unplugged wells can be conduits for drilling fluids and methane and have been responsible for explosions and loss of life. Such migration is also harmful to soil, water, and air and must be prevented. (182)

Response: For matters related to well plugging prior to hydraulic fracturing, please see response to comment 627.

644. Comment: 78.52a – For shallow well drillers, this will significantly increase the cost of survey work and site map fees. The survey will now have to include a 72 acre area. The surveyor's time to draw a well site map will increase from one day to as much as a week to collect the info and map 72 acres, raising the cost from \$500 to \$2500. (183)

Response: For matters related to how the benefits of the rulemaking outweigh the costs, please see response to comment 625.

645. Comment: 78.52a – The circular area of 1000 feet of investigation from the well bore is flawed by the science of a shallow well. The hydrofrack zone varies by rock structure, but has not exceeded 250' from the well bore in shallow wells. This is proven by new well spacing of 450' apart from each other. The proposed 1000' distance far exceeds any distance required between shallow wells.

Presently a well developer is already responsible for any pressure communication from their new well with an orphan/abandoned well. This regulation appears to benefit only the DEP database, but it will cost the driller more money for each new well without solving any of their problems. (183)

Response: For matters related to the dimensions of the area of review, please see response to comment 627.

Response: For matters related to the current application of due diligence by operators, please see response to comment 626.

646. Comment: § 78.52, which require drillers to search databases for abandoned wells within 1,000 feet to help build a database of abandoned wells, is also a common-sense proposal. (188)

Response: The Department acknowledges the comment.

647. Comment: The gas and oil operators should be required to identify orphaned or abandoned wells at a distance in which they plan to drill horizontally. They should also take into account the depth of the orphaned or abandoned wells in terms of potential impact to the site specific geology from their proposed drilling in a horizontal direction. In addition to the oil and gas companies consulting with the Department's database, farm line maps, and submitting a questionnaire to surface land owners, the PA DEP needs to investigate independent studies that can and have determined a safe distance from an abandoned and orphaned well to a new drill site. The research must include: pros and cons; health impacts, environmental impacts, complete and concise information pertaining to the risks to the specific geology in that area at the very least. If that research is unable to be obtained then the money from these proposed regulations must also assist with further research to obtain that data, otherwise, we're being reactive rather than proactive. (189)

Response: Generally speaking, due to lithostatic pressure applied by overlying rock layers and the physics constraining fracture mechanics, the most likely pathway to fresh groundwater during hydraulic fracturing is represented by improperly abandoned oil and gas wells. If faults or zones of fracture concentration do play some role in communication, it is by allowing propagated fractures to move out of zone and into an improperly abandoned oil or gas well. However, the Department has modified the regulatory language to include a

provision for monitoring fracture treatment pressures and volumes at the stimulated well site. This provision is intended to allow for the identification of abnormal fracture growth.

The buffer distances in the regulation are generally considerate of well spacing and the difference between the volume of the reservoir stimulated and a well's drainage areas. Although the Department acknowledges exceptions may exist, the regulation is designed to effectively reduce, and not completely eliminate risk.

- 648.** Comment: Compel companies to identify existing wells before new well construction in order to prevent negative impacts on water supplies and the environment. (193, 199, 471, 477, 494, 560, 1161, 1165)

Response: For matters related to the timing of the area of review survey, please see response to comment 627.

- 649.** Comment: § 78.52a should require operators to plug all abandoned or orphaned wells, not just those that are 'altered'. (1165)

Response: For matters related to well plugging prior to hydraulic fracturing, please see response to comment 627.

- 650.** Comment: Surveys for abandoned and orphaned wells should be required for all wells, not just wells that are hydraulically fractured. History has shown that even non-hydraulically fractured wells can cause problems. A smaller identification and monitoring distance could be used for non-hydraulically fractured wells. (1165)

Response: The intent of the regulation is to mitigate risk in association with hydraulic fracturing and, as such, targets wells that will be stimulated using this process. Due to the geology in the state, the vast majority of oil and gas wells are stimulated using this process. Existing laws and regulations address environmental risks associated with the drilling and operation of all wells in the state.

- 651.** Comment: Simplify this section to the following for all wells: Prior to drilling the well, the operator shall make a good faith effort to identify the location of all operating, inactive, orphaned or abandoned wells within 500 feet of the wellbore in accordance with subsection (b). This would cover the general consensus that frac propagation does not exceed 500 feet from the wellbore. The key word is wellbore so by this definition, a standard Upper Devonian conventional well with a total depth of 3500 feet would not have to be identified for a horizontal Marcellus Shale well at a true vertical depth of 6000 feet or more.

It would be more beneficial and practical for the operator to identify these types of wells prior to drilling and during the permitting process. The identified wells could be included on the well location plat and will be more cost effective to collect the locations of said wells while the surveyors are already in the field. The identification of these wells is just a crucial during the drilling phase in the event of a blow out and the associated risk of over pressuring a well that penetrates the same open formation while drilling.

Will the review of the Department's orphaned and abandoned well database require and operator to gain access to the Well Information System (WIS)? I believe this is only accessed through a PAIRIS account. Is the Department willing to give free access this PAIRIS for this well review?

The identification or potential identification of these types of wells has an effect on other aspects of well permitting. For the operator that must deal with coal vs. non-coal determinations, this will affect the outcome of those determinations. With the identification of these abandoned or orphaned wells in a coal area, unless the operator can prove that the well was abandoned prior to November 30, 1955; the operator will have to respect that location for coal spacing. The question that comes into play is that if it's based on the location of the well from an old map, how does the accuracy affect that outcome? Caution must be taken when showing these well locations as some well locations on older maps was simply that, just a proposed location and was never drilled.

The Department needs to provide the forms for review prior to the establishment of this section. What will the Department do if a landowner denies the operator access or fails to respond? What if the operator identifies a well but does not know or cannot find any information about the well such as depth, casing design, etc.? A definition of "precise location" needs to be given for clarity. (411)

Response: For matters related to the dimensions of the area of review, please see response to comment 627.

For matters related to the timing of the area of review survey, please see response to comment 627.

For matters related to sources that should be referenced when completing the area of review survey, please see response to comment 628.

The Department acknowledges the existence of uncertainty related to well location and surficial evidence of legacy well sites. The landowner survey is one mechanism that may be beneficial for resolving such uncertainties, as landowners may be aware of the location of such sites on their property. Further, there is no additional expectation for operators to attempt to find and monitor sites that are not in the general vicinity of mapped locations. This regulation makes no further attempt to clarify coal-spacing requirements, which must be consistently observed in accordance with existing statutes.

For matters related to the value of the landowner questionnaire, please see response to comment 626.

- 652.** Comment: Abandoned and orphaned well identification is very crucial to the development and protection of surrounding resources. We are concerned that these wells could lead to potential risks to the natural resources surrounding areas under deep well drilling development. We encourage the development of reporting these well sites and would like to see monitoring conducted over a period of time within the 1,000ft. and 500ft. ranges that ensures the safety of development activities associated with potential groundwater compromises. A rigorous plugging and sealing of abandoned and orphaned well program should then be implemented by the Department or required of the industry as the wells are identified. (566)

Response: The Department will develop clarifying guidance related to the area of review requirements prior to promulgation of the final rule. Specifically, this issue will be addressed in a guidance document discussing the components of a suitable monitoring plan.

For matters related to well plugging prior to hydraulic fracturing, please see response to comment 627.

653. Comment: A search radius of 500 feet is inappropriate for shallow wells drilled on 300 foot centers. For very sound technical reasons and for these types of wells a search radius of 150 feet is appropriate. (606, 606a)

Response: For matters related to the dimensions of the area of review, please see response to comment 627.

654. Comment: I applaud the addition of the proposed 78.52a. With an estimated 250,000 wells that were not properly plugged, this addition will help to identify these wells and encourage mitigation efforts in this regard. The 1,000 foot identification distance should remain as the minimum identification distance. Reduction of this distance should not be approved. Regarding the visual monitoring of identified orphan wells, I would suggest language be added to include required recordkeeping by the operator of such monitoring. As I am not an expert in what parameters should be monitored, I would leave it to the Board to further define the proper required recordkeeping. (625)

Response: The Department acknowledges this comment and has modified the regulatory language to require an area of review report and monitoring plan.

655. Comment: Abandoned and orphaned well identification, proposes that the operator identify the location of orphaned or abandoned wells within 1000 feet measured from the surface above the entire length of a horizontal well bore.

Identifying abandoned and orphan wells is acceptable; however, this requirement must not be open ended. In its current form this regulation is unclear as to what requirements will be placed on industry and has the potential for undue and unnecessary added expense. (639)

Response: For concerns related to the open-ended characterization of the rule, please see response to comment 632.

656. Comment: I agree these wells should be identified but they must be identified before any site disturbance and recorded publicly, plugged and sealed according to state safety standards PRIOR to well site construction and testing of area water wells and intakes should be done by the operator to assess any pollution caused by the orphaned or abandoned well. These wells are a serious safety hazard in Pennsylvania and there should be every precaution taken to find them, avoid communication between new wells and old to avoid blowouts, accidents and well casing failure. These old wells that are pollution threats should be plugged. (649, 787, 1030, 1030a, 1064, 1073-1077, 1079-1082, 1084, 1101, 1158, 1168, 4584 – 4650)

Response: For matters related to the timing of the area of review survey, please see response to comment 627.

For matters related to well plugging prior to hydraulic fracturing, please see response to comment 627.

657. Comment: Section 78.52a, Abandoned and orphaned well identification, is an example of a good start on a rule to address a problem that has occurred in the past. DEP should have operators identify existing wells before wells are spudded, instead of, “prior to hydraulic fracturing” as the language in the section currently reads. (846, 1109)

Response: For matters related to the timing of the area of review survey, please see response to comment 627.

658. Comment: Another change that will help insure a more effective survey will be undertaken is to increase the distances measured from the surface above the horizontal well bores to 1,400' from the current language's 1,000'. This recommendation is derived from an explanation given by a representative of the Shell Corporation at the TAB meeting in State College of the maximum distance the energy in a frac operation can penetrate the rock around it, which was stated to be 1,400'. This distance should be derived based on science rather than an arbitrary rounded figure of 1,000'. (846, 1109)

Response: For matters related to the dimensions of the area of review, please see response to comment 627.

659. Comment: 1000 feet is the allowable distance for drillers to drill new wells when the provisions admit that abandoned wells have been known to be altered and contribute to methane migration when new wells are drilled and with horizontal hydraulically fractured wells what difference will 1000 feet make from the initial vertical well bore? And the provisions propose that visual monitoring and plugging is required by the operator of the well drilling and we all know from past experience that that is simply a ridiculous notion on all fronts because the dream of huge amounts of money (which almost never materializes) are far too strong a draw for them to follow regulations and fines are simply tokens and not even a slap on the fingers if they are not followed. Again the solution for this problem is a total ban of this industry in Pennsylvania and actually in this country as a whole. (864)

Response: The Department disagrees that the area surrounding the vertical wellbore should not be assessed for well sites. For example, in situations where fractures communicate with a shallower portion of the well being stimulated, wells surrounding the vertical portion of the stimulated well may serve as conduits to the surface.

The Department disagrees that a ban on oil and gas development is the only way to effectively mitigate risk associated with hydraulic fracturing. See response to comment 2501.

660. Comment: This section proposes that the operator identify the location of orphaned or abandoned wells within 1000 feet measured from the surface above the entire length of a horizontal well bore. Identifying abandoned and orphaned wells is acceptable, however this requirements must not be open ended. In its current form this regulation is unclear as to what requirements will be placed on industry and has the potential for undue and unnecessary added expense. (908)

Response: For concerns related to the open-ended characterization of the rule, please see response to comment 632.

661. Comment: I am supportive of the proposed revisions regarding the documentation of orphaned and abandoned oil and gas wells. The documentation of these wells prior to the commencement of drilling will minimize hazardous incidents. We do, however, encourage DEP to consider expanding the radius for these surveys from 1000' to 2500' from the entire length of the horizontal legs. (919, 943)

Response: For matters related to the dimensions of the area of review, please see response to comment 627.

For matters related to the timing of the area of review survey, please see response to comment 627.

662. Comment: We support the Department’s desire to proactively locate, document, and address abandoned and orphaned oil and gas wells in the stipulated vicinity of a well that will be hydraulically fractured. We propose two (2) changes/clarifications to what has been proposed. Our suggested amendatory language:

- It is recommended that the Department develop similar, but different distance requirements for horizontal and vertical wells; for example:
 - a. Unconventional wells – within 1000 feet measured horizontally from the surface projection of any portion of the wellbore whose true vertical depth is known or reasonably expected to be less than 1,500 feet above the shallowest vertical depth to be perforated or isolated for hydraulic fracturing
 - b. Conventional wells – within 500 feet measured horizontally from the surface projection of the wellbore whose true vertical depth is known or reasonably expected to be less than 500 feet above the shallowest vertical depth to be perforated or isolated for hydraulic fracturing
- We ask that a notification and response period be established to ensure that future operations are not unnecessarily delayed by non-responsive property owners. A property owner will need to complete and return the questionnaire within the specified time frame to have the historic penetration included in the official documentation sent to the Department. (952)

Response: For matters related to which well sites must be monitored because of vertical proximity to the stimulated interval, please see response to comment 626.

The Department will develop a questionnaire and instructions and draft clarifying guidance regarding the area of review requirements, including landowner questionnaires, prior to promulgation of the final rule.

663. Comment: 78.52a – Abandoned and Orphaned Well Identification - (a) – “Prior to hydraulically fracturing the well...”. -- It is suggested that language is added to include a 6 month effective date to allow for wells already permitted but not yet completed. (1057)

Response: For matters related to the implementation schedule of the rule, please see response to comment 631.

664. Comment: Abandoned and orphan well identification (78.52a) should be done by the operator prior to drilling, not just prior to fracking. After all, there have been instances in our Northern Tier Counties of methane migration from drilling prior to fracking, even without the presence of abandoned wells. Since the industry fully acknowledges that unplugged abandoned wells are a prime route for methane migration, it seems logical that there is an even greater risk of pre-fracking problems occurring in their presence. Ideally, these abandoned wells should be plugged prior to drilling rather than just monitoring them after fracking. (1066, 1089, 1229)

Response: For matters related to the timing of the area of review survey, please see response to comment 627.

665. Comment: 78.52a: Abandoned and Orphaned Well Identification- Improve Area of Review Based on Sound Horizontal and Vertical fracturing Propagation

The proposed scope of the 1000 feet of the well bore and along the entire length of the horizontal well bore could be enhanced to better reflect sound horizontal and vertical fracturing propagation. The proposed text requires operators to survey for abandoned and orphan wells in the vicinity of their unconventional well prior to fracturing. We share the Department's goal of reducing, if not eliminating, the impacts to health, safety, and the environment that an unidentified abandoned well could pose. Another shared goal is reducing the substantial inventory of known abandoned wells in the Commonwealth. In defining the scope of review, the Board should leverage the expertise derived from the available technology to achieve these goals.

The area of review should be precise and limited to an area based on sound horizontal and vertical fracturing propagation, in our view. It seems appropriate that any wells which appear on the Department's database should be identified, provided their total depth extends below the interval that could reasonably be influenced by hydraulic fracturing. We recommend addressing the vertical isolation distances in the Rule's area of review. To that end, we suggest a vertical isolation distance of 1,500 feet above the zone to be perforated or isolated for hydraulic fracturing in an unconventional well and 500 feet above the zone to be perforated or isolated for hydraulic fracturing in any other well is a reasonable isolation distance that exceeds the normally expected vertical growth of induced fractures. (1085)

Response: For matters related to which well sites must be monitored because of vertical proximity to the stimulated interval, please see response to comment 626.

For matters related to sources that should be referenced when completing the area of review survey, please see response to comment 628.

666. Comment: Those wells must be identified and sealed prior to any gas wells being drilled. Drillers are financially responsible for protecting the waters of Pennsylvania via the identification and plugging process

There are thousands of abandoned wells in PA, increasing the possibility of the migration of methane and other contaminants from fracked wells will move up to abandoned well bores to ground water. (938a)

Response: For matters related to well plugging prior to hydraulic fracturing, please see response to comment 627.

667. Comment: Because conventional well drilling does not employ the practice of horizontal drilling, a search radius of 150 feet is sufficient to identify abandoned and orphaned wells that may be impacted by the operations. (1113, 1118, 1120, 1115a, 1176-1188)

Response: For matters related to the dimensions of the area of review, please see response to comment 627.

668. Comment: Pennsylvania has thousands of abandoned coal and gas wells, the locations of which are unknown. The driller must locate these wells before drilling, so that the drilling process does not puncture them, contaminating drinking water supplies. (1146)

Response: For matters related to the timing of the area of review survey, please see response to comment 627.

669. Comment: The Proposed Rulemaking would add a new Section 78.52a, pertaining to the identification of abandoned and orphaned wells. Section 78.52a(b)(3) would require a well operator to identify abandoned and orphaned wells within 1000 feet of any vertical and horizontal well bores that the operator intends to drill, and requires an operator to send questionnaires (using forms approved by the Department) to nearby landowners seeking information about abandoned and orphaned wells in those 1000 foot zones. An operator would also be required to submit a plat showing the location of any abandoned or orphaned well that the operator's investigation reveals to the Department before the well in question is hydraulically fractured. Abandoned and orphaned wells can cause air, water, and soil contamination. (PENNSYLVANIA DEPT. OF ENVTL. PROT., ABANDONED AND ORPHAN OIL AND GAS WELLS AND THE WELL PLUGGING PROGRAM, Doc. No. 8000-FS-DEP1670 (Nov. 2012), available at <http://www.elibrary.dep.state.pa.us/dsweb/Get/Document-91715/8000-FS-DEP1670.pdf>). The requirements that Section 78.52a would impose are thus a good first step towards minimizing the pollution and contamination risks of drilling. But only a first step. Operators should also be required to take steps to prevent or minimize potential contamination resulting from the abandoned and orphaned wells that they identify (by plugging wells that penetrate the confining layer, for example). Such remediation work would help protect well operators, by making them less likely to incur liability for pollution or contamination caused by their drilling activities, and also benefit the public generally, by reducing sources of potential water pollution. (1159)

Response: For matters related to well plugging prior to hydraulic fracturing, please see response to comment 627.

670. Comment: The proposed regulation would require the operator to identify orphaned or abandoned wells within 1,000 feet measured horizontally from the vertical well bore and 1,000 feet measured from the surface above the entire length of a horizontal well bore for a gas well or horizontal oil well. The proposed regulation should clarify if it applies to any gas well, such as coal bed methane (CBM) wells. (1170)

Response: Coalbed methane wells are a specific subset of gas wells and, as such, are subject to the regulation.

671. Comment: The proposed regulation does not recognize landowner rights. For example, in § 78.52a (b)(3) regarding the questionnaire to determine the locations of orphaned and abandoned wells. In these instances, the operator could certify the lack of cooperation by the landowner. It is recommended that a time limit of 30 days be placed on the landowner for providing to the operator the ability to comply through access or response, or upon certification, the operator be relieved of the duty to comply.

It is suggested that the Department add to this section the length of time operators are going to be required to wait for property owners to complete and return the "questionnaire."
(124a)

Response: For matters related to the landowner questionnaire, please see response to comment 662.

672. Comment: Section 78.52a(b)(3) will potentially slow down the permitting process, allow landowners to submit unverified and unverifiable information and potentially submit false information to prevent operations on their property. The section fails to address how information received from the landowner is to be used or reported, allowing for open ended delays in the completion of the well and delaying final reclamation of well sites. All these will potentially lead to financial hardship for

operators. We propose an exemption for wells of depth less than 3000'. (460)

Response: For matters related to the value of the landowner questionnaire, please see response to comment 626.

For concerns related to the open-ended characterization of the rule, please see response to comment 632.

For matters related to the applicability at conventional well sites, please see response to comment 630.

673. Comment: We are concerned that the Department's database is not presently a reliable source on which a regulatory requirement can be based. The database does not have field GPS location coordinates for a large number of wells, some coordinates have been derived from old maps and are inaccurate. Similarly, a requirement to consult "applicable farm line maps, where accessible" in order to identify wells lacks the clarity required for a regulation. If the Department's database could be sufficiently enhanced, a review of the database should be an adequate obligation for well identification. However, the regulatory obligation should be focused on only those which appear on the Department's database and which have a total depth that extends within 500 feet of the target zone to be perforated or isolated for hydraulic fracturing. Lastly, it is unclear how responses to such questionnaires as proposed language in § 78.52a (b)(3) would be directed and what obligations might fall on operators to verify information received. (1071)

Response: For matters related to sources that should be referenced when completing the area of review survey, please see response to comment 628.

For matters related to which well sites must be monitored because of vertical proximity to the stimulated interval, please see response to comment 626.

For matters related to the landowner questionnaire, please see response to comment 662.

674. Comment: **78.52a(b)(3)** - In our rural areas, property changes hands and thus, it may be very possible that a landowner may be aware of an orphaned or abandoned well/s that may be located on property they formerly owned, or they may be aware of such well/s on their present property. We realize that landowners have an obligation to advise the Department of such wells, but most landowners are not intimately aware of that requirement placed on them. Therefore, we support providing a questionnaire to all the landowners within the area of review and also, requiring a DEP fact sheet on orphaned and abandoned wells is included in the well permit certified mail notification packet that is mailed to landowners advising them of the new well permit.

Based on information shared at the TAB subcommittees this summer, we recommend that DEP not only continue to collect data creating a database, but also that the revised assessment be done after spudding a well. We also recommend both a questionnaire and fact sheet regarding orphaned and abandoned wells be included in the landowner notification certified mailings. (660a)

Response: For matters related to the landowner questionnaire, please see response to comment 662.

The intent of the regulation is to mitigate risks associated with hydraulic fracturing and, thus, the proposed timing for monitoring identified sites is appropriate.

For matters related to sources that should be referenced when completing the area of review survey, please see response to comment 628.

675. Comment: 78.52(b) and (c) address requirements related to identification of abandoned and orphaned wells. Commentators question in Paragraph (b)(2) what is meant by “a review of applicable farm line maps, where accessible.” Other commentators ask for clarification of what is expected from operators regarding submitting the questionnaire to landowners under Paragraph (b)(3) and proof of submitting the questionnaire to landowners under Subsection (c). We agree that it is unclear as to how the regulated community is expected to comply with these provisions. Are there expectations for operators beyond submitting questionnaires to landowners and submitting proof of submitting the questionnaires? Will there be a timeframe for compliance? What proof of notification will EQB require from operators? We ask EQB to clarify the implementation procedures related to these subsections. (1099)

Response: The Department has modified the regulatory language to broaden the sources that may be referenced to complete the area of review and has also introduced flexibility in recognition of the fact that not all companies may have access to the same historical source maps and databases.

For matters related to the landowner questionnaire, please see response to comment 662.

676. Comment: The issuance of drilling permits that will result in a violation of the Oil and Gas Act or the Clean Streams Law would result in the failure to eliminate the threat of pollution and injury to the public. The Department has a duty to prevent adverse impacts to the public health, safety, welfare, and the environment under the Oil and Gas Act, and a duty to prevent pollution of ground water and surface water under the Clean Streams Law. As a result, the Department’s Proposed Rulemaking is inadequate and must be amended to require well operators to identify and evaluate orphaned and improperly abandoned wells at the application stage. (1152)

Response: For matters related to the timing of the area of review survey, please see response to comment 627.

677. Comment: The Department cannot issue a permit that would violate the Oil and Gas Act. The Department must deny a well permit if the issuance of the permit will result in a violation of the Oil and Gas Act. Pursuant to the Oil and Gas Act, it is unlawful to “in any manner...adversely affect public health, safety, welfare or the environment.” In order to ensure that authorized activity will not result in a violation of the Oil and Gas Act, the Department must consider improperly abandoned wells in the vicinity of the proposed drilling activity before it issues a drilling permit, not after. (1152)

Response: For matters related to the timing of the area of review survey, please see response to comment 627.

678. Comment: The Board’s proposal is unlawfully inadequate. Pollution caused by improperly abandoned wells in Pennsylvania was documented in a 2009 report prepared by the Department. The Department’s report listed 27 cases where improperly abandoned wells have been the source of groundwater contamination. The requirement to identify and evaluate orphaned and improperly abandoned wells must be expanded to include identification and evaluation prior to all oil and gas operations, including but not limited to seismic testing, site disturbance and construction, and drilling. (1152)

Response: For matters related to the timing of the area of review survey, please see response to comment 627.

679. Comment: The Department cannot issue a permit that would violate the Clean Streams Law. The Department must also deny a well permit if the issuance of the permit would result in a violation of an applicable law.⁹⁷ The Clean Streams Law is an applicable law and protects against, among other things, the pollution of groundwater.⁹⁸ It is unlawful for any person to discharge industrial wastes into groundwater without the appropriate permit.⁹⁹ The Clean Streams Law even anticipates instances when there mere potential of pollution may trigger the need for a permit.¹⁰⁰ Drilling in the vicinity of orphaned or improperly abandoned wells creates a potential for pollution because it could cause the discharge of industrial wastes and other pollutants into groundwater and even possibly into surface waters. Without knowing the location, depths, and other characteristics of the old abandoned wells within the radius of the most far-reaching lateral wellbores, the Department is unable to issue a well permit that would affirmatively avoid the discharge of industrial waste and other pollutants into waters of the Commonwealth. (1152)

Response: For matters related to the timing of the area of review survey, please see response to comment 627.

680. Comment: The Department has neither explained how a well operator must visually monitor abandoned wells during hydraulic fracturing nor what would constitute altering an improperly abandoned well. Therefore, the Department's proposal is not sufficient to fulfill its duty under the Oil and Gas Act. Additionally, the Department's proposal requires operators to take steps to prevent the pollution of waters of the Commonwealth if it alters an improperly abandoned well. Again, by the time an operator notices that an improperly abandoned well has been altered, there is at the very least a reasonable probability that there has already been an unlawful discharge of industrial waste into groundwater. The Board must deny this proposed amendment because the Department has a duty to prevent the pollution or diminution of fresh groundwater. (1152)

Response: The Department will develop clarifying guidance related to the area of review requirements prior to promulgation of the final rule. Specifically, this issue will be addressed in a guidance document discussing the components of a suitable monitoring plan. Any identified frac communication with an identified well site constitutes alteration of that well site.

For matters related to the timing of the area of review survey, please see response to comment 627.

681. Comment: All existing wells abandoned or otherwise must be identified and should be mapped on a publicly available web platform. The state lacks the resources to address the large number of old wells, so drillers should be responsible for preventing pollution of adjacent water wells and air pollution by sealing the old wells.(72, 73, 114, 635)

Response: For matters related to sources that should be referenced when completing the area of review survey, please see response to comment 628.

For matters related to well plugging prior to hydraulic fracturing, please see response to comment 627.

682. Comment: I support all of the comments Tracy Carluccio made in her statement. I'd like to spend the remainder of my time addressing the issue of orphaned and abandoned wells, specifically.

A study on well-capping out of Carnegie Mellon cites a DEP report issued before Marcellus drilling had come to Pennsylvania that said it would take 160 years, at 2004 funding levels, to cap all of the orphaned and abandoned wells it knew about at the time.; This paper doesn't mention the number of wells DEP had in mind when it calculated that figure. A different paper from the DEP called *Pennsylvania's Plan for Addressing Problem Abandoned Wells and Orphaned Wells* from 2000 says this: In the 140 years since the first oil well was drilled, an unknown number of oil and gas wells have been drilled in Pennsylvania. An estimate by the Independent Petroleum Association of America places that number at approximately 325,000. DEP has records of 88,300 operating wells which it regulates, 44,700 plugged wells, and approximately 8,000 orphaned and abandoned wells. The status of the remaining 184,000 wells is unknown. Many wells were drilled, operated, and plugged at the end of their useful life while others were drilled, operated and abandoned without proper plugging. Some wells were "temporarily abandoned" while the operators waited for the price of oil to rise to a level which would make producing the wells profitable; this sometimes never occurred.

In an article on O&G wells from May 2013 was this quote from Bill [sic] Pine, Chief of the Subsurface Activity Section [sic] of the DEP: Well drilling began in 1859 in Pennsylvania and it's a safe bet the very first well abandoned in Pennsylvania was in 1859. We have thousands of abandoned oil and gas wells in the Commonwealth. I don't think anyone has an accurate record of how many really exist. Later in the DEP document, it says: Since the well plugging program began, 108 wells have been plugged at a cost of over \$2.4 million using funds from the Abandoned Well Plugging Fund, the Orphaned Well Plugging Fund, and a Federal Clean Water Act, Section 319 Non-Point Source (319 NPS) grant.

So there are a number of different funding sources to pay for capping wells. The Section 319 grant was used to cap wells to stop discharges of acid mine drainage. The Abandoned Well Plugging Fund was established in 1984. The Orphaned Well Plugging Fund was established in 1992. In the 16 years that funding was available prior to the publication of this paper, only 108 wells were capped.

Rick Steiner, a retired University of Alaska professor and marine conservation specialist, says "The oil industry has this term 'permanently plugged wells,' but nobody knows what that means over time. They have completely unreliable expectations for some really basic technology. They plug wells with concrete. Just look at your sidewalks. Pour a fresh sidewalk, wait a few years, and it's cracking and heaving. That's what happens to concrete. But nobody wants to admit this could possibly be going on with oil well plugs. And this isn't just a problem here in America. If we have millions of abandoned wells here, just imagine the scope of the problem globally." We have failed to deal with the hundreds of thousands of O&G wells. We're only adding to that sad legacy with the thousands of wells the oil & gas industry has drilled in Pennsylvania since 2003.

The National Petroleum Council's *North American Resource Development Study* from 2011 cites barriers to progress on this issue – lack of research and lack of long-term vision. We have no plan for managing this going forward. We have no idea how we're going to manage all the wells in our state long-term. Priority needs to be given to addressing this issue – to giving the public an honest assessment of the debt we're incurring to allow drillers come here and destroy our natural resources and communities, to researching and implementing the best safety procedures for managing wells long-term, to getting a handle on exactly how many wells are out there and where they are, and to getting the wells properly capped. And if you're going to keep permitting wells in this state, then the industry making a fortune on the backs of Pennsylvanians should be responsible for surveying before they drill, sharing what they find publicly, and capping wells according to the most rigorous safety standards. (115)

Response: For matters related to the timing of the area of review survey, please see response to comment 627.

For matters related to sources that should be referenced when completing the area of review survey, please see response to comment 628.

For matters related to well plugging prior to hydraulic fracturing, please see response to comment 627.

683. Comment: 78.52a. Require identification of existing/abandoned pipeline infrastructure. (118)

Response: The Department does not agree that surface facilities represent a primary risk with respect to communication during hydraulic fracturing, although they may serve as useful reference points for finding abandoned well sites.

684. Comment: We also urge DEP to more adequately address abandoned and orphaned wells in the proposed Chapter 78 revisions. According to DEP estimates, there are an estimated 200,000 abandoned wells in Pennsylvania. Unplugged wells will continue emitting gases such as methane and VOCs over time and DEP has dealt with dozens of situations in which methane reached the earth's surface through abandoned wells. There have also been cases in Pennsylvania in which companies drilled into abandoned wells, one in particular that resulted in a 30 foot methane geyser and required multiple flares over many days to remediate. Some estimates show old wells in our state alone could be emitting tens of thousands of tons per year of methane, an extremely potent greenhouse gas, and VOCs, which include chemicals known or suspected to cause cancer in humans.

It is critical that DEP require companies to identify existing abandoned wells and to appropriately address these wells before site construction and drilling occurs. Drilling companies must be responsible for preventing pollution and accidents from occurring by correctly plugging, sealing, or otherwise remediating potential issues caused by the presence of old wells. This would save a company time and money from removing the risk of potential accidents and subsequent remediation.

In addition, DEP should require companies to search within a quarter mile radius of a proposed drilling site for potential abandoned wells and to also include other pathways for methane in their search, such as major and minor fault lines and fractures. Companies should be required to contact landowners to ask about any known abandoned wells. We urge DEP to update their maps with any new information and make the data available to the public on their website. (119, 242a, 629, 950)

Response: For matters related to the timing of the area of review survey, please see response to comment 627.

For matters related to well plugging prior to hydraulic fracturing, please see response to comment 627.

Plats submitted to the Department identifying wells sites will be done so electronically and are considered public records.

For matters related to the dimensions of the area of review, please see response to comment 627.

Generally speaking, due to lithostatic pressure applied by overlying rock layers and the physics constraining fracture mechanics, the most likely pathway to fresh groundwater during hydraulic fracturing is represented by improperly abandoned oil and gas wells. If faults or zones of fracture concentration do play some role in communication, it is by allowing propagated fractures to move out of zone and into an improperly abandoned oil or gas well. However, the Department has modified the regulatory language to include a provision for monitoring fracture treatment pressures at the stimulated well site. This provision is intended to allow for the identification of abnormal fracture growth.

685. Comment: I do not believe with the past performance of abandoning gas and oil wells and with the shape my area of Pennsylvania has been left in where wells were left to leak oil, polluted water and gas materials, abandoned pipelines and equipment in countless unknown locations (you run across them if you hike or hunt) and with the previous destruction of water tables in this area by the Oil & Gas Industry that these entities have any business with “fracking methods” or injection wells. (158)

Response: The Department does not agree that stopping development is the only way to manage risk. By monitoring the highest risk, any environmental impacts can be greatly curtailed and addressed by the operator completing stimulation activities.

686. Comment: The term “alter” as it is used in § 72.52a should be defined. (1165)

Response: "Alteration" is currently defined in Act 13 and in this case the physical characteristics of the wellbore communicated with are modified through the establishment of a hydraulic connection with a different portion of the reservoir/a new reservoir.

687. Comment: DEP must require on-site inspections and assessments to identify abandoned wells, in addition to the paper/map review, prior to drilling to eliminate potential pathways for fluid movement into groundwater. Record keeping has been inadequate in locating these wells – most of which are undocumented. The applicant should be required to gather full information without limits on sources. (399, 400, 401, 1165)

Response: For matters related to sources that should be referenced when completing the area of review survey, please see response to comment 628.

For matters related to the timing of the area of review survey, please see response to comment 627.

688. Comment: It has always been a long standing procedure to identify all offset wells including orphan and abandoned to the best of our abilities and locate the same on the well plat. Most often, we have to rely on our own records such as historic land line maps and field investigations to locate these old wells. In a lot of instances a well may be depicted on a landline map but is impossible to field verify which makes one question the validity of the map being reviewed. It is also possible, especially in areas where strip mining was prevalent that these wells have simply been removed over time and or covered over by brush and debris preventing field verification. Additionally, it has been common for landowners to remove the top portions of these nonproducing wells to ease their farming. As a result, a producer may make a very diligent effort to find these abandoned wells and never locate them in the field. Some of these pre-act wells have no permit number and may or may not have existed. Often pre-act wells were not surveyed so their locations can vary widely from what is depicted on the old maps.

Our contention with the proposed rule resides under 78.73(d). According to the proposed regulation

should a producer communicate and stimulate into an orphan or abandoned well bore than that producer becomes liable for something from which it received no financial benefit. The quality and or existence of completion reports for these old wells can be quite challenging, plugging operations could become very costly as a producer will truly be operating in the dark with little or no well information. There should be funds available to take care of this issue as a portion of every Well Permit Fee collected from Producers goes toward the Orphan and Abandoned Well plugging fund. This money is to be used by the State to plug these problem wells. Section 78.73(d) places an unjust penalty on Producers and holds them liable for something the State has already addressed through the State Plugging Fund. (416, 418)

Response: For matters related to the current application of due diligence by operators, please see response to comment 626.

For matters related to well site locational uncertainty, please see response to comment 626.

The Department has plugged and continues to plug thousands of wells from which it did not receive any direct economic benefit. Operators are obligated to address violations of the Clean Streams Law, which serves as the foundation of the rule.

- 689.** Comment: I believe the questionnaire and requirement for operators to search for abandoned wells within any radius of a proposed well is unnecessary for conventional well development. In the vast majority of cases, any abandoned wells in a potential area for new development will have the exact target formation as the proposed new wells. Simple economics play a key role in the identification of old wells: conventional well operators stand to drill a dry hole if an abandoned well in the vicinity of a new well is not identified. In addition, current PADEP regulations stating that an operator who affects an abandoned well must plug it is enough deterrence to ensure that operator due diligence is done correctly.

The proposed regulation is vague and offers no process for which unverifiable evidence by landowners can be resolved. I recommend dropping this proposed regulation for conventional operators. (450)

Response: For matters related to the applicability at conventional well sites, please see response to comment 630.

For matters related to the value of the landowner questionnaire, please see response to comment 626.

- 690.** Comment: Section 78.52a(c) fails to define what steps the operator has to take to construct the plat, including whether a licensed surveyor has to provide the plat with GPS information. This could potentially cost the operator \$1000 or more. (460)

Response: All plats must be prepared by a competent engineer or survey in accordance with Section 3211(b) of the 2012 Oil and Gas Act. However, only the well sites requiring monitoring under Section 78.73 must be surveyed.

- 691.** Comment: I have spent much of my 75 years on the Allegheny National Forest lands. I have seen the effect of operators simply walking away from their responsibilities after wells fail to be economical. I have seen hundreds of orphaned and abandoned gas and oil wells on the ANF. Can't you learn from the "Fed's" mistakes? (631)

Response: By monitoring the highest risk sites, any environmental impacts can be greatly curtailed and addressed by the operator completing stimulation activities.

692. Comment: Include stronger provisions to find and plug off the state's 250,000 "orphaned or abandoned" wells. These wells are a danger for methane release and other chemical contamination. (650, 651, 653, 655-658, 205a, 219a, 255a, 278a, 304a, 663-675, 678, 680-684, 687, 688, 692-694, 697, 701, 703-706, 710, 711, 713, 717-723, 726-728, 733, 735-736, 744a, 746, 747, 750-752, 755-757, 759, 762-767, 769, 771, 775, 778-780, 789-791, 796-797, 803, 805, 811, 813, 815-818, 825, 826, 828-830, 834-839, 960-969, 1020-1027, 1096)

Response: For matters related to well plugging prior to hydraulic fracturing, please see response to comment 627.

693. Comment: DEP reportedly has recorded approximately 128 confirmed stray gas migration cases in Pennsylvania. Only 24 of these have any connection to well integrity issues, and of those, it is not clear whether the wells were operator-owned or orphaned. A failure of 24 wells out of the approximately 135,000 wells operating in the state - a "failure" rate of 0.02% - does not justify the proposed burden to industry generally or the conventional industry specifically. The operating pressure of a conventional well is fundamentally different than that of an unconventional well. Conventional wells typically operate at only hundreds of psi of pressure or less, which means the surface shut-in pressure and surface producing back pressure inside the surface casing does not exceed the 0.433 psi standard set forth in 25 Pa. Code § 78.73(c). (If greater pressure than the 0.433 psi standard is encountered in a conventional well the industry practice is to introduce a second string of casing so that the surface casing is not exposed to that greater pressure.) This in turn means that if a shallow conventional well loses integrity, groundwater would migrate into the well bore, not the other way around where there would be a risk of gas or other fluids migrating from lower formations into fresh groundwater.

Much of the DEP's commentary during the recent MIA meetings and workshops seems not to have fully appreciated this point or the economic impact that new MIA program will have on small businesses.

The impact of the new MIA form is very significant to them. Using DEP's formula, it appears that a minimum of 1 additional employee may be required for every 500 wells. A conservative "all-in" cost to hire an inexperienced, entry-level employee would be approximately \$65,000- \$70,000 a year per 500 wells. Implementing the MIA guidance will be very work-intensive at the outset - educating existing technical staff (or creating a new position requiring additional team members) in inspection imperatives, constructing an inspection template compatible with the MIA form for each technician to use in the field, and training an office position with some knowledge of well mechanics to transfer the data from the field to the electronic MIA form. DEP has not fully considered this significant economic impact. (413a)

Response: For matters related to the applicability at conventional well sites, please see response to comment 630.

694. Comment: § 78.52a. Abandoned and orphaned well identification: This proposed section requires operators to identify orphaned and abandoned wells in proximity to the vertical and horizontal well bore prior to hydraulically fracturing a well. The section outlines how operators shall conduct this identification; including consulting with the Department's database, farm line maps and submitting a questionnaire to surface landowners. The results of this survey shall be provided to the Department.

In addition to the United States Geological Survey (USGS) 'farm line' maps, the Department of Conservation and Natural Resources (DCNR) has been working to digitize their records. These should be consulted also.

Also USGS survey reports and USGS topography maps. Thousands of legacy well locations are identified in these records.

During an appointment with a geologist at the DEP Meadville I obtained copies of maps that identified over a thousand legacy wells in Lawrence County. 16 are listed on the DEP's orphan and abandoned list. Until the PADEP database reconciles their records and maps drilling permits should not be authorized in areas known by the DEP to have large numbers of potential pathways.

IN 2010 STRONGER, State Review of Environmental Regulations recommended: The review team recommends that DEP consider whether there are areas or situations in which wells (active and abandoned) in the vicinity of hydraulic fracturing operations provide pathways for fluid movement into groundwater. In such areas or situations, DEP should require operators to identify and eliminate these potential pathways for fluid movement into groundwater before conducting hydraulic fracturing operations."

The proposal to identify and monitor the wells within 1000 feet does not comport with the recommendation made by STRONGER to the DEP. § 78.52a proposals simply ignores STRONGER recommendations and does nothing to prevent communication between wells.

Shell hired professionals to search for wells on Maggy Henry's farm in Lawrence County. DOZENS are identified on a farm line map and they gave up. They were led to the area and couldn't locate any of the 27 and there were pipes all over the place.

The equipment used for surveys is expensive and takes training. Surveys are not free Surface owners should be provided funding to conduct these surveys and a reasonable amount of time (at least 30 days per acre) to respond to the questionnaire to surface landowners to search for abandoned wells. This would be a good use of the impact fees. If abandoned wells are found, and an operator decides to drill and frac, nearby water sources should be monitored before and after drilling and fracking and the operator should be required to replace the well water to pre- drill standards, if impacted.

In Erie, PA Presque Isle, Hammermill/International Paper injected waste into a well and it migrated over 4 miles and came to the surface through an abandoned wellbore.

Requiring operators to watch unplugged wells within 1000 feet of new wells to see if the flux/ flow of odorless and colorless gas changes, is a gift from the Commonwealth to operator. (844a)

Response: For matters related to sources that should be referenced when completing the area of review survey, please see response to comment 628.

By monitoring the highest risk sites, any environmental impacts can be greatly curtailed and addressed by the operator completing stimulation activities.

For matters related to the landowner questionnaire, please see response to comment 662.

Water supply wells are addressed under existing laws and regulations, including the presumptive liability and setback language of the Act.

The Department will develop clarifying guidance related to the area of review requirements prior to promulgation of the final rule. Specifically, this issue will be addressed in a guidance document discussing the components of a suitable monitoring plan.

695. Comment: We'd like to see the department (DEP) identify spent wells and enter each one into a data base to make for easier identification. We would like any and all spent wells to be capped before any future work begins. (862)

Response: For matters related to sources that should be referenced when completing the area of review survey, please see response to comment 628.

For matters related to well plugging prior to hydraulic fracturing, please see response to comment 627.

696. Comment: Abandoned and orphaned well identification - the identification procedure in this section of the proposed regulation outlines a very difficult process. Traditionally, the operator has completed its "due-diligence" in order to avoid potential environmental impacts and communication with abandoned wells. The introduction of a map finder identification tool will be helpful. However, the use of a questionnaire with adjacent property owner will likely cause some issues from the standpoint of property access or lack of, or inaccurate knowledge regarding the existence of abandoned wells. (880)

Response: For matters related to sources that should be referenced when completing the area of review survey, please see response to comment 628.

For matters related to the landowner questionnaire, please see response to comment 662.

697. Comment: Pennsylvania is pot-marked by old abandoned wells, some known, and some unknown. The existence of these wells presents a possible migratory pathway for harmful fracturing fluids, drilling fluids, and gas. While we appreciate the Department's effort to address the issue of abandoned wells in Pennsylvania, the proposed regulations do not go far enough to protect citizens and the environment. Section 78.73 does not do enough to prevent a problem. Under the proposed regulations, if an abandoned well is identified within 1000 ft. of the well bore or lateral, and the abandoned well likely penetrates a formation intended to be stimulated, the operator must visually monitor during stimulation activities. If the operator alters the orphaned or abandoned well by fracturing, then it must plug the well.

The Department has neither defined what the operator must do to visually monitor the abandoned well nor what constitutes altering an abandoned well, thereby triggering the requirement that the operator must plug the well. It is conceivable that by the time the operator, by visually monitoring the well, notices it altered the abandoned well - the damage may be done. The Department has a duty to prevent environmental harm. If an abandoned well is located and it is likely that the old well penetrates a formation intended to be fracked, the Department should require the operator to either plug the abandoned well or locate its well pad somewhere else. (887)

Response: For matters related to acceptable monitoring protocols, please see response to comment 694.

"Alteration" is currently defined in Act 13 and in this case the physical characteristics of the wellbore communicated with are modified through the establishment of a hydraulic connection

with a different portion of the reservoir/a new reservoir. By monitoring the highest risk well sites, any environmental impacts can be greatly curtailed and addressed by the operator completing stimulation activities.

For matters related to well plugging prior to hydraulic fracturing, please see response to comment 627.

- 698.** Comment: A “paper” review of maps and questionnaires is not sufficient to prevent gas migration in old gas and oil fields with old unplugged and abandoned wells. There must be an on-site inspections and assessment to identify any orphaned or abandoned wells prior to drilling. (891)

Response: For matters related to the timing of the area of review survey, please see response to comment 627.

The regulations requires field reconnaissance and monitoring of the highest-risk well sites and is not limited to just a file review.

- 699.** Comment: Potential stray gas migration is also not being addressed by the proposed rules. Stray gas migration has been and continues to be a major problem in the gas fields of Pennsylvania. Old unplugged and abandoned wells are a source of gas which migrates and if and when the concrete casings crack, which is a 50% certainty over a decade even more problems will occur. There must be a means to eliminate potential pathways for fluid movement into groundwater before conducting hydraulic fracturing operations. The proposed rules for pre-fracking surveys must require onsite inspections and assessments for the purposes of identification of orphaned or abandoned wells prior to drilling.

There must be provisions in regulations to require the original driller gas well owner to provide for the capping of all played out wells. (916)

Response: For matters related to the timing of the area of review survey, please see response to comment 627.

For matters related to well plugging prior to hydraulic fracturing, please see response to comment 627.

- 700.** Comment: It is well known that there are hundreds of thousands of orphan and abandoned oil & gas wells spread across the Commonwealth. Each of these wells is a potential conduit for contamination. Before any development should be allowed, the applicant for a permit should be required to conduct an onsite survey extending at least one mile from the edge of the proposed site, one mile radially from any horizontal well bore, and one mile from the end of each well bore to identify orphan and abandoned wells. The permit application must document that such a survey has been performed and any wells identified have been properly plugged. (930)

Response: For matters related to the timing of the area of review survey, please see response to comment 627.

For matters related to the dimensions of the area of review, please see response to comment 627.

- 701.** Comment: Abandoned and orphaned well identification: Will this requirement be handled on a “best effort basis”? If operators do not have surface agreements to access private properties to identify

abandoned and orphaned wells, the surface owners may require unreasonable payments, or deny access. If the operator cannot comply with this requirement due to access issues, will the DEP deny the issuance of permit? The distance requirement for identifying these wells should be reduced for conventional well sites. (445a)

Response: For matters related to the dimensions of the area of review, please see response to comment 627.

For matters related to the landowner questionnaire, please see response to comment 662.

702. Comment: We commend the Department for taking the initiative with respect to pre-hydraulic fracturing assessment under Sections 78.52a and 78.73 of the proposal. PEC identified preexisting wells and subsurface hazards as a key issue in our 2010 policy report on shale gas development. We believe these provisions should be strengthened to expand the scope of the operators' analysis of potential fluid conduits in the impacted strata, and to require operators to verify avoidance or mitigation of identified hazards prior to hydraulic fracturing. (997)

Response: Generally speaking, due to lithostatic pressure applied by overlying rock layers and the physics constraining fracture mechanics, the most likely pathway to fresh groundwater during hydraulic fracturing is represented by improperly abandoned oil and gas wells. If faults or zones of fracture concentration do play some role in communication, it is by allowing propagated fractures to move out of zone and into an improperly abandoned oil or gas well. However, the Department has modified the regulatory language to include a provision for monitoring fracture treatment pressures at the stimulated well site. This provision is intended to allow for the identification of abnormal fracture growth.

The Department has modified the final-form rulemaking language to require that the survey be completed prior to drilling, thus allowing risk mitigation through the implementation of avoidance measures.

703. Comment: Before drillers begin drilling, they should be required to do baseline testing (with results released to the DEP and to the public) of the surrounding water supplies, so that they cannot later wrongly claim that water contamination was probably there before they drilled. They should also be required to identify and map old abandoned wells on their site, to cap those that are improperly sealed, and to make sure they don't intersect the old wells in their new drilling. (1033)

Response: Water supply wells are addressed under existing laws and regulations, including the presumptive liability and setback language of the Act.

For matters related to the timing of the area of review survey, please see response to comment 627.

For matters related to well plugging prior to hydraulic fracturing, please see response to comment 627.

704. Comment: There are old wells, many not identified within our watershed that actually dates back to 1881 [Report of Progress ...By Geological Survey of Pennsylvania, Pennsylvania. State Geologist (1874-1890), Pennsylvania. Board of Commissioners for the Second Geological Survey http://books.google.com/books?id=XXMMAAAAYAAJ&pg=PA149&dq=mehoopany+oil+company&hl=en&sa=X&ei=iKcgU8yKIM3F0AGZ_4CIBA&ved=0CEUQ6AEwAA#v=onepage&q=Mehoopany%20oil%20company&f=false]. Drilling in our watershed also occurred during the late 1940's-

1950's with the John Sheehan well [Mehoopany Township, Wyoming County] and other wells including one near the environs of the current Chesapeake Energy ROUNDTOP location in Colley Township, Sullivan County. Additional natural gas wells were drilled in North Branch Township, Wyoming County during the 1970's of which the rigging remains in place in the woods and abandoned pipelines run through some of our member's properties. So, we are concerned about possible environmental impacts, especially knowing that some of these older casings have been removed. Therefore, we recommend the area of review be revised to 1,400'. (1035)

Response: For matters related to the dimensions of the area of review, please see response to comment 627.

705. Comment: 78.52a should be rewritten as below:

78.52a. Well identification and evaluation.

(a) Prior to drilling the well, the operator of a horizontal gas or oil well shall make a good faith effort to identify the location of all operating, inactive, orphaned or abandoned wells in accordance with subsection (b) within a rectangular area of investigation that extends:

- (1) Horizontally to a distance, and in the direction of predicted fracture propagation:
- (2) 500 feet beyond both the toe and the heel of a horizontal well in directions parallel to the primary well azimuth: and
- (3) Vertically along the entire lateral length of the well, from the depth of the shallowest well perforation upward to such depth that a predicted barrier to fracture propagation can be documented (above which vertical fracture

Prior to hydraulically fracturing the well, the operator of a vertical oil or gas well shall make a good faith effort to identify the location of all operating, inactive, orphaned or abandoned wells within 500 feet of the well bore in accordance with subsection (b).

(b) Identification shall be accomplished by conducting the following:

- (1) A review of the Department's orphaned and abandoned well database;
- (2) A review of company records, available records of offset operators, public data bases, and other regulatory agency records;
- (3) A review of historical maps (i.e. WPA, USGS, Pennsylvania Geologic Survey, operator "farm sheet" maps), where available;
- (4) A review of historical air photos available on the Pennsylvania State University 'Penn Pilot' website (<http://www.pennpilot.psu.edu/>).

(c) Prior to drilling a well, the operator shall assess the potential risk of hydraulic fracture communication with operating, inactive, abandoned or orphan wells that penetrate the target formation or confining formations above. The assessment shall be accomplished by conducting the following:

(1) A determination of how far away an operating, inactive, abandoned or orphan well is in the subsurface and whether a well is within the path of predicted lateral propagation of fracture stages planned for the well at the targeted reservoir level.

(2) Identification of faults at the reservoir level that may be penetrated by an operating, inactive, abandoned or orphan well or that lies in the path of predicted propagation of fracture stages planned for the well.

(3) An assessment of the condition and quality of the plugging of any abandoned or orphan well, if possible. Such assessment may include a review of available historical well reports, geologic reports and descriptions, wellbore diagrams and construction schematics, plugging and abandonment reports, DEP plugging and abandonment certificates, wireline well logs, cement bond logs or other available information on the

abandoned or orphan well.

(d) Prior to drilling a well, the operator may revise the proposed wellbore path, revise the well completion design, or take other actions to mitigate the risk of potential communication, if the operator determines that hydraulic fracture communication may occur with a well.

(e) Prior to hydraulically fracturing a well, the operator shall submit a plat to the Department showing the location and GPS coordinates of wells penetrating at or below the planned reservoir interval or overlying primary confining layer that have been identified pursuant to subsection (b). (1049)

Response: For matters related to sources that should be referenced when completing the area of review survey, please see response to comment 628.

For matters related to the dimensions of the area of review, please see response to comment 627.

For matters related to the timing of the area of review survey, please see response to comment 627.

For matters related to the inclusion of other well types in the area of review survey, please see response to comment 626.

For matters related to which well sites must be monitored because of vertical proximity to the stimulated interval, please see response to comment 626.

Generally speaking, due to lithostatic pressure applied by overlying rock layers and the physics constraining fracture mechanics, the most likely pathway to fresh groundwater during hydraulic fracturing is represented by improperly abandoned oil and gas wells. If faults or zones of fracture concentration do play some role in communication, it is by allowing propagated fractures to move out of zone and into an improperly abandoned oil or gas well. However, the Department has modified the regulatory language to include a provision for monitoring fracture treatment pressures and volumes at the stimulated well site. This provision is intended to allow for the identification of abnormal fracture growth. The Department has also modified the regulatory language to account for out-of-zone fracture growth and require a visual assessment of the integrity of well sites identified during the area of review survey.

For matters related to avoidance measures, please see response to comment 702.

The final-form regulation requires that all wells be identified on the plat, but that only the highest-risk wells be monitored in the field. There may be instances when wells cannot be located in the field or when unanticipated frac communications take place. By keeping track of all well locations, operators and companies will be better able to respond to incidents that may occur in association with such well locations.

706. Comment: § 78.52a. Abandoned and Orphaned Well Identification

The issue of potential communication between hydraulically fractured wells and existing abandoned or orphaned wells is of paramount importance to the NPS. Reported occurrences of “frack hits” (subsurface well communication) and the resulting environmental and safety hazards

are very concerning to agencies such as the NPS, charged with conserving the environment and serving the visiting public.

When drilling operations are proposed near units of the National Park System and affiliated areas, the NPS would like to work closely with the Department and the specific operator wherein the required orphaned or abandoned well surveys could be completed on National Park System owned or administered lands. Due to the large acreages involved, the NPS does not always have accurate surveys of all wells within park boundaries. A cooperative working agreement between the Department, operators, and the NPS to complete the required surveys would benefit all involved parties and assist the Department in a more efficient permitting process. The NPS would be happy to help the Department craft this cooperative working process for inclusion in draft regulations.

We also suggest that this section include language requiring environmental remediation by the operator if orphaned or abandoned wells not previously located or cataloged are adversely impacted by new operations. We also request that park units within the notification distance required in § 78.15 (f)(1)(i) for publicly owned or administered park lands be notified when an operator reports wellbore annulars have become over pressured to a degree that requires some well remedial action in response to defective casing or insufficient or defective cementing as specified under § 78.86. The condition that an underground blowout or elevated sustained casing pressure was occurring in a nearby well would be an indication of an increased threat of gas migration to nearby properties and alert the NPS to potential subsurface resource impacts (increased methane levels in potable aquifers). Impacts to water supplies from increased methane levels or surface resources may then only become apparent upon further groundwater monitoring or inspection for a surface release (i.e. gas, condensate or other fluid seep). (1062, 1133)

Response: Notifications and other provisions may be most appropriately addressed in the lease agreement between the operator and the appropriate agency. If the federal government does not possess the oil and gas rights for the property, the Department will still coordinate with all surface rights owners if surface impacts occur.

All violations of the Clean Streams Law must be addressed and appropriate remediation standards demonstrated in situations when a frac communication occurs.

The Department made substantive changes to Subchapter D as part of its February 5, 2011 rulemaking. Current changes to the section are intended to address monitoring and actions that must be taken when a frac communication results in alteration of an orphaned or abandoned well, although this comment may be appropriate for future updates to Subchapter D.

707. Comment: We applaud this section of the proposed regulations. This category of wells represents a significant risk to both the environment and citizens of the State. The proposed regulations should also include an extensive monitoring effort for abandoned and orphaned wells to benchmark potential risks from the outset. Unless pre-drilling data is gathered, assessing environmental damage caused by subsequent drilling will be impossible to categorize. The greatest benefit from this amendment is achieved if pre-emptive data is gathered and made available to the DEP and local municipalities. (1063)

Response: The Department acknowledges the comment. For matters related to the timing of the area of review survey, please see response to comment 627

- 708.** Comment: The Proposed Regulations should maintain and enhance the duties they impose on well operators with respect to abandoned and orphaned wells: §§ 78.52a and 78.73 require well operators to identify, inspect, monitor, and in some cases plug abandoned and orphaned wells. This final requirement is triggered only when an operator alters an abandoned or orphaned well during the course of its own hydraulic fracturing operation. I support these sections, along with the comments that offer a concrete enhancement.

On January 22, 2014, the Clear Air Council submitted comments (the “CAC comments”) urging a revision to § 78.52, such that operators would have to identify abandoned and orphaned wells in proximity to the vertical and horizontal well bore prior to site construction, rather than prior to hydraulic fracturing. This is a common-sense change that would benefit operators because it would increase the predictability of site development costs. Some commentators have suggested that these sections impose “open-ended,” unpredictable obligations on well operators. I disagree, because the Proposed Regulations establish a clear process that includes the identification, inspection, and monitoring of orphaned and abandoned wells. The alternative would be to leave Pennsylvania residents and tourists at risk of serious bodily harm and death. As the CAC comments point out, disasters can result when a hydraulic fracturing operation alters an abandoned or orphaned well.

Furthermore, on January 9, 2014, Berks Gas Truth submitted comments (the “Berks comments”), highlighting the Commonwealth’s compelling interest in managing and plugging abandoned and orphan wells. The Berks comments illustrate the scale and significance of the problem by citing numerous expert sources. For example, DEP officials have estimated that of the 325,000 oil and gas wells that have been drilled in Pennsylvania, the status of 184,000 are unknown. A study from Carnegie Mellon University estimated that it would take 160 years for DEP to cap all of the orphaned and abandoned wells at 2004 funding levels. Abandoned and orphaned wells, like previously contaminated water supplies, are legacy costs of previous industrial exploitation. Again, DEP is correct and perhaps even obligated to seek assistance from drilling operators in addressing these costs. (1070)

Response: For matters related to the timing of the area of review survey, please see response to comment 627.

- 709.** Comment: There are opportunities for clarifying areas of this section. The State Review of Oil & Natural Gas Environmental Regulations (STRONGER), a national non-profit organization charged with assessing states’ oil and gas regulations, reviewed Pennsylvania’s oil and gas regulatory program in May 2013 at the Department’s request. STRONGER released its report in September 2013 and found that Pennsylvania’s program “is, over all, well-managed, professional and meeting its program objectives.” STRONGER specifically commended the Department for its Orphan and Abandoned Well Program.

Commentator joins STRONGER in commending the Department for furthering the joint efforts of the regulated community, the public, and the Department with some of the new regulations in this area. Successful new regulations are sustainable and based on available technologies. (1085)

Response: The Department acknowledges the comment and will provide clarifying guidance prior to the final rulemaking.

- 710.** Comment: 78.52a: *Abandoned and Orphaned Well Identification- Need for Consolidating Historic Maps and Geographic information on Oil and Gas Activity*
Before promulgating a rule that utilizes such a broad scope of review, Commentator asks that the Department make all available data easily accessible to the industry from one comprehensive

source. Specifically, the Department should first complete and digitize the Farm Line Map Project and other resources to make them easily accessible before implementing a regulation of this type. Without such a comprehensive source of data on orphaned and abandoned wells, assuring a thorough pre-hydraulic fracturing review on a well-by-well basis will be very difficult for the Department and the regulated community. Operators do their best to obtain all information regarding potential orphaned and abandoned wells in the vicinity of a planned unconventional well. However, operators remain without a comprehensive source of best available data from the Commonwealth that would aid in the pre-hydraulic fracturing review. Commentator encourages prompt digitization and accessibility of identification resources prior to implementation of a Rule tasking operators with consultation of the same. (1085)

Response: For matters related to sources that should be referenced when completing the area of review survey, please see response to comment 628.

While the availability of a comprehensive database will make area of review surveys easier, the Department does not believe it is appropriate to delay these important provisions until such time as the database is complete and available for use.

711. Comment: The Board should consult with the Department on the functional status of the Department's GIS mapping database being developed to house the GIS data submitted by several operators. Successful development and implementation of this project could help support the goals of proposed regulations. Identifying abandoned and orphaned wells before hydraulic fracturing is good standard practice; however, the rule as currently proposed does not provide operators with enough clarity and flexibility to properly identify and plan operations for such wells. The GIS mapping database could serve as a key component to the continued success of the Orphan and Abandoned Well Program. (1085)

Response: For matters related to sources that should be referenced when completing the area of review survey, please see response to comment 628.

712. Comment: It is much easier to prevent contamination than to try remediating it. There should be adequate fees imposed for the purpose of plugging more of these abandoned wells.

Along the same area of concern, the bonding requirements for O&G activities are woefully inadequate. If these cannot be increased, there should be rigorous verification by DEP inspection that well sites are properly restored and plugged prior to releasing the operator from liability. (1089, 1229)

Response: The bonding levels were recently updated by amendments to the Oil and Gas Act (now Act 13 of 2012), although levels for conventional well sites reverted back to 1985 amounts through changes to the fiscal code. The Department is planning a study to evaluate the current orphaned and abandoned well surcharges applied during permitting. Finally, permitting fees were recently increased.

Site restoration and post-plugging inspections are currently conducted by the Department. However, the Department acknowledges this comment and notes that additional changes to Subchapter D, including substantial changes to the well plugging regulations, are planned over the course of the next several years.

713. Comment: Because of the potential for serious contamination, include identification of abandoned and orphaned wells through advertisements in local newspapers (3 or more times), posting in

municipal buildings (30-days), specific seismic testing, and on-the-ground surveillance to note pipes, casings, depressions, small sheds and/or pits. [78.52 (b)] (855, 1098)

Response: The information most pertinent to locating well sites exists with property owners or can be referenced through the review of available historical maps and databases. The Department has addressed these information sources through updated language in the rulemaking requiring landowner questionnaires, map reviews, and database searches.

For matters related to acceptable monitoring protocols, please see response to comment 694.

714. Comment: 78.52a (c) --The location coordinates for large number of wells that may exist in the Department's database are likely derived from sources other than field GPS coordinates. Some coordinates may have been derived from old maps. For a variety of reasons, a well with latitude/longitude coordinates in the Department's database may not be visible on the ground, perhaps because the coordinates are inaccurate, or possibly because the well does not exist. (1103)

Response: For matters related to well site locational uncertainty, please see response to comment 626.

715. Comment: Because of the generally higher rate, volume and pressure used in hydraulic fracturing of the Marcellus and other deep shale formations, constructing a more comprehensive database of historical deep wells (those that penetrate to a depth at least 1,500 feet above the Marcellus Shale) would be a priority. It is hoped that with good cooperation, this could be accomplished within a few months, as the state's current database for this set of deeper wells is believed to be nearly complete. Enhancement of the shallow well database will require significantly more work, time and expense, and is likely a multi-year project. Additionally the oil and gas industry's identification of abandoned and orphaned wells will benefit from further development of the Department's database, and should be postponed until the database and map viewer system is improved. Accordingly, the Department should consider a phased implementation of this new section. (1103)

Response: For matters related to sources that should be referenced when completing the area of review survey, please see response to comment 628.

716. Comment: Suggested amendatory language for 78.52a:

§ 78.52a. Well identification prior to hydraulic fracturing

(a) Prior to hydraulically fracturing an unconventional well, the operator shall identify in accordance with subsection (b) the location of active, inactive, plugged, orphaned or abandoned wells within 1,000 feet measured horizontally from the surface projection of any portion of the wellbore whose total depth is known or reasonably expected to be less than 1,500 feet above the shallowest vertical depth to be perforated or isolated for hydraulic fracturing. Prior to hydraulically fracturing a conventional well, the operator shall identify the location of active, inactive, plugged, orphaned or abandoned wells within 500 feet of the wellbore whose total depth is known or reasonably expected to be less than 500 feet above the shallowest vertical depth to be perforated or isolated for hydraulically fracturing.

(b) Identification shall be deemed to have been satisfied by conducting a review of the Department's database for active, inactive, plugged, orphaned and abandoned wells.

(c) Prior to hydraulically fracturing a well, the operator shall submit a plat to the Department

showing the location and GPS coordinates of wells identified pursuant to subsection (b) whose total depth is known or reasonably expected to be less than 1,500 feet, in the case of an unconventional well or 500 feet, in the case of any other well, above the shallowest vertical depth to be perforated or isolated for hydraulic fracturing. The operator may notify the Department of any wells that are identified on the Department's database but which have not been located on the ground using reasonable efforts.

(d) This subsection shall become effective [six months] from final publication in the Pennsylvania Bulletin. (1103)

Response: For matters related to the inclusion of other well types in the area of review survey, please see response to comment 626.

For matters related to which well sites must be monitored because of vertical proximity to the stimulated interval, please see response to comment 626.

For matters related to sources that should be referenced when completing the area of review survey, please see response to comment 628.

For a summary of which wells sites in the area of review must be mapped, please see response to comment 705.

The survey must be completed prior to drilling, permitting or stimulation, dependent upon the anticipated timing of stimulation activities, and will not apply to wells that are partially drilled at the time of promulgation.

717. Comment: Standards should include for highest level of control relative to potential stray gas migration. (1106)

Response: The subject of gas migration is already addressed in various sections of the Act and current regulations. It is acknowledged that communication with an improperly plugged abandoned well during stimulation can and has led to gas migration. Once that occurs, operators are required to follow the appropriate laws and regulations to mitigate gas migration.

718. Comment: **78.52a** – We support the requirement for well operators to identify orphaned and improperly abandoned wells prior to hydraulic fracturing operations. It is estimated that there are approximately 200,000 improperly abandoned or orphaned wells in Pennsylvania. (Scott Detrow, *Perilous Pathways: Behind the Staggering Number of Abandoned Wells in Pennsylvania*, StateImpact (Oct. 10, 2012), <http://stateimpact.npr.org/pennsylvania/2012/10/10/perilous-pathways-behind-the-staggering-number-of-abandonedwells-in-pennsylvania>).

We recommend that the requirement to identify orphaned and improperly abandoned wells be expanded to include identification prior to all oil and gas drilling operations, including but not limited to site disturbance, drilling, and construction.

Improperly abandoned wells include wells that have not been abandoned in compliance with the PADEP's requirements for long-term plugging and abandonment at 25 Pa. Code § 78.91 through § 78.98. An improperly abandoned well could include a well that was plugged and abandoned (P&A'd), but was done so in a manner where the well still poses a risk to the environment (e.g., insufficient barriers or cement used to seal the well). Because operators typically do not monitor the condition of P&A'd wells, improperly abandoned wells often go un-resolved.

Well construction standards, techniques, and technology have improved over time, and it is reasonable to assume that most of these long-term idle wells were not constructed to today's standards, have been subject to mechanical wear and corrosion, and warrant proper abandonment to mitigate risk to protected groundwater resources. To compound problems, many wells that have not been properly abandoned do not have financial security (e.g., bonds) in place, or have insufficient bond amounts set aside, to fund P&A work.

The number of improperly abandoned wells in Pennsylvania is a significant issue as new wells are constructed and existing wells are hydraulically fractured or re-drilled to optimize production. These old wells could provide a vertical conduit for pollutants to reach protected aquifers. Wells drilled and fracture stimulated nearby pose a risk of communicating with the improperly abandoned or orphaned well. For example, a hydraulic fracture treatment can propagate a fracture that, depending on geology, design, and well depths, could pose a risk of intersection with a nearby well (e.g., active producer, abandoned or orphaned well). This type of well-to-well communication is typically referred to in industry publications as a "frac-hit."

Improperly abandoned wells (including improperly abandoned orphaned wells) pose a risk to the environment. Wellbore infrastructure can corrode and erode, failing over time and creating a potential pollutant pathway for hydrocarbons to move vertically through failed casing or cement to groundwater resources. These wells can either leak gas on their own or provide a vertical pollutant pathway to groundwater resources that can be activated by new well activity nearby.

Pollution caused by improperly abandoned wells in Pennsylvania was documented in a 2009 report prepared by the PADEP. The PADEP report listed 27 cases where improperly abandoned wells have been the source of groundwater contamination. (PADEP, Bureau of Oil and Gas Management, Stray Natural Gas Migration Associated with Oil and Gas Wells (Draft Oct. 28, 2009)). In some of the 27 cases the wells were abandoned according to the standard practices of the time, but now leak and need to be re-abandoned using improved materials and techniques. Some of the cases cited by the PADEP include very old well construction techniques, for example, surface casing made out of wood that has rotted away, and wells with no surface casing or cement installed at all. These wells have provided a conduit for gas and other pollutants to reach groundwater through damaged or worn casing, poorly installed cement, or more directly where casing or cement was not initially installed.

The PADEP also identified wells that need to be P&A'd, but have not yet been addressed due to the lack of a responsible party and/or on account of the PADEP resource limitations. (See *id.* Cases include: Independent Valley News Migration, Allegheny County – SWRO – March 2009; Versailles Migration, Versailles, Allegheny County – SWRO – 2007 through 2008; Childers Migration, Washington County – SWRO – June 2005; Groshek Migration, Keating Twp., McKean County – NWRO – 2008; and Skinner Migration, Columbus Twp., Warren County – NWRO).

There were three cases cited by the PADEP where fracture stimulations in an operating well communicated with a nearby abandoned well, causing a gas leak in the abandoned well. (See *id.*) The PADEP's study highlighted the importance of locating orphaned and improperly abandoned wells near new oil and gas developments, and showed the importance of properly abandoning wells before new development proceeds.

A 2011 Duke University study covering Pennsylvania and New York found methane contamination of drinking water associated with shale-gas extraction. The study found that methane concentrations were 17 times higher, on average, in drinking water wells in active drilling

and extraction areas than in wells in nonactive areas. (S.G. Osborn, et al., *Methane Contamination of Drinking Water Accompanying Gas Well Drilling and Hydraulic Fracturing*, Proc. of the National Academy of Sciences, U.S.A.; DOI: 10.1073/pnas.1100682108, p.2 (2011)). Clearly, the higher incidence rate of methane contamination in drinking water wells in shale gas extraction areas is not a coincidence, but is an indicator of shale gas drilling and completion operations mobilizing gas from the shale gas reservoir into protected aquifers. One of the most likely pathways for leaking of gas mobilized by a hydraulic fracture treatment is a nearby existing well that either was improperly constructed or improperly plugged. Given their failed cement, corroded casing, or lack of casing or cement, such improperly abandoned wells present vertical pathways to aquifers and drinking water resources.

Mechanical failure, human error, and engineering design flaws do occur in the construction and operation of wells. Indeed, groundwater contamination has been attributed to operational failures at various Marcellus Shale gas development operations in Pennsylvania, including operations by Cabot Oil & Gas Corporation, Catalyst Energy, Inc., and Chesapeake Energy Corporation.

Pennsylvania has found that significant planning, research, and field work is needed to identify orphaned and improperly abandoned wells before drilling nearby wells; such aspects must be integrated into the proposed regulations to guide operator identification of abandoned wells. At a 2009 Stray Gas Workshop in Pennsylvania, Garrett Velosi, from the National Energy Technology Laboratory, pointed out that one of the main problems with stray gas leaks from abandoned wells is verifying the location of improperly abandoned wells. Records on older wells are often limited or non-existent. Mr. Velosi presented methods for locating unmarked abandoned wells. They include the use of historic photos, ground magnetic surveys, and airborne surveys (equipped with magnetometers and methane detectors). (G. Veloski, National Energy Technology Laboratory, *Methods for Locating Wells in Urban Areas – A Summary of Case Studies* (Nov. 2009) (Pennsylvania Stray Gas Workshop)).

Additionally, we are concerned that the proposed radius of investigation for locating improperly abandoned wells is too small, and that action is not required to properly abandon a well that could be intersected by a hydraulic fracture treatment.

The EQB proposed a radius of investigation of 1,000 feet for all gas wells (that produce marketable quantities of gas or a gas/oil ratio of more than 100 Mcf/bbl). The EQB did not explain how it determined a 1,000 feet threshold to be sufficient and protective of ground water resources. Nor did the EQB explain why it proposes to exempt all gas wells that do not produce marketable quantities of gas or a gas/oil ratio of less than 100 Mcf/bbl from the operator's obligation to identify orphaned and abandoned wells prior to hydraulic fracturing operations.

The amount of gas a well can actually produce will depend on the success of the hydraulic fracture treatment. This information will not be known until after the hydraulic fracture treatment is completed. Therefore, decision criteria based on data that will not be available at the time the decision is made are not good criteria to use to determine whether abandoned and orphaned wells must be identified prior to a hydraulic fracture treatment.

We are also concerned that, in addition to gas that may be mobilized with the hydraulic fracture treatment, that the chemicals contained in the hydraulic fracture treatment itself have the potential to intersect an abandoned or orphaned well and result in ground water contamination. Therefore, the need to identify abandoned or orphaned in the hydraulic fracture treatment radius is independent of the gas flow rate.

The EQB proposed a radius of investigation of 1,000 feet for all horizontally drilled oil wells and 500 feet for vertically drilled oil wells. The EQB did not explain how it determined the 500 and 1,000 feet thresholds to be sufficient and protective of ground water resources.

As proposed by the EQB, there is no variability in the impact radii to account for hydraulic fracture treatment type or size variation. Fracture zones can propagate at considerable distances from the wellbore, and the EQB should require operators to identify abandoned wells within the potential zone of impact, with an additional margin of safety.

We recommend that operators be required to identify any improperly abandoned wells within 2,500 feet of the furthest fracture zone extent measured along the entire wellbore. This method will ensure a larger radius of investigation is completed for larger hydraulic fracture treatments with larger radii of impact.

Additionally, we recommend that operators that have not properly P&A'd all their wells in Pennsylvania be required to complete that work before being issued permits to drill and hydraulically fracture new wells. It is not acceptable for operators to continue to drill new wells without taking responsibility for remedying existing problem wells. Pennsylvania law provides the PADEP with the authority to deny a permit if issuance of the permit would result in a violation of applicable law. 58 Pa.C.S. § 3211(e)(1). Failure to plug and abandon wells would be a violation of applicable law 58 Pa.C.S. § 3220.

Additionally, regulations should clarify that operators applying for a permit to drill a new well nearby an improperly P&A'd or orphaned well must either: (1) locate the well's owner and arrange for the well to be P&A'd consistent with the PADEP's regulations; (2) work with the PADEP to use the PADEP's Well Plugging Funds (58 Pa.C.S. § 3271) to properly P&A each improperly abandoned well identified; or (3) if the PADEP has insufficient funds to complete this work on the time schedule and the operator wants to implement its project at a faster pace, the operator should be required P&A the improperly abandoned well before the PADEP issues any site construction or drilling permits.

New wells drilled and hydraulically fractured near improperly P&A'd wells can result in groundwater contamination. It is not acceptable to defer resolution of improperly P&A'd wells to a future, yet-to-be determined process with an unknown outcome, and proceed with approval of new wells, when those defective wells are located within the potential hydraulic fracture treatment zone of impact. (In its 2010 Pennsylvania Hydraulic Fracturing Review, STRONGER recommended that the Department take action to "eliminate potential pathways for fluid movement into groundwater..." and consider situations in which active and abandoned wells located near fracking operations will "...provide pathways for fluid movement into groundwater," with a goal of preventing communication between wells).

We also recommend that where current and accurate records are not available, that the operator be required to conduct aeromagnetic and ground magnetic surveys and use methane detectors to identify those wells, consistent with abandoned well location method recommendations from the U.S. Geological Survey (USGS). (U.S. Geological Survey (USGS), Fact Sheet 163-95, Magnetic Surveys for Locating Abandoned Wells, <http://pubs.usgs.gov/fs/fs-0163-95/FS163-95.html>)

A report of these investigations shall be filed with the PADEP within 7 days and the PADEP shall make this information available on a publicly available database.

We recommend the following proposed revision to §78.52a(a)-(c):

§ 78.52a. Abandoned and orphaned well identification.

(a) Prior to site construction and drilling or hydraulically fracturing a the well, the operator of a gas well or horizontal oil well shall identify the location of orphaned or abandoned wells or improperly abandoned wells within 1,000 feet measured within 2,500 feet of the vertical wellbore, measured horizontally, and within 2,500 feet of the horizontal wellbore, measured from the surface directly above its entire length, or in in the case that the well is hydraulically fractured, within 2,500 feet of the furthest predicted fracture zone extent measured along the length of a horizontal the entire well bore in accordance with subsection (b). Prior to hydraulically fracturing the well, the operator of a vertical oil well shall identify the location of orphaned or abandoned wells within 500 feet of the well bore in accordance with subsection (b). For the purposes of this section, a gas well is a well which is producing or capable of producing marketable quantities of gas or of gas and oil with a gas-oil ratio of more than 100 MCF per bbl of oil.

(b) Identification shall be accomplished by conducting the following the steps required in (1) through (6), submitting a report documenting this work, and submitting the survey results within seven days of completion. The Department shall make this survey work publically available on its website within 7 days of receipt.

(1) A review of the Department's active, inactive, plugged, orphaned and abandoned well database.

(2) A review of applicable farm line maps made available on the Department website, where accessible.

(3) Submitting a questionnaire on forms provided by the Department to landowners whose property is within the area identified in subsection (a) regarding the precise location of orphaned and abandoned wells on their property.

(4) A review of historical air photos.

(5) A field survey that includes a ground survey to identify surface evidence of orphaned, abandoned, or improperly abandoned wells, including the use of methane detection equipment.

(6) Aeromagnetic and ground magnetic surveys.

(c) Prior to obtaining a permit for site construction or to drill or hydraulically fracturing a well, the operator shall:

(1) Provide evidence to the Department that all the wells it is financially responsible for in Pennsylvania either are producing or have been properly P&A'd in accordance with 58 Pa.C.S. § 3220 and the Department's requirements for long-term plugging and abandonment.

(2) Submit a plat to the Department showing the location and GPS coordinates of orphaned and abandoned wells identified under subsection (b) and proof of notification that the operators submitted questionnaires under subsection (b)(3).

(3) Provide evidence to the Department that, for each orphaned or abandoned well identified, the well's owner was located, and the well owner has properly P&A'd the well according to the Department's requirements for long-term plugging and abandonment or,

(A) The well owner cannot be located or will not properly P&A the well and that the Department's Well Plugging Funds (58 Pa.C.S. § 3271) have been used to properly P&A each well, according to the Department's requirements for long-term plugging and abandonment, or

(B) The operator has properly P&A'd the well according to the Department's requirements for long term plugging and abandonment.

(d) The Department will include any new orphaned and abandoned well data into its well database, within 30 calendar days, and make that data publically available on the Department's website.

If the EQB disagrees with our recommendation for improving the proposed regulation for abandoned and orphaned well identification, and allows the PADEP to issue permits without

requiring all improperly abandoned wells (including orphaned wells) to be P&A'd according to the PADEP's requirements for long-term plugging and abandonment, we request that the EQB:

- (1) Explain how its proposal is consistent with Pennsylvania law;
 - (2) Provide statistics on the number of improperly abandoned wells (including orphaned wells) in Pennsylvania;
 - (3) Provide a quantitative technical assessment of the cumulative adverse impact these wells have had on the air, surface water, and groundwater; and,
 - (4) Provide a projection of potential future cumulative impacts.
- (1143)

Response: For matters related to the timing of the area of review survey, please see response to comment 627.

The Department disagrees with this comment, as oil and gas production levels can be anticipated by referencing current and historical production activities in the area of development.

Existing laws and regulations address the proper plugging and abandonment of wells and when such activities must be completed. The Department has various enforcement mechanisms at its disposal for ensuring that those laws and regulations are complied with. Plugging identified wells ahead of hydraulic fracturing is one option for mitigating risk and has been practiced in the state historically. The Department has agreed to make forms and clarifying guidance available prior to adoption of the final rule in order to address some of the concerns expressed in this comment.

For matters related to the dimensions of the area of review, please see response to comment 627.

For matters related to the inclusion of other well types in the area of review survey, please see response to comment 626.

Plats submitted to the Department identifying wells sites will be done so electronically and are considered public records. The Department's databases will be updated with information as appropriate, although the timeframe for making updates is not being addressed as part of this rulemaking.

Farm line maps are currently available for review at the PA Geologic Survey's office in Pittsburgh. The Department currently maintains and makes available a list of orphaned and abandoned sites that have not been plugged. The location of plugged wells are available in PA*IRIS/WIS. Existing databases are being expanded upon by the Department as historical analog source maps become available and as time permits. Companies in possession of such maps may share them with the Department, if they so choose, in order to facilitate development of a more comprehensive reference database over time. It should also be noted that the Department has modified the regulatory language to broaden the historical maps and database sources that could be referenced during the area of review survey. However, the revised language recognizes that not all operators may have access to the same sources. Finally, pending guidance will detail appropriate search techniques in cases where wells are not found at the reported location.

Under the Clean Streams Law, it is considered unlawful for any person or municipality to put

or place into any of the waters of the Commonwealth, or allow or permit to be discharged from property owned or occupied by such person or municipality into any of the waters of the Commonwealth, any substance of any kind or character resulting in pollution as herein defined. Any such discharge is declared to be a nuisance. Oil and gas wells must be constructed, completed, and operated in a way that does not violate the Clean Streams Law. The Department evaluates environmental and well integrity data that it collects and continues to look for opportunities to complete studies to inform the rulemaking process.

For matters related to well plugging prior to hydraulic fracturing, please see response to comment 627.

With regard to cumulative impacts, please see response to comment 2910.

719. Comment: I am glad to see that article 13 acknowledged the communication or migration between the new and historic oil and gas wells. Are some areas, because of previous drilling or mining, unfit for new non-conventional drilling? If there is an interest to drill new wells in a pre-drilled area, who is responsible for finding and plugging the existing historic oil or gas well, or coal mine or salt well? I heard an argument from the industry as to that second question. That argument is, “no other industry has to clean up after a previous”. That is weak. Would a rail-roader try to run a high speed train without doing extensive work on the road bed and tracks first? Would an auto mechanic change a water pump without replacing the weak hoses? Would you paint your house without preparing the surfaces to be painted? Would an army officer send his troops across a field or down a road without sweeping for mines? Besides, the gas industry today is beholding in many ways, to the pioneers of the industry. We should use the opportunity of today to clean up the environmental mess of the past. (1126)

Response: By monitoring the highest risk sites, any environmental impacts can be greatly curtailed and addressed by the operator completing stimulation activities.

720. Comment: In 2010 The Pennsylvania (PA) Department of Environmental Protection (DEP) volunteered to have its hydraulic fracturing program reviewed by The State Review of Oil and Natural Gas Environmental Regulations, Inc., (STRONGER). One of the recommendations STRONGER made to the Pennsylvania Department of Environmental Protection was the following:

The review team recommends that DEP consider whether there are areas or situations in which wells (active and abandoned) in the vicinity of hydraulic fracturing operations provide pathways for fluid movement into groundwater. In such areas or situations, DEP should require operators to identify and eliminate these potential pathways for fluid movement into groundwater before conducting hydraulic fracturing operations.

“Require operators to identify” the potential pathways needs to be recognized for what it is: a recommendation to require operators to conduct surveys to identify nearby wells.

In order to comport with STRONGER recommendations; at minimum the Department of Environmental Protection’s proposed changes to Act 78 should require a comprehensive environmental survey to be conducted. Methods and standards of how the department will require operators to conduct environmental surveys need to be defined.

Locating wells, even for trained professionals can be difficult.

In some areas of Pennsylvania searching existing wells, such as areas of the Bradford Oil Field

where early wells were cased with wood, many of the casings have disintegrated, leaving unlined wellbores. Some have caved in, leaving wide open holes. Some are partially covered with vegetation or snow, surveying these areas can be extremely dangerous.

The department should consider this is not uncommon in some early oil fields and require professionals, trained in the field of environmental surveying to conduct environmental surveys in historic oil and gas fields.

STRONGER's recommendation was also to "eliminate these potential pathways for fluid movement into groundwater before conducting hydraulic fracturing operations." Plugging is the only way to eliminate the potential pathways.

At minimum regulations should require orphan, abandoned and unplugged wells identified by surveys within 1000 feet of proposed wells and well bores to be plugged before authorizing new well permits.

During a comment period at the TAB meeting held in State College, Aug. 2013, a conventional well operator explained he had hydraulically fractured "shallow" horizontal wells. "At least 30." Conventional well operators should also be required to perform environmental surveys and existing unplugged, orphan and abandoned wells should be plugged before new well permits are authorized, especially before authorizing permits for intentionally deviated shallow wells. (844b)

Response: The Department disagrees that it is necessary to specify the qualifications of individuals completing the area of review survey. By requiring a plat, it is implied that identified well sites must be surveyed by engineers/surveying professionals.

The regulatory language has been modified and the final-form rulemaking now requires that the survey be completed prior to drilling. Plugging an identified well is a potential risk mitigation strategy available to an operator and this practice has been applied historically. However, assuming that all identified wells in the survey have not been plugged or pose equivalent risks, and mobilizing plugging equipment to each site to re-enter wells is beyond the scope of a reasonable regulation aimed at minimizing risk. By monitoring well sites appropriately, an assessment can be made regarding the potential for environmental impact and corrective actions employed should an unanticipated communication event occur.

For matters related to the timing of the area of review survey, please see response to comment 627.

721. Comment: Southwestern Energy would support a rule that requires reasonable diligence to identify nearby active, inactive, plugged, abandoned, and orphaned wells prior to hydraulic fracturing. The DEP's proposal, however, would lead to open-ended obligations for identifying these wells. (1145)

Response: For concerns related to the open-ended characterization of the rule, please see response to comment 632.

For matters related to the inclusion of other well types in the area of review survey, please see response to comment 626.

722. Comment: In subsection (b)(1), the word "of" appears to be missing between "review" and "the". (852a)

Response: The Department acknowledges this comment and will make the necessary correction.

723. Comment: Within 1,000 feet of a well bore or lateral, the operator must locate abandoned or orphaned wells. Some of these wells were drilled in the 1800's (with wood conductor pipe). In the early 1900's, thousands of wells were abandoned with the casings pulled to provide steel for World War II. As a result, it is virtually impossible to locate these wells. (627, 4681 – 4682)

Response: Although the Department acknowledges some well sites may be difficult to identify in the field, it does not agree that this will be the case for all high-risk sites requiring monitoring.

724. Comment: Information obtained by the operator regarding orphaned wells and subsequent monitoring reports of those wells should also be provided to the landowner as part of the proposed regulation. (1170)

Response: For matters related to the dissemination of information regarding identified orphaned and abandoned wells, please see response to comment 684.

725. Comment: Consideration must be taken into account for those landowners within the defined search radius who refuse to provide orphaned well location information to an operator and/or allow access to orphaned wells on their property. (1170)

Response: For matters related to the landowner questionnaire, please see response to comment 662.

726. Comment: 78.52a - The location coordinates for a large number of wells that may exist in the Department's database are likely derived from sources other than field GPS coordinates. Some coordinates may have been derived from old maps. For a variety of reasons, a well with latitude/longitude coordinates in the Department's database may not be visible on the ground, perhaps because the coordinates are inaccurate, or possibly because the well does not exist. It seems appropriate that any wells which appear on the Department's database should be identified, provided their total depth extends below the interval that could reasonably be influenced by hydraulic fracturing. A vertical isolation distance of 1,500 feet above wellbore perforations in an unconventional well and 500 feet above wellbore perforations in any other well is a reasonable isolation distance that exceeds the normally expected vertical growth of induced fractures. A requirement to consult "applicable farmline maps, where accessible" in order to identify wells lacks clarity required for a regulation. There are many sources of information on old wells in Pennsylvania, including many reports by state agencies, as well as privately owned maps and records maintained by various operators. If the Department's database could be sufficiently enhanced, a review of the database should be an adequate obligation for well identification. A partnership effort between industry and state government seems an appropriate method of compiling available data on historical oil and gas wells. Because of the generally higher rate, volume and pressure used in hydraulic fracturing of the Marcellus and other deep shales, constructing a more comprehensive database of historical deep wells (those that penetrate to a depth at least 1,500 feet above the Marcellus Shale) would be a priority. It is hoped that with good cooperation, this could be accomplished within a few months, as the state's current database for this set of deeper wells is believed to be nearly complete. Enhancement of the shallow well database will require significantly more work, time and expense, and is likely a multi-year project. The proposed language in Subsection 78.52(b)(3) would require submission of a questionnaire to landowners on forms

provided by the Department. There has been no opportunity to review the proposed questionnaire and no details provided with regard to what the Department envisions as the operator's obligations to verify information received. There is far too much uncertainty related to this provision to support it as a regulatory requirement. Additionally, the oil and gas industry's identification of abandoned and orphaned wells will benefit from further development of the Department's database, and should be postponed until the database and mapviewer system is improved. Accordingly, the Department should consider a phased implementation of this new section.

Suggested Language: 78.52a Well identification prior to hydraulic fracturing

(a) Prior to hydraulically fracturing an unconventional well, the operator shall identify in accordance with subsection (b) the location of active, inactive, plugged, orphaned or abandoned wells within 1,000 feet measured horizontally from the surface projection of any portion of the wellbore whose total depth is known or reasonably expected to be less than 1,500 feet above the shallowest vertical depth to be perforated or isolated for hydraulic fracturing. Prior to hydraulically fracturing a conventional well, the operator shall identify the location of active, inactive, plugged, orphaned or abandoned wells within 500 feet of the well bore whose total depth is known or reasonably expected to be less than 500 feet above the shallowest vertical depth to be perforated or isolated for hydraulic fracturing.

(b) Identification shall be deemed to have been satisfied by conducting a review of the Department's database for active, inactive, plugged, orphaned and abandoned wells.

(c) Prior to hydraulically fracturing a well, the operator shall submit a plat to the Department showing the location and GPS coordinates of wells identified pursuant to subsection (b) whose total depth is known or reasonably expected to be less than 1,500 feet, in the case of an unconventional well or 500 feet, in the case of any other well, above the shallowest vertical depth to be perforated or isolated for hydraulic fracturing. The operator may identify on the plat those wells that are identified on the Department's database but which have not been located on the ground using reasonable efforts.

(d) This subsection shall become effective six months from final publication in the Pennsylvania Bulletin.(1174)

Response: For matters related to sources that should be referenced when completing the area of review survey, please see response to comment 628.

For matters related to which well sites must be monitored because of vertical proximity to the stimulated interval, please see response to comment 626.

For matters related to the value of the landowner questionnaire, please see response to comment 626.

For matters related to the inclusion of other well types in the area of review survey, please see response to comment 626.

For a summary of which wells sites in the area of review must be mapped, please see response to comment 705.

727. Comment: 78.52a – Pre-Hydraulic Fracturing Assessment: With regard to proposed Section 78.52a,

Commentator supports a rule that requires reasonable diligence to identify abandoned and orphaned wells prior to hydraulic fracturing. We also believe the identification should include active, inactive and plugged wells. The regulation should provide clear direction to both the DEP staff and well operators. The rule should provide a precise limitation of the area of review, both horizontally and vertically from the well bore, based upon potential risks related to hydraulic fracturing and communication with other wells in the area, rather than propose open ended obligations. There is a technical consensus that shallow wells are largely irrelevant to deep unconventional well operations. As such, the questionnaire as proposed is unlikely to yield useful information and is more likely to create confusion, administrative complications and delays for well operators and DEP staff without any benefit. The questionnaire should be eliminated. The regulation should be amended to reflect that the operator's obligation consists of: a) consulting with the DEP's database to identify only those active, inactive, plugged, abandoned and orphaned wells that are known or reasonably expected to penetrate the area of review (i.e., located within the specified horizontal distance of a planned wellbore and extending deep enough to potentially be impacted by hydraulic fracturing of the target horizon); b) monitoring of abandoned or orphaned wells that penetrate the area of review during hydraulic fracturing by visual observation or other method approved by the DEP, including circumstances where an operator does not have access to the well; and c) taking appropriate remedial action on any well that is affected by hydraulic fracturing in such a way as to create an environmental risk, recognizing limitations of access and ownership of such well.(1174)

Response: For matters related to the value of the landowner questionnaire, please see response to comment 626.

For concerns related to the open-ended characterization of the rule, please see response to comment 632.

For matters related to the inclusion of other well types in the area of review survey, please see response to comment 626.

The area of review has been defined in reference to the horizontal plane and has been further refined in the vertical plane in consideration of available studies and provided comments.

For matters related to which well sites must be monitored because of vertical proximity to the stimulated interval, please see response to comment 626.

For matters related to sources that should be referenced when completing the area of review survey, please see response to comment 628.

For matters related to acceptable monitoring protocols, please see response to comment 694.

For matters related to remediation following a frac communication incident, please see response to comment 706.

728. Comment: Consideration must be given to special circumstances in which an orphaned well is utilized for a certain purpose. For example, the PGC utilizes an artesian orphaned oil and gas well to supply wetlands that were created on SGLs to improve wildlife habitat. Should drilling operations negatively impact the water quality or quantity from this well, would the operator be responsible for replacing the use? Operators should be required to evaluate the functions and values, if any, of any identified abandoned or orphaned wells prior to drilling. (1170)

Response: The Department disagrees that this should be addressed in the rulemaking. In the

unlikely event that the altered well is being used for some other purpose, replacing that resource would be subject to §§ 78.51(e) and 78a.51(e), which protect water supplies for uses other than human consumption. Certain restoration requirements in the Act may also apply.

729. Comment: § 78.52a and § 78.73 Pre-Hydraulic Fracturing Assessment - We applaud the Department for pursuing detailed assessment of potential conduits for fluid migration prior to the commencement of hydraulic fracturing activities. Orphaned and abandoned wells, improperly constructed production wells, natural fissures, and “complex” geology can all represent potential pathways for contamination of protected water, and we are glad to see the Department proposing to require operators to examine the area around proposed wells for such hazards. In an attached Appendix, we offer some suggestions for enhancing the Department’s proposed evaluation.

Appendix -- Proposal for Revision to draft PA § 78.52a and § 78.73

Definitions

“Impacted strata” shall mean (i) the productive horizon that is to be stimulated with a hydraulic fracturing treatment and (ii) all strata that are immediately adjacent to such productive horizon and are within the operator’s estimated or calculated effective fracture height for such hydraulic fracturing treatment.

“Intervening zone” shall refer to those geological formations (or part of a formation) located between the top boundary of the productive horizon that is being hydraulically fractured and the base of the deepest stratum or zone that contains protected water.

“Limited intervening zone” shall mean an intervening zone that (i) is less than 1,000 vertical feet thick, or (ii) is more than 1,000 vertical feet thick, but which the Department determines, based on the lithologic, geomechanical or other properties of the formations that comprise the intervening zone, may not contain an adequate confining layer or is in a structurally complex geologic setting with known faults that extend through the intervening zone and are likely to be transmissive. Notwithstanding the foregoing, an intervening zone less than 1,000 vertical feet thick may be excluded from classification as a “limited intervening zone” if the Department determines that such intervening zone contains an adequate confining layer

§ 78.52a. Identification of operating, inactive, abandoned and orphaned wells, and other potential fluid conduits.

- (a) Prior to hydraulically fracturing the well, the operator of a gas or oil well shall identify the location of operating, inactive, orphaned and abandoned wells that penetrate the impacted strata, and geologic faults and natural fracture zones that are known to completely transect the impacted strata, within 1,320 feet measured horizontally from the vertical well bore and 1,320 feet measured from the surface above the perforated section of a horizontal well bore (if applicable) in accordance with subsection (b). The Department may specify a greater or lesser distance upon determination that regional or local conditions justify a larger or smaller area of investigation.
- (b) Identification shall be accomplished by conducting the following:
 - (1) A review of the Department’s operating, inactive, orphaned and abandoned well databases;
 - (2) Submitting a questionnaire on forms provided by the Department to landowners whose property is within the area identified in subsection (a) regarding the precise location of orphaned and abandoned wells on their property;

- (3) A review of company records, available records of offset operators, public databases, and other regulatory agency records;
- (4) A review of historical maps (i.e. WPA, USGS, Pennsylvania Geologic Survey, operator “farm sheet” maps), where available;
- (5) A review of historical air photos available on the Pennsylvania State University ‘Penn Pilot’ website (<http://www.pennpilot.psu.edu/>);
- (6) For wells with a limited intervening zone:
 - (A) An analysis of the site specific hydrology (depth of protected water) and geophysical characteristics of the intervening zone and confining layer(s) contained within the intervening zone. The purpose of the analysis is to demonstrate that the confining layer(s) has sufficient areal extent, impermeability, and absence of transmissive faults or fractures such that the proposed hydraulic fracturing treatment design will not: (i) result in the vertical migration of the fracturing fluids, hydrocarbons, or other contaminants into strata that contains protected water; or (ii) result in a horizontal fracture that intersects with a nearby well that could result in the vertical migration of the fracturing fluids, hydrocarbons, or other contaminants into strata that contains protected water. A confining layer is of sufficient areal extent and thickness if it is capable of preventing or arresting vertical fracture propagation
 - (B) An analysis including information on the geologic structure, stratigraphy and hydrogeologic properties of the proposed producing formation(s) and intervening zone in the area of investigation, including (i) geologic name and description of all formations penetrated, including relevant logs, (ii) structure maps, including any faults, and (iii) any geomechanical analyses, including permeability, relative hardness (using Young’s Modulus) and relative elasticity (using Poisson’s Ratio).
 - (C) An analysis that utilizes a 3D model populated with the most current data available and approved by the Department that will estimate the maximum vertical and horizontal fracture propagation length, and which shows that the hydraulic fracturing treatment will not propagate fractures into strata containing protected water. The model input and output shall be submitted as part of the application, and the model shall be based on all relevant geologic and engineering data including but not limited to rock mechanical and geochemical properties of the producing zone and confining layer(s) and anticipated hydraulic fracturing pressures, rates, and volumes;
- (c) Prior to hydraulically fracturing a well, the operator shall submit:
 - (1) a plat to the Department showing the location and GPS coordinates of operating, inactive, orphaned and abandoned wells identified pursuant to subsection (b)
 - (2) a statement that the operator has met the identification requirements of subsection (b)
 - (3) a statement that the operator does not expect the hydraulic fracturing treatment to cause fluid movement through any identified wells or geologic features that would pollute waters of the Commonwealth.
- (d) For limited intervening zone wells, the analysis called for by subsection (b)(6) may be submitted on a well-by-well basis, or may be approved by Department for an area, and referenced as a pre-approved intervening zone analysis in the well application for wells with a limited intervening zone drilled in such area. (997a)

Response: For matters related to which well sites must be monitored because of vertical proximity to the stimulated interval, please see response to comment 626.

The risk being addressed is in association with hydraulic fracturing and, generally speaking, due to lithostatic pressure applied by overlying rock layers and the physics constraining

fracture mechanics, the most likely pathway to fresh groundwater during hydraulic fracturing is represented by improperly abandoned oil and gas wells. The detailed geological analysis specified in this comment does not significantly improve the ability of the Department to mitigate the risk being addressed, although the regulatory language has been modified and now requires treatment pressure and volume monitoring aimed at identifying abnormal fracture growth.

For matters related to the inclusion of other well types in the area of review survey, please see response to comment 626. Generally speaking, due to lithostatic pressure applied by overlying rock layers and the physics constraining fracture mechanics, the most likely pathway to fresh groundwater during hydraulic fracturing is represented by improperly abandoned oil and gas wells. If faults or zones of fracture concentration do play some role in communication, it is by allowing propagated fractures to move out of zone and into an improperly abandoned oil or gas well. However, the Department has modified the regulatory language to include a provision for monitoring fracture treatment pressures at the stimulated well site. This provision is intended to allow for the identification of abnormal fracture growth.

For matters related to the dimensions of the area of review, please see response to comment 627.

For matters related to sources that should be referenced when completing the area of review survey, please see response to comment 628.

The Department disagrees that requiring operators to submit a statement that frac communications are not expected is a useful risk mitigation strategy.

- 730. Comments:** With regard to proposed section 78.52a, the regulation should provide clear direction to both the PADEP staff and well operators. The rule should provide a precise limitation of the area of review, both horizontally and vertically from the well bore, based upon potential risks related to hydraulic fracturing and communication with other wells in the area, rather than proposed open ended obligations.

The regulation should be amended to direct the operator to: a) consult the PADEP's database to identify only those active, inactive, plugged, abandoned and orphaned wells that are known or reasonably expected to penetrate the area of review (i.e., located within the specified horizontal distance of a planned wellbore and extending deep enough to potentially be impacted by hydraulic fracturing of the target horizon); b) monitor abandoned or orphaned wells that penetrate the area of review during hydraulic fracturing by visual observation or other method approved by the PADEP (allowing exceptions where an operator does not have access to the well); and c) take appropriate remedial action on any well that is affected by hydraulic fracturing in such a way as to create an environmental risk, recognizing limitations of access and ownership of such well. (1147)

Response: For matters related to the dimensions of the area of review, please see response to comment 627.

For matters related to which well sites must be monitored because of vertical proximity to the stimulated interval, please see response to comment 626.

For matters related to sources that should be referenced when completing the area of review survey, please see response to comment 628.

For matters related to acceptable monitoring protocols, please see response to comment 694.

The Department is developing clarifying guidance related to site access prior to promulgation of the final rule. Specifically, this issue will be addressed in a guidance document discussing the area of review requirements and the components of a suitable monitoring plan. The provision in the final-form rulemaking that addresses this matter is related to treatment pressure and volume monitoring. The Department believes that even in situations where identified wells cannot be visually monitored, monitoring at the well being hydraulically fractured will allow the operator to determine if anomalous frac growth is taking place that is indicative of a possible communication event.

- 731.** Comment: Pre-hydraulic fracturing assessment (abandoned wells) - Sections 78.52a and 78.73. Proposed section 78.52a would require an operator, before hydraulically fracturing a gas well, to identify the location of all orphaned and abandoned wells within 1,000 feet from the vertical well bore and 1,000 feet from the entire length of a horizontal well bore. Section 78.73 would require an operator to plug and orphaned or abandoned well that it “alters” during hydraulic fracturing.

TAB is very concerned with breadth and vagueness of these sections. First, Act 13 does not require identification of abandoned or orphaned wells to obtain a drilling permit nor does it require operators to plug these wells. Express statutory authority for these sections is lacking. Second, the Department’s proposal raises many practical compliance problems. As examples, there is no definition of what it means to “alter” an abandoned or orphaned well. The necessary diligence to identify and subsequent obligations related to abandoned wells remain unclear and could potentially create unreasonable burdens without coincident environmental benefit. Access may be denied to property on which abandoned or orphaned wells are located. A well may be identified on the DEP database or historic farm maps but cannot be field-located. The regulation does not address what happens in any of these circumstances. Even if identifying abandoned or orphaned wells before hydraulic fracturing is good standard practice in certain circumstances, the rule does not provide operators the flexibility to identify such wells during various other stages of permitting, drilling, or completion. (1172)

Response: For matters related to the statutory authority of the regulation, please see response to comment 625.

For matters related to the definition of alteration, please see response to comment 686.

For matters related to well site access, please see response to comment 730.

- 732.** Comment: Let me express my strong support for the new provisions requiring those constructing an unconventional gas well to do a survey for orphan and abandoned wells. This is long overdue and commendable. The Oil & Gas Industry’s opposition to this provision is disgraceful. (869)

Response: The Department acknowledges this comment.

- 733.** Comment: My understanding of the issues regarding drilling near legacy wells dates back to 2009 when I realized that the planned Lundy horizontal 2H well in standing Stone Township was in close proximity to the legacy Harold W. Lundy well, plugged in 1991. At that time, I provided input relative to the permitting of the Lundy wells, wrote letters to Oil & Gas, TAB and CHK. I provided input on the advanced rulemaking and again during the public comment period of final rulemaking. I am providing copies of comments I made and the response that I got. Although no regulations regarding abandoned wells were enacted by DEP at that time, my efforts were not in

vain. The Harold w. Lundy legacy well did get evaluated and ultimately was plugged in March 2011 prior to the fracking of the new Lundy 2H.

Although I am pleased to see the DEP addressing this issue at this time, I am more than disappointed at the lack of strength of the regulations. The regs deal only with a very limited set of wells, the officially “abandoned and orphaned” and do not include identification of inactive wells in the area of proposed new wells. Given the Harold w. Lundy well experience, there is clearly a need to identify inactive wells also.

Identification of wells is not enough. All wells in the area of a planned horizontal well must be evaluated, even if previously plugged. In Bradford County, there are currently 5 orphaned and abandoned wells. By my last count from DEP eFacts records when the site search for inactive wells was still operational online, Bradford County has 23 inactive wells. The potential hazard to our environment from fracing near these wells is potentially much greater than from the orphaned and abandoned wells. I assume there is a similar situation statewide. The wells must be plugged or replugged, if necessary, prior to fracing.

The “visual monitoring” at unspecified frequency in your proposed 78.73 is insufficient. The concept of allowing fracing until changes in the monitored legacy well are noted is unacceptable. Requiring plugging after the changes occur is requiring plugging too late to prevent impact to the environment. This approach is not proactive and does not protect our water.

My proposal relative to identification is to adopt the Alaskan proposed regulations which were reviewed by the DEP and commented upon in the regulatory analysis associated with these standard changes. We need to go all the way and identify all well penetrations, as well as geological faults and fractures. At a minimum, inactive wells should be included in the identification step along with abandoned and orphaned wells. In addition, well penetrations must be evaluated, and replugging conducted if necessary prior to fracing the horizontal well.

I have twice provided the wording for a standard that would provide meaningful change. The DEP has had almost 3 years to seriously consider my input, if the DEP were so inclined. I will now read the proposed standard that I provided to the DEP in the advanced rulemaking and rulemaking public comment processes.

This proposal is included in my handout and highlighted and is numbered 78.77. With minor revision, it would meet the needs of providing proactive protection to the waters of the commonwealth, including the private water supplies of our residents. Read from document 2857 Received by the DEP Aug 2010 here. Relative to 78.103 and 78.105, many wells currently classified as inactive need to be reclassified as abandoned. There is no stated impetus in the standards as to when the Department takes the initiative to do this. I will assist, if needed, in providing that impetus for Bradford County’s inactive wells. Only one well previously considered inactive has been reclassified as orphaned and abandoned in the past several years. Despite my dissemination of the inactive list to CHK and to Bradford county leadership, I do not see any evidence of the other wells on the inactive list having been evaluated, and potentially replugged, despite my pleas for this to occur. The inactive list is being ignored in Bradford county and likely across the state. The true proportions of the problem with legacy wells in PA are best represented by the sum total of the orphaned, abandoned, and inactive legacy wells.

Regarding data, there have been changes in the DEP’s eFACTS which limit the ability of the public to access data that we previously were able to obtain. There are several examples but the pertinent

one here is the inability to access the inactive well list in totality. I have included in my testimony package the list I was able to access 2 years ago. I applaud the DEP's current mapping project; it needs to be completed with all wells shown. The Harold w. Lundy well is not shown, and is also semi-invisible in eFACTS.

I would welcome the opportunity to discuss these problems with a data administrator if I could be directed to the correct person.

Lastly, I would like to voice a specific concern for our areas, and specifically Wyoming County's, glacial lakes. Encroachment of drilling toward Lake Carey and Lake threaten special public resources. Current standards do not deal adequately with the special needs of our area's glacial lakes. Water quality, habitat, and recreational opportunities afforded by these lakes need to be specially considered, as does the underlying geology. One proposal would be for an automatic evaluation of all glacial lakes for potential classification as EV (exceptional value).

I expect to submit additional comments via e-mail. These comments will address other aspects of the proposed regulations. If I should register to comment at a different county's public comment forum, it will be to provide comments pertaining to different regulations than covered today. I ask you not to exclude my participation at a second event. I request that an additional public hearing be scheduled for Bradford County. s See Appendix 4 for attachments (877)

Response: For matters related to the inclusion of other well types in the area of review survey, please see response to comment 626. For matters related to the identification of natural features, please see response to comment 705.

Plugging an identified well is a potential risk mitigation strategy available to an operator and this practice has been applied historically. However, assuming that all identified wells in the survey have not been plugged or pose equivalent risks, and mobilizing plugging equipment to each site to re-enter wells is beyond the scope of a reasonable regulation aimed at suitably addressing risk. By monitoring well sites appropriately, an assessment can be made regarding the potential for environmental impact and corrective actions employed should an unanticipated communication event occur.

For matters related to well plugging prior to hydraulic fracturing, please see response to comment 627.

The Department does not agree with this comment. Statutory and regulatory provisions currently allow for wells to be classified as inactive.

For matters related to sources that should be referenced when completing the area of review survey, please see response to comment 628.

The Department does not believe that a lake should be classified as Exceptional Value in Ch. 93, Water Quality Standards, simply due to the fact that it was formed by glacial activity.

- 734.** Comment: I agree with DEP that these wells should be identified. But they must be identified and plugged and sealed according to state safety standards before well site construction starts. Operators must be required to avoid communication between new wells and old to prevent blowouts, accidents and well casing failure. (5936 – 6089)

Response: For matters related to the timing of the area of review survey, please see response to comment 627.

For matters related to well plugging prior to hydraulic fracturing, please see response to comment 627.

§ 78.53 Erosion and sediment control and stormwater management.

735. Comment: Failure to meet erosion and sedimentation control requirements can harm public natural resources, especially waters of the Commonwealth. We recommend that the Board revise the Proposed Rulemaking to provide a public participation process, include guidance and requirements related to riparian buffer protection and restoration, and require full compliance with Chapter 102, notwithstanding the provisions of § 102.8(n). (1152)

Response: Oil and gas activities are subject to the requirements of Chapter 102, including the applicable public participation, riparian buffer and stormwater management requirements. To the extent the commentator objects to Chapter 102 applicability, the Department responds that it is inappropriate to modify regulatory requirements established under 25 Pa. Code Chapter 102 through modifications to 25 Pa. Code § 78.53. This rulemaking does clarify restoration requirements in Sections 78.65 and 78a.65, and in turn addresses concerns related to § 102.8(n).

736. Comment: The term “Oil and Gas Operations” should be used in place of the undefined term “Oil and Gas Activities” or the term “Oil and Gas Activities” should be defined in Chapter 78. (852a, 1137, 1147, 1153, 1164, 1174)

Response: The Department agrees and has modified the section to use the term oil and gas operations in place of oil and gas activities.

737. Comment: Chapter 78.53 should be rewritten to prevent incorporation of guidance documents into the regulation. The regulation should only require compliance with Chapter 102. (1137, 1147, 1153, 1164, 1174)

Response: The guidance documents are listed as a reference and are not incorporated as requirements.

738. Comment: There is an important need to update the referenced manuals in § 78.53 as sources of best management practices for oil and gas well activities. Additionally, the recent efforts to develop model plan for erosion and sediment control, post construction stormwater management and site restoration should be finalized. (1137, 1164, 1174).

Response: The Department agrees that guidance manuals should be kept up to date.

739. Comment: We appreciate the updated clarification of this provision. We recommend the adoption of this provision at the minimum as it is written. (660a)

Response: The Department acknowledges the comment.

740. Comment: Under § 78.53, language has been added to clearly state that any person conducting earth disturbance activities associated with any aspect of oil and gas activities, as defined in § 78.1, must comply with Chapter 102 to Title 25 of the Pennsylvania Code, as well as the DEP’s Erosion and

Sediment Pollution Control Manual and the Oil and Gas Operators Manual.

While we support the explicit inclusion of these requirements, we are disappointed that DEP opted not to take the opportunity to formalize, through regulation, certain sections of its erosion and sediment control policy for oil and gas activities. (Policy for Erosion and Sediment Control and Stormwater Management for Earth Disturbance Associated with Oil and Gas Exploration, Production, Processing, or Treatment Operations or Transmission Facilities. Document No. 800-2100-008). Specifically, DEP failed to include its interpretation of the definition of a “project” for purposes of determining whether an erosion and sediment control permit is needed. Section III. of the policy states:

DEP interprets “project” to be substantially connected well sites, access roads, pipelines, other service lines, support facilities, and/or other oil and gas activities. Well pads, impoundments and pipelines, etc., may be permitted separately but are considered together solely to determine whether the total project acreage limit of §102.5(c) has been met and a permit is required. All portions of a project area of 5 acres or more must obtain permit coverage prior to commencing earth disturbance activity.

There has been significant confusion among the public about DEP’s interpretation of a project and under which circumstances the DEP will require an erosion and sediment control permit for oil and gas activities. We strongly recommend that DEP formally adopt through this regulation, in both §§ 78.51 and 78.53, a definition of a “project” for purposes of determining when an erosion and sediment control permit is needed, pursuant to DEP’s Policy for Erosion and Sediment Control and Stormwater Management for Earth Disturbances for Oil and Gas Exploration, Production, Processing, or Treatment Operations or Transmission Facilities, Document No. 800-2100-008. (1157)

Response: The Policy for Erosion and Sediment Control and Stormwater Management for Earth Disturbance Associated with Oil and Gas Exploration, Production, Processing, or Treatment Operations or Transmission Facilities (Document No. 800-2100-008) provides guidance for implementation of § 102.5, including guidance regarding what constitutes a project for purposes of determining permit applicability. Erosion and sediment control permits are issued under authority of Chapter 102. The Department believes that guidance for implementation of Chapter 102 is most appropriately implemented through a technical guidance document.

741. Comment: Sites activities related to siting, drilling, completing, producing, servicing and plugging the well, constructing, utilizing and restoring the access road and restoring the site...”
Recommendation: Prescriptive language should be included for erosion and sediment control for pipelines and pipeline infrastructure. (118)

Response: Section 78.53 requires compliance with Chapter 102 for all oil and gas operations. The term “oil and gas operations” includes earth disturbance associated with oil and gas exploration, production, processing, or treatment operations or transmission facilities which includes pipelines and pipeline infrastructure.

742. Comment: The proposed amendments to this section cross reference the requirements of Chapter 102. This section also specifies that best management practices for erosion and sediment control for oil and gas activities are listed in the Erosion and Sediment Pollution Control Program Manual , Commonwealth of Pennsylvania , Department of Environmental Protection, No. 363-2134-008, as

amended and updated, and the Oil and Gas Operators Manual, Commonwealth of Pennsylvania , Department of Environmental Protection, Guidance No. 550-0300-001, as amended and updated. Erosion and sedimentation Control is at the forefront of our service to Greene County residents. We appreciate that the updated Chapter 102 regulation has been addressed in the regulation update. (566)

Response: The Department acknowledges the comment.

743. Comment: We are encouraged to see language specifying that “Any person proposing or conducting earth disturbance activities associated with oil and gas activities shall comply with the requirements of 25 Pa. Code Chapter 102 (relating to erosion and sediment control)”, and that best management practices for erosion and sediment control for oil and gas well activities are listed in the *Erosion and Sediment Pollution Control Program Manual*, Commonwealth of Pennsylvania, Department of Environmental Protection, No. 363-2134-008, as amended and updated. The guidance therein, stating that activities creating runoff from a permitted project site that discharges to Special Protection Waters streams (those classified as High Quality [HQ] or Exceptional Value [EV]), and that calls for more stringent criteria being used to design the BMPs for these sites, is sound.

Furthermore, language referring to work in these drainages and stating that “Nondischarge alternatives are to be used wherever possible” is fully justifiable. We believe these protections would be strengthened by including a requirement that specifies that Antidegradation Best Available Combination of Technologies (ABACT) BMPs be used to the fullest extent possible at all times when working in drainages of Special Protection Waters with anti-degradation standards. (1062, 1133)

Response: Implementation of the Chapter 93 antidegradation requirements for erosion and sediment control in special protection watersheds is addressed in Chapter 102 including requirements to evaluate nondischarge alternatives and implement ABACT BMPs when nondischarge alternatives do not exist. Section 78.53 requires compliance with Chapter 102 for all oil and gas operations. Therefore § 78.53 requires compliance with antidegradation provisions in Chapters 102 and 93.

744. Comment: Section 78.53 should explicitly reference the operators’ post-construction stormwater management obligations under 25 Pa. Code Chapter 102. Chapter 102 requires operators to control erosion and sedimentation during earth disturbance activities (25 Pa. Code §102.4), and to manage stormwater after disturbance activities have ceased (25 Pa. Code §102.8). Current section 78.53 notes only the section 102.4 requirements because current 78.53 was promulgated in 2001 – nine years before section 102.8 became law. Now that section 102.8 is law, section 78.53 should note that PCSM BMPs are listed in the Pennsylvania Stormwater Best Management Practices Manual Commonwealth of Pennsylvania. (852a)

Response: The Department agrees and has added “Stormwater Management” to the title of the section as well as included a reference to the Stormwater Best Management Practices Manual in the section. The requirement to comply with Chapter 102 encompasses post construction stormwater management requirements.

745. Comment: Regarding the Department’s proposal to require compliance with Chapter 102 generally, rather than specifically requiring the implementation of BMPs and E&S plans, we understand this as an acknowledgement that under Chapter 102, some oil and gas earth disturbance activities do not require E&S plans. Specifically, Chapter 102 does not require E&S plans for projects that disturb less than 5,000 square feet and do not have the potential to discharge to a special protection water

body. Chapter 102 also does not require post-construction stormwater management (“PCSM”) BMPs or plans for any oil and gas earth disturbance activities that disturb less than five acres of earth.

Section 78.53 should require PCSM plans for all oil and gas activities that require erosion and sediment controls plans. Section 78.53 and Chapter 102 should be formally harmonized. However, we also believe that protection of the Commonwealth’s water resources demands that PCSM BMPs and plans be required for all activities that require E&S BMPs and plans, respectively. Currently, proposed revised section 78.53 does not mention post-construction stormwater management at all.

Section 78.53 should require PCSM BMPs and/or plans for post-construction activities in all cases where E&S BMPs and/or plans are required during construction. The fact that Chapter 102 requires E&S BMPs and/or plans (but not PCSM BMPs and/or plans) for activities that disturb less than five acres appears to be a drafting error. In any case, it is irrational and directly contrary to the purpose of Chapter 102, which is “to minimize the potential for accelerated erosion and sedimentation *and to manage post construction stormwater.*” Oil and gas activities that disturb less than five acres of earth create impervious surfaces and post-construction stormwater just like larger activities. Consequently, PCSM BMPs should be required for all such activities, and PCSM plans should be required for all projects that require E&S plans – i.e., all projects that disturb between 5,000 square feet and five acres, and projects that disturbs less than 5,000 feet but have the potential to discharge stormwater to a surface water with a designated or existing use of High Quality or Exceptional Value. (852a)

Response: The rulemaking is consistent with and requires compliance with the existing Chapter 102 requirements, for which there are different acreage triggers for permit applicability for certain categories of earth disturbance activities. Chapter 102 requires post construction stormwater management when a permit is required under Section 102.5. The commentator is proposing a requirement that goes beyond existing Chapter 102 requirements. It is not appropriate to modify regulatory requirements established under Chapters 92a and 102 through modifications to Chapter 78 or Chapter 78a.

746. Comment: Section 78.53 should also note that operators must seek and obtain National Pollutant Discharge Elimination System (NPDES) permits under 25 Pa. Code Chapter 92a for stormwater discharges that cause or contribute to violations of water quality standards. While stormwater discharges from oil and gas activities are generally exempt from NPDES requirements under the federal Clean Water Act, *see* 2005 Energy Policy Act Pub. L. No. 109- 58, § 323, 119 Stat. 694 (codified as amended at 33 U.S.C. § 1362(24)), this exemption does not apply to discharges that cause or contribute to a violation of a water quality standard – e.g., sediment-laden discharges into streams impaired for siltation. *See* 40 C.F.R. § 122.26(c)(1)(iii)(C). (852a)

Response: The Department agrees that an NDPEs permit is required for stormwater discharges that cause or contribute to a violation of water quality standards. In Pennsylvania, operators can demonstrate compliance with water quality standards when the operator obtains and complies with the required permits under Chapter 102, as provided in the 2010 Chapter 102 rulemaking. The Department does not agree that the inclusion of the suggested language in the final rulemaking is necessary or appropriate.

747. Comment: For purposes of clarity, section 78.53 should also be retitled “Earth disturbance activities.” (852a)

Response: The intent of the section is to reference the requirements in Chapter 102 which is titled “Erosion and Sediment Control”.

748. Comment: Section 78.53 should be revised to read as follows:

§ 78.53. Earth disturbance activities.

(a) General Requirements

Any person proposing or conducting earth disturbance activities associated with oil and gas operations shall comply with the requirements of 25 Pa. Code Chapter 102 (relating to erosion and sediment control and post-construction stormwater management) and 25 Pa. Code Chapter 92a (relating to National Pollutant Discharge Elimination System). Best management practices for erosion and sediment control for oil and gas well activities-operations are listed in Erosion and Sediment Pollution Control Program Manual, Commonwealth of Pennsylvania, Department of Environmental Protection, No. 363-2134- 008, as amended and updated, and the Oil And Gas Operators Manual, Commonwealth of Pennsylvania, Department of Environmental Protection, Guidance No. 550-0300-001, as amended and updated. Best management practices for post-construction stormwater management for oil and gas activities are listed in the *Pennsylvania Stormwater Best Management Practices Manual* Commonwealth of Pennsylvania, Department of Environmental Protection, No. 363-0300-002, as amended and updated.

(b) PCSM BMPs and Plans

- i. Notwithstanding any other provision of law, any earth disturbance activities covered under section (a) that require the implementation of E&S BMPs under 25 Pa. Code 102.4 shall also require the implementation of PCSM BMPs satisfying the requirements of 25 Pa. Code 102.8(b)-(n) and 25 Pa. Code 102.11.
- ii. Notwithstanding any other provision of law, any earth disturbance activities covered under section (a) that require the preparation and implementation of an E&S plan under 25 Pa. Code 102.4 shall also require the preparation and implementation of a PCSM plan that satisfies the requirements of 25 Pa. Code 102.8(b)-(n) and 25 Pa. Code 102.11.

(c) NPDES Permits

Any person proposing or operating a point-source discharge of stormwater that causes or contributes to a violation of water quality standards under 25 Pa. Code Chapter 93 shall obtain a NPDES permit under 25 Pa. Code Chapter 92a. (852a)

Response: See responses to comments 744, 745, 746 and 747.

749. Comment: 78.53 – Since passage of legislation in 2005, the federal Clean Water Act exempted most stormwater discharges associated with oil and gas construction activities from permitting requirements under the National Pollutant Discharge Elimination System (NPDES) program. The PADEP has established a state specific regulatory program for such discharges under the Pennsylvania Clean Streams Law. The centerpiece of this program is the PADEP’s Erosion and Sediment Control General Permit for Earth Disturbance Associated with Oil and Gas Exploration, Production, Processing, or Treatment Operations or Transmission Facilities, or the ESCGP permit. Although the PADEP’s program is intended to prevent oil and gas construction activities from polluting the waters of the Commonwealth, it has not been successful in many cases.

A February 2012 report by the PennEnvironment Research and Policy Center documented 3,355 citations for environmental violations at Pennsylvania oil and gas wells between January 1, 2008, and December 31, 2011, and 2,392 of those violations posed a direct threat to the environment.

(Erica Staff, Penn Environment Research & Policy Center, Risky Business: An Analysis of Marcellus Shale Gas Drilling Violations in Pennsylvania 2008-2011 (Feb. 2012)). The greatest percentage of violations (26 percent) was related to erosion and sediment control. Some operators incurred the same violations repeatedly at a single site, failing to address conditions related to the violation. Some operators repeated the same violations at multiple sites, indicating the need to improve both regulatory requirements and implementation of improved practices. Violation issues were related to both erosion and sediment control and to pollution prevention practices. There are many reasons, some of which are outlined below, why the PADEP's program has been unsuccessful in protecting water quality from surface discharges in so many cases.

The PADEP reviews applications for coverage under ESCGP-2 (and its predecessor, ESCGP-1) through an "expedited review process" that is too brief to allow agency staff to conduct meaningful technical reviews. For most projects, the PADEP grants permit coverage within 14 business days as long as an application is deemed administratively complete and is certified by a professional with proper credentials, such as a state-licensed engineer. For projects in special protection watersheds, on floodplains, and on contaminated brownfield sites, the PADEP's review period is 43 business days. Given the PADEP's declining budget—a 50 percent reduction over the last decade—and increasing workload during the shale gas boom, neither timeframe is long enough to allow for the meaningful technical review that an ESCGP-2 application associated with unconventional oil and gas production activities necessitates. Yet Governor Corbett's Executive Order 2012-11 directed the agency to process permit applications "as expeditiously as possible" and even made "compliance with the review deadlines a factor in any job performance evaluation." As a result, the ESCGP-2 process, whether expedited or not expedited, operates largely as a self-regulating process with limited or no PADEP technical review and oversight. (1143)

Response: This comment relates to administration of the Chapter 102 program and the associated Erosion and Sediment Control General Permit, which are beyond the scope of this rulemaking.

750. Comment: The ESCGP-2 program does not include public participation opportunities. Notice is not published in the Pennsylvania Bulletin (or anywhere else) when an operator applies for coverage under ESCGP-2; notice is provided only when coverage is granted. Even if the public is aware that an application for ESCGP-2 coverage has been submitted, the PADEP's expedited review period makes it nearly impossible to meaningfully review an operator's plan before the appeal deadline (30 days from the date of Bulletin publication). The PADEP thus lacks the benefit of input from citizens who may be knowledgeable about local conditions. (1143)

Response: This comment relates to the administration of the Chapter 102 Erosion and Sediment Control General Permit and is beyond the scope of this rulemaking.

751. Comment: For as long as wells are being drilled, the well site may be considered under construction. During that period, which could last for years on a multi-well pad, the site need only be "permanently stabilized." Under that standard, erosion and sediment controls may be in place but post-construction stormwater management practices may not be required. Further, the minimal stabilization requirement applies for an additional nine months after the last well is drilled, when partial restoration begins, and under 58 Pa.C.S. § 3216(g), operators may request restoration extensions of up to two years. The lack of stormwater management during the lengthy stabilization period means that large impervious areas will cause uncontrolled runoff. (1143)

Response: This comment relates in part to the Chapter 102 Erosion and Sediment Control General Permit which is beyond the scope of this rulemaking. In addition, § 3216(g) of the

2012 Oil and Gas Act requires implementation of post construction stormwater management BMPs during the restoration extension period. Restoration or partial restoration after drilling to post construction standards is addressed through clarifications to the restoration section of the rulemaking in §§ 78.65 and 78a.65.

752. Comment: Even after construction is complete, the PADEP's regulations do not ensure that post-construction stormwater management Best Management Practices (PCSM BMPs) will be properly designed and implemented at Oil and Gas Operations. Although those sites are required to provide stormwater management, including measures to prevent increases in stormwater runoff flow rates and volume, operators of oil and gas activities that require site restoration or reclamation are exempt from the obligation to provide an engineering analysis confirming that the proposed management will work as intended (§ 102.8(n)). Without the supporting engineering calculations and documentation, neither the PADEP nor the applicant have any assurance stormwater management measures will protect water quality during the long periods of well operation prior to final site restoration. We have provided recommendations for site restoration criteria in our recommendations under § 78.65. (1143)

Response: This comment relates in part to the Chapter 102 Erosion and Sediment Control General Permit which is beyond the scope of this rulemaking. In addition, §3216(g) of the 2012 Oil and Gas Act requires implementation of post construction stormwater management BMPs during the restoration extension period. Restoration or partial restoration after drilling to Chapter 102 post construction standards is addressed through clarifications to the restoration section of the rulemaking in sections 78.65 and 78a.65.

753. Comment: The PADEP's regulations do not require a PCSM plan for any projects disturbing fewer than five acres. Under § 102.5(c), ESCGPs are required only for oil and gas activities occupying at least five acres, and PCSM is required only as part of the ESCGP. This approach is flawed, because sites not meeting the five-acre threshold can pose a risk to water quality, particularly if there are numerous small sites co-located in one defined area, such as a watershed. (1143)

Response: The rulemaking is consistent with and requires compliance with the existing Chapter 102 requirements, for which there are different acreage triggers for permit applicability for certain categories of earth disturbance activities. Chapter 102 requires post construction stormwater management when a permit is required under Section 102.5. The commentator is proposing a requirement that goes beyond existing Chapter 102 requirements. It is not appropriate to modify regulatory requirements established under Chapters 92a and 102 through modifications to Chapter 78 or Chapter 78a.

754. Comment: In applications submitted to the PADEP under the ESCGP-2, it is common practice for both the erosion and sediment control measures and the stormwater measures to be undersized or improperly designed. Practices specific to erosion and sediment control are routinely and incorrectly applied as post construction stormwater management practices. The guidelines provided in Chapter 4 of the Oil and Gas Operators Manual (550-0300-001) were last updated in 2001 and do [not] reflect the current criteria provided in the March 2012 Erosion and Sediment Pollution Control Manual (No. 363-2134-008). The more stringent and technologically up to date design criteria should always apply for erosion and sediment control. The requirements of the December 2006 Pennsylvania Stormwater Best Practices Manual (363-0300-002) should prevail for stormwater management BMPs. (1143)

Response: Operators must comply with the requirements of Chapter 102. The Department acknowledges that the Oil and Gas Operators Manual should be updated but also

acknowledges that the guidance documents are listed as a reference and are not incorporated as requirements. The reference has been retained. To the extent the comment relates to implementation of the regulatory requirements, it is beyond the scope of this rulemaking.

755. Comment: Under § 102.14(d)(vii), oil and gas activities that include site reclamation or restoration are exempt from the riparian buffer requirements so long as the “riparian buffer is undisturbed to the extent practicable.” Because there is no guidance for application of that standard, riparian buffer waivers are routinely granted for oil and gas activities, without supporting documentation of the need to disturb the buffers and without any requirement to minimize buffer disturbance or to provide restoration. We recommend that Chapter 78 be revised to cure as many of these defects as possible. Failure to meet the ESCGP-2 or other Chapter 102 requirements can cause harm to human health or public natural resources, especially waters of the Commonwealth. We recommend that the EQB strengthen what is now an essentially self-regulating permit process, by creating a public participation process for adjacent property owners, public resource agencies, water purveyors, and other interested parties, who can assist the PADEP in ensuring that those requirements are met. We also recommend that the EQB include guidance and requirements regarding riparian buffer protection and forested buffer restoration. (1143)

Response: See response to comment 735.

756. Comment: We recommend that the EQB require full compliance with Chapter 102, notwithstanding the provisions of § 102.8(n). Doing so will increase public confidence that proposed erosion and sedimentation and stormwater controls will in fact protect waters of the Commonwealth. The additional documentation is essential in the absence of any watershed-based or cumulative analysis of the impacts of Oil and Gas Operations, including chronic water pollution and flow disruption, and in the absence of a meaningful metric for the extent impervious surface the PADEP will allow to remain after restoration occurs across numerous and dispersed well sites. (1143)

Response: See responses to comments 735, 751 and 2910.

757. Comment: For the reasons discussed in comments 749 through 756, above, We recommend that § 78.53 be revised as follows:

§ 78.53. Erosion and sediment control, stormwater management, and riparian buffers

(a) Any person proposing or conducting earth disturbance activities associated with oil and gas activities shall comply with Chapter 102 (relating to erosion and sediment control and stormwater management). Best management practices for erosion and sediment control for oil and gas activities are listed in the *Erosion and Sediment Pollution Control Program Manual*, Commonwealth of Pennsylvania, Department of Environmental Protection, No. 363-2134-008, as amended and updated. Best management practices for stormwater management are listed in the *Pennsylvania Stormwater BMP Manual*, Department of Environmental Protection, No. 363-0300-002. The guidelines of the most recently updated document shall prevail.

(b) NOIs, as defined in § 102.1, for Oil and Gas Operations shall be published in the Pennsylvania Bulletin, and the PADEP may not issue its determination on a permit application until a thirty-day period for public review and comment is complete.

(c) Any person may submit notice to the Department of documentation and design deficiencies related to erosion and sediment control or stormwater management in a permit application submitted by any oil and gas operation seeking permit coverage under Chapter 102. Provided that

the notice includes documentation of the specific components of the permit application that do not meet Chapter 102 requirements, the Department shall deliver written acknowledgement of the notice to both the applicant and the person submitting the notice within 14 days of receiving the notice. The Department shall have an additional 14 days to complete a written deficiency determination. If the Department identifies deficiencies, the permit holder shall have 14 days to address all deficiencies. If the deficiencies are not addressed within the 14-day period, permit coverage shall be suspended until all deficiencies are addressed.

(d) Two years after site disturbance begins and until full site restoration is complete, notwithstanding the provisions of § 102.8(n), the post-construction stormwater management required under Chapter 102 shall be implemented at all areas of a well site not needed for safe Oil and Gas Operations. The areas needed for safe Oil and Gas operations include the following:

- (1) Areas used for service vehicle, well workover equipment, and rig access.
- (2) Areas used for storage tanks and secondary containment facilities.
- (3) Areas used for wellheads and appurtenant processing facilities.
- (4) Areas used for any necessary safety buffer limited to the area surrounding equipment that is physically cordoned off to protect the facilities.
- (5) Areas used to store supplies or equipment required for exploration or production operations.
- (6) Areas used for operation and maintenance of long-term PCSM best management practices.

(e) Notwithstanding the provisions of § 102.8(n), a person proposing oil and gas activities that involve one (1) acre or more of earth disturbance over the life of the project shall comply fully with the erosion and sediment control and stormwater management requirements of Chapter 102.

(f) Existing riparian buffers shall be considered undisturbed to the extent practicable, within the meaning of § 102.14(d)(vii), provided that there is no removal of vegetation or site disturbance within the riparian buffer. For wooded riparian buffers, disturbance or compaction of the root zone of wooded vegetation shall be considered disturbance. Direct discharge of stormwater to riparian buffer areas without prior stormwater management is prohibited. If riparian buffer disturbance occurs, forested riparian buffer restoration in accordance with the technical requirements of § 102.14 is required for all disturbed areas. (1143)

Response: See responses to comments 749 through 756.

758. Comment: Assure compliance for erosion and sediment pollution control specific to special protected waters under the Clean Streams Act. [78.53] (1098)

Response: See response to comment 743.

§ 78.55 Control and disposal planning

759. Comment: 78.55(a) - Are site specific plans just for new or altered wells that will generate waste, or for all wells on operators bond? Is it retroactive? (411)

Response: The regulation specifies that planning must occur prior to conducting oil and gas operations. The regulation specifies that persons conducting oil and gas operations shall prepare and implement site specific PPC plans. The definition of oil and gas operation specifies that it includes well site preparation, construction, drilling, hydraulic fracturing, completion, production, operation, alteration, plugging and site restoration associated with an oil or gas well.

760. Comment: **78.55** – Operators are required to prepare a Preparedness, Prevention, and Contingency (PPC) Plan in conformance with the 2001 Pennsylvania Guidelines for the Development and Implementation of Environmental Emergency Response Plans (PADEP, Guidelines for the Development and Implementation of Environmental Emergency Response Plans, No. 300-2200-001 Sept. 2001) [hereinafter 2001 Guidelines]) We support the requirement to prepare a PPC plan. However, we do not agree that the requirement to prepare a PPC plan should apply only to unconventional wells (shale gas wells). A PPC plan is needed for all Oil and Gas Operations as defined at § 78.1, which includes all wells and well sites.

Pennsylvania currently estimates that the environmental hazard associated with conventional wells (\$10 billion) far exceeds that of unconventional wells (\$713 million). The 2013 Pennsylvania Standard State All-Hazard Mitigation Plan estimates that conventional oil and gas well incident hazards could occur at 1,183 facilities, potentially impacting over a million buildings, with a replacement value of over \$10 billion, based on “brick-and-mortar structures located within 1000 yards of an active or abandoned conventional oil or gas well.” (2013 Pennsylvania Standard State All-Hazard Mitigation Plan, page 131, http://www.portal.state.pa.us/portal/server.pt/community/programs_and_services/4547/hazard_mitigation_forms_presentations_and_other_documents/806856). The same report estimates that unconventional oil and gas well incident hazards could occur at 77 facilities, potentially impacting over a hundred thousand buildings, with a replacement value of over \$713 million, based on “brick-and-mortar structures located within 1000 yards of an active, inactive, or plugged unconventional oil or gas well.” (*Id.*) Additionally, the Pennsylvania Standard State All-Hazard Mitigation Plan states that there is a risk of private water supply contamination:

Private water supplies such as domestic drinking water wells in the vicinity of oil and gas wells are at risk of contamination from brine and other pollutants including methane which can pose a fire hazard. (Id. at 419). (1143)

Response: Both conventional and unconventional operators are required to develop and implement PPC Plans under §§ 78.55 and 78a.55, respectively.

761. Comment: The 2001 Pennsylvania Guidelines for the Development and Implementation of Environmental Emergency Response Plans state that a Spill Prevention Response (SPR) is required for regulated storage tank facilities with an aggregate aboveground storage tank capacity of more than 21,000 gallons. (2001 Guidelines). Oil and Gas Operations should also require a SPR, but this is not addressed in the proposed regulation.

The proposed regulation is written in a confusing manner. First, it requires a PPC plan for Oil and Gas Operations, but provides incomplete instruction on what is required. Second, it does not advise the operator when a SPR plan is needed.

We recommend that the regulation be re-written to clarify that all Oil and Gas Operations require a PPC plan and that a SPR may be required if a storage tank with a capacity of more than 21,000 gallons is used (2001 Guidelines, *supra.*). We recommend the emergency response elements listed in § 78.55(i) be included in one integrated PPC plan, rather than having two separate plans (a PPC Plan and a separate Emergency Response Plan for the wellsite). (1143)

Response: The regulation specifies that plans developed in conformance with the *Guidelines for the Development and Implementation of Environmental Emergency Response Plans*, Commonwealth of Pennsylvania, Department of Environmental Protection, No. 400-2200-001, as amended and updated, will be deemed to meet the requirements of §§ 78.55 and 78a.55.

The guidance referenced by the commentator refers to the need for a Spill Prevention Response (SPR) plan for regulated storage tank facilities. These facilities are regulated under Chapter 245 of the Department's regulations and are beyond the scope of Chapter 78. Therefore, the revisions proposed by the commentator to include a statement that a spill prevention response plan may be required would unnecessarily increase the complexity of the regulation. Operators may develop an integrated plan instead of separate PPC and Emergency Response Plans.

762. Comment: The proposed regulations do not require PADEP review and approval of the PPC plan before Oil and Gas Operations commence or when the plan is amended. We recommend that the PADEP review and approve the PPC plan as part of the permit application process and that the PADEP review and approve amendments and that Pennsylvania update its All-Hazard Mitigation Plan to include information provided in the industry plans. (1143)

Response: The Department disagrees that it is reasonable or necessary for the Department to review and approve all PPC plans prior to commencement of Oil and Gas Operations. Review and approval of PPC plans has not been historically required by the Department prior to conducting activities. The Department does not believe that a requirement for the Department to review and approve PPC plans prior to commencement of oil and gas operations will result in a significant increase in the quality or implementation of PPC plans. Updates to the All Hazard Mitigation plan are beyond the scope of this rulemaking.

763. Comment: Commentator recommends that local governments be consulted by the applicant in the preparation of the PPC Plan to ensure that any responsibilities assumed or assigned to the local government in the plan can be delivered by the local government. The applicant should also be required to provide adequate funding to the local government and/or provides supplemental resources to provide a high-quality response system. Local governments should also update their local All-Hazard Mitigation Plan to include information provided in the industry plans. (1143)

Response: The Department agrees that it is prudent for oil and gas operators to consult with all entities which are relied upon by the PPC plan. The Department also agrees that it is prudent for local All Hazard Mitigation Plans to be kept up to date. Requiring operators to provide funding for local governments is beyond the scope of this rulemaking.

764. Comment: We support the requirement for a pressure barrier policy to be contained in the PPC plan; however, we recommend that the regulation clarify that a minimum of two pressure barriers (the initial and a redundant backup) be required, consistent with industry's two-barrier safety recommended practice, because "hazards are contained by multiple protective barriers. (Int'l Ass'n of Oil & Gas Producers, Asset Integrity – the Key to Managing Major Incident Risks, Report No. 415 (Dec. 2008); Int'l Ass'n of Oil & Gas Producers, Process Safety – Recommended Practices on Key Performance Indicators, Report No. 456 (Nov. 2011)) (1143)

Response: Revisions to blow out prevention requirements are beyond the scope of this rulemaking. However, the Department is currently developing a pressure barrier policy guidance document.

765. Comment: The distribution list contained in the 2001 PPC Guidance document at Section I, Subpart D requires a copy to be provided to the PADEP and agencies that may become involved in the response. The proposed regulation should at least match the distribution requirement in the 2001 PPC Guidance document. The proposed regulation states that copies of the PPC plan will be provided only to the PADEP, landowner, and Fish and Boat Commission upon request. We

recommend that plan distribution be expanded. Local governments, first responders, and residents on or adjacent to land used for Oil and Gas Operations should receive copies of the PPC plan prior to commencement of construction activities. (1143)

Response: Sections 78.55(f) and 78a.55(f) specify that copies of well operator's PPC plan shall be provided to the Department, the Fish and Boat Commission or the landowner upon request and shall be available at the well site during drilling and completion activities. Section 78a.55(i)(5)(v) specifies that all unconventional operators shall submit the emergency response plan and subsequent updates to PEMA, the Department, the county emergency management agency and the public safety answering point with jurisdiction over the well site. The Department believes that the requirements in this section are sufficient to ensure protection of public health and safety and the environment.

766. Comment: The PPC plan should incorporate National Incident Management System planning standards, (See the Federal Emergency Management Administration website for a complete description of the National Incident Management System planning standards, <http://www.fema.gov/national-incident-management-system>; and the Pennsylvania State Fire Commissioner website for a description of the National Incident Management System and how it relates to responding to oil and gas emergencies in Pennsylvania, <http://www.portal.state.pa.us/portal/server.pt/community/nims>) including the use of the Incident Command System, Incident Action Planning and Common Communications Plans (See the Federal Emergency Management Administration website for a complete set of Incident Command System forms and instructions, <http://www.fema.gov/forms/job-aids-tools-templates>) for all Oil and Gas Operations (defined at § 78.1), not just unconventional well operations. (1143)

Response: The regulatory language requiring development of PPC plan in conformance with the *Guidelines for the Development and Implementation of Environmental Emergency Response Plans*, Commonwealth of Pennsylvania, Department of Environmental Protection, No. 400-2200-001, as amended and updated is sufficient to ensure protection of public health and safety and the environment. To the extent that the Department determines that it is necessary and appropriate to require incorporation of National Incident Management System planning standards, use of the Incident Command System, Incident Action Planning and Common Communications Plans into PPC plans, the Department will revise the *Guidelines for the Development and Implementation of Environmental Emergency Response Plans*, Commonwealth of Pennsylvania, Department of Environmental Protection, No. 400-2200-001 to incorporate such requirements.

767. Comment: Industrial fires, explosions, blowouts, and spills require specialized emergency response equipment, which may not be available at local fire and emergency services departments. For example, local fire and emergency services departments typically do not have well capping and control systems. Larger, paid fire and emergency services departments, located near existing industrial developments, may have some industrial firefighting capability; however, the level of capability should be assessed by the operator and supplemented. If local emergency response services are relied upon in the PPC, operators should ensure emergency response personnel are trained, qualified, and equipped to respond to oil and gas industrial accidents. Small, local, volunteer fire and emergency services departments will typically not be equipped or qualified to meet this need.

On average, a blowout occurs in 7 out of every 1,000 onshore exploration wells.(S. Rana, *Environmental Risks- Oil and Gas Operations Reducing Compliance Cost Using Smarter Technologies*, 4-6 (Aug. 2009) (SPE Paper 121595-MS, Asia Pacific Health, Safety, Security and

Environment Conference)). Blowout rates are less frequent for production wells where more information is known about the reservoir, well control is optimized, and personnel are more experienced in site-specific conditions. For example, a review of production well blowouts in California estimated 1 blowout per 2,500 wells drilled. (P.D. Jordan, & S.M. Benson, *Well Blowout Rates in California Oil and Gas District 4- Update and Trends, Summary of Well Blowout Risks for California Oil and Gas District 4*, 1991-2005, Table 1) California's data showed that: 25% of the blowouts affected more than 25 acres; the average blowout lasted 18 hours; and the maximum blowout length was 6 months. Therefore, blowouts are a reasonably foreseeable significant impact, and mitigation is warranted.

Hydrocarbon reservoirs can contain large quantities of gas and formation water, which can be released into the surrounding environment during a well blowout, resulting in significant damage. For example, the Chesapeake Energy 2011 Marcellus well blowout in Bradford County, Pennsylvania spilled thousands of gallons of fracture treatment fluid over "containment walls, through fields, personal property and farms, even where cattle continue[d] to graze." (*Pennsylvania Fracking Spill: Natural Gas Well Blowout Spills Thousands of Gallons of Drilling Fluid*, The Huffington Post, (Apr. 20, 2011), <http://www.huffingtonpost.com/2011/04/20/pennsylvania-fracking-spill-gas-blowout-2011n851637.html>.)

Methods to control a gas well blowout can require significant water withdrawals – from 500,000 to 6,000,000 gallons per day. Well control experts may also use foam and dry chemicals to respond to a blowout. Controlling a well blowout can create large volumes of waste. Rig-deluge operations create large pools of water that can transport oil, chemicals, fuels, and other materials toward lower elevation drainage areas.

In addition to the Chesapeake Energy 2011 well blowout, another Pennsylvania Marcellus Shale blowout occurred in 2010. (*Blowout Occurs at Pennsylvania Gas Well*, Wall Street Journal (June 4, 2010); *Pennsylvania Fracking Spill: Natural Gas Well Blowout Spills Thousands of Gallons of Drilling Fluid*, The Huffington Post, (Apr. 20, 2011), <http://www.huffingtonpost.com/2011/04/20/pennsylvania-fracking-spill-gas-blowout-2011n851637.html>). Also, in 2010, there was a major industrial fire. The news reported that it took "16 hours for out-of-state crews to address a June 3 blowout in Clearfield County and 11 hours to extinguish a July 23 fire in Allegheny County. In both cases, well operators had to wait for response crews to fly in from Texas." (*Emergency Crews Set for Pa. Wells* (Aug. 25, 2010), <http://pagasdrilling.com/tag/cudd-well-control/>). In 2010, CUDD Well Control located a new facility in Canton Township, Bradford County, Pennsylvania. It is recommended that the regulation require operators to have a contract in place for immediate response by a trained and qualified well control contractor. If a contract with a well control expert is not in place when a blowout occurs, contract negotiations can cause detrimental delays. A recent gas well fire (February 2014) at a Chevron well in Greene County Pennsylvania lasted two weeks (K. Colaneri, *Crews Cap Leaking Chevron Gas Well That Started Fire in Southwest Pa*, StateImpact (Feb. 24, 2014), <http://stateimpact.npr.org/pennsylvania/2014/02/24/crews-cap-leaking-chevron-gas-well-that-started-fire-in-southwest-pa/>) and resulted in the death of one worker. (J. Casto, *State Police Recover remains of worker from Greene County Gas Well Fire*, TribLiveNews (Feb. 19, 2014), <http://triblive.com/news/adminpage/5624873-74/gas-state-pad#axzz2vW0Y8fEK>) The cause of the gas well explosion is under investigation by the PADEP, but early reports indicate a defective wellhead. The well was brought under control by a specialized well capping expert, Wild Well Control. The initial well explosion also resulted in a fire at an adjacent well. (K. Colaneri, *Well Fire in Southwest Pa. May Burn Through the Weekend*, StateImpact (Feb. 14, 2014), <http://stateimpact.npr.org/pennsylvania/2014/02/14/well-fire-in-southwest-pa-may-burn-through-the-weekend/>) (1143)

Response: The Department acknowledges that specialty companies are needed to actually address the technical matters associated with a well control incident. The role of first responders is, and continues to be, security of the perimeter of the site in such instances and assisting with any impacts in the surrounding community.

768. Comment: Well capping is a proven, effective, and rapid method to control a blowout. Well control contractors provide the expertise and equipment for this operation. However, in some limited cases, well capping is not effective, and a relief well may be required. Therefore, it is important for operators to also have prearranged access to a relief well rig, either via a contract with a rig provider or via a memorandum of agreement to provide emergency response assistance with a nearby operator. (1143)

Response: Due to the frequency of occurrence of well control incidents, the Department does not believe it is reasonable or necessary to have this requirement in place for safe and environmentally protective operations to be conducted.

769. Comment: The regulation should also include requirements for the operator to conduct drills to practice the plan, and for the PADEP to audit the plan via drills, exercises, equipment inspections, and personnel training audits. (1143)

Response: Requirements for the operator to conduct drills to practice the plan and for the Department to audit the practice have not been historically required by the Department. The Department does not believe the requirement will result in a significant increase in the quality or implementation of PPC plans and would be overly burdensome for operators.

770. Comment: In accordance with comments 760 through 769, above, Commentator recommends that the section be amended to read:

§ 78.55. Control and disposal planning; Emergency Response Plans for Oil and Gas Operations.

(a) Preparation and implementation of plan for Oil and Gas Operations.

Persons conducting Oil and Gas Operations shall prepare and implement site specific PPC plans according to §§ 91.34 and 102.5(l) (relating to activities utilizing pollutants; and permit requirements).

(1) The PPC plan shall include information demonstrating that the oil and gas operator has sufficient equipment and trained and qualified personnel immediately available, or on contract, to contain, control and clean up the worst-case discharge or respond to the worst-case emergency.

(2) If local emergency response resources are relied on in the PPC, operators shall ensure they are trained, qualified, and equipped to respond to an industrial accident. Operators are required to provide adequate funding to the local government and provide sufficient industrial response equipment and trained and qualified personnel to supplement local emergency response resources to ensure that there are sufficient resources, in total, to contain, control and clean up the worst-case discharge or respond to the worst-case emergency.

(3) The operator must conduct an annual drill to test the PPC, with sufficient prior notice to the Department and local emergency response resources that are relied on under the PPC to ensure that they have an opportunity to participate.

(4) In addition to the PPC Plan, a Spill Prevention Response (SPR) is also required for regulated storage tank facilities with an aggregate aboveground storage tank capacity of more than 21,000 gallons.

(b) Preparation and implementation of a plan for well sites. In addition to the requirements in subsection (a), the well operator shall prepare and develop a site specific PPC plan prior to storing, using, generating or transporting regulated substances to, on or from a well site from the drilling, alteration, production, plugging or other activity associated with oil and gas wells.

(1) The PPC plan shall include a written well blowout response plan, a contract retainer with an emergency well control expert, and prearranged access to a relief well rig, either via a contract with a rig provider or via a memorandum of agreement, to provide emergency response assistance with a nearby operator.

(2) If local emergency response resources are relied on in the PPC, operators shall ensure they are trained, qualified, and equipped to respond to an industrial accident. If the operator cannot demonstrate that local emergency responders have the required training, qualifications, an equipment to respond to an industrial accident, the operator should be required to provide its own response resources or have a contract in place with a qualified professional.

(c) Containment practices. The well operator's PPC plan must describe the containment practices to be utilized at the Oil and Gas Operation. The PPC plan must include a description of the equipment to be kept onsite during drilling and hydraulic fracturing operations, and all other Oil and Gas Operations, that can be utilized to prevent a spill from leaving the well site.

(d) Requirements. The well operator's PPC plan must also identify the control and disposal methods and practices utilized by the operator and be consistent with the act, The Clean Streams Law (35 P. S. §§ 691.1—691.1001), the Solid Waste Management Act (35 P. S. §§ 6018.101—6018.1003) and §§ 78.54, 78.56—78.58 and 78.60—78.63. The PPC plan must also include a pressure barrier policy developed by the operator that identifies a minimum of two pressure barriers to be used during all identified Oil and Gas Operations.

(e) Approval and Revisions. The well operator shall submit the PPC and SPR plans to the Department for review and approval as part of the permit application. Operations may not commence until Department approval of the PPC and SPR plans is complete. Proposed revisions to the PPC and SPR plans must be submitted to the Department for review and approval prior to implementing a change to the practices identified in the PPC and SPR plans.

Once approved, the Department will audit each PPC and SPR plan at least once every five years at an oil and/or gas production operation, or once during the well construction operation to verify that there is sufficient trained and qualified personnel and equipment available to carry out the plan.

(f) Copies. A copy of the well operator's PPC and SPR plans shall be provided to the Department, the Fish and Boat Commission, or the land owner, residents on or adjacent to the land to be used, the County and Local Emergency Management Agency, Local Fire and Medical Service Agencies that would be involved in the response upon request and shall be available at the site during drilling and completion activities for review.

(g) Guidelines. With the exception of the pressure barrier policy required under subsection (d), PPC and SPR plans developed in conformance with the Guidelines for the Development and Implementation of Environmental Emergency Response Plans, Commonwealth of Pennsylvania, Department of Environmental Protection, No. 400-2200-001, as amended and updated, will be deemed to meet the requirements of this section.

(h) Emergency contacts. A list of emergency contact phone numbers for the area in which the well site is located must be included in the PPC and SPR plans and be prominently displayed at the well site during drilling, completion, or alteration activities.

(i) Emergency response planning elements required in the PPC and SRP Plans Oil and Gas Operations.

(1) Applicability. This subsection applies to all Oil and Gas Operations.

(2) Definitions. For the purposes of this subsection, the following definitions apply:

Emergency responder—Police, firefighters, emergency medical technicians, paramedics, emergency management personnel, oil and gas personnel trained and qualified for response to emergencies and their contract staff, well control experts, public health personnel, state certified hazardous materials response teams, Department emergency personnel and other personnel authorized in the course of their occupations or duties, or as an authorized volunteer, to respond to an emergency.

(3) Registration of addresses.

(i) Prior to construction of an access road to a well site, the operator of an oil or gas well shall request a street address for the well site from the county or municipality responsible for assigning street addresses.

(4) Signage.

(i) Prior to construction of the access road, the operator of an oil or gas well shall display a reflective sign at the entrance.

(5) Emergency response.

(i) The operator of an Oil and Gas Operation shall develop and implement an emergency response plan that provides for equipment, procedures, training and documentation to properly respond to emergencies that threaten human health and safety for each well site. The plan shall incorporate National Incident Management System planning standards, including the use of the Incident Command System, Incident Action Planning and Common Communications Plans. The plan must include:

(A) The emergency contact information, including phone numbers, for the well operator's local representative for the Oil and Gas Operation and the operator's 24-hour emergency phone number.

(B) The emergency notification procedures that the operator shall utilize to contact emergency responders during an emergency.

(C) A description of the Oil and Gas Operation personnel's response to the following well site emergencies:

(I) Fire.

(II) Medical emergency.

(III) Explosion or similar event.

(IV) Spill.

(V) Security breach or other security event.

(VI) Any other incident that necessitates the presence of emergency responders.

(D) A description of the procedure to be used to provide the most current information to emergency responders in the event of an emergency, including the following:

(I) The current Material Safety Data Sheet (MSDS) required under law to be present at the Oil and Gas Operation.

(II) The location of the MSDSs at the Oil and Gas Operation.

(III) The name of the position in the operator's organization responsible for providing the information in subclauses (I) and (II).

(E) A list containing the location of any fire suppression, well control and spill control equipment maintained by the Oil and Gas Operator at the Oil and Gas Operation.

(F) A description of any emergency equipment available to the operator that is located off of the Oil and Gas Operation.

(G) A summary of the risks and hazards to the public within 1 mile of the well site and the associated planning assumptions.

(H) An outline of the emergency response training and qualification plan that the operator has established.

- (ii) The emergency response plan in subparagraph (i) may consist of two parts:
 - (A) A base plan common to all of the operator's Oil and Gas Operations well site containing some of the elements described in subparagraph (i).
 - (B) A site-specific plan containing the remaining elements described in subparagraph (i).
- (iii) The operator shall submit a copy of the current emergency response plan for that well site unless the permit provides otherwise. For plans using the approach in subparagraph (ii), the operator may submit one base plan provided that the site-specific plans are submitted for each well site.
- (iv) The operator shall review the plan and submit an update annually on or before March 1 each year for Department review and approval in accordance with § 78.55(e). In the event that updates are not made to the plan for that review period, the operator shall submit a statement indicating the review was completed and updates to the plan were not necessary.
- (v) The plan and subsequent updates shall be submitted to:
 - (A) PEMA.
 - (B) The Department.
 - (C) The county emergency management agency.
 - (D) The Public Safety Answering Point with jurisdiction over the well site.
 - (E) The landowner and residents on or adjacent to the land where the Oil and Gas Operation is located.
 - (F) The local government.
- (vi) A copy of the plan shall be available at the Oil and Gas Operation during all phases of operation.
- (vii) The emergency response plan must address response actions for Oil and Gas Operations as defined in § 78.1.
- (viii) The requirements in subparagraphs (i)—(vii) may be met by implementing guidance issued by the Department in coordination with PEMA. (1143)

Response: See responses to comments 760 through 769.

771. Comment: 78.55(a) requires persons conducting oil and gas operations to prepare and implement site specific preparedness, prevention and contingency (PPC) plans. As suggested by commentators, allowing conventional operators to prepare a single PPC plan for multiple sites would lessen the fiscal impact of the regulation. Would this Commonwealth's natural resources be adequately protected if the regulation allowed conventional operators to prepare one PPC plan for multiple sites? If so, we suggest that this subsection be amended accordingly. (1099)

Response: It is necessary to ensure that the PPC plan is appropriate to address site specific conditions for each site. There may be instances where the operator finds that a PPC plan prepared for one site is applicable to another site but the plan must be analyzed prior to making such a determination.

772. Comment: 78.55(a) -- This provision should clarify that PPC planning is required to the extent 25 Pa. Code §§ 91.34 and 102.5(1) apply to the subject activity. It also appears that Section 78.55(a) overlaps and duplicates requirements that are set forth in Section 78.55(b). While Section 78.55(b) requires well operators to prepare PPC plans for activities at well sites, Section 78.55(a) covers "oil and gas operations" and applies to any "person" conducting such operations thereby introducing significant uncertainty and confusion as to how these provisions are to operate in tandem. Section 78.55(a) must be clarified to apply only to oil and gas operations that do not take place at well sites (well sites are covered under Section 78.55(b)) and that at such locations, the person or entity in charge of the operations be responsible for preparing and implementing a PPC plan, as appropriate, to eliminate the potential for preparation of multiple, competing PPC plans.

Suggested amendatory language:

(a) Preparation and implementation of plan for oil and gas operations at a location other than a well site. Persons conducting oil and gas operations at a location other than a well site shall prepare and implement site specific PPC plans according to §§ 91.34 and 102.5(l), as applicable. (1103)

Response: Requirements outlined in subsection (b) are in addition to the requirements in subsection (a). Subsection (a) simply reiterates requirements found at §§ 91.34 and 102.5(l). Subsection (b) establishes a requirement for development of a PPC plan for oil and gas operations occurring on a well site. Oil and gas operations occurring on a well site must comply with both subsections (a) and (b).

773. Comment: The proposed amendments to 25 Pa. Code Chapter 78 include changes to requirements for preparing and implementing pollution prevention and contingency (“PPC”) plans. As drafted, the provisions are confusing and appear to create overlapping and duplicative requirements. Specifically, while the proposed version of 25 Pa. Code § 78.55(b) requires well operators to prepare PPC plans for activities at well sites, the proposed version of 25 Pa. Code § 78.55(a) covers “oil and gas operations” and applies to any “person” conducting such operations. Operations at well sites are encompassed within “oil and gas operations” as that term is defined, thereby introducing significant uncertainty and confusion as to how the foregoing provisions are to operate in tandem. To address this problem, we recommend that 25 Pa. Code § 78.55(a) be clarified to apply only to oil and gas operations that do not take place at well sites (well sites are covered under Section 78.55(b)) and that at such locations, the person or entity in charge of the operations be responsible for preparing and implementing a PPC plan, as appropriate, to eliminate the potential for preparation of multiple, competing PPC plans by different entities. We also recommend that in conjunction with this change, the first phrase of the proposed version of 25 Pa. Code § 78.55(b) be eliminated (i.e., “In addition to the requirements in subsection (a)”).

In addition, it is important to note that the need to have PPC plans is specifically addressed in 25 Pa. Code §§ 91.34 and 102.5(l). Accordingly, the proposed versions of both 25 Pa. Code §§ 78.55(a) and 78.55(b) should contain cross references to those provisions and indicate that PPC plans must be prepared “in accordance with” and “to the extent required by” those provisions.

Recommended changes to the proposed version of 25 Pa. Code §§ 78.55(a) and (b) to address the foregoing issues are set forth below:

(a) Preparation and implementation of plan for oil and gas operations. Persons conducting oil and gas operations at a location other than a well site shall prepare and implement site specific PPC plans in accordance with and to the extent required by 25 Pa. Code §§ 91.34 and 102.5(l) (relating to activities utilizing pollutants; and permit requirements). The person in charge of the operations at the location shall be responsible for preparing and implementing the PPC plan for the location.

(b) Preparation and implementation of plan for well sites. The well operator shall prepare and develop a site specific PPC plan in accordance with and to the extent required by 25 Pa. Code §§ 91.34 and 102.5(l) (relating to activities utilizing pollutants; and permit requirements) prior to storing, using, generating or transporting substances to, on or from a well site from the drilling, alteration, production, plugging or other activity associated with oil and gas wells. (1173)

Response: See response to comment 772.

774. Comment: § 78.55(a)-(b) - This provision should clarify that PPC planning is required to the extent 25 Pa.Code §§ 91.34 and 102.5(l) apply to the subject activity. It also appears that Section 78.55(a) overlaps and duplicates requirements that are set forth in Section 78.55(b). While Section 78.55(b) requires well operators to prepare PPC plans for activities at well sites, Section 78.55(a) covers “oil and gas operations” and applies to any “person” conducting such operations thereby introducing significant uncertainty and confusion as to how these provisions are to operate in tandem. We suggest that Section 78.55(a) be clarified to apply only to oil and gas operations that do not take place at well sites (well sites are covered under Section 78.55(b)) and that at such locations, the person or entity in charge of the operations be responsible for preparing and implementing a PPC plan, as appropriate, to eliminate the potential for preparation of multiple, competing PPC plans.

Suggested amendatory language:

- (a) Preparation and implementation of plan for oil and gas operations at a location other than a well site. Persons conducting oil and gas operations at a location other than a well site shall prepare and implement site specific PPC plans according to §§ 91.34 and 102.5(l), as applicable.
- (b) Preparation and implementation of plan for well sites. The well operator shall prepare a site specific PPC plan, in accordance with §§ 91.34 and 102.5(l), as applicable, prior to storing, using, generating or transporting substances subject to those provisions to, on or from a well site. (1137, 1147, 1174)

Response: See response to comment 772.

775. Comment: This section creates an unnecessary burden for small operators who conduct operations at multiple well sites in close proximity where the PPC plan would be the same for all such operations. That annual cost will be about \$25 million. If the Department’s concern is that PPC plans tend to become outdated with changing personnel or methods, that concern can be addressed by requiring PPC plans to be updated with any change in the relevant information.

Suggested amendatory language:

- (a) *Preparation and implementation of plan for oil and gas operations.* Persons conducting oil and gas operations at locations other than well sites shall prepare and implement updated site specific PPC plans according to the requirements in 25 Pa.Code § 91.34 and 102.5(l).
- (b) Well operators shall prepare and develop an updated PPC plan prior to storing, using, generating or transporting regulated substances to, on or from a well site [including tophole water, brines, drilling fluids, additives, drilling muds, stimulation fluids, well servicing fluids, oil, production fluids and drill cuttings, from the drilling, alteration, production, plugging or other activity associated with oil and gas wells to, on or from a well site.
- (c) *Requirements.* The well operator’s PPC plan must also identify the control and disposal methods and practices utilized by the well operator and be consistent with the act, The Clean Streams Law (35 P.S. §§ 691.1—691.1001), the Solid Waste Management Act (35 P.S. §§ 6018.101—6018.1003) and §§ 78.54, 78.56—78.58 and 78.60—78.63.
- (d) *Revisions.* The well operator shall revise the PPC plan prior to implementing a change to the practices identified in the PPC plan.
- (e) *Copies.* A copy of the well operator’s PPC plan shall be provided to the Department, upon request and shall be available at the well site during drilling and completion activities for review.
- (f) *Guidelines.* A PPC plan developed in conformance with the *Guidelines for the Development and Implementation of Environmental Emergency Response Plans*, Commonwealth of

Pennsylvania, Department of Environmental Protection, No. 400-2200-001, as amended and updated, shall be deemed to meet the requirements of this section.
(1135)

Response: See responses to comments 771 regarding development of site specific PPC plans and 772 regarding the requirements of subsections (a) and (b). Inclusion of the pressure barrier policy in the PPC plan is appropriate.

776. Comment: Control and Disposal Planning (PPC Plans) - 78.55 is titled “Control and Disposal Planning; Emergency Response for Unconventional Wells.” Paragraph “(a)” mandates the implementation of “site specific PPC plans according to the requirements in 25 Pa. Code § 91.34 and 102.5(1).” Neither of the cross-referenced regulations is specific to unconventional activities. The requirement for operators to generate “site specific” PPC Plans needs additional clarity and should be consistent throughout the PA Code. 93.34(b) says that the Department “may” require the submission of a plan. How does a conventional operator discern if a request for a plan will be forthcoming and what would be the timeframe given to the operator to produce a plan? As a conventional operator, we began compiling site specific PPC Plans based on rules like 102.5(1) as part of our pre-drill preparation. Because of the effort involved, these plans are initiated months in advance of the site construction. If the Department may or may not be requiring a plan (as intimated in 91.34b) and 78.55 is specific to unconventional operators, how are conventional operators to interpret applicability and how can they be guaranteed that their drilling and completion operations will not be interrupted by an order to produce a plan within some indeterminate timeframe and based on interpretational discretion? The regulatory language regarding the PPC plans and their applicability lacks clarity and consistency. Perhaps conventional operators should be permitted to develop a general, PPC template as opposed to the site specific expectation mandated for the unconventional operators. These proposed additions should be tabled in favor of further consideration. (12, 623)

Response: See responses to comments 771 regarding development of site specific PPC plans and 772 regarding the requirements of subsections (a) and (b). As part of this rulemaking, in response to comments and recent legislation (the Act of July 10, 2014 (P.L. 1053, No. 126)), the Department split Chapter 78 into two separate Chapters – one for conventional oil and gas wells (Chapter 78) and the other for unconventional wells (Chapter 78a). The purpose of this amendment to the final rulemaking was to clarify the different requirements for conventional and unconventional wells. The Department believes that having two completely separate regulatory Chapters should serve to eliminate any confusion about what requirements apply to conventional and unconventional wells. In addition, having separate Chapters allows the Department to craft regulations to match the environmental risks posed by each segment of the industry (compare, for example, section 78.56 and section 78a.56, which contain significantly different requirements for temporary storage at conventional and unconventional well sites, respectively). The bifurcation of the regulation into Chapters 78 and 78a clarifies the issue brought up by the commentator regarding applicability of this section to conventional operations.

777. Comment: This section is titled “Control and Disposal Planning; Emergency Response for Unconventional Well Sites” (in the Pennsylvania Bulletin version), which is misleading and appears to limit the section to unconventional wells.

Paragraph (a) mandates the implementation of “site specific PPC plans according to §§ 91.34 and 102.5(l).” Neither of the cross-referenced regulations is specific to unconventional activities. The requirement for operators to generate “site specific” PPC Plans needs additional clarity and should

be consistent throughout the PA Code. Section 91.34(b) says that the Department “may” require the submission of a plan. How does a conventional operator discern if a request for a plan will be forthcoming and what would be the timeframe given to the operator to produce a plan? If the Department may or may not be requiring a plan (as intimated in 91.34(b)) and 78.55 is specific to unconventional operators, conventional operators will not be able to interpret applicability. They cannot be assured that their drilling and completion operations will not be interrupted by an order to produce a plan within some undetermined timeframe and based on interpretational discretion.

The regulatory language regarding the PPC plans and their applicability lacks clarity and consistency. Conventional operators should be permitted to develop a general, PPC template as opposed to the site specific expectation mandated for the unconventional operators. These proposed additions should be given further consideration regarding the clarity of these regulations.

Section 78.55(a) also broadens the scope of PPC plans to any “person” conducting oil and gas operations,” generally, whereas subsection (b) is specific to operators at well sites, which makes section 78.55(a) even more confusing. Subsection (a) should be clarified to apply only to oil and gas operations that do not take place at well site.

Suggested amendatory language:

(a) Preparation and implementation of plan for oil and gas operations at a location other than a well site. Prior to generation of waste, persons conducting oil and gas operations at a location other than a well site shall prepare and implement PPC plans according to the requirements in 25 Pa.Code §§ 91.34 and 102.5(l), as applicable.(1153)

Response: See responses to comments 771 regarding development of site specific PPC plans and 772 regarding the requirements of subsections (a) and (b).

As part of this rulemaking, in response to comments and recent legislation (the Act of July 10, 2014 (P.L. 1053, No. 126)), the Department split Chapter 78 into two separate Chapters – one for conventional oil and gas wells (Chapter 78) and the other for unconventional wells (Chapter 78a). The purpose of this amendment to the final rulemaking was to clarify the different requirements for conventional and unconventional wells. The Department believes that having two completely separate regulatory Chapters should serve to eliminate any confusion about what requirements apply to conventional and unconventional wells. In addition, having separate Chapters allows the Department to craft regulations to match the environmental risks posed by each segment of the industry (compare, for example, section 78.56 and section 78a.56, which contain significantly different requirements for temporary storage at conventional and unconventional well sites, respectively). The bifurcation of the regulation into Chapters 78 and 78a clarifies the issue brought up by the commentator regarding applicability of this section to conventional operations.

778. Comment: 78.55(b) – “...prior to storing, using, generating or transporting regulated substances to, on or from a well site...” --- It is suggested that this section be revised to allow for a general discussion of what substances are anticipated to be found at the well site since an operator may not know what regulated substances will be onsite prior to use. (1057)

Response: The Department disagrees that the revisions proposed by the commentator are needed. If the operator is uncertain about which regulated substances will be at the well site, the operator may include all potential regulated substances in the PPC plan.

779. Comment: Section 78.55 (b) should require site specific PPC and SPC plans to the Department in addition to the appropriate local and state emergency response coordinators in .pdf format to make the plans more easily transferable and accessible on mobile devices. (852a)

Response: See response to comment 761 regarding inclusion of a requirement for SPR Plans.

780. Comment: We believe that PPC plans should be available to all state agencies, including residents, and made available to the public. (845)

Response: See response to comment 784.

781. Comment: 78.55(b) -- The use of the term “regulated substance” in this subsection is unclear and is difficult to apply to the oil and gas industry. The potential for an overly broad interpretation is high with the Department’s proposed definition, which includes literally thousands of substances, many of which are naturally occurring and many of which are environmentally benign. In addition, the proposed paragraph appears to include some grammatical confusion, which should be clarified.

Suggested amendatory language:

(b) Preparation and implementation of plan for well sites. The well operator shall prepare a site specific PPC plan, in accordance with §§ 91.34 and 102.5(1), as applicable, prior to storing, using, generating or transporting substances subject to those provisions to, on or from a well site. (1103, 1137, 1174)

Response: Use of the term “regulated substance” was intentionally selected to be very broad and cover all substances that may cause pollution.

782. Comment: 78.55(b) – The term “regulated substances” is not sufficiently precise, as explained above in our comments concerning its definition. The existing list of materials for which a PPC plan is required should be retained.

Suggested Regulatory Language:

(b) Preparation and implementation of plan for well sites. The well operator shall prepare a site specific PPC plan prior to storing, using, generating or transporting tophole water, brines, drilling fluids, additives, drilling muds, stimulation fluids, well servicing fluids, oil, production fluids and drill cuttings from the drilling, alteration, production, plugging or other activity associated with oil and gas wells. (1153)

Response: See response to comment 781.

783. Comment: **78.55(c)** – The Proposal has not clarified the nature of equipment that should be described in the PPC plan. The second sentence of this subsection should be deleted.

Suggested amendatory language:

(c) Containment practices. The unconventional well operator’s PPC plan must describe the containment practices to be utilized and the area of the well site where containment systems will be employed as required under section 78.64a. (1103, 1137, 1153, 1174)

Response: The nature of equipment that should be described in the PPC plan is specified in

the rulemaking and is described as equipment that can be used to prevent a spill from leaving the well site.

- 784.** Comment: 78.55 (d)(d.2) – Distribute copies and revisions of control disposal plans and emergency response plans to local emergency response groups, county conservation districts, and municipal offices to promote awareness and compliance; post electronically for public review. (855, 1098)

Response: Sections 78.55(f) and 78a.55(f) specify that copies of well operator’s PPC plan shall be provided to the Department, the Fish and Boat Commission or the landowner upon request and shall be available at the well site during drilling and completion activities. Section 78a.55(i)(5)(v) specifies that all unconventional operators shall submit the emergency response plan and subsequent updates to PEMA, the Department, the county emergency management agency and the public safety answering point with jurisdiction over the well site. The Department believes that the requirements in this section are sufficient to ensure protection of public health and safety and the environment. In addition, emergency response plans submitted to the Department are available to the public for review through the Department’s website.

- 785.** Comment: 78.55(d)(2) – If federally listed species are identified in the PNDI online project review receipt, known species occurrences are in proximity to the proposed project permit site. The National Park Service should be afforded the option of requesting a copy of the Preparedness, Prevention and Contingency Plan (PPC) to avoid placing the Department and the applicant at risk of an ESA section 9 violation. (1134)

Response: The Department disagrees that the National Park Service should be added to this section of the rulemaking. This process is captured by § 78.15(d). If a potential impact to threatened or endangered species is identified in the PNDI receipt, the applicant must demonstrate to the Department that the impact will be minimized and mitigated to the satisfaction of the applicable public resource agency. Also, PPC plans are public documents which are available upon request.

- 786.** Comment: Section 78.55(d.2) – Since this section deals with control and disposal planning and emergency response, would it not be a benefit if both the municipality and county also received a copy of the PPC plan? Both entities have responsibility for emergency response and having the information beforehand would greatly improve responses. (415)

Response: See response to comment 784.

- 787.** Comment: 78.55(d.2) – We support that copies of the well operator’s PPC plan shall be provided to the Department, PFBC or the landowner upon request as well as being available at the well site. Not every landowner is going to be interested in having the PPC. However, there are landowners that are concerned about the site specific measures taken regarding storing, using, generating or transporting regulated substances to, on or from a well site. The details therein, such as, containment systems employed and equipment that may be kept onsite during drilling and fracturing operations that can be utilized to prevent a spill from leaving a well site may be important to our farmers with consideration to their crops and livestock. Our organic farmers may need to provide this information to their cooperative.

Incidents in our region such as the ATGAS blowout in Bradford County and YARASAVAGE blowout in Wyoming County both point to the need to have adequate planning and emergency response and thus, a detailed PPC Plan. We have come to the conclusion that in the case of an

emergency, such plans are invaluable. The submitted plan must be site specific. It is imperative the Department review these plans. On the local level, we've seen how initial emergency response plans provided by operators, for example, such as Williams Field Services' Emergency Response Plan was so inadequate the Township's Planning Commission and Zoning Board Solicitor rejected and returned it to the Williams regarding the proposed Sickler Compressor Station in Washington Township, Wyoming County. Thus the devil is in the details and whether it is a PPC or Emergency Response Plan they must be adequately prepared and reviewed. We recommend this provision at the minimum as it is written. (660a)

Response: The regulation specifies that persons conducting oil and gas operations shall prepare and implement site specific PPC plans. See response to comment 762.

788. Comment: The proposed "pressure barrier policy," to be developed by the operator, is poorly defined with no restraints or guidelines. It is impossible to assess economic losses from the policy as currently written. I recommend either a more specific definition or its removal from the proposed regulations. (450)

Response: Pressure barrier requirements are outlined in § 78.72

789. Comment: The well operator's PPC plan must also identify the control and disposal methods and practices utilized by the well operator and be consistent with the act, The Clean Streams Law (35 P. S. §§ 691.1-691.1001), the Solid Waste Management Act (35 P. S. §§ 6018.101-6018.1003) and §§ 78.54, 78.56-78.58 and 78.60-78.63. The PPC plan must also include a pressure barrier policy developed by the operator that identifies barriers to be used during identified operations. Pressure barrier policy is not defined. Objection is made that the lack of a definition does not allow the operator to know if the policy will require expenditures to fulfill requirements, or if the requirement is reasonable. (460)

Response: See response to comment 788.

790. Comment: 78.55(d.2) – We recommend the following revision to the existing text: (d.2) "Copies. A copy of the well operator's PPC plan shall be provided to the Department, the Pennsylvania Fish and Boat Commission, nearby landowners, including the National Park Service, if applicable, or the general public upon request and shall be available at the site during drilling and completion activities for review." (1062, 1133)

Response: See response to comment 784 and 785.

791. Comment: Emergency Response Planning frequently becomes the focus of attention only after the emergency occurs. In the aftermath of The Deepwater Horizon oil spill, the post mortem was accompanied by intergovernmental blame across all levels of governance. If we have learned anything from recent environmental accidents, strengthening the requirements surrounding emergency response planning are essential to safeguarding public resources and environmental health. The Preparedness, Prevention and Contingency (PPC) plans warrant more attention than just to meet the format of the DEP guidelines, No.400-2200- 001. The regulations must indicate that all PPC plans are reviewed and approved by the appropriate DEP official and have incorporated municipal and local authorities into the planning process. (1063)

Response: See response to comment 762.

792. Comment: The Department should update its oil and gas operators manual or develop guidelines

specifically for oil and gas that better reflects its current practice of requiring site specific information within a PPC plan and/or tailor a template for oil and gas specific PPC plans. Much of the “Guidelines for the Development and Implementation of Environmental Emergency Response Plans” document is outdated and does not necessarily apply to oil and gas development. (1071)

Response: The Department agrees that technical guidance documents and policy should be kept up to date.

793. Comment: 78.55(d.2) – The well operator’s PPC Plan must be submitted to local Emergency Management authorities. The PPC plan contains important information which is crucial to planning by local authorities having responsibility for Emergency Management first response. It is simply inexcusable that 25 PA Code Chapter 78 does not convey to well operators the duty of providing this information by force of rule. Not only must this rulemaking require the well operator to provide the complete PPC plan to local Emergency Management personnel, existence of the plan must be communicated to counties and municipalities by means of Act 14 county/municipality notifications. (869a)

Response: See response to comment 784.

794. Comment: 78.55(d.2) – PPC plans should be automatically submitted to the Department. Given its emergency response authority, the Department should have all relevant safety information in hand. (997a)

Response: See response to comment 784.

795. Comment: Pursuant to the Department’s emergency response authority, the records of mine influenced water should be automatically submitted to the Department to ensure that all relevant safety information is immediately in hand. (1142)

Response: Under §§ 78.59b and 78a.59b, operators must develop and submit a mine influenced water storage plan to the Department prior to storing mine influenced water in a well development impoundment.

796. Comment: If an oil or gas activity is within a SWPZ the affiliated water system should also receive a copy of the operators PPC plan. The operator should also have the water systems’ emergency contact information. (1149, 1150)

Response: The Department disagrees the water system owners must receive a copy of the oil and gas operator’s PPC plan when activities are conducted within a source water protection zone. The Department has amended public resource screening requirements to include approved wellhead protection areas established under § 109.713. This allows for an objective and identifiable area to be identified by the operator. The Department acknowledges that surface water sources should be protected and believes that Chapter 78 and other Department regulations and statutes provide adequate protection. PPC plans developed under the *Guidelines for the Development and Implementation of Environmental Emergency Response Plans*, Commonwealth of Pennsylvania, Department of Environmental Protection, No. 400-2200-001 are deemed adequate. To the extent that the operator should include a water system’s contact information in their PPC plan under the *Guidelines for the Development and Implementation of Environmental Emergency Response Plans*, Commonwealth of Pennsylvania, Department of Environmental Protection, No. 400-2200-001, it is required.

797. Comment: Emergency plans (78.55) should include notification of affected individuals, including landowners and those who might be impacted by difficulties with water supplies. (153)

Response: Section 78a.55 regarding emergency response plans requires that the operator develop and implement an emergency response plan which includes a summary of the risks and hazards to the public within 1/2 mile of the well site and the associated planning assumptions which should include notification of potentially impacted parties in the event of an emergency.

798. Comment: All tanks and pipelines should be designed and built to last at least 100 years. All wellheads and pipelines should be monitored closely with an array of sensors, with information summarizing current and past leaks summarized for the public (analogous to a weather report). Wells in production should be tested yearly for integrity of casing and cement, and any that are leaking should be repaired, or sealed and abandoned.(156)

Response: All tanks and pipelines utilized to store or transport regulated substances must be maintained in good working condition regardless of the age of the facility.

Current regulations in § 78.88 address mechanical integrity monitoring at operating wells in Pennsylvania. Such wells must be inspected quarterly and any leaks noted must be reported to the Department annually. Various means may be used to check for leaks.

799. Comment: I am the primary owner of Bull Run Energy, LLC . My company produces oil and gas from conventional oil and gas wells in Pennsylvania. I didn't grow up in the oil patch and I don't come from a long line of oil men. I don't have thousands or even dozens of wells. I am an entrepreneur who is trying to build a company. We drilled 4 wells last year and I hope to drill 10 or 12 this year. My office is above my garage and my work truck has car seats in it because it also our family truck. I am a well pumper, construction supervisor, development planner, geologist, landman, bookkeeper, company man and most relevantly the environmental compliance officer. Every regulation that needs understood, report that needs filed, plan that needs written, record that needs sent, notification that needs submitted on a non-functioning website - that all has to be done by me. I can't contract out 15 minutes here and 2 hours there to meet regulatory compliance; it's just not practical. Of course the DEP isn't the only government agency that needs my constant attention. There is also the EPA, IRS, OSHA, PENNDOT, Township Road Master, and many others. The cumulative effect of all of these laws and regulations is a tremendous burden not only in terms of dollars spent, but in efficiency.

My company is a member of the Pennsylvania Grade Crude Oil Coalition (PGCC). PGCC has carefully reviewed the proposed regulatory changes and the accompanying Regulatory Analysis Form submitted by the DEP (the DEP Analysis). Our company has participated in that review and, together, we members who work in the conventional oil and gas industry have performed our own analysis of the estimated costs that will be imposed upon the regulated community of conventional oil and gas producers.

Time after time the DEP Analysis fails to state the cost for the new regulatory requirements. One example is the increased burden imposed upon conventional operators generated by the site specific component of proposed section 78.55. Most conventional operators employ a generic PPC plan that meets the requirements of existing section 78.55. Among other items the generic plan lists the company contacts and internal spill cleanup resources and lists the outside contractors who might be called upon to assist in the response. This information is and has been a sufficient guide on how to

handle materials and respond to releases or threatened releases, because (i) conventional well and tank sites are small, (ii) the volume of material that could be released from an accidental spill is small, and (iii) there are fewer different materials on site at conventional vs. unconventional operations to manage. The proposed regulation requires a “site specific” plan that meets the requirements in 25 Pa. Code 91.34. Section 91.34 applies to locations where pollutants are both “produced” and “stored” and thus the proposed regulations would require a site specific plan at the well (where the fluid is “produced”) and at the separate tank locations (where it is “stored”).

The Analysis fails to state either the need for or the cost of such additional burden. Assuming 200,000 conventional well and tank locations, a cost of \$40 for the PPC storage unit, a labor cost of \$25 to install, and a cost of \$100 to prepare each plan, the initial installation cost would be \$33,000,000. That \$100 preparation cost assumes that the plan can be prepared internally. Many conventional operators do not have the internal resources and if the plan preparation is contracted out the cost can run as high as \$500. In that case the high end of the estimate is over \$100 million. Thereafter the plans would have to be periodically updated and damage to the onsite storage boxes will have to be repaired. If we assume an annual update and repair cost at \$125 per site, the annual maintenance cost is \$25,000,000. This is just one example. There are many more costs that are either not cited at all or are significantly understated. (389,1136)

Response: See responses to comments 771 regarding development of site specific PPC plans and 772 regarding the requirements of subsections (a) and (b). Subsection (a) simply reiterates the requirements already existing in §§ 91.34 and 102.5(l). Since subsection (a) does not establish any new requirements, no cost was attributed to this subsection.

- 800.** Comment: The climate for small business has become increasingly more difficult over the past several decades. One of the heightened challenges to both large and small business has been the substantial increase of new regulations. These regulations have caused many smaller businesses to reduce their work force or just close all together.

I was pleased when in 2012 the Legislature revised the Regulatory Review Act to require agencies like the DEP to specifically consider the impact of new regulations on small business. Among other things, the DEP is now supposed to consider the benefit of any new regulation in conjunction with the associated costs.

Today we are reviewing numerous proposed regulations and requirements that will result in substantial increases in costs on Pennsylvania’s conventional oil and gas industry. As you have heard from a number of speakers this evening, the DEP has failed to show a compelling need for many of these.

I would like to take a few minutes to speak about the new requirements regarding well site and tank battery site specific PPC (Preparedness, Prevention & Contingency) plans to be imposed on conventional oil and gas operators.

Today most conventional operators employ a generic PPC plan that meets the requirements of existing section 78.55. Among other items the generic plan lists the company contacts and internal spill cleanup resources. It also lists the outside contractors who might be called upon to assist in the response.

This information has been and is a sufficient guide on how to handle materials and respond to releases or threaten releases. In conventional versus unconventional operations, well and tank sites are smaller, the volume of materials that could be released from an accidental spill are smaller and

there fewer types of materials to manage on site at conventional versus unconventional operations.

The proposed regulation elevates the burden by requiring a “site specific” plan that meets the requirements in 25 Pa. Code, section 91.34. Section 91.34 applies to locations where pollutants are both “produced” and “stored”. Therefore, the site specific requirements would apply to both individual wells and to separate tank locations.

When the DEP provided their analysis of the new regulations to you, the DEP failed to attribute any cost to this new requirement. They also failed to discuss the need for such an additional burden. I am confident that the need does not exist. In addition to containing small amounts of materials, conventional well and tank locations are highly similar. Unique chemicals or other pollutants do not exist from site to site. The critical information of who to contact and where to locate cleanup resources are already contained in the existing generic plan.

It is shocking that the DEP did not provide to you any cost estimates for compliance with this new proposed requirement. There is a reasonable assumption of 200,000 discrete conventional well and tank locations. Assuming a cost of \$40 for the PPC storage unit, a labor cost of \$25 to install and a cost of \$100 to prepare each plan, the initial installation cost would be \$33,000,000. The \$100 preparation cost assumes that the plan can be prepared internally. The plan prepared by contracted professionals could cost as much as \$500. Annual plan updates and repair costs will continually increase the cost of doing business.

Based on my 34 years of lending experience, I can assure you the small business man and women who make up our conventional oil and gas industry cannot absorb these tens of millions of dollars in increased costs. This is especially true when the DEP has failed to show any reason why the existing generic plans are inadequate. The costs of these new burdens are dramatically out of balance with any benefits that might be achieved. (874)

Response: See responses to comments 771 regarding development of site specific PPC plans and 772 regarding the requirements of subsections (a) and (b). Subsection (a) simply reiterates the requirements already existing in §§ 91.34 and 102.5(l). Since subsection (a) does not establish any new requirements, no cost was attributed to this subsection.

- 801.** Comment: while not directly related to natural gas activities, we cannot ignore the implications of the tragic and avoidable situation in West Virginia. When dealing with industrial activities, especially those of the extractive industries, it is essential to ensure that our residents are protected by strong regulations. While Section 78.55 of the proposed regulations requires a Preparedness, Prevention, and Contingency Plan to prevent and address pollution events, I appeal to you to strengthen this section by including a requirement that these plans FULLY DISCLOSE ALL CHEMICALS, THEIR AMOUNTS AND MIXTURES, as well as any potential harm they may cause, to all agencies, landowners, and first responders. (918)

Response: Under § 78a.55 operators must include a description of the procedure used to provide the most current information to emergency responders in the event of an emergency including material safety data sheets required under law to be present at the well site in the emergency response plan.

- 802.** Comment: The DEP wants us to put PPC plans at every well site and tank battery. The DEP doesn't include a cost estimate for this, but if the whole industry has to put up storage units at over 100,000 well sites and make up individual plans for each site, it will cost 10's of millions of dollars. Talk about a waste of money. Our well sites are all the same. The generic plans that we

already have tell us where to go and who to contact, and those generic plans work fine. Our wells only produce small amounts so any spill that we ever have would be small. All that a site specific plan would do is cost a lot of money. But it wouldn't give any more protection. (985)

Response: See responses to comments 771 regarding development of site specific PPC plans and 772 regarding the requirements of subsections (a) and (b). Subsection (a) simply reiterates the requirements already existing in §§ 91.34 and 102.5(l). Since subsection (a) does not establish any new requirements, no cost was attributed to this subsection.

- 803.** Comment: The requirement for PPC plans creates an unnecessary burden for small operators. Plans would be similar for each well site yet frequent updating would be required for the plans to be meaningful. (998)

Response: See responses to comments 771 regarding development of site specific PPC plans and 772 regarding the requirements of subsections (a) and (b). Subsection (a) simply reiterates the requirements already existing in §§ 91.34 and 102.5(l).

- 804.** Comment: § 78.55 (f) - This section requires the well operator to provide the PPC plan to, in addition to the Department, the Pennsylvania Fish and Boat Commission or the landowner upon request. This is unreasonable. The Fish and Boat Commission and the landowner have no jurisdiction to access PPC plans. The Department should not by regulation give them authority they do not have otherwise, or be placed in a situation by those parties that would require the Department to take enforcement action for violations of this section. It is strongly recommended that these proposed changes be deleted. (124a)

Response: The Pennsylvania Fish and Boat Commission has jurisdictional responsibilities over waters of the Commonwealth, as well as DEP, therefore it is within the intent of the rulemaking for the Pennsylvania Fish and Boat Commission to be provided a copy of the PPC Plan. It is not unreasonable to provide them a copy of an oil and gas site's PPC plan, so they may investigate any areas of concern that fall under their jurisdiction. Additionally, landowners have a vested interest in the contents of the PPC plan and should have access to the plan. Therefore, it is in the best interest of the landowner to be provided a copy of the PPC Plan so they understand the activities and potential pollutants and how they will be controlled in the event of a spill or release of a regulated substance.

- 805.** Comment: 78.55(f) - Upon what authority does the PAFBC or the landowner have the right to review a PPC plan? The Department should have the only authority to request and review a PPC plan. (411)

Response: See response to comment 804.

- 806.** Comment: 78.55(d.2) – The Pennsylvania Fish and Boat Commission and a landowner have no authority or right to review a PPC plan. The Department should have the only authority to request and review a PPC plan.

Suggested Regulatory Language:

(d.2) Copies. A copy of the well operator's PPC plan shall be provided to the Department upon request and shall be available at the well site during drilling and completion activities for review. (1103, 1137, 1153, 1174)

Response: See response to comment 804.

807. Comment: Operators should not be required to submit PPC plans to the PFBC or landowners. These are public documents that are available through DEP and operators should not be required to do the Departments job or transfer implied regulator authority to other entities. This is simply an administrative task that adds an unnecessary and unneeded burden to the operators. (606, 606a)

Response: See response to comment 804.

808. Comment: 78.55(f): In addition to providing a copy of the PPC plan to the Department, this revised subsection will now require well operators to provide a copy of the PPC plan to the Fish and Boat Commission or the landowner, upon their request. Did EQB consider the possibility of also allowing local governments to request a copy of the PPC plan? (1099)

Response: See response to comment 784.

809. Comment: The surface impact of a conventional well site represents only a small fraction of an unconventional well, and unlike unconventional well sites, conventional operators store minimal equipment and fluids at individual sites. Furthermore, the impacts of conventional well sites vary nominally. The proposed language requiring Preparedness, Prevention & Contingency (PPC) Plans should clarify that a single comprehensive plan is satisfactory for conventional well operators rather than site specific PPC plans. If the proposal is intended only for unconventional wells, the language should consistently state so. (1113, 1118, 1120, 1115a, 1176-1188)

Response: See response to comment 771 regarding development of site specific PPC plans.

810. Comment: Compliance with Guidance. Section 78.55 (g) indicates that PPC plans developed in accord with the Department's Emergency Response Plan Guidelines will meet the regulatory requirement, but the regulation does not mandate that the PPC plan comply with the Guidelines. The regulation should eliminate this ambiguity and simply mandate that PPC plans comply with the Guidelines. (852a)

Response: The department has considered this comment and declines to make the suggested amendment to this final-form rulemaking. The final-form rulemaking establishes a standard for PPC plan preparation. While compliance with the Guidance may be one way of meeting that standard, it is possible to comply with the standard without complying with the Guidance.

811. Comment: Catastrophic releases. Neither section 78.55 nor the Guidance addresses public health and safety concerns regarding dam failure and catastrophic releases that may result from freshwater and centralized impoundments. The PPC Plan should provide for such an event. (852a)

Response: Sections 78.55(a) and 78a.55(a) require all persons conducting oil and gas operations to prepare and implement site specific PPC plans according to §§ 91.34 and 102.5(l). Construction and operation of freshwater and centralized impoundments is included in the definition of Oil and Gas operations. In addition, public health and safety concerns regarding dam failure and catastrophic releases that may result from freshwater and centralized impoundments are address under Chapter 105.

812. Comment: Spills from pipelines associated with the impoundments. Section 78.55 does not appear to require planning for spills from pipelines that carry freshwater and wastewater to centralized impoundments. 78.55 should be amended to require the PPC Plan to address spills from pipelines associated with the impoundment. (852a)

Response: Sections 78.55(a) and 78a.55(a) require all persons conducting oil and gas operations to prepare and implement site specific PPC plans according to §§ 91.34 and 102.5(l). Construction and operation of pipelines that carry freshwater and wastewater to centralized impoundments is included in the definition of Oil and Gas operations.

- 813.** Comment: The Proposed Regulations require a well operator to provide a copy of its Preparedness, Prevention and Contingency Plan (“PPC Plan”) to the Department upon request. Pursuant to the Department’s emergency response authority, the PPC plan should be automatically submitted to the Department to ensure that all relevant safety information is immediately in hand. (1142)

Response: PPC plans must be submitted to the Department upon request and maintained onsite at all times oil and gas operations are being conducted. It is most important that the PPC plan is readily available at the project site to ensure that it can be quickly accessed and implemented when necessary.

- 814.** Comment: Control and disposal planning; emergency response for unconventional wells – As most well pads are very similar in nature and design, Site-specific requirements for PPC plans should be struck from the Chapter 78 language. A master plan governing all owner/operator locations is appropriate. (1167)

Response: See response to comment 771 regarding development of site specific PPC plans.

- 815.** Comment: We would like the Department (DEP) to put a halt to open-air pits for produced water and waste water, as well as drill cuttings. (862)

Response: Air quality issues are addressed under Article III and the outside of the scope of this rulemaking.

§ 78.56 Temporary storage

- 816.** Comment: 78:56: The control and storage of production fluids (Section C) is vital, given the toxicity and unknown nature of production fluids. The prohibition against the use of open top structures to store brine and other produced fluids during and after the operation of the well is of utmost importance. (980, 1098)

Response: The Department acknowledges the comment.

- 817.** Comment: 78.56(a)(1) – The term “regulated substances” is not sufficiently precise and is unnecessary in this paragraph.

Suggested Regulatory Language:

(a) Except as provided in §§ 78.60(b) and 78.61(b) (relating to discharge requirements; and disposal of drill cuttings), the operator shall contain substances generated from the drilling, altering, completing, recompleting, servicing and plugging the well, including brines, drill cuttings, drilling muds, oils, stimulation fluids, well treatment and servicing fluids, plugging and drilling fluids other than gases in a pit, tank or series of pits and tanks or other approved storage structures. The operator shall install or construct and maintain the pit, tank or series of pits and tanks or other approved storage structures in accordance with the following requirements:

(1) The pit, tank, series of pits and tanks or other approved storage structure shall be constructed

and maintained with sufficient capacity to contain substances which are used or produced during drilling, altering, completing, recompleting, servicing and plugging the well. (1153)

Response: “Regulated substance” is defined in section 103 of The Pennsylvania Land Recycling and Environmental Remediation Standards Act (Act 2) (35 P.S. §6026.103). This definition is very specific and has been used without significant ambiguity or confusion since the passage of Act 2 in 1995.

- 818.** Comment: DEP has failed to consider the impact of this section on 150,000 legacy conventional wells and associated tanks in Pennsylvania. All conventional wells, whether predominantly oil or gas producers, produce some amount of liquids and tanks are used to store that produced oil and the associated production fluids. These tanks are a multitude of sizes and, in general, older operations consist of smaller and more numerous tanks. Tanks are also used throughout the conventional industry for other purposes including the recovery of liquids from “drips” (devices used to segregate liquids from natural gas) and for the temporary storage or recovery of liquids during well-servicing or plugging operations. PGCC estimates there are 175,000 of these various tanks in use in the conventional oil and gas industry.

The proposed revision to the current regulation is unnecessary and the cost of compliance is not remotely in balance with the benefit to be derived. Tanks have existed in the conventional oil and gas fields for 150 years and the risks of unfettered access to valves and lids is no different today than it was 12 years ago (when Subchapter C was last updated) or 30 years ago when the Oil and Gas Act of 1984 was adopted.

In addition, the term “regulated substance” throughout section 78.56 is overly broad and ambiguous because the section refers to temporary storage of substances from drilling, altering, completing, recompleting, servicing and plugging the well. Reference to the particular substances, e.g., brines, cuttings, stimulations and fluids other than gases would provide better guidance to the regulated community. Finally, the use of the term “fluid” can be confusing and unclear where the term is meant to refer to “liquids” rather than gases.

Suggested amendatory language:

(a) Except as provided in §§ 78.60(b) and 78.61(b) (relating to discharge requirements; and disposal of drill cuttings), the operator shall contain ~~[pollutional]~~ **regulated** substances from the drilling, altering, completing, recompleting, servicing and plugging the well, including brines, drill cuttings, drilling muds, oils, stimulation fluids, well treatment and servicing fluids, plugging and drilling fluids other than gases in a pit, tank or series of pits and tanks **or other approved storage structures**. The operator shall install or construct and maintain the pit, tank or series of pits and tanks **or other approved storage structures** in accordance with the following requirements:

(1) The pit, tank, ~~[or]~~ series of pits and tanks **or other approved storage structure** shall be constructed and maintained with sufficient capacity to contain all ~~[pollutional]~~ **regulated** substances which are used or produced during drilling, altering, completing, **recompleting, servicing** and plugging the well.

(2) **Modular aboveground storage structures that exceed 20,000 gallon capacity, which ~~that~~ are assembled on site, may not be utilized to store regulated substances resulting from drilling, altering, completing, recompleting, servicing and plugging the well without Department approval. The Department shall maintain a list of approved modular storage structures on its website. The owner or operator shall notify the Department at least 3 business days before the commencement of construction of these storage structures. This**

notice shall be submitted either electronically to the Department through its website and include the date the storage structure installation will commence or by hard copy U.S. Mail if the operator is a Small Business registered with the Department. If the date of installation is extended, the operator shall re-notify the Department with the date that the installation will commence which need not be 3 business days in advance.

[(2)] (3) A pit shall be designed, constructed and maintained so that at least 2 feet of freeboard remain at all times. If open tanks **or open storage structures** are used, the tanks **and storage structures** shall be maintained so that at least 2 feet of freeboard remain at all times unless the tank **or storage structure** is provided with an overflow system to a standby tank or pit with sufficient volume to contain all excess liquid ~~[fluid or waste] regulated substances~~. If an open standby tank **or open storage structure** is used, it shall be maintained with 2 feet of freeboard. If this subsection is violated, the operator immediately shall take the necessary measures to ensure the structural stability of the pit, or tank **or other storage structure**, prevent spills and restore the 2 feet of freeboard.

[(3)] (4) Pits, ~~[and]~~ tanks **and other approved storage structures** shall be designed, constructed and maintained to be structurally sound and reasonably protected from unauthorized acts of third parties.

(5) Operators shall install “Danger” or “No Trespassing” signs on tanks unless ~~[Unless an individual is continuously present at the well site, operators shall equip all tank valves and access lids to regulated substances with reasonable measures to prevent unauthorized access by third parties such as]~~ gates, locks, open end plugs, removable handles, retractable ladders or other measures are utilized to ~~[that prevent]~~ discourage unauthorized access by third parties. Tanks storing freshwater, fire prevention materials and spill response kits are excluded from the requirements of this paragraph. (1135)

Response: See response to comment 817 with regard to the definition of the term “regulated substances.” See response to comment 1217 with regard to use of the term “prevent.” The Department agrees that changes in the final-form rulemaking to § 78.56 to remove the requirement to install equipment to prevent unauthorized access by third parties are appropriate for conventional operations. The Department agrees that aboveground modular storage facilities with a capacity of 20,000 gallons or less do not need authorization by the Department prior to use and has added that language to the final rulemaking. Finally, the Department has added a definition of “modular aboveground storage structure” to § 78.1 and § 78a.1 of the final-form rulemaking clarifying that aboveground storage tanks that are assembled onsite and have a storage capacity greater than 20,000 gallons are considered “modular aboveground storage structures” for purposes of this subsection.

819. Comment: The protection of tanks from unauthorized acts of third parties is nearly impossible when that unauthorized party decides to vandalize equipment and tanks. Measures that fit the circumstances (tank sizes, location secondary containment signing, and locks where appropriate) need applied at the operator’s discretion rather than mandated by regulation. Given the number of tanks, man ways, plumbing, and valves that have been installed during the existence of the industry a regulation cannot address all the variables without resulting in the need to replace tanks, and tank containment facilities in many instances. Modifying tanks by drilling or welding to secure locking devices would require expensive cleaning, use of inert gases to prevent explosion at substantial cost. (998)

Response: The Department agrees that changes to § 78.56 to remove the requirement to install equipment to prevent unauthorized access by third parties are appropriate for conventional operations.

820. Comment: Given the number of tanks in use the initial costs of compliance for subsection (6) above will be between \$325 million and \$1 billion. The benefit of this proposed provision is recklessly out of balance with the cost. Even assuming that the valves and tank lids are secured by locks, a third party can easily commit “unauthorized access.” Standing 300 yards away an unauthorized accessor can breach the tank with a rifle shot. Even after the locking valve is installed an unauthorized accessor can breach the tank with a single swing of a sledgehammer against the valve nipple. And any locking device that can be bolted or welded on can be pried off with a pipe wrench or cut by bolt cutters, in a few seconds.

The draft rule failed to consider reasonable options, such as signage. Warning or no trespassing signs can be affixed at reasonable cost. In analyzing the effectiveness of signage one must acknowledge that a mere sign will not discourage a determined trespasser. But on the same hand, neither will a mere lock when a rifle, sledgehammer or bolt cutter can so easily defeat the defense. But the signage might give pause to a teenage vandal who simply needs a small warning to jerk them out of their youthful blindness and see that there is a danger present that they had not originally contemplated.

Suggested amendatory language:

- (6) [(4)] [(9)] A pit, [or] tank or other approved storage structure** that contains drill cuttings from below the casing seat, ~~pollutional regulated substances, wastes~~ or **liquids [fluids]** other than tophole water, fresh water and uncontaminated drill cuttings shall be impermeable. **[and comply with the following:]**
- [(i) The pits] [(9)] (7) Pits** shall be constructed with a synthetic flexible liner **that covers the bottom and sides of the pit.** [The] [I] **Liners** used in a pit **with a footprint area of 1/5 of an acre or more** or other approved storage structures shall comply with the following:
- (i) Have [with]** a coefficient of permeability of no greater than 1×10^{-7} 10^{-10} cm/sec. **[and with sufficient strength and thickness to maintain the integrity of the liner.]**
- (ii) Be at least 30 mils thick unless otherwise approved by the Department. Approval may be granted if the manufacturer demonstrates that the alternative thickness is at least as protective as a 30 mil liner. A list of approved alternative liners shall be maintained on the Department’s website.**
- (iii) The liner shall be designed, constructed and maintained so that the physical and chemical characteristics of the liner are not adversely affected by the [waste] regulated substance stored therein and the liner is resistant to physical, chemical and other failure during transportation, handling, installation and use. Liner compatibility for pits storing waste shall satisfy ASTM Method D5747 Compatibility Test for Wastes and Membrane Liners or other compatibility test approved by the Department for the duration the pit or other temporary storage structure is used.**
- (iv) Adjoining sections of liners shall be sealed together to prevent leakage in accordance with the manufacturer’s directions. The integrity of all seams of the adjoining sections of liner shall be tested prior to use. Results of the tests shall be available upon request. [If the operator seeks to use a liner material other than a synthetic flexible liner, the operator shall submit a plan identifying the type and thickness of the material and the installation procedures to be used, and shall obtain approval of the plan by the Department before proceeding.] (1135)**

Response: The Department agrees that changes to § 78.56 to remove the requirement to install equipment to prevent unauthorized access by third parties are appropriate for conventional operations.

The Department disagrees with the other proposed changes and believes that appropriate liners should be required even for pits of a relatively small size. Without an appropriate liner, even a relatively small pit can leak and cause pollution of the waters of the Commonwealth. The Department agrees that a listing of approved alternative liners can be made available on the Department's website.

- 821.** Comment: This new slope requirement is a very significant departure from existing conventional practice wherein vertical walled pits are employed. Pits at a conventional well site are used for a very short period of time (generally one or two days) and contain a small amount of liquid (measured in dozens or hundreds of barrels). Vertical walled pits have sufficed for these purposes without environmental incidents; indeed vertical walled pits are better than the 2:1 option because of the vertical pit's small footprint and low environmental disturbance.

A sloped 2:1 pit would occupy a much larger space. On a level surface the disturbance area for a 2:1 pit is 10 times larger than a vertical walled pit. The required space increases with slope so that where the slope is 40% the disturbance area for a 2:1 pit is 100 times larger than a vertical walled pit. The additional space would have to be cleared thus requiring the removal of more timber and earth disturbance. The additional earth disturbance will require greater sedimentation control measures.

Moreover, one of the key concerns of pit construction is the insertion of the pit liner upon a smooth surface free of roots, sharp rocks or other elements that lead to loss of liner integrity. The 2:1 requirement vastly increases the area which must be prepared for the liner, thus exponentially increasing the hazard of liner puncture. The much larger footprint will also bear a significant financial cost. Annual compliance with the proposed requirement will cost between \$18.75 million and \$83.75 million.

Suggested amendatory language:

[(ii)] [(10)] (8) The pit shall be constructed so that the liner subbase is smooth, uniform and free from debris, rock and other material that may puncture, tear, cut or otherwise cause the liner to fail. **The pit must be structurally sound and the interior slopes of a pit with a foot print area of 1/5 acre or more must have a slope no steeper than 2 horizontal to 1 vertical.** The liner subbase and subgrade shall be capable of bearing the weight of the material above the liner without settling that may affect the integrity of the liner. If the pit bottom or sides consist of rock, shale or other materials that may cause the liner to fail, a subbase of at least 6 inches of soil, sand or smooth gravel, or sufficient amount of an equivalent material, shall be installed over the area as the subbase for the liner.

[(iii)] [(11)] (9) The bottom of the pit shall **not penetrate [be at least 20 inches above]** the seasonal high groundwater table **upon installation**, unless the operator obtains approval under subsection (b) for a pit that exists only during dry times of the year and is located above groundwater.

[(12)] (10) Stormwater shall be diverted away from the pit.

[(13)] (11) Prior to placing material in the pit, the liner shall be inspected for lack of uniformity, damage and other imperfections that may cause the liner to leak. The well operator shall correct damages or imperfections before placing the material in the pit, and shall maintain the pit until closure of the pit.

[(iv)] [(14)] (12) If a liner becomes torn or otherwise loses its integrity, the pit **or approved storage structure** shall be managed to prevent the **[pit]** contents from leaking **[from the pit]**. If repair of the liner or construction of another temporary pit **or approved storage structure** is not practical or possible, the **[pit]** contents shall be removed and disposed at an approved waste

disposal facility or disposed on the well site in accordance with § 78.61, § 78.62 or § 78.63 (relating to disposal of residual waste—pits; and disposal of residual waste—land application).

[(v)] [(45)] (13) The liner shall be secured around the perimeter of the pit in a manner that does not compromise the integrity of the liner. If the liner drops below the 2 feet of freeboard, the pit shall be managed to prevent the pit contents from leaking from the pit and the 2 feet of lined freeboard shall be restored.

[(47)] (14) Condensate, whether separated or mixed with other fluids, shall not be stored in any open top structure or pit. Tanks used for storing or separating condensate during well completion shall be monitored and shall have controls to prevent vapors from exceeding the lower explosive limits of the condensate outside the tank. Tanks used for storing or separating condensate shall be grounded. (1135)

Response: The Department agrees with the proposed changes to subsection (a)(8); however, the Department believes that 1/5th of an acre is too large a footprint to serve as an appropriate cutoff. The Department has revised § 78.56(a) to remove minimum slope requirements for a pit with a footprint less than 3,000 ft² or volume less than 125,000 gallons of capacity. For pits with greater aerial extent or capacity, operators must obtain authorization from the Department prior to construction.

The Department disagrees with the proposed changes to subsection (a)(9) because the 20 inch separation requirement allows for a physical barrier between the seasonal high groundwater table and the bottom of the pit to prevent mixing of impounded materials and groundwater and to ensure structural integrity of the pit.

822. Comment: 78.56 – We do not support limiting new requirements to unconventional wells only. Best practices for temporary storage should apply to all wells. (1143)

Response: The Department acknowledges the comment.

823. Comment: 78.56 – We oppose the use of open pits for temporary waste storage, because of the pollution hazards posed.

We oppose continued allowance and waivers for the long-term burial of drilling waste on-site. It is inefficient to construct a temporary pit that could leak and then transfer that waste later to a tank to remove the waste to an approved waste handling site. It is more efficient to place the waste directly into the tank that will be used to transport it to an approved waste handling site. Such closed loop systems are more conducive to recycling than open pit storage.

Open pits have the potential to contaminate groundwater and surface water and many spills, leaks, and other problems involving pits have occurred statewide. The state's continued use of production pits poses significant environmental problems. (The State Review of Oil and Gas Environmental Regulations "Pennsylvania Hydraulic Fracturing Review" (STRONGER, 2010) Finding III.4 stated: "the DEP's experience with pits has shown that, although their use is decreasing, many liner failures still occur with pits and other types of waste are being dumped into pits." STRONGER recommended that DEP "consider adopting regulations or incentives for alternatives to pits used for unconventional wells in order to prevent the threat of pollution to the waters of the Commonwealth.") Open pits and open tanks contribute to air pollution. Oil and Gas Operations, like the ones shown in the photo below can be located very close to homes and nearby residents should be protected from inhaling toxic vapors from these operations. Closed-loop tank systems should be used to contain volatile materials and wastes to capture air pollution and route vapors to be sold or used for power (preferably), or alternatively to an incinerator or flare.

Homes within close proximity to shale drilling operations in Hopewell Township, Washington County, PA.

We recommend deletion of all regulations that allow pits. Waste and regulated substances should be stored in covered aboveground storage tanks or modular structures. (1143)

Response: The Department has amended the final rulemaking to ban the use of pits for temporary waste storage at unconventional well sites. The Department has determined that it is appropriate to remove this practice because it is not commonly used by unconventional operators. Additionally, the typical type and scope of use by unconventional operators is generally incompatible with technical standards for temporary pits prescribed under § 78.56. Conversely, the typical type and scope of use by conventional operators is generally compatible with the technical standards for temporary pits prescribed under § 78.56. The Department believes that the technical standards for temporary pits prescribed under § 78.56 ensure protection.

- 824.** Comment: 78.56 – We support the use of closed-loop temporary tankage for handling materials, chemicals, and waste at Oil and Gas Operations, providing that they do not pose pollution or other environmental and health hazards, generate new problems such as excessive truck traffic, or land disturbance from pipelines. While closed containment systems such as tanks can be preferable to impoundments for air and water quality, they are not risk-free and require strong regulation and oversight. Any facility that holds flowback water, brine, and other gas wastes, and from which substances are transported, can pose threats to the environment and health. For tanks to be beneficial, their location and size must be appropriate for the site in question. Tanks must be enclosed to prevent air pollution, have sufficient containment to prevent leaks and subsequent water and soil contamination, and be consistently and properly inspected and maintained. For tanks that are vented, filtering or capture and control of pollutants is essential to protect people from harmful air emissions depending on the tank content type. (1143)

Response: The Department acknowledges the comment.

825. Comment: **78.56(a)(2)** – We support the proposed change that includes PADEP development of an approved list of modular temporary storage units that are allowed. However, we request that the PADEP include a definition for modular storage structure in the definition section at § 78.1. We assume that the EQB is referring to modular storage structures such as connexs and other metal-sided box shaped structures that are prefabricated and brought to the oil and gas site to safely store materials on site, out of the weather and so that they can be secured by a lock, although this needs clarification. If the EQB is considering modular storage structures to contain other hazardous materials such as fuels and chemicals, it needs to be clear what structures it envisions and how they are appropriate and safe for that use. (1143)

Response: The Department has added a definition of “modular aboveground storage structure” to §§ 78.1 and 78a.1 of the final-form rulemaking to clarify that a modular aboveground storage structure is “an aboveground structure used to store wastewater that requires final assembly at a well sit to function an can be disassembled and moved to another well site after use.”

826. Comment: We request that the PADEP make it clear what can be stored in a temporary tank, and what can be stored in an approved modular storage structure. (1143)

Response: Use of temporary storage structures is restricted to storing regulated substances generated by the well or used during drilling, altering, completing, recompleting servicing and plugging the well.

827. Comment: It is essential that the PADEP clarify whether these tanks and “tank farms” would be for principal use at well sites or also be allowed to service multiple wells from a wide radius (as is the case with existing centralized impoundments).

The PADEP should also clarify when operators would be required to obtain a Waste Management Permit (WMGR 123) for tanks and “tank farms;” this aspect was indicated as an area for regulatory review during the April 23, 2013 Technical Advisory Board (TAB) meeting. (1143)

Response: Temporary storage structure use is defined. Use of temporary storage structures is restricted to storing regulated substances generated by the well or used during drilling, altering, completing, recompleting servicing and plugging the well. Large tank farms & tank storage pads are permitted on well sites when criteria are met under §§ 78.56 and 78a.56. A waste management permit is necessary when § 78.56 does not apply to the proposed operation.

828. Comment: We support the requirement for lined containment areas to be placed under temporary storage. A temporary tank poses a greater environmental risk than a stationary tank, because temporary tanks are relocated many times during their operating lives, increasing the potential for tank damage during transit and the likelihood of tank appurtenance leakage.

Liners should be impervious and impermeable (not allowing fluid to pass through). The proposed regulation would allow some permeability through the liner, albeit a small coefficient of permeability is proposed. No amount of leakage should be allowed. Lined containment should be “leak proof.” (1143)

Response: The standard of a coefficient of permeability of 0 as proposed by the commenter is

not reasonably achievable. The standard of coefficient of permeability is sufficiently low to ensure that no significant amount of regulated substances will escape through a properly functioning liner.

829. Comment: The proposed language contains conflicting instructions about disposal of drill cuttings. Existing regulation § 78.56 requires that the operator shall contain polluttional substances including drill cuttings. The revised language includes a proposed option for land application of drill cuttings. We do not support land application of drill cuttings. Please see our recommendations below in our comments on the proposed regulation at § 78.61. (1143)

Response: See response to comment 1442 and 1574.

830. Comment: The regulation should clarify that the PADEP approves the use of fully enclosed aboveground storage tanks and modular structures, that uncovered storage containers may not be used for any wastes, and that temporary use of buried tanks and structures are prohibited. Pits currently in use should be phased out within one year. (1143)

Response: See response to comment 823. The Department does not believe that an explicit phase out date is required because existing regulations require removal of onsite pits within 9 months of completion of drilling.

831. Comment: We recommend that the PADEP require storage tank inspections and alarm systems. Tank inspections should be conducted at least once every five years to examine structural conditions and document corrosion or damage, and identify necessary repairs before returning the tank to service. Monitoring and control systems should be installed, including high-liquid-level alarms that sound and display in an immediately recognizable manner; high-liquid-level automatic pump shutoff devices, which are designed to stop flow at a predetermined tank content level; and a means of immediately determining the liquid level of tanks. (1143)

Response: The Department disagrees for several reasons. First, these tanks are only providing temporary storage while wells are being drilled and completed on a well site. Second, the Department has not documented frequent compliance or environmental harm issues with tank storage on well sites, absent intentional acts of vandalism or dumping. Finally, the Department is not mandating inspections as these tanks are typically only located on active well sites where operator personnel are present regularly while the tank is in operation. Operators are required to outline their monitoring and inspection requirements and frequency in site-specific PPC plans under §§ 78.55 and 78a.55.

832. Comment: Based on information contained in comments 822 through, 831 above, Commentator recommends the following changes to the proposed regulations at § 78.56:

§ 78.56. Temporary Approved Aboveground Storage Tanks and Modular Structures; Prohibition of Pits.

(a) Except as provided in § 78.60(b) (relating to discharge requirements), the operator shall contain regulated substances and wastes from the drilling, altering, completing, recompleting, servicing and plugging the well, including brines, drill cuttings, drilling muds, oils, stimulation fluids, well treatment and servicing fluids, plugging and drilling fluids other than gases in a aboveground tank or series of tanks or modular structures approved by the Department. The use of buried tanks and buried modular structures are prohibited. The operator shall install or construct and maintain the aboveground tank or series of tanks or other modular structures in

accordance with the following requirements:

- (1) The tank, series of tanks, or other modular structures shall be constructed and maintained with sufficient capacity to contain all regulated substances and wastes which are used or produced during drilling, altering, completing, recompleting, servicing and plugging the well. Tanks or other authorized storage equipment may not be located in a mapped floodplain or within 50 feet of the top of bank of any watercourse.
- (2) Modular aboveground storage structures that are assembled onsite may not be utilized to store regulated substances; only factory prefabricated modular storage structures are allowed. The Department will maintain a list of approved aboveground tanks and modular storage structures on its web site and will make clear the type of regulated substances that can be safely stored in each approved tank or the structure. The owner or operator shall notify the Department at least 3 business days before the planned use of these storage structures. The notice shall be submitted electronically to the Department through its web site and include the date the aboveground tank or modular storage structure installation will begin. If the date of installation is extended, the operator shall renotify the Department with the date that the installation will begin, which does not need to be 3 business days in advance.
- (3) Aboveground tanks and modular storage structures containing volatile materials and wastes shall be designed and operated to capture air pollution and route vapors to power generation equipment (preferably), or alternatively to an incinerator or flare.
- (4) Aboveground storage tanks and other approved modular structures shall be designed, constructed at the factory and maintained, routinely inspected and verified to be structurally sound and reasonably protected from unauthorized acts of third parties prior to use. Each tank shall be inspected by a certified tank inspector and each modular structure shall be inspected by a structural engineer at least once every five years. The inspection shall examine structural conditions and document corrosion or damage, and identify necessary repairs before returning it to service. Overflow alarms shall be installed. Alarm systems shall be installed on all liquid storage tanks or other approved storage structures. The systems shall include high-liquid-level alarms that sound and display in an immediately recognizable manner; high-liquid-level automatic pump shutoff devices, which are designed to stop flow at a predetermined tank content level; and a means of immediately determining the liquid level of tanks.
- (5) Unless an individual is continuously present at the well site, a fence must completely surround the storage equipment all pits to prevent unauthorized acts of third parties and damage caused by wildlife. Netting or fencing must be provided to prevent wildlife capture such as birds.
- (6) An individual must be continuously present at the well site during well construction, well workovers and well stimulation operations. For other Oil and Gas Operations, when an individual is not continuously present at the well site, operators shall equip all tank valves and access lids to regulated substances with reasonable measures to prevent unauthorized access by third parties such as locks, open end plugs, removable handles, retractable ladders or other measures that prevent access by third parties. Tanks storing freshwater, fire prevention materials and spill response kits are excluded from the requirements of this paragraph.
- (7) The operator of the well site shall display a sign on or near the tank or other approved storage structure identifying the contents and an appropriate warning of the contents such as flammable, corrosive or a similar warning.
- (8) A tank or other approved modular storage structure that contains drill cuttings from below the surface casing seat, regulated substances, wastes or fluids other than tophole water, fresh water and uncontaminated drill cuttings from above the surface casing seat shall be impermeable.
- (9) Aboveground storage tanks and other approved modular structures shall be set on top of a synthetic flexible liner that is sufficient in size to capture any leaks or drips that may occur from the tank or modular structure.

Liners must be impervious, impermeable and comply with the following:

- (i) The liner must be at least 30 mils thick.
- (ii) The liner shall be designed, constructed and maintained so that the physical and chemical characteristics of the liner are not adversely affected by the regulated substance stored therein and the liner is resistant to physical, chemical and other failure during transportation, handling, installation and use. Liner compatibility must satisfy ASTM Method D5747, Compatibility Test for Wastes and Membrane Liners, or another compatibility test approved by the Department for the duration the temporary storage structure is used.
- (iii) Adjoining sections of liners shall be sealed together to prevent leakage in accordance with the manufacturer's directions. The integrity of all seams of the adjoining sections of liner shall be tested prior to use. Results of the tests shall be available upon request.
- (10) Prior to placing storage tanks or modular structures on the liner, the liner shall be inspected for lack of uniformity, damage and other imperfections that may cause the liner to leak. The well operator shall correct damages or imperfections before placing any the material in storage tanks or modular structures on the liner.
- (11) If a liner becomes torn or otherwise loses its integrity, storage tanks or modular structures must be continuously monitored for leaks by onsite personnel while the liner is repaired. If repair of the liner is not practical or possible, the storage tank or modular structure contents shall be removed and disposed of at an approved waste disposal facility.
- (12) The well operator shall notify the Department at least 3 business days before the installation of the liner. The notice shall be submitted electronically to the Department through its web site and include the date the liner will be installed. If the date of installation is extended, the operator shall renotify the Department with the date of installation, which does not need to be 3 business days in advance. A licensed professional engineer or geologist shall design the well site and shall submit a statement on forms provided by the Department certifying that the liner, as built, is compliant with this section. This certification shall be submitted within 10 business days of installation of the liner.
- (13) Condensate, oil, natural gas, or volatile substances, whether separated or mixed with other fluids, may not be stored in any open top structure or pit. Tanks and modular structures used for storing or separating condensate, oil, natural gas, or volatile substances during well completion shall be grounded, monitored and have controls to capture vapors. All captured vapors shall be used for power or, upon demonstration of good cause, shall be routed to an incinerator or flare, and to prevent vapors from exceeding the lower explosive limits outside the tank or modular structure.
- (b) The operator may request to use practices other than those specified in subsection (a) which provide equivalent or superior protection by submitting a request to the Department for approval. Use of pits or uncovered storage containers will not be approved as meeting the standard of equivalent or superior protection. The request shall be made on forms provided by the Department.
- (c) Storage and Disposal of uncontaminated all drill cuttings, regardless if from above or below the surface casing seat, in pits is prohibited.
- (d) Storage and disposal of contaminated fluids, semifluids, or solids associated with oil and gas activities, including, but not limited to, fresh water, wastewater, flowback, mine influenced water, and drilling mud, in pits is prohibited. All existing pits used to store and dispose of contaminated fluids, semifluids, or solids associated with oil and gas activities, including, but not limited to, wastewater, flowback, mine influenced water, and drilling mud must be removed and the pit be remediated by ____ Editor's Note: The blank refers to one year after the effective date of adoption of this proposed rulemaking). (1143)

Response: See responses to comments 822 through 831.

833. Comment: We opposed long-term onsite burial of any drill cuttings contaminated with chemicals,

oil, grease, pollutional materials, regulated substances, water based drilling muds that contain chemical additives, oilbased drilling muds, polymer-based drilling muds containing mineral oil lubricants, NORM, mercury, heavy metals, and other chemical additives or toxins. We are particularly concerned that the EQB does not require on-site burial pits to meet the same construction, monitoring, and leak detection standards that would be required of a centralized approved solid waste treatment facility. Nor does the EQB require the operator to test the waste and verify its composition and hazard. For example, the onsite burial methods proposed for drill cuttings are not appropriate for drill cuttings containing NORM or heavy metals or coated with some types of chemicals that would damage the liner.

Drilling waste should be removed from the drilling location and properly disposed of at an approved waste disposal facility capable of handling the quantity and type of waste generated. We recommended the use of closed-loop tank systems to handle and store drilling muds and cuttings, and disposal of this waste at an offsite approved solid waste treatment facility or by deep well injection in an EPA approved well.

If the EQB rejects this recommendation, and permits the continued use of pits, we request that the EQB provide a written scientific and technical analysis justifying the proposal, including:

- (1) A quantitative technical assessment of air, water, soil and human health impact of pit use and proposed disposal methods (onsite burial and land application);
- (2) Data on the historic use of pits in Pennsylvania, including those known to have leaked or overflowed, and quantification of the cumulative adverse impact of these impoundments on air, soil, surface water, groundwater and animal life;
- (3) Data that proves land application of drill cuttings in contact with tophole water, fresh water, or gas is safe. While drill cuttings from above the surface casing seat that have only been in contact with tophole water, freshwater, or gas may not be contaminated if the EQB uses our proposed definition of tophole water and freshwater, we remain concerned that there is no limitation on composition of the drill cuttings itself. For example, drill cuttings could contain NORM or heavy metals. The EQB must consider not only whether the drill cuttings have been contaminated during the drilling process, but whether the drill cuttings themselves contain contaminants;
- (4) Data on historic use of drill cutting land application in Pennsylvania and other states, including an analysis of the frequency, type, and severity of pollution events resulting from land application and a projection of future cumulative impact; and,
- (5) Data on historic long-term onsite burial of drill cuttings in Pennsylvania and other states, including an analysis of the frequency, type, and severity of pollution events resulting from onsite burial and a projection of future cumulative impact.

If, after this analysis is complete, and the EQB finds that use of pits provide a net environmental and human health benefit, we request that the EQB significantly strengthen the regulatory requirements, by including best practices used by the federal government (BLM), other oil and gas producing states, and those we recommend. At a minimum, the following improvements to the proposed regulations should be included:

- (1) Protection Standard: All pits shall be designed, constructed, and operated to prevent contamination of fresh water; and protect public health and the environment. (N.M. Code, § 19.15.17 (Pits, Closed-Loop Systems, Below-Grade Tanks and Sumps)). The applicant should be required to provide a design, construction and operation plan, signed by a professional engineer that ensures this standard will be met.
- (2) Pit Location. No pits should be constructed in sensitive areas or other locations that have

heightened potential to result in adverse impacts to human health or the environment. (USDOI, BLM, *Management of Oil and Gas Exploration and Production Pits* (Nov. 15, 2011)). Pits may not be located in a mapped floodplain or within 50 feet of the top of bank of any watercourse. Pits should be installed above seasonal groundwater levels. Pit locations should be accurately surveyed, and the location provided to the PADEP for inclusion in a web-based database made available to the public, listing the size, location, and contents of the pit.

(3) Pit Separation Distance from Streams and Wetlands. Pits must not be located within 100 linear feet upstream of any watercourse, wetland, or spring. The applicant shall evaluate the potential flow path and point of discharge from a pit to the nearest downstream water body. The PPC Plan shall document the potential flow path, maximum potential discharge, and proposed emergency response for management of any discharge from a pit to an adjacent or downstream water body.

(4) Pit Distance to Seasonal High Water Table: The requirement that buried pits be only 20 inches above the seasonal high water table gambles with local water quality since Pennsylvania has many shallow groundwater sources. Other states require far greater distances, such as 25 feet in New Mexico. (N.M. Code, § 19.15.17 (Pits, Closed-Loop Systems, Below-Grade Tanks and Sumps))

(5) Meet Chapter 105 Requirements. All pits should be subject to the PADEP's Chapter 105 regulations, as explained above in the Centralized Impoundment comments. [Cross reference]

(6) Pit Liner. All pits should be lined with a synthetic liner that is compatible with the pit contents, resistant to weathering, sunlight, puncturing and tearing (USDOI, Bureau of Land Management, *Surface Operating Standards and Guidelines for Oil and Gas Exploration and Development* (The Gold Book) (4th ed. 2006)). Unlined pits are prohibited (N.M. Code, § 19.15.17 (Pits, Closed-Loop Systems, Below-Grade Tanks and Sumps.)). The liner must be impervious (Colorado, Rule 904 Pit Lining Requirements and Specifications, <https://cogcc.state.co.us/Announcements/Rule904.pdf>). Liner material must be of sufficient thickness and length to withstand expansion and contraction without cracking or being damaged, and withstand settling movements of the underlying earth, and be at least 60 mils thick. (Id.) Two layers of liners should be installed, providing one complete redundant back-up barrier. Pit lining systems shall be designed, constructed installed and maintained in accordance with the manufacturer's specifications and good engineering practices (Id.)

(7) Pit Leak Detection. Pits must have a leak detection system that underlies the liner (USDOI, BLM, *Onshore Oil and Gas Order No. 7* (1993)). The leak detection system should monitor a leak between the two layers of liner material.

(8) Groundwater Monitoring Systems. Install groundwater monitoring systems.

(9) Fences and Netting. Pits must be surrounded by fences tall and strong enough to keep out wildlife, and nets or other devices installed to prevent birds from coming in contact with the wastes (N.M. Code, § 19.15.17 (Pits, Closed-Loop Systems, Below-Grade Tanks and Sumps)).

(10) Inspection. The pit liner and leak detection system must be inspected weekly and a record of the inspection results kept by the operator. The Department should be notified immediately if a leak is detected or the liner is damaged.

(11) Repair/Removal. If a leak is detected, pit use must be immediately stopped, the pit removed, and the contamination remediated.

(12) Land Application and Burial. Drill cuttings must be tested to verify that it is uncontaminated prior to land application or burial. (By comparison, Ohio requires contaminated drill cuttings to be sent to a permitted solid waste disposal facility, unless the Ohio EPA approves a beneficial reuse option. Ohio EPA, Fact Sheet: Drill Cuttings from Oil and Gas Exploration in the Marcellus and Utica Shale Regions of Ohio (Jan. 2014), http://epa.ohio.gov/Portals/34/document/fact_sheets/Fact%20Sheet%20on%20Drilling%20Muds%20and%20Cuttings%20Final%2010-01-13.pdf). Drill cuttings containing Naturally Occurring Radioactive Materials, heavy metals, or other regulated substances shall be disposed at an at an offsite approved solid waste treatment facility.

(13) Reporting and Recordkeeping. Quarterly reports should be submitted to the PADEP to verify that the pit continues to meet the PADEP's requirements. Any deficiencies must be immediately reported and remedied.

(14) Insurance and Liability. Require a certificate of pollution insurance of at least \$1,000,000 for each pit. Clarify the operator is strictly liable for any contamination or harm caused by the pit. (1143)

Response: See response to comment 823.

834. Comment: The Department should impose a specific time limit for the on-site storage of fluids. (1142)

Response: A time limit for pits is specified under § 78.56(d) where removal of all pits and wastes is required within 9 months after completion of drilling. In addition, § 78.56(d) requires pits used during servicing, plugging or recompleting a well to be removed within 90 days of construction.

835. Comment: 78.56(a)(2) – Commentator appreciates the Department's willingness to review and approve aboveground storage structures once and then have that structure be preapproved for future use without additional review. That should be stated in the regulation. The term "regulated substances" is overly broad as used in this section, as noted elsewhere in these comments.

Suggested Regulatory Language:

(2) Modular aboveground storage structures that are assembled on site may not be utilized to store substances under this section without Department approval. The Department shall maintain a list of approved modular storage structures on its internal website. The owner or operator shall notify the Department at least 3 business days before the commencement of construction of these storage structures. This notice shall be submitted electronically to the Department through its website and include the date the storage structure installation will commence. If the date of installation is extended, the operator shall re-notify the Department with the date that the installation will commence which need not be 3 business days in advance. The Department shall set forth a procedure for companies supplying such structures to follow to obtain Department approval. Once a design has been approved by the Department, subsequent assembly of the approved structure at another site does not require a new approval, but would require notices to landowners and local governments.

(1153)

Response: See response to comment 817 in regard to the definition of the term "regulated substances. The Department disagrees with the proposed revisions to the subsection. Authority to construct and operate above ground modular facilities is issued under the well

operators' well permit. Approval may not be granted to companies supplying such structures if they are not oil and gas well operators.

836. Comment: 78.56(a)(1) – Define “recompleting the well.” (1098)

Response: “Completion of a well” is defined in the 2012 Oil and Gas Act as the date after treatment, if any, that the well is properly equipped for the production of oil or gas, or if the well is dry, the date that the well is abandoned.

837. Comment: C.O.G.E.N.T. advocates the use of tanks as the preferred method for both conventional and unconventional operations. One operator in our region, Cabot has already utilized above ground modular structures. Our water resources need to be adequately protected and it is well known that above ground temporary storage is a superior practice in regards to eliminating environmental impacts associated risks. Adequate security and safety measures are necessary to protect the public and the facility from wildlife and unauthorized access. Many of these sites are near homes and they need to be adequately secure to protect nearby properties as well.

We recommend the provisions related to modular above ground containment structures as they can assist operators in their recycling methods and water storage along with being a better environmental practice near our homes. We prefer the use of tanks over the use of pits, especially in the case of unconventional drilling. Since this practice is lingering with perhaps only a few unconventional drillers, we are receptive to these revised regulations. In reality however, we would like to see all unconventional operators cease using pits and rather utilize tanks. (660a)

Response: The Department acknowledges the comment. See response to comment 823.

838. Comment: 78.56(a)(3) – The proposal changes the word “waste” to “regulated substances.” The use of this term is not sufficiently precise, as explained above in our comments concerning its definition, and results in an unreasonable and unlawful expansion of the scope of this section. So that the scope of this provision is not unreasonably and unlawfully broadened, the proposed term “regulated substances” should be rejected and the correct terms “fluid” and “waste” should continue to be used.

Suggested Regulatory Language:

(3) A pit shall be designed, constructed and maintained so that at least 2 feet of freeboard remain at all times. If open tanks or open storage structures are used, the tanks and storage structures shall be maintained so that at least 2 feet of freeboard remain at all times unless the tank or storage structure is provided with an overflow system to a standby tank or pit with sufficient volume to contain all excess fluid or waste. If an open standby tank or open standby storage structure is used, it shall be maintained with 2 feet of freeboard. If this subsection is violated, the operator immediately shall take the necessary measures to ensure the structural stability of the pit, or tank or other storage structure, prevent spills and restore the 2 feet of freeboard. (1153)

Response: Regulated substance is defined in section 103 of The Pennsylvania Land Recycling and Environmental Remediation Standards Act (Act 2) (35 P.S. §6026.103).

839. Comment: Regarding the monitoring requirements for ‘Temporary Storage’ at unconventional well sites, it appears that potential pollution from air emissions has not been adequately addressed. These pits and tanks have the potential to emit air pollutants, such as Volatile Organic Compounds, Hazardous Air Pollutants and Greenhouse Gases, uncontrolled into the outdoor atmosphere. As with existing regulations for conventional permitted compressor stations, monitoring and reporting of tank

emissions occurs. I would recommend that language be added to include monitoring, and reporting to the Department, of air pollutants from all applicable storage sources, be they temporary or permanent. As it is, these sites do not require Air Quality permits and the Department's Air Quality Program does not monitor these air pollutants. Inspections of these sites are conducted by the Department's Oil & Gas Bureau which do not adequately address air quality concerns. Charged with protecting the air quality of the Commonwealth, the Department should require owners and/or operators to monitor and report air pollutant emissions throughout all aspects of well development and maintenance. With the current inventory, and expected increase in inventory, of these types of sources, the emission of air pollutants is of great concern and should be the duty of the Department to monitor.

As currently stated within 78.56(a)(1) The pit, tank or series of pits and tanks shall be constructed and maintained with sufficient capacity to contain all pollutional substances and wastes which are used or produced during drilling, altering, completing and plugging the well. Owners/operators of wells are currently unable to be within 100% compliance with this requirement due to evaporative and fugitive air emission processes that occur from, but not limited to, pits and tank pressure relief valves. As written, it provides protection from water and soil pollution but does not provide adequate protection from air pollution. Language should be added to adequately include air pollution concerns. This same issue would apply if/when the language is changed to 'Temporary Storage'. (625)

Response: Air quality issues are addressed under Article III and the outside of the scope of this rulemaking.

- 840.** Comment: § 78.56(a) should be clearly entitled to reflect the scope of the provisions, which are limited to the use of pits and tanks for temporary storage.

In addition, the use of the term regulated substances is overly broad and creates uncertainty under this subsection, which should be better focused on the substances at well sites that would be contained in pits, tanks or other approved storage structures.

Suggested amendatory language:

§ 78.56. Temporary storage in pits, tanks and other approved storage structures

Except as provided in §§ 78.60(b) and 78.61(b) (relating to discharge requirements; and disposal of drill cuttings), the operator shall contain substances generated from and used for the drilling, altering, completing, recompleting, servicing and plugging the well, including brines, drill cuttings, drilling muds, oils, stimulation fluids, well treatment and servicing fluids, plugging and drilling fluids other than gases in a pit, tank or series of pits and tanks or other approved storage structures. The operator shall install or construct and maintain the pit, tank or series of pits and tanks or other approved storage structures in accordance with the following requirements: (1137, 1174)

Response: Regulated substance is defined in section 103 of The Pennsylvania Land Recycling and Environmental Remediation Standards Act (Act 2) (35 P.S. §6026.103).

- 841.** Comment: **78.56(a)(1) – (3)**, - It appears the word “standby” was inadvertently omitted from the next to last sentence in subsection(3) in association with the “storage structure.” In addition, the term “regulated substance” should be replaced in accordance with the comment above to provide clarity with respect to the obligations under this section. Suggested Language: (1) The pit, tank, series of

pits and tanks or other approved storage structure shall be constructed and maintained with sufficient capacity to contain substances which are used or produced during drilling, altering, completing, recompleting, servicing and plugging the well. (2) Modular aboveground storage structures that are assembled on site may not be utilized to store substances resulting from the drilling, altering, completing, recompleting, servicing or plugging the well without Department approval. The Department shall maintain a list of approved modular storage structures on its website. The owner or operator shall notify the Department at least 3 business days before the beginning of construction of these storage structures. The notice shall be submitted electronically to the Department through its website and include the date the storage structure installation will begin. If the date of installation is extended, the operator shall re-notify the Department with the date that the installation will begin, which does not need to be 3 business days in advance. (3) A pit shall be designed, constructed and maintained so that at least 2 feet of freeboard remain at all times. If open tanks or open storage structures are used, the tanks and storage structures shall be maintained so that at least 2 feet of freeboard remain at all times unless the tank or storage structure is provided with an overflow system to a standby tank or pit with sufficient volume to contain all excess fluid. If an open standby tank or open standby storage structure is used, it shall be maintained with 2 feet of freeboard. If this subsection is violated, the operator immediately shall take the necessary measures to ensure the structural stability of the pit, or tank or other storage structure, prevent spill and restore the 2 feet of freeboard.(1137, 1174)

Response: The Department agrees and has added the word “standby” to the respective section. The Department disagrees with the remainder of the comment. Regulated substance is defined in section 103 of The Pennsylvania Land Recycling and Environmental Remediation Standards Act (Act 2) (35 P.S. §6026.103).

842. Comment: **78.56(a)(1)** – “...shall be constructed and maintained with sufficient capacity to contain all polluttional regulated substances which are used or produced during drilling, altering, completing, recompleting, servicing and plugging the well.: -- The same comment as 78.55(b) applies to this section. It is suggested that this section be revised to allow for a general discussion of what substances are anticipated to be found at the well site since an operator may not know what regulated substances will be onsite prior to use. It is suggested that the language is revised to state “...which are used [**or anticipated to be**] produced...” (1057)

Response: The storage facilities must be constructed and maintained with sufficient capacity to contain all regulated substances which are used or produced during drilling, altering, completing, recompleting, servicing or plugging the well whether anticipated or not.

843. Comment: **78.56(a)(1)** – As noted on page 53 of the STRONGER, September, 2013 Review “The regulations do not require liners or secondary containment around tanks or other facilities storing polluting substances, but such liners are recommended practices.” With sites located near within and around our rural, farmland and forested communities, many times nearby our homes, schools and even local hospitals, we really want to see safeguards consistently employed operator to operator, site to site. We urge the Department to consider adding this recommended practice as a provision to this rulemaking as noted by the STRONGER Review. (660a)

Response: Sections 3218.2(a),(c)(d) of the Oil and Gas Act require unconventional well sites to install containment practices to prevent spills to ground surface or spills off the well site. When using modular aboveground storage, §§ 78.56(a)(2) and 78a.56(a)(2) require prior approval from the Department which includes a review for adequate secondary containment.

844. Comment: **§ 78.56 (a)(I)** - It is suggested that the language be revised to state “...which are used or

anticipated to be produced ...” (861)

Response: See response to comment 842.

- 845.** Comment: Eliminate pits and open storage structures as referenced in 78.56(a)(2) – (4); if maintained, increase freeboard to 3 feet at all times given frequency and volume of recent storm-related precipitation. (1098)

Response: See response comment 818. Two feet of freeboard is an appropriate standard and must be maintained at all times. Therefore it does take into account storm related precipitation.

- 846.** Comment: 78.56(a)(2) - What is the protocol for Department approval? A time frame needs to be set upon which the Department must make an approval or denial decision. Who at the Department is qualified to approve modular storage structures? (411)

Response: The Department evaluates proposed modular aboveground storage structures on a case by case basis to determine whether the proposed structure will provide equivalent or superior protection. Reviews are conducted by qualified staff. Requests to use modular aboveground storage structures are tracked in the Department’s eFACTS system.

- 847.** Comment: § 78.56(a)(2) – Clarify the design approval process for modular aboveground containment structures so that once a design has been approved by the DEP, subsequent assembly of the approved structure at another site does not require a new approval. (861)

Response: Each site requires its own authorization from the Department. The Department reviews not only modular designs but also site specific construction and topographic conditions. The Department’s website will list approved modular structures but authorization of the process will still be required to ensure proper siting of the facility. Clarifying language has been added to the subsection in the final-form rulemaking.

- 848.** Comment: 78.56(a)(2) – Eliminate modular aboveground storage structures unless they are comparable to closed tanks and, if used, extend notification periods from 3 to 10 business days. (1098)

Response: The Department evaluates proposed modular aboveground storage structures on a case by case basis to determine whether the proposed structure will provide equivalent or superior protection. The Department believes that the notification timeframe established in the regulations is sufficient to allow Department field staff to plan inspection schedules.

- 849.** Comment: **78.56(a)(2):** As previously referenced in our general comments about the drawbacks of overly prescriptive language, it is suggested that the Department strikes the language saying “The Department shall maintain a list of approved modular storage structures on its website” and instead establish minimum requirements for modular aboveground storage structures. This would maintain the Department’s desired standard, but allow operators flexibility to determine the best available options at any given time for their circumstances. Additionally, the Department should issue guidance as to the approval process required for modular above ground storage structures assembled on site. (1071)

Response: The Department evaluates proposed modular aboveground storage structures on a case-by-case basis to determine whether the proposed structure will provide equivalent or

superior protection. Each site requires its own authorization from the Department. The Department reviews not only modular designs but also site specific construction and topographic conditions. The Department's website will list approved modular structures but authorization of the process will still be required to ensure proper siting of the facility.

850. Comment: Section 78.56(a)(2) should indicate that the Department will maintain the list of approved modular structures on its web site. (852a)

Response: The Department agrees. No changes to the subsection are required.

851. Comment: Section 78.56(a)(2) should require the applicant to estimate the amount of waste/wastewater generated and stored in the temporary facility. The regulation requires the design of the pit or tank to include two feet of freeboard, but without more specific information about the collection and disposal schedule of wastewater, the Department cannot know if the freeboard is attainable throughout the use of the pit or tank. The Department's approval should include a review of the facility design to ensure compliance with this requirement. To that end, the design of the temporary pit or tank should include the ability to contain rainfall from a 25- year, 24-hour storm event, and still maintain two feet of freeboard. (852a)

Response: See response to comment 842. Two feet of freeboard is an appropriate standard and must be maintained at all times. Therefore it does take into account storm related precipitation.

852. Comment: **78.56(a)** – The wording in this provision appears inconsistent with the intended scope, confusing the details of the requirements. First, the Board ought to update the provision heading to state: “Temporary Storage in Pits, Tanks and Other Approved Structures” to accurately reflect the scope of the provision. Second, to the extent “other approved storage structures” in 78.56(a) is to refer to those storage structures approved under the proposed subpart (a)(2) of 78.56, the Board could clarify the term to support efficient implementation of the requirement. While it may seem evident that this is what is intended by the Board, it should be specified in the initial language of the provision to avoid any confusion. Finally, the use of the term “regulated substance” seems inappropriate for this section, which is limited to substances at well sites that would be contained in pits, tanks or other approved storage structures. The Board should consider an alternative term. (1085)

Response: See response to comment 817 in regards to the definition of “regulated substance.” The title for the section is appropriate. The language in subsection (a) is broadly worded to account for all situations where the Department is approving alternative storage structures or practices.

853. Comment: **78.56(a)(2)** – The owner or operator shall notify the Department at least 3 business days before the commencement of construction of these containment structures. Add language to clarify the design approval process for modular aboveground containment structures so that once a design has been approved by the DEP subsequent assembly of the approved structure at another site does not require a new approval. (1057)

Response: See response to comment 849.

854. Comment: In § **78.56(a)(3)**, the Department should receive immediate notice of any violation. (997a)

Response: The Department encourages all operators to report all violations to the Department. In certain circumstances the Department mandates notification. For example, see §§ 78.66(b) and 78a.66(b).

855. Comment: **78.56(a)(3)** – The scope and reach of the proposed rule seems unclear regarding the type of regulated substance it applies to and the Board should clarify that the requirements do not pertain to solidified waste. It appears that the proposal requires two feet of freeboard for open tanks or open storage structures for regulated substances in liquid form. However, this is not made clear by the proposed language. Because open tanks or open storage structures are used to store solidified waste, such as drill cuttings, two feet of freeboard is unnecessary. The Board should consider clarifying this language. We propose that the Board rewrite the second sentence of the provision to state: “If open tanks or open storage structures are used, the tanks and storage structures shall be maintained so that at least 2 feet of freeboard remain at all times unless the tank or storage structures is provided with an overflow system to a standby tank or pit with sufficient volume to contain all excess fluid or regulated substances in liquid phase.” (1085)

Response: The subsection requires 2 feet of freeboard to be maintained for all open topped structures that are used to contain regulated substances including substances which are in a solid phase. This requirement is appropriate to accommodate storm events and other operational issues.

856. Comment: In § **78.56(a)(5)**, since no fence can absolutely ensure “prevention” of unauthorized acts by third parties or damage by wildlife, We recommend replacing “prevent” with “discourage”.

Suggested amendatory language:

For unconventional well sites, unless an individual is continuously present at the well site, a fence or fences shall completely surround all pits to discourage unauthorized acts of third parties and damage caused by wildlife. (1137)

Response: See response to comment 1217.

857. Comment: **78.56(a)(5)** – Unconventional wells should not be singled out to require fencing around pits. If it is acceptable to have an unfenced pit on a conventional well site, why not an unfenced pit on an unconventional well site? A chain link fence may provide for some protection from third parties and wildlife, but not all. There is no way to prevent a person who wants to vandalize a pit from doing so simply by putting up a fence, as a person can use wire cutters to access the pit. Environmental groups argue for fences built high enough to keep out deer and tight enough at the bottom 1-2 feet to keep out small animals. Even with those types of protections, animals that tunnel under the ground, that can climb fences like snakes, or that can jump over fences like deer cannot be kept out under all circumstances. There have been many incidents along the roads where deer jump the fence and run into traffic, or where deer jump a fence and then cannot get back out and are stranded. Putting nets on neither pits nor impoundments should be required as birds get caught in nets and then die.

There are too many unanswered questions here. For example, the proposed language does not address when this must be done: for only new pits or impoundments or would it also include existing ones. If existing ones, then what would be the time frame to comply? Requiring fencing creates legal ramifications, such as potential liability for trespassers. DEP apparently has not considered the cost/benefit analysis of this requirement. Installing fencing can range in tens of thousands of dollars to possibly keep out an animal. There are many other industries that have a

variety of pits or impoundments that do not require fences around them such as electric generation, mining and paper manufacturing as a few examples. Delete subsection (5). (1153)

Response: The Department has revised § 78a.56 to disallow the use of pits on unconventional well site and accordingly has removed the requirement to install fencing around pits on unconventional well sites.

858. Comment: **78.56(a)(5)** – Why are unconventional wells singled out to require fencing around pits. If it's ok for a conventional drill pit, why not a pit on an unconventional well site? (411)

Response: The Department has revised § 78a.56 to disallow the use of pits on unconventional well site and accordingly has removed the requirement to install fencing around pits on unconventional well sites.

859. Comment: **78.56(a)(5)** – (7) address security for pits, tanks and approved storage structures. Commentators raise a variety of concerns related to these provisions, such as timelines for implementation, safety issues related to installing locks and locking lids, reasonableness of equating the presence of a person to a fence, cost of installing a fence and/or locks, and whether a person, lock and/or fence can ensure prevention of damage or access. We ask EQB to explain in the Preamble and RAF of the final-form regulation how the security requirements in this section reasonably and adequately balance protection of the public health and natural resources against the fiscal impact on the oil and gas industry. (1099)

Response: The Department agreed that changes to § 78.56 to remove the requirement to install equipment to prevent unauthorized access by third parties are appropriate for conventional operations. In addition, the Department has revised § 78a.56 to disallow the use of pits on unconventional well site and accordingly has removed the requirement to install fencing around pits on unconventional well sites. The Department has retained requirements in § 78a.56 to continue to require installation of equipment to prevent unauthorized access by third parties at unconventional well sites. The intent of these requirements is to prevent unauthorized acts by third parties. The Department acknowledges that fencing or personnel on site will not prevent unauthorized acts of third parties in all cases but replacing “prevent” with “discourage” would not satisfy the intent of the section.

860. Comment: The Proposed Rulemaking includes a number of revisions to 25 Pa. Code § 78.56's requirements concerning the use of pits for temporary storage of contaminated fluids, including brine. When left in pits, brine and other drilling fluids can stagnate and become a source of malodors. The Proposed Rulemaking should require well operators to treat produced water (by removing volatile organic compounds, adding biocides, or aerating fluids stored in pits) to prevent malodors and the bacterial growth that can lead to the formation of malodors. For example, the Colorado Oil and Gas Conservation's Rule 902.i requires that “[o]perators shall utilize appropriate biocide treatments to control bacterial growth and related odors as needed”¹³ when pits are used to store produced water. Further, produced water can contain pollutants that can harm domestic animals and wildlife. Neither the existing Chapter 78 regulations nor the Proposed Rulemaking include any protections designed to keep birds away from drilling fluids stored in pits, and section 78.56(a)(5) of the Proposed Rulemaking requires that a pit be fenced only when an individual is not continuously present at its well site. This is inadequate both to protect domestic animals and wildlife from the fluids in pits and to protect pits from damage that could be caused by domestic animals and wildlife. Accordingly, Section 78.56 should include a requirement that well operators install fencing around, and netting over, pits whenever necessary to protect domestic animals and wildlife. Again, the Colorado Oil and Gas Conservation Commission's rules concerning pits include just such a

requirement: Where necessary to protect public health, safety and welfare or to prevent significant adverse environmental impacts resulting from access to a pit by wildlife, migratory birds, domestic animals, or members of the general public, operators shall install appropriate netting or fencing.¹⁴ (1159)

Response: Malodors are regulated by the Department Air Quality Program including those from oil and gas pits and impoundments. Treatment by aeration is acceptable and does not require any special permits. Treatment using biocides/chemicals/filtering at the well site does require OG 71 permit approval.

The Department acknowledges the comment about bird netting. There are federal laws that protect migratory birds, including the requirement for bird netting. These laws are administered by the U.S. Fish & Wildlife Service (FWS) and are outside the scope of this rulemaking.

861. Comment: We support the requirement in subsection (a)(5) to install fencing around all pits to protect wildlife. (1157)

Response: The Department acknowledges the comment.

862. Comment: 78.56(a)(5) – This provision meets the recommendation of the STRONGER, September 2013 Review as noted on page 38 of the report. (STRONGER 2013 Guideline Sections 5.5.3.f. and 5.5.4.b.) C.O.G.E.N.T. concurs with the Department’s inclusion of the fencing provision. We recommend the adoption of this provision at a minimum as it is written. (660a)

Response: The Department acknowledges the comment.

863. Comment: 78.56(a)(6) – We support the implementation of this provision for both conventional and unconventional drillers. While we realize that this may create an additional cost for the conventional drillers, our Commonwealth is moving forward to a new age as major oil and gas producing state. It is unfortunate that our conventional drillers have not kept pace with technology, enhancing their operations to better practices. Now that we are in this changing time, many entities within our state have had to adapt. More rural residents have had to adapt to having industrial facilities nearby their homes. Our state highway and local road systems have had to adapt. Our counties and local governments, and at times, even our school districts have had to adapt by designating more resources to address oil and gas related issues. Thus, our conventional drillers have come to a time now where they also need to adapt and comply with this provision.

On February 20, 2014, West Texas Crude was noted at \$103.30/Barrel as reported by Energy Assurance Daily. At the Tunkhannock Hearing, Mark Cline, a fourth generation oil man and PIPP Board member testified that Pennsylvania’s conventional wells produce Penn Grade Crude Oil which is the best lubricating oil in the world. So, it just makes sense that the Pennsylvania conventional drillers are benefiting from these increasing prices and top dollar for the world’s best lubricating oil. It does appear that now, they can easily afford to bring their operations in line with the modern technologies. According to the regulatory analysis form, the cost the conventional drillers would bear for compliance with this regulatory change ranges from \$40 to \$5,000. This is really a reasonable expenditure that will provide for public health and safety and environmental protections.

We’ve taken the time to consider the information provided at the EQB/DEP rulemaking hearings by conventional drillers. Testimonies provided give an unclear review of their operations. One aspect

they've strongly advocated is that they have not created environmental harm with their operations and that the past 30 years of the O&G Act proves that. We put forth here information to the contrary, that is neither true for all operators, nor all of the time. We also note that, it is indeed time to update the O&G Act for conventional drillers based on new and available technologies that they may employ concerning tanks and horizontal drilling as just two examples. We'd like to draw your attention now to just two easily discovered items that indicate why conventional drillers need to be subject to adequate regulations that protect our public health and safety, environment and especially water resources. While we can sympathize with their plight on perhaps an added expense, when it comes to public health and safety, it is also necessary that serious consideration is given regardless of the business size and scope.

We also strongly caution the Department regarding separate regulations for conventional drillers. Two-tiered approaches for any type of regulation only serve to weaken and confuse. We strongly advocate that the Department note within each provision the 'target audience'. As a suggestion, the regulatory language may be indicated as follows.

- 00.0 Title
 - 00.01 Pursuant to conventional oil and gas operations, operators shall....
 - 00.02 Pursuant to unconventional oil and gas operations, operators shall....

- 00.0 Title
 - 01.01 This section applies to both conventional and unconventional oil and gas operations.

This creates clear language and understanding for all stakeholders, the Department, the regulated community, and the public. It is also helpful as there are some operators with both conventional and unconventional operations. It is much clearer to have all regulations in the same format and in the same document. (660a)

Response: As part of this rulemaking, in response to comments and recent legislation (the Act of July 10, 2014 (P.L. 1053, No. 126)), the Department split Chapter 78 into two separate Chapters – one for conventional oil and gas wells (Chapter 78) and the other for unconventional wells (Chapter 78a). The purpose of this amendment to the final rulemaking was to clarify the different requirements for conventional and unconventional wells. The Department believes that having two completely separate regulatory Chapters should serve to eliminate any confusion about what requirements apply to conventional and unconventional wells. In addition, having separate Chapters allows the Department to craft regulations to match the environmental risks posed by each segment of the industry (compare, for example, section 78.56 and section 78a.56, which contain significantly different requirements for temporary storage at conventional and unconventional well sites, respectively). See response to comment 818.

864. Comment: 78.56(a)(6) – Consideration must be given to locking access lids to tanks. During normal well production, the well is blown to the tank and pressure must be released through the access lids on some wells. If this is shut and locked, the tank can explode due to the increased pressure.

Suggested Regulatory Language:

(6) Unless an individual is present at the well site or the well is not in production, operators shall equip all tank valves and access lids to substances under this section with reasonable measures to discourage unauthorized access by third parties such as locks, open end plugs, removable handles, retractable ladders or other measures that discourage access by third parties. Tanks

storing freshwater, fire prevention materials and spill response kits are excluded from the requirements of this paragraph. (411, 1153)

Response: See response to comment 818. Section 78a.56(a)(6) allows for alternatives to tank lid locks, specifically it allows measures other than those listed to be utilized to prevent access by third parties. Access lids that are not designed to be operated as pressure relief valves should not be operated as pressure relief valves.

865. Comment: In § 78.56(a)(6), since no lock, plug, handle, etc. can absolutely ensure “prevention” of unauthorized acts by third parties or damage by wildlife, We recommend replacing “prevent” with “discourage”.

Suggested amendatory language:

(6) Unless an individual is continuously present at the well site, operators shall equip all tank valves and access lids to substances under this section with reasonable measures to discourage unauthorized access by third parties such as locks, open end plugs, removable handles, retractable ladders or other measures that discourages access by third parties. Tanks storing freshwater, fire prevention materials and spill response kits are excluded from the requirements of this paragraph. (1137, 1174)

Response: See response to 1217.

866. Comment: **78.56(a)(6):** As previously referenced in our general comments about the drawbacks of overly prescriptive language, we suggest that the phrase “such as locks, open end plugs, removable handles, retractable ladders or other measures that prevent access by third parties” be stricken. The requirement that operators take reasonable measures to prevent third party access provides clear direction while allowing operators flexibility to determine the best protections for their specific circumstances. (1071)

Response: See response to comment 818. Section 78a.56(a)(6) allows for alternatives to tank lid locks, specifically it allows measures other than those listed to be utilized to prevent access by third parties.

867. Comment: **78.56(a)(6) and 78.57(g)** – Commentator requests that the Rule provide for the need to vent or partially access temporary storage for other general safety management requirements and consider the differences between key locks and spring-loaded thief hatches where appropriate in defining what constitutes “reasonable measures” to prevent unauthorized third-party access to support the industry in achieving compliance. The Board could make the language more complete by defining what constitutes “reasonable measures” as some storage requires the option of partial opening for venting in the event the tank becomes pressurized, such as with produced water tanks. The Board should amend the provisions to allow for such access. (1085)

Response: The Department believes that the language is sufficiently flexible to address the concerns raised by the commentator.

868. Comment: The regulation **78.56(a)(6)** which talks about securing our tanks from third party access has no environmental benefits. There are around 150,000 tanks used in the conventional industry. There is no history of problems. To equip 150,000 tanks with secure lids and valves would be quite a dangerous undertaking. They contain an explosive material. We would have to empty the tank and

then fill it with water. Even then there is always a possibility for a problem to happen. Then we would have to haul the water that we used to the brine plant because now according to the DEP it would be contaminated. That in itself is another added cost. Securing tanks with locks doesn't do much as they can be cut very easily. Locking the doors on your home ever; day doesn't keep people from breaking in. Just ask the people from Bradford. This is just another burdensome regulation that will do more harm than good. Regulation 78.56 Pits. The environmentalists are calling for no more pits because they say our wastes are hazardous. The Environmental Protection Agency says it is not a hazardous substance. The environmentalist say there are studies that say there may be harmful health effects. They can talk about studies all they want, but there is no proof. There are 26,000 people working directly in the conventional oil and gas industry. 26,000 people working directly with this material on a daily basis. Not one of us are sick because of it. (863c)

Response: See response to comment 818.

- 869.** Comment: 78.56(a)(7): As previously referenced in our general comments about the benefits of streamlined program, the Department should strike the language in 78.56(a)(7) which is duplicative of federal regulation. Operators are already required by the Occupational Safety and Health Administration's Hazard Communication Standard, which aligns to the Globally Harmonized System of Classification and Labeling of Chemicals (GHS) Standard, and requires operators to provide hazard information by putting labels on containers and preparing safety data sheets. (1071)

Response: It is appropriate to include this health and safety provision in the rulemaking.

- 870.** Comment: The commentator recommends the removal of unnecessarily prescriptive language in § 78.56(a)(7) by striking "such as flammable, corrosive, or similar warning."

Commentator suggests the following amendatory language:

(7) The operator of an unconventional well site shall display a sign on or near the tank or other approved storage structure identifying the contents, and as applicable, containing an appropriate warning of the contents. (1137, 1174)

Response: See response to comment 869.

- 871.** Comment: **78.56(a)(7)** – An operator, whether it is a conventional or unconventional operator, should display a sign to provide such notice; however, this section should only be applied to operations after the regulations take effect and should not be made retroactive. The signs only need to be for contents such as flammable, corrosive or similar warnings that would be needed for emergency responders.

Suggested Regulatory Language:

(7) The operator of a well site shall display a sign on or near the tank or other approved storage structure identifying the contents, if the contents warrant identification for emergency responders such as flammable, corrosive or a similar warning. This section shall not be applied to existing well sites. (1153)

Response: Existing tanks or other approved storage structures should already be labeled in accordance with federal safety standards.

- 872.** Comment: **78.56(a)(8)** – The renumbering proposed below, combined with the proposed deletion of the phrase "and comply with the following" in (8) above, would have the effect of proposed

paragraphs (9) through (16) applying to all pits, including those containing topohole water, fresh water, and uncontaminated drill cuttings. Consistent with the current construct in existing Subsection 78.56(a)(4), We recommend retaining the suggested language below:

Suggested Language: (8) A pit, tank, or other approved storage structure that contains drill cuttings from below the casing seat or fluids other than topohole water, fresh water and uncontaminated drill cuttings shall be impermeable, and comply with (9) - (16) of this subsection. (1137, 1174)

Response: The Department disagrees with the suggested amendments. The requirements in paragraphs (8) through (14) of § 78.56 are appropriate for pit construction and operation regardless of the materials stored in the pit.

873. Comment: **78.56(a)(8)** – Given the unknown hazards of drill cuttings, fracking fluid, wastewater, and emerging gases, omit the use of pits and storage structures unless closed; limit the use of pits to potable water; maintain parameters for liners and pit construction to optimize water containment. (1098)

Response: See response to comment 823.

874. Comment: **78.56(a)(8)** – The proposal changes the words “pollutional substances” and “wastes” to “regulated substances.” The use of this term is not sufficiently precise, as explained above in our comments concerning its definition, and results in an unreasonable and unlawful expansion of the scope of this section. So that the scope of this provision is not unreasonably and unlawfully broadened, the proposed term “regulated substances” should be rejected and the correct terms “pollutional substances” and “waste” should continue to be used.

Suggested Regulatory Language:

(8) A pit, tank, or other approved storage structure that contains drill cuttings from below the casing seat, wastes or fluids other than topohole water, fresh water and uncontaminated drill cuttings shall be impermeable. (1153)

Response: See response to comment 817.

875. Comment: Site plans should be certified by a licensed professional. Under section **78.56(a)(9)**, site specific design plans and specifications for each of the temporary storage structures should be submitted to the Department for approval and should be signed and sealed by a professional engineer with certification that the system meets the requirements of all applicable state and federal laws and is protective of public health and the environment. (852a)

Response: To the extent that the commenter is referring to modular above ground storage facilities, §§ 78.56(a)(2)-(3) and 78a.56(a)(2)-(3) require both structural and siting approval for facilities greater than 20,000 gallons. To the extent that the commenter is referring to pits at conventional well sites or tanks, the permit by rule concept is appropriate given the design, construction and temporary nature of these structures.

876. Comment: **78.56(a)(9)** – Liners of the same type and quality required for the impoundments should be required to cover freeboards to minimize risk to the waters of the commonwealth. (997a, 1031)

Response: The Department agrees that liners are required to cover freeboard; no changes to the regulatory language are required. The Department disagrees that temporary pits require liners of the same type and quality of those required for impoundments.

877. Comment: The specification requires the liners to have a coefficient of permeability no greater than 1×10^{-10} and to be above a certain thickness (30 mils for secondary containment and 40 mils for primary containment). The DEP reserves the right to approve an equivalent “as protective as a 30 mil (or 40 mil) liner”. It is our opinion that this information is not precise. Different liners with the same thickness will have different properties. Organizations, such as the GRI (Geosynthetic Research Institute), have researched and developed basic geomembrane specifications to assure a specific level of manufacturing quality for geomembranes. Industries such as waste and mining have adopted these regulations as minimum requirements and still use them today. It is therefore our recommendation that the PA DEP Oil & Gas Regulations specifies the GRI-GM-13 or GRI-GM-17 as minimum requirement for the mechanical and physical properties. For example, article 78.56(a)(9)(ii) could read as follows: *“Liner must have physical, mechanical and endurance properties equal or better as a 30 mils GRI-GM- 13 or GRI-GM-17 liner. Approval may be granted...”*(166)

Response: The Department believes that the requirements for liner thickness are appropriate to ensure protection. The subsection allows for a liner to be approved if the manufacturer demonstrates that an alternative thickness is at least as protective as a 30 mil liner. A list of approved alternative liners shall be maintained on the Department’s web site.

878. Comment: Relying on the manufacturer’s recommendations for installation guidelines does not guarantee an impermeable liner. As impermeable as a material is, the impermeability of a liner is only as good as its weakest link and often, this link is the installation. As such, the International Association of Geosynthetic Installers (IAGI) has developed standard practices for the installation of geomembranes that will maximize the potential of impermeability. They also set standard practices for the quality control and quality assurance of the installation. It is therefore our recommendation that the DEP should use these standards and not refer to the manufacturer’s best practices as they might not all lead to an impermeable liner. For example, article 78.56(a)(9)(iv) could read as follows:

“Adjoining sections of liners shall be sealed together to prevent leakage in accordance with the IAGI installation guidelines. The integrity...”

In the same frame of mind, the IAGI installation guidelines also specify how repairs should be performed and therefore, any references to repairs should be:

“... as per IAGI Installation guidelines...”

Our above recommendations are based on past experiences. The specifications mentioned above have been proven and are still utilized by many organizations such as the US EPA for waste containment. Following these recommended specifications would ensure a quality in the material manufacturing as well as in the installation and repairs of the liners. (166)

Response: The Department acknowledges that proper installation of a geosynthetic liner is critical to ensure that the liner is impermeable and believes that installation in accordance with manufacturer’s recommendations is the most reasonable and appropriate requirement to include in this rulemaking.

879. Comment: § 78.56(9)(i) The language requiring “sufficient strength and thickness” must be restored. The following wording has been deleted in the current rulemaking: “... and with sufficient strength and thickness to maintain the integrity of the liner.” Deletion of this wording is simply indefensible. Does the Environmental Quality Board seriously intend to relieve well operators of responsibility for maintaining integrity of a pit liner? That is certainly how this reads to a layperson. Imposing the duty on a well operator of maintaining the integrity of its infrastructure is exactly what 25 PA Code

Chapter 78 is supposed to do. (869a)

Response: The provisions under § 78.56(a)(8)(i)–(iv) contain language that addresses liner strength, thickness and integrity.

880. Comment: 78.56(a)(9)(ii) – Pit liners at conventional wells are currently only required to be 20 mils thick and an exemption should be made for that under this section. (411)

Response: The subsections allow for a liner to be approved if the manufacturer demonstrates that an alternative thickness is at least as protective as a 30 mil liner.

881. Comment: 78.56(a)(9)(ii) – Commentator appreciates the Department’s willingness to review and approve liners one time and then have preapproved liners available for future use without additional review. That should be stated in the regulation.

Also, if previously acceptable 20 mil liners are no longer adequate, then the conventional well industry finds this objectionable as the associated increased costs of thicker liners will not necessarily translate into reduced environmental risk. Pits associated with conventional operations are small in size and generally open for a short amount of time. The 30 mil requisite is an excessive and inappropriate standard for conventional operators who land farm drill cuttings or perform service work on an existing producing well.

Suggested Regulatory Language:

(ii) For unconventional operators, liners must be at least 30 mils thick unless otherwise approved by the Department. Approval may be granted if the manufacturer demonstrates that the alternative thickness is at least as protective as a 30 mil liner. A list of approved alternative liners shall be maintained on the Department’s website. The Department shall set forth a procedure for suppliers of such liners to follow to obtain Department approval. For conventional operators the liner shall be at least 20 mils thick unless otherwise approved by the Department. (1153)

Response: See response to comment 823 regarding pits at unconventional well sites. See response to comment 880.

882. Comment: The 30 mil liner thickness required in Pennsylvania’s oil and gas regulations is anachronistic, particularly given the practices in some other states. For example, Michigan requires the use of a second liner to encapsulate the entire pit, not just its contents. Colorado specified that liners must be of sufficient thickness and length to withstand expansion, contraction and settling of the underlying earth and in some cases must be 60 mils thick. Utah regulations indicate the need for a minimum of 60 mil primary liners and 40 mil secondary liners. (853a)

Response: The Department believes that the requirements for liner thickness are appropriate to ensure protection. The subsection allows for a liner to be approved if the manufacturer demonstrates that an alternative thickness is at least as protective as a 30 mil liner. A list of approved alternative liners shall be maintained on the Department’s web site.

883. Comment: 78.56(a)(9)(iii) – The proposal changes the word “waste” to “regulated substance.” The use of this term is not sufficiently precise, as explained above in our comments concerning its definition, and results in an unreasonable and unlawful expansion of the scope of this section. So that the scope of this provision is not unreasonably and unlawfully broadened, the proposed term “regulated substances” should be rejected and the correct term “waste” should continue to be used.

Suggested Regulatory Language:

(iii)The liner shall be designed, constructed and maintained so that the physical and chemical characteristics of the liner are not adversely affected by the material stored therein and the liner is resistant to physical, chemical and other failure during transportation, handling, installation and use. Liner compatibility for waste shall satisfy ASTM Method D5747 Compatibility Test for Wastes and Membrane Liners or other compatibility test approved by the Department for the duration the pit or other temporary storage structure is used. (1153)

Response: See response to comment 817.

884. Comment: 78.56(a)(9)(iv) – What comprises an integrity test of liner sections? (411)

Response: Seam testing should be conducted in accordance with a quality assurance and quality control plan. Operators should consult with the manufacturer of the liner to determine appropriate testing protocols.

885. Comment: 78.56(a)(9)(iv) – It is suggested that language is added to allow for visual inspections of a liner as means to satisfy the liner integrity requirement. (124a, 861, 1057)

Response: Visual inspections are not an acceptable means to ensure the liner integrity requirement is met.

886. Comment: 78.56(a)(9)(iv): As previously referenced in our general comments about the drawbacks of overly prescriptive language, it is our suggestion that the entire prescriptive pit section be stricken and replaced with a specification that pits should be lined with impervious liners with bottom above the measured groundwater table . That requirement provides clear direction while allowing operators flexibility to determine the best impermeable liner for their site specific circumstances. In addition, the language in the proposed Section 78.56(a)(9)(iv) requiring that all liner seams be tested and available to the Department upon request would be challenging to implement. (1071)

Response: The Department believes that the rulemaking is appropriate to protect waters of the Commonwealth from pollution due to pits leaking regulated substances. Testing of liner seams is an appropriate practice to ensure the quality of the liner installation.

887. Comment: 78.56(a)(9)(v)(16) – Extend notification for installation of pit liners to 10 business days; limit certification of pit compliance to employees of the Department. (1098)

Response: Three business days notification is more practical for industry and the Department. The subsection also allows a certification process by a licensed engineer or geologist in lieu of 3 day notification to the Department.

888. Comment: 78.56(a)(9) provides technical requirements related to pit liners. Commentators suggest amending this provision to make liner thickness dependent upon pit depth, require certification of pit liners, and require liners to cover freeboard. Other commentators state that visual inspections of liner seams should suffice. We ask EQB to explain in the Preamble and RAF of the final-form regulation how the technical requirements for pit liners in this section reasonably and adequately balance protection of the public health and natural resources against the fiscal impact on the oil and gas industry. (1099)

Response: The Department has explained in the Preamble and RAF of the final form regulation how the technical requirements for pit liners in this section reasonably and adequately balance protection of public health and natural resources against the fiscal impact on the oil and gas industry.

889. Comment: Liner thickness for any pits should be increased depending on depth and certifications should be required. Section 78.56(a)(9) provides that pits must be lined with 30 mil thick synthetic liner. Pits with anticipated liquid depths greater than 10 feet should have a liner material at least a 40 mils thick and certification from the manufacturer that pinhole frequency for the plastic will not cause a coefficient of permeability greater than 1×10^{-10} cm/sec, or excessive leakage beyond the allowable leakage specified in the regulation. (852a)

Response: The standards are appropriate to provide adequate protection from pollution.

890. Comment: Alternative systems should be certified by a licensed professional. Section 78.56(a)(9) authorizes an alternative liner system. The proposed alternative liner system should be certified by a licensed professional engineer with a narrative description of how the alternative system is equal to or greater than the performance standards in the regulations. (852a)

Response: It is not appropriate licensing in the regulation as there may be some instances in which certification by a licensed professional are unnecessary. The Department will address this issue in guidance implementing these provisions.

891. Comment: 78.56(a)(10): Pits with 2:1 slopes are both impractical and unnecessary for conventional well operations. Pit collapse at conventional sites has not been a problem, largely because those pits are small in size and generally open for a short period of time. The average size of a pit for conventional oil wells is: 15' x 35' x 6' (width x length x depth). This requirement would increase that size from 525 square feet to 2100 square feet or more - an increase of 400% leading to an increase in the size of the well pad. While this may be a reasonable safeguard for long-term pits on multi-well unconventional pads, it represents an unnecessary expense to conventional operators whose pits are significantly smaller and are open only a fraction of the time by comparison. This increase would cause added expenses to the operator requiring:

- 1.) A larger pit liner
- 2.) Construction expenses
- 3.) Additional timber damage
- 4.) Land-use agreement changes
- 5.) Restoration costs

By mandating 2:1 interior slopes, pit size will need to increase significantly in order to accommodate sufficient volume. Therefore, bigger pits will translate into larger locations, increased environmental damage, and additional costs to the operator. These pits are temporary in nature and should be exempt if they are less than 1/8 an acre in size and are in use for 90 days or less. This paragraph (10) details the construction parameters for pits mandating a 2 to 1 horizontal to vertical slope for the interior sides. While this may be a reasonable safeguard for long-term pits on multi-well unconventional pads, it is an unnecessary expense to conventional operators. It will require a much larger footprint of disturbed area and is not practical in confined drilling areas. Bigger pits will translate into larger locations, increased environmental damage, and additional costs to the operator. *Please refer to the attached illustration showing how 2:1 interior pit slopes translate into

larger pits, larger pads, increased costs, and potentially more environmental damage. (PULL ILLUSTRATION)

Suggested Regulatory Language:

(10) The pit shall be constructed so that the liner sub-base is smooth, uniform and free from debris, rock and other material that may puncture, tear, cut or otherwise cause the liner to fail. The pit must be structurally sound. For pits associated with unconventional well development or that will remain open for more than 30 days, the interior slopes of the pit with a foot print area of 1/5 acre or more must have a slope no steeper than 2 horizontal to 1 vertical. The liner sub-base and subgrade shall be capable of bearing the weight of the material above the liner without settling that may affect the integrity of the liner. If the pit bottom or sides consist of rock, shale or other materials that may cause the liner to fail, a subbase of at least 6 inches of soil, sand or smooth gravel, or sufficient amount of an equivalent material, shall be installed over the area as the sub-base for the liner, unless otherwise approved by the Department. (1153)

Response: The Department disagrees that the requirements will result in an increase of the aerial extent of on-site pits to the extent indicated in the comment. The Department has revised§ 78.56(a) to remove minimum slope requirements for a pit with a footprint less than 3,000 ft² or volume less than 125,000 gallons of capacity. For pits with greater aerial extent or capacity, operators must obtain authorization from the Department prior to construction. The Department believes that this revision addresses the commenter's concerns.

892. Comment: 78.56(a)(10) implements a new requirement for pit slopes which commentators say is impractical and unnecessary. Commentators state that the new requirement would dramatically increase the size of the pits, thereby increasing the environmental impact. We ask EQB to explain in the Preamble and RAF of the final-form regulation the need for this change. We also ask EQB how the slope requirements in this section reasonably and adequately balance protection of the public health and natural resources against the fiscal impact on the oil and gas industry. (1099)

Response: The Department has revised§ 78.56(a) to remove minimum slope requirements for a pit with a footprint less than 3,000 ft² or volume less than 125,000 gallons of capacity. For pits with greater aerial extent or capacity, operators must obtain authorization from the Department prior to construction. The Department believes that the revised requirements reasonably and adequately balance protection of the public health and natural resources against the fiscal impact on the oil and gas industry.

893. Comment: With regards to pit side slopes of 2: 1 (H:V), the surface area disturbance necessary to meet this proposed requirement will increase the pit size by at least a factor of ten up to a factor of 100. No specific incidents or justification for this proposed regulation have been referenced by PADEP. Implementation of this regulation will be a detriment to the environment since it will require further earth disturbance with no clear benefit. I recommend removing this requirement or imposing an exemption for pits 1,000 BBL or less.(450)

Response: See response to comment 891.

894. Comment: The proposed 78.56(a)(10) states all pits must have a maximum side slope of 2:1. At my job, it is imperative that I work directly with land owners and their reasonable requests to minimize disturbance related to our activity. This proposed requirement is a slap in the face to any land owner who will have oil & gas activity on their property. It essentially takes away our ability to work with landowners to make sure they are satisfied with the disturbance they are faced with. (613)

Response: See response to comment 891.

895. Comment: The proposed language specifying a 2:1 slope for storage pits should be revised to allow for vertical sides in small pits. Pits at conventional well sites are used for a shorter duration and a steeper slope allowance will result in less surface disturbance without any greater likelihood of ground contamination. (1115a, 1118, 1120, 1176-1188)

Response: See response to comment 891.

896. Comment: Paragraph 10 details the construction parameters for pits mandating a 2:1 horizontal to vertical slope for the interior sides. While this may be a reasonable safeguard for long-term pits on multi-well, unconventional pads, this, too, represents not only an unnecessary expense to conventional operators, but it will require a much larger footprint of disturbed area. This consequential environmental impact will not be a popular reality with the surface owners who have historically appreciated our willingness to work in tight quarters. (12, 623)

Response: See response to comment 891.

897. Comment: 78.56(a)(11) - In addition to giving this task to a trained professional, they must also research the specific soil of that terrain by accessing the soil maps at the court house for that location and also investigate other community resources that would be able to contribute to their research of that specific location such as a local conservation program. They must also document soil type, and soil characteristics such as drainage, permeability, potential for surface run off and potential changes during changing weather patterns. Once this data is collected and reviewed their information must be reviewed by the PA DEP, EPA (for possible future guideline data collection), and should also be submitted to the local court houses for record keeping purposes. Their process of data collection should be documented and reviewed to ensure a complete investigation occurred, this should also be public information as well as the name of the person and entity that reviewed their study also. (189)

Response: The requirements for determining the seasonal high groundwater elevation is sufficient to ensure environmental protection.

898. Comment: Determine seasonal high water table over a 12-month period; hold operator accountable for findings given the implications of flooding.[78.56 (a) (9)(iii)(11)] (1098)

Response: Seasonal high groundwater conditions can be determined through observation of soil characteristics in the field by a soil scientist or other similarly qualified person. A 12 months observation period is not required.

899. Comment: 78.56(a)(11) – Determination of Seasonal High Groundwater Table (SHGT) should be done by an independent 3rd party. A requirement that waste protection infrastructure should be located at a “safe distance” above SHGT is fitting and proper, though many have questioned whether 20 inches is sufficient distance to be “safe”. Just as important as the actual measure of distance is the issue of who determines what the SHGT actually is. It is quite simply a conflict of interest for a well operator to be the party that determines this. The Environmental Quality Board must require that SHGT be determined by an independent certified professional, similar to the requirement that pre-drilling water tests be done by an independent certified laboratory (§ 78.52). (869a)

Response: The subsection requires the determination to be made by a qualified person. Operators will be held responsible to ensure that the requirements are met and to address and issues that may arise as a result of an improper determination.

900. Comment: The certification by a soil scientist, required under § 78.56(a)(11), that the pit bottom is at least 20 inches above the seasonal high groundwater table, be provided to DEP (not just made available) prior to placing material in the pit. (1157)

Response: See response to comment 823 regarding temporary pits at unconventional well sites.

901. Comment: 78.56(a)(11) – This section, as written is appropriate. The determination of the seasonal high water table can be difficult and includes many variables such as the time of year the determination is made as well as recent precipitation. An example that has been experienced is a geologist or soil scientist with education and qualifications in hydrogeology and hydric soils has made a scientific determination of the seasonal high water table at a drill pit on day 1. On day 2, the Department Water Quality Specialist makes a site inspection prior to the pit liner being installed and due to the precipitation during day 2 the Water Quality Specialist makes the determination that the operator has intercepted the seasonal high groundwater table based on visual standing water in the base of the pit without any scientific reasoning. The scientific determination should be the deciding factor.

A suggestion is the re-writing of the definition of *seasonal high groundwater table* in section 78.1 for clarification and to make a clear separation of groundwater and precipitation accumulated in a pit prior to the liner being installed. A further suggestion is to use the term *seasonal high saturation* instead of *seasonal high groundwater table* as the inclusion of the term *groundwater table* can be confusing. (411)

Response: The subsection accommodates the hypothetical situation presented in the comment by requiring the operator to provide the name, qualifications and statement of the individual making the determination and the basis for the determination to be provided to the Department upon request. The Department will review the documentation to ensure that an appropriate determination has been made.

902. Comment: 78.56(a)(11) – Operators, their consultants and Department field staff sometimes disagree on the distance between the pit bottom and seasonal high groundwater table, often when there is accumulated precipitation in the pit before the liner is installed. An accepted agronomic definition of “seasonal high groundwater table” is the endosaturation. See Keys to Soil Taxonomy (11th ed. 2010), U.S. Department of Agriculture and National Resources Conservation Service, pg. 24. The seasonal high groundwater table should not be based on episaturated conditions. Episaturated soil is saturated soil in a horizon that overlies an unsaturated horizon, where the unsaturated horizon lies within a depth of 2 meters from the surface, i.e., a perched water table. Episaturation is associated with the presence of perched water tables through Pennsylvania that may be as shallow as 12 inches that are not associated with wetland areas. Without using the more precise definition of endosaturation, a significant percentage of pits will have to be constructed to grade, which may eliminate or the option of cutting pits into grades and/or require that pits be placed on fill. This may not be practical in some circumstances and may disturb more surface area and have a greater environmental impact than necessary.

The definition of “seasonal high groundwater table” in section 78.1 should be revised for clarification, to make a clear separation between groundwater and precipitation accumulated or

beneath in a pit prior to the liner being installed. This determination is not intended to require a high degree of expertise. Geologists and wetlands biologists with a good soil background should be able to make this determination without a problem.

Revise the definition of “Seasonal high groundwater table” in section 78.1 as follows: “The soil is saturated with water in all layers from the upper boundary of saturation to a depth of 200 cm or more from the mineral soil surface.” (1153)

Response: The definition and implementation of the seasonal high groundwater table are appropriate. Elevated water tables within 20 inches of the bottom of the pit may impact structural integrity of the pit or cause intermingling of groundwater and the regulated substances contained within the pit.

- 903.** Comment: 78.56(a)(11) – The minimum separation distance of 20 inches between oil and gas pits and impoundments is inexcusably short and gambles with water quality in a state with many shallow water resources. It is notable that other states require greater separation such as 25 feet in New Mexico, 5 feet in Louisiana and 4 feet in Michigan. (853a)

Response: The 20 inch separation requirement allows for a physical barrier between the seasonal high groundwater table and the bottom of the impoundment to prevent mixing of impounded water and groundwater and to ensure structural integrity of the impoundment. Remediation of potential leaks from pits by the soil is not expected due to the nature of the waste generally contained in temporary pits.

- 904.** Comment: Further proposals under temporary storage are suggesting liner compatibility testing, liner seam testing, inspection requirements, notification to the Department prior to pit liner installation and a demonstration that the pit bottom is 20 inches above the seasonal high water table. In order to test liner compatibility, if we want true and transparent results, every single chemical used at that site must be known. Every single chemical going into that pit must have research data showing what reactions they will have with one another. If the gas and oil company counters with the argument that these chemicals are proprietary ingredients they shall not be granted any type of permit or allowance for a storage pit as this has great potential to cause harm to ground water, surface water, air quality, and human health. We can do things as long as they are legal, but also as long as they do not negatively impact anyone or anything else. If we choose to practice something that does have potential to harm, we face moral, ethical, and legal repercussions, as should these companies.

The proposals also state:

“[(4)] (8) A pit [or], tank or other approved storage structure that contains drill cuttings from below the casing seat, [pollutional] regulated substances[, wastes] or fluids other than tophole water, fresh water and uncontaminated drill cuttings shall be impermeable [and comply with the following:].” “(iii) The liner shall be designed, constructed and maintained so that the physical and chemical characteristics of the liner are not adversely affected by the [waste] regulated substance stored therein and the liner is resistant to physical, chemical and other failure during transportation, handling, installation and use. Liner compatibility must satisfy ASTM Method D5747, Compatibility Test for Wastes and Membrane Liners, or other compatibility test approved by the Department for the duration the pit or other temporary storage structure is used.”

The EPA document titled “METHOD 9090A COMPATIBILITY TEST FOR WASTES AND MEMBRANE LINERS” supplies information and instructions for testing liners. Each well contains several different mixtures of known chemicals and chemicals which are regarded as proprietary ingredients. In order for the gas and oil companies to use these liners they must attest

to the fact that each liner will indeed hold up to these regulations set forth by the EPA. If some of the chemicals are proprietary data and are unknown it would be interesting to see how the lawyers, whom submit information to and from the DEP to obtain permitting, can attest that all of the information in their packets are true and accurate. I propose that the PA DEP work with the EPA in investigating the validity of their statements as well as investigate whether there is information that these liners have been tested with multiple combinations of the chemicals they use and that the liners are specific to each and every well site. If the Department ends up choosing to continue to allow liner use in pits then I also propose that the thickness of these liners are increased as well as ensuring that the liners are individualized and specific to each site. It is also interesting to note that this particular EPA document has not been revised since 1992. (189)

Response: The requirements for ensuring liner compatibility are appropriate and ensure environmental protection.

- 905.** Comment: In regards to pits being 20 inches above the seasonal high water table, these pits should not be near the seasonal high water table. The potential chemicals in these pits pose risk to contaminating the seasonal high water table. One must also consider the fact that each region consists of different soil types which affect drainage, permeability, and run off. For example, Mercer County, Pennsylvania, consists of mainly 4 different soil types, “The Ravenna-Frenchtown association is the most extensive in the county, making up about 57 percent of the total landscape. It is a somewhat poorly drained to poorly drained soil. Its character leads to a high water table and restricted permeability which can limit its use. Next, is the Chenango-Braceville-Halsey association, which is well drained to poorly well drained. Its limitations include seasonal high water table, slowly or highly permeable, and drought. This association makes up approximately 20 percent of the county’s soils. Third, is the Canfield-Ravenna association. It consists of moderately well drained and somewhat poorly drained soils. Its limitations include a slowly permeable subsoil and a seasonal high water table. This association covers nearly 17 percent of the county. Finally, is the Wayland, coarse variant-Papakating-Red Hook association which is very poorly drained to moderately well drained soils underlain by alluvium. Slow permeability, seasonal wetness, and likelihood of flooding are major limitations of these soils.(4)” When an operator advises the DEP that they have checked the location of the seasonal high water table they must submit proof of what materials were reviewed to determine this, along with copies of those materials. Prior to an operator receiving a permit for a pit, this information must be reviewed by an independent professional who specializes in geology and hydrogeology. Of course, the concerned Citizens of the State of Pennsylvania, including myself, do not feel comfortable with pits that contain any type of chemical being anywhere near the ground especially when a “liner” is the only barrier. The seasonal high water table also fluctuates with weather changes and we do not have the capabilities to predict exactly what type of weather will affect us in the future. Meteorologists, and people who have interests in the land and farming, can hypothesize what the weather will be like in the coming year, but it is rarely if ever exact. (189)

Response: See response to comment 903. The subsection requires the operator to provide the name, qualifications and statement of the individual making the determination and the basis for the determination to be provided to the Department upon request. The Department will review the documentation to ensure that an appropriate determination has been made.

- 906.** Comment: The challenge that operators face in dealing with growing volumes of solid and liquid waste should not be an excuse to allow dangerous substances to harm health and the environment. The oil and gas industry alone enjoys a special exemption to the U.S. Resource Recovery and Conservation Act (RCRA), which regulates the storage, transport, and disposal of hazardous materials. Pennsylvania should choose to follow the protective standards of RCRA. At the very least, DEP’s proposed Chapter 78 changes must address the risks posed by drilling waste; as

currently proposed, they simply do not.

Many spills and leaks occur at waste pits and impoundments. Production pits and any open impoundments, tanks, and modular structures should be prohibited for the temporary containment of regulated substances and production fluids (such as wastewater, drill cuttings, gels, and used frac sand).

Only covered, closed-loop systems should be allowed for this purpose. These must have consistent and reliable leak detection, secondary containment, groundwater monitoring, and emission prevention systems.

The requirement that pits and impoundments be only 20 inches above the seasonal high groundwater table gambles with local water quality in a state with many shallow water sources. If pits are allowed, the separation distance must be vastly expanded; other states require far greater distances, such as 5 feet in Louisiana and 4 feet in Michigan. (853, 912, 926)

Response: See response to comment 823 regarding pits at unconventional well sites. The Department has incorporated by reference the federal definition of “hazardous waste” in 25 Pa. Code Chapter 261a. Any changes to that regulation are beyond the scope of this rule making. See response to comment 903 in regards to the 20 inch separation requirement.

907. Comment: Subsection 78.56(a)(13) states that an operator shall correct damages or imperfections (in the liner) before placing material in the pit, and shall maintain the pit until closure of the pit. We recommend adding language to this section that describes the monitoring and inspection requirements for the life of the pit, including the frequency by which the liner should be inspected and required methods for leak detection. (1157)

Response: The Department is not mandating inspection types and schedules as these facilities are typically only located on active well sites where operator personnel are present regularly while the facility is in operation. Operators are required to outline their monitoring and inspection requirements and frequency in site-specific PPC plans under 25 Pa. Code § 78.55 and 25 Pa. Code § 78a.55.

908. Comment: 78.56(a)(14) – Operators should be allowed to use or reuse pit contents if the liner is compromised instead of requiring the contents of the pit/tank/structure to be managed/disposed of as a residual waste.

Suggested Regulatory Language:

(14) If a liner becomes torn or otherwise loses its integrity, the pit or approved storage structure shall be managed to prevent the contents from leaking. If repair of the liner or construction of another temporary pit or approved storage structure is not practical or possible, the contents may be used or reused as permitted by law or shall be removed and disposed at an approved waste disposal facility or disposed on the well site in accordance with § 78.61, § 78.62 or § 78.63 (relating to disposal of residual waste—pits; and disposal of residual waste—land application). (1153)

Response: Pit contents must be managed appropriately and the subsection allows for that appropriate management.

909. Comment: § 78.56 (a)(14) - It is suggested that language is added to allow for the reuse and storage of liquids if the liner is compromised instead of requiring the contents of the pit/tank/structure to be managed/disposed as a residual waste. (861, 124a)

Response: See response to comment 908.

- 910.** Comment: 78.56(a)(14) – “...the [pit] contents shall be removed and disposed at an approved waste disposal facility or disposed on the well site in accordance with § 78.61, § 78.62 or § 78.63 (relating to disposal of [residual] solid waste—pits; and disposal of [residual] solid waste—land application).” -- It is suggested that language is added to allow for the reuse and storage of liquids if the liner is compromised instead of requiring the contents of the pit/tank/structure to be managed/disposed as a residual waste. (1057)

Response: See response to comment 908.

- 911.** Comment: 78.56(a)(14) – The subsection should not require disposal of pit liners or contents where those materials can be reused. The second sentence should be deleted. Suggested language: (14) If a liner becomes torn or otherwise loses its integrity, the pit or approved storage structure shall be managed to prevent the pit contents from leaking from the pit.(1137, 1174)

Response: See response to comment 908.

- 912.** Comment: 78.56(a)(11, 16-17) Pits – Unconventional Operations. - We have serious concerns over the use of pits with unconventional operations. It is our understanding, and it was noted in the February 20, 2014 Penn State Extension Webinar regarding the recently released production and waste reports, that the industry has largely moved away from this practice. For the few complacent operators, does it really seem the best move is to create more stringent regulations or rather, perhaps discontinue the use may be a better option? Why create more stringent operations for the few rather than discontinue and commence with above ground storage structures as the more responsible operators have done? Above ground storage structures are a superior choice with consideration to adequately protecting our water resources and knowing the damage that pits can create. Nearby residents need to be protected from second best operations when there are better, more community friendly, more environmentally friendly options available. Regulations serve the floor of requirement for some operators that are otherwise complacent. (660a)

Response: See response to comment 823.

- 913.** Comment: 78.56(a)(16) – The form showing the statement from the engineer or geologist should be produced and reviewed prior to establishment of this section. (411)

Response: See response to comment 823

- 914.** Comment: Currently a typical Dallas Energy well site consists of an area 60 feet by 100 feet (6,000 square feet). The pit used to contain fluids and sand that flow back during the well stimulation and completion process is 8 feet wide by 40 feet long by 8 feet deep disturbing an area of about 320 square feet. This size of pit fits within the confines of the typical well site and can be constructed using one excavator in a few hours depending on the soil conditions encountered. This type of pit is used for a short period of time and is usually filled-in shortly after the well is completed.

Implementation of § 78.56(a)(10), which requires the interior slopes of the pit must have a slope no steeper than 2 horizontal to 1 vertical, would require a pit with a top of 40 feet wide by 72 feet long for a pit with a bottom of 8 feet wide by 40 feet long resulting in earth disturbance of an area 9 times (2,880 square feet) that of pit with vertical sides. Construction of this style of pit would require use of both an excavator and bulldozer, take a minimum of 8 hours or more to construct

depending on the soil conditions encountered on the well site, result in a cost of 3 to 4 times that of a pit with vertical sides and require a increase in size of the well site to accommodate the larger pit size. (885)

Response: See response to comment 891.

- 915.** Comment: 78.56(a)(16): It is unclear why an operator would be asked to notify the Department before the installation of the pit liner as it does not add any environmental protection, but does add additional process burden on the operator and on the Department. We suggest striking the language or at a minimum, that the Department provides clear explanation of the benefit of this requirement that justifies the additional obligation for the operator. (1071)

Response : See response to comment 823

- 916.** Comment: Licensed professional engineers and not geologists should certify pit and liner compliance. Section 78.56 (a)(16) allows a geologist to certify pit design and compliance. A geologist does not have the experience or skills to certify pit and pit liner compliance for as built structures. As built certification should be done by a licensed professional engineer that observed the construction of the pit and pit liner. (852a)

Response: See response to comment 823. In accordance with the Pennsylvania Engineer, Land Surveyor And Geologist Registration Law it is considered unprofessional and inconsistent with honorable and dignified bearing for any professional engineer, professional land surveyor or professional geologist to attempt to practice in any field of engineering, land surveying or geology in which the registrant is not proficient. Accordingly, to the extent that a licensed professional geologist did not have the experience or skills to certify pit and pit liner compliance, but did so anyway, they would be in violation of the Pennsylvania Engineer, Land Surveyor And Geologist Registration Law. It is reasonable for the Department to expect the regulated community to comply with the law when developing regulations.

- 917.** Comment: Notice to the Department. Section 78.56 (a)(16) should require that the Department receive notice prior to installation of the pit and pit liner, whether or not a certification is submitted after construction. In fact, post construction certification should be required for all pits and tanks with notations of any changes between proposed and as-built design plans and specifications. (852a)

Response: See response to comment 823.

- 918.** Comment: 78.56(a)(16) - We recommend that an appropriately trained professional can provide a statement that a pit and its liner have been built in compliance with this section. Requiring a statement from a licensed professional engineer or geologist imposes an unnecessarily strict, and potentially expensive, requirement. Suggested Language: (16) The unconventional well operator shall notify the Department at least 3 business days before the installation of the pit liner. This notice shall be submitted electronically to the Department through its website and include the date the liner will be installed. If the date of installation is extended, the operator shall re-notify the Department with the date of installation which does not need to be 3 business days in advance. Notice is not required if the appropriately trained professional that designed the well site submits a statement on forms provided by the Department certifying that the pit and the pit liner, as built, are compliant with this section. This certification shall be submitted within 10 business days of installation of the pit liner.(1137, 1174)

Response: See response to comment 823.

919. Comment: 78.56(d): To account for the dynamics of an operation like ours where with one rig move we drill and complete every well on a pad in sequence, we ask that this section should be clarified to read, “9 months after completion of the last permitted well.” Additionally this subsection should acknowledge that pits used for onsite disposal of drill cuttings or residual waste in accordance with 78.61 or 78.62 do not have to be removed and filled under this paragraph (d). (1071)

Response: See response to comment 1694.

920. Comment: All gas facilities including tanks, pits, wells, and compressor stations should have monitors designed and operated by a third party, functioning 24 hours a day, and recording findings that are directly available to the DEP and public. The gas industry should not be responsible for conducting this monitoring but should be financially responsible for payment of the implementation and conduction of that process. 78.56(a)(17): (938a)

Response: The Department disagrees that the scope of monitoring proposed in the comment is necessary to ensure environmental protection.

921. Comment: Temporary Storage - During the Oil & Gas Technical Advisory Board Workgroup meetings last year, industry suggested expanding temporary storage authorizations to facilitate reuse of wastewater for hydraulic fracturing. While this proposal was not incorporated into the Proposed Rulemaking, we understand it still may be included in revisions to the draft or in a subsequent agency policy. If the Department is considering establishing guidelines for expanded temporary storage, any regulation or policy at a minimum should include the following requirements:

- Storage should be limited to permitted and bonded well sites.
- The Department should receive notice after installation, but prior to use, to allow for inspection if deemed appropriate.
- Storage should be limited to closed loop or modular tank systems with robust containment and leak detection coupled with routine monthly inspection. Tanks should be inspected between uses.
- Storage should truly be temporary – limited to no more than twelve months, including any extensions granted by the Department.
- There should also be a maximum storage volume limit, based on case-by-case analysis of each individual site. (997a)

Response: The Department believes that the provisions of § 78.56 are appropriate for temporary storage of regulated substances at well sites. Temporary Storage is restricted to use during drilling, altering, completing, recompleting, servicing and plugging the well. Due to the concerns of the Oil and Gas Industry and the fact that the Department’s Bureau of Waste Management also addresses the storage of residual waste, the department has decided that the provisions for Centralized Tank Storage are no longer necessary.

922. Comment: It is very important that temporary storage be defined because under 78.57, brine and other well operation fluids have to be in a covered tank, unless these materials are in temporary storage, then they could be in uncovered pit. These pits can be used during the drilling process and up to 9 months after. That is a long time for any of the regulated substances and wastes to be exposed to the elements and environment. There is a risk of contamination even though there is to be a 2’ space between the surface and the top of the storage unit. Heavy rains, wind, snow pack, ice formation, evaporation of the stored substances and the risk of wildlife falling in, are all concerns

that can have a negative impact to the environment and the liner, by not having these storage units covered.

Diverting stormwater away from the pits should also include provisions that the diversion does not create an erosion and sediment issue and that it is not directed to a stream, watercourse or SWPZ. (1149)

Response: See response to comment 823. The Department believes that the provisions of § 78.56 are appropriate for temporary storage of regulated substances at conventional well sites. Temporary Storage is defined by use of these structures. Their use is restricted to use during drilling, altering, completing, recompleting, servicing and plugging the well. See response to comment 1694. Erosion and sediment control issues are covered under § 78.53.

923. Comment: On December 19 of 2013, the Pennsylvania Supreme Court invalidated significant portions of Act 13, notably to the extent that the absence of defined criteria in the law could lead to arbitrary decision making on the part of the DEP. In addition to the section noted above (Section 2), the DEP must also reevaluate the whole of the proposed regulation in order to better take into account the requirements of the Pennsylvania Supreme Court in “Robinson Township” regarding its decision-making process, and ensure that any proposed criteria is not unduly vague or missing necessary criteria. One good example of this is the lack of a definition for “temporary”.

In other example, under § 78.56 and § 78.57, the DEP’s decision-making process to approve “modular aboveground storages”, “underground or partially buried storage tanks” and/or “other practices other than those specified” is not defined nor regulated and could be viewed as unconstitutional. There are no guidelines for the approval process. As a consequence, there can be no evaluation of whether decisions are being made in a consistent manner, nor could a decision of the DEP be challenged if the decision-making process is not regulated by conditions or criteria. Additionally, under § 78.57, an operator could discharge the brine and other fluids on or into the ground or into the waters of this Commonwealth if approved by the Department, without any criteria for determining when such an instance is appropriate. Similarly, this provision could be view as unconstitutional - being too vague to comply with the Environmental Rights Amendment.

In order to comply with the state of the law, these provisions must be completed with a defined decision-making process to approve modular aboveground storages, buried storage tanks, other practices and/or the discharge of fluids into waters of the Commonwealth, with a right of appeal granted to residents and municipalities.

Finally, several provisions in the proposed regulations refer to the waiver that can be granted by the DEP from setback requirements from certain bodies of water (§ 78.56, § 78.57, § 78.60 and § 78.61). The decision-making process to grant a waiver has been declared unconstitutional by the PA Supreme Court in its decision “Robinson Township v. Commonwealth of Pennsylvania” on December 19, 2013.¹⁶ As a consequence, if the DEP does not take into account the requirements of the Court, the waivers granted could be easily challenged. An amendment of the present proposed legislation would be the opportunity to comply with the PA Supreme Court requirements. In order to take into account local concerns and to secure the permits that are granted by the DEP, the amendment should at least:

- Add the precise conditions that would lead the DEP to grant a waiver in order to avoid arbitrary decision.
- Grant a right of comment and a right of appeal for the residents, municipalities and storage operators.

- Reverse the burden of proving during an appeal from a DEP’s decision. (1161)

Response: “Temporary” is not defined in Chapter 78a, however this Chapter has also been developed under the authority of the Solid Waste Management Act (SWMA), 35 P.S. § §6018.101, et seq. In Section 103, “storage” is defined as “the containment of any waste on a temporary basis in such a manner as not to constitute disposal of such waste. It shall be presumed that the containment of any waste in excess of one year constitutes disposal. This presumption can be overcome by clear and convincing evidence to the contrary.” If the regulated substance that is being stored under § 78.56(a) is a waste, the criteria is found in the definition of “storage” under SWMA. For other regulated substances, the plain meaning definition of “temporary” in the dictionary may be used. Temporary is defined as lasting for only a limited period of time, not permanent. In the context of this section, it is also worth noting that the well site must be restored within 9 months of the completion of drilling, including removing all drilling supplies, equipment, primary containment and secondary containment not necessary for production or needed to safely operate the well.

Section 78.56(b) allows an operator to request through a form on the Department’s website the ability to use practices that provide equivalent or superior protection than those outlined in subsection (a), and therefore the procedure and evaluating criteria are included in § 78.56.

Section 78.57(a) specifically indicates that the operator may not discharge brine and other fluids on or into the ground or into the waters of this Commonwealth, except as allowed in Subchapter C, Environmental Protection – Performance Standards or otherwise approved by the Department. Therefore, the criteria are currently provided in Subchapter C and in accordance with each section that allows approval by the Department in accordance with standards that are the equivalent or offer superior protection than those provided.

Under § 7514(c) of the Environmental Hearing Board Act, 35 P.S. § 7514(c), no action of the Department adversely affecting a person shall be final as to that person until the person has had the opportunity to appeal the action to the Board in accordance with the Board’s regulatory procedures. If a person has not perfected an appeal in accordance with the regulations of the Board, the Department’s action shall be final as to the person.

The ability of the Department to waive setbacks for certain water bodies has been deleted from the final-form rulemaking.

The Department believes the revisions to Chapters 78 and 78a are consistent with the Constitution and applicable statutes, and provide appropriate protections for public health and safety.

- 924. Comment: We call on DEP to completely ban the use all pits for the storage of wastewater, drill cuttings, residual waste, and other contaminated substances in these proposed regulations – whether permanent or temporary holding ponds. Instead, DEP should be ensuring that produced wastewater, flowback, and other contaminated fluids are stored in closed loop systems, with a secondary containment, and a leak detection system, in accordance with best industry standards. This must happen without exceptions in order to better protect our health and out environment. Mounting violations, and the potential for water and air pollution have already led some companies to transition away from pits and standardize the use of closed loop systems which utilize tanks to store wastewater. Despite these best industry practices that should have inspired the DEP while drafting the bill, the proposed regulation unfortunately currently does not prohibit the storage of wastewater in open pits. (1139, 1160, 1161)**

Response: See response to comment 823.

925. Comment: In all instances, any impoundment or storage pits required to have a liner, whether deemed “temporary” or not, and whether it is located on a well pad site or off a well pad site as part of a secondary or centralized storage area, should be required to be drained and liner inspected on an annual basis. In lieu of annual draining and liner inspection, a leak detection system should be installed between primary and secondary liners. (997a)

Response: See response to comment 823 regarding temporary pits at unconventional well sites. See response to comment 907 in regards to temporary pit inspections.

926. Comment § 78.56 Temporary Storage - Suggested amendatory language:

(a) Except as provided in §§ 78.60(b) and 78.61(b) (relating to discharge requirements; and disposal of drill cuttings), the operator shall contain substances generated from and used for the drilling, altering, completing, recompleting, servicing and plugging the well, including brines, drill cuttings, drilling muds, oils, stimulation fluids, well treatment and servicing fluids, plugging and drilling fluids other than gases in a pit, tank or series of pits and tanks or other approved storage structures. The operator shall install or construct and maintain the pit, tank or series of pits and tanks or other approved storage structures in accordance with the following requirements:

(1) The pit, tank, series of pits and tanks or other approved storage structure shall be constructed and maintained with sufficient capacity to contain substances which are used or produced during drilling, altering, completing, recompleting, servicing and plugging the well.

(2) Modular aboveground storage structures that are assembled on site may not be utilized to store substances resulting from the drilling, altering, completing, recompleting, servicing and plugging the well without Department approval. The Department shall maintain a list of approved modular storage structures on its website. The owner or operator shall notify the Department at least 3 business days before the beginning of construction of these storage structures. The notice shall be submitted electronically to the Department through its website and include the date the storage structure installation will begin. If the date of installation is extended, the operator shall re-notify the Department with the date that the installation will begin, which does not need to be 3 business days in advance.

(3) A pit shall be designed, constructed and maintained so that at least 2 feet of freeboard remain at all times. If open tanks or open storage structures are used, the tanks and storage structures shall be maintained so that at least 2 feet of freeboard remain at all times unless the tank or storage structure is provided with an overflow system to a standby tank or pit with sufficient volume to contain all excess fluid. If an open standby tank or open standby storage structure is used, it shall be maintained with 2 feet of freeboard. If this subsection is violated, the operator immediately shall take the necessary measures to ensure the structural stability of the pit, or tank or other storage structure, prevent spills and restore the 2 feet of freeboard.

..*

(5) For unconventional well sites, unless an individual is continuously present at the well site, a fence or fences shall completely surround all pits to discourage unauthorized acts of third parties and damage caused by wildlife.

(6) Unless an individual is continuously present at the well site, operators shall equip all tank

valves and access lids to substances under this section with reasonable measures to discourage unauthorized access by third parties such as locks, open end plugs, removable handles, retractable ladders or other measures that discourages access by third parties. Tanks storing freshwater, fire prevention materials and spill response kits are excluded from the requirements of this paragraph.

..*

(8) A pit, tank, or other approved storage structure that contains drill cuttings from below the casing seat or fluids other than tophole water, fresh water and uncontaminated drill cuttings shall be impermeable, and comply with (9) – (16) of this subsection.

..*

(14) If a liner becomes torn or otherwise loses its integrity, the pit or approved storage structure shall be managed to prevent the [pit] contents from leaking [from the pit]. (1147)

Response: See response to comment 817 regarding the definition of regulated substances.

927. Comment: We believe that the Department should include technical standards for closed loop systems in guidance or in § 78.56, and other places where appropriate. Many operators are already implementing this management practice. The Department should encourage and enforce the use of closed loop systems where conditions merit and where it will result in improved environmental performance and risk reduction. Technical standards will be important to ensuring these systems perform as intended. (997a)

Response: See response to comment 823.

928. Comment: Sections 78.56 and 78.57, as written, are conflicting and contradictory. Section § 78.57 (Control, storage and disposal of production fluids), states that open top structures shall not be used to store brine and other fluids produced during operation of the well. However, § 78.57 (b) also provides that the operator may not use a pit for storage of fluids or brine, with the exception of temporary storage, without adding further information. This provision is then undermined by § 78.56, which clearly allows open top temporary storages, without adding any definition of “temporary”. There is no clear indication whether it is § 78.56 or § 78.57 that will be applicable in a given situation.

Furthermore, there is no definition of ‘temporary storage’ in the regulations. In the webinar on January 3rd, 2014, a DEP staffer suggested a definition by stating that stored wastewater should be removed at the end of the drilling operation – however this is not outlined in the proposed regulations. This however illustrates the point that the DEP is not in fact banning the use of open air waste pits. As a drilling operation can last for an extended or undetermined period of time, the proposed legislation concretely does not halt the use of permanent open storage structure. In addition, this definition would imply that some storages containing waste that are not “temporary” should not be removed at the end of the operations.

Finally, these provisions also allow buried storage in certain circumstances. Buried pits can result in groundwater and other pollution, and should be prohibited. (1161, 1166)

Response: Under § 78.56(a)(1) use of pits for temporary storage is restricted to the following: drilling, altering, completing, recompleting, servicing and plugging the well. Subsection 78.56(d) requires pits to be removed within 9 months of completion of drilling. Pits used

during servicing, plugging and recompleting the well shall be removed or filled within 90 calendar days of construction.

929. Comment: **78.56** – The proposed amendments fail to include a definition of what constitutes temporary. Subsection (d) requires an owner or operator to remove or fill a temporary pit within 9 months of completion of drilling, or in accordance with an extension granted by DEP. Because there is no timeframe by which all the wells permitted for a particular well pad must be drilled, the “temporary” pit that was constructed to service that well pad could exist for many years, becoming more of a permanent fixture in the landscape. (1157, 1166)

Response: See response to comment 928.

930. Comment: We also recommend that the operator be required to submit documentation to the DEP, describing methods used to divert stormwater away from the pit, at the same time as the certification from the soil scientist is submitted. This will help to ensure that stormwater controls are in place for the pit, before any material is placed therein. (1157)

Response: Diversion of stormwater is a simple task that can be identified and corrected after construction and does not require review by the Department. In addition, erosion and sediment control issues are covered under §78.53.

931. Comment: Pits and Liners - Section 78.56 has intermittent references to unconventional operations blurring the lines of applicability for conventional operators. 9(ii) mandates that all pit liners have a minimum thickness of 30 mils. While this may be a reasonable safeguard for long-term pits on multi-well, unconventional pads, it represents an unnecessary expense and inconvenience to conventional operators whose pits are significantly smaller and are open only a fraction of the time by comparison. It can be understood that a conventional operator use a 30 mil liner in pits that they intend to encapsulate, but in situations where they intend to landfarm drill cuttings or are performing service work to an existing, producing well, the 30 mil requisite is an inappropriate standard. (12, 263)

Response: See response to comment 2627 regarding the bifurcation of the regulations. See response to comment 823 regarding temporary pits at unconventional well sites. See response to comment 880 regarding minimum liner thickness for temporary pits. The Department has documented numerous pit liner tears and other failures and believes that use of 30 mil liner is appropriate to reduce the number of liner failures at well sites.

932. Comment: Fluids related to wells should be contained in man-made facilities that prevent these fluids from contaminating groundwater (78.1, 78.56, definitions of “pit”, etc). The allowance of “natural depressions” presents the possibility of liquid being stored in holes that are insufficient protected from leakage.

Requirements for liners for containment facilities should be increased and applied uniformly. Requirements specified in 78.56 for liners are not applied consistently in other sections, such as 78.56(a)(8)-(19). Specified distances between the bottoms of storage pits and seasonal high groundwater tables are insufficient. Instead of 20”, these distances should be at least 4-5 feet. (153)

Response: Liners are required for all pits containing regulated substances. See response to comment 903 regarding the seasonal high groundwater separation requirement.

933. Comment: All fluids related to oil and gas development should be contained in engineered facilities,

not “natural depressions.” (Section 78.1, definition of “freshwater impoundment” and “pit,” Section 78.56) (19, 21, 23, 26, 55, 165, 180, 192, 391, 429a, 637, 851, 843, 868, 946, 951, 958, 1005, 1019)

Response: See response to comment 932.

- 934.** Comment: Section 78.56 should no longer authorize the use of earthen pits for temporary storage. Section 78.56 continues to allow earthen pits to be used for temporary storage of materials capable of polluting soil and groundwater. If the Department applied a best practices and best available technology standard, and compared the environmental protectiveness of available options, it would conclude that earthen pits should no longer be authorized for that purpose.

Above ground tanks and containers are more dependable. Above ground tanks and containers can be located on liners and fitted with secondary containment. Spills and leaks are more readily spotted using above ground tanks and containers, so that actions to prevent environmental harm can be taken more promptly. In addition, because the Department lacks adequate personnel to fully inspect each temporary storage pit before construction, there is little or no assurance that liners are properly installed without leaks or tears. Because there is no requirement for groundwater monitoring at temporary storage pits, it is virtually impossible for the Department to determine that a pit has leaked. Further, aside from historical practice, there is no scientific basis for assuming that twenty inches of soil is protective of groundwater across Pennsylvania regardless of where the pit is located. For all of these reasons, we urge the Department to ban the practice of allowing earthen pits to continue to be used for temporary storage of regulated and waste materials. (852a)

Response: See response to comment 823.

- 935.** Comment: Ban open pit waste impoundments (99, 149, 649, 1168)

Response: See response to comment 823.

- 936.** Comment: Article 1, Section 27 of the PA Constitution imposes an obligation upon the EQB to act as a trustee for Pennsylvania’s public natural resources. The Constitution directs the EQB to “conserve and maintain these resources for the benefit of all people. In revision Chapter 78 the EQB must consider this constitutional requirement and craft regulations that protect the corpus of the trust by preserving PA’s natural resources. Open pits needlessly threaten PA’s public resources. We urge the EQB to faithfully discharge its duty as a trustee by imposing a ban on open pits. (1166)

Response: The Department acknowledges the comment. Under § 78.56 open pits are allowed to temporarily store regulated substances and wastes from the drilling, altering, completing, recompleting, servicing and plugging wells at the well site where the substances or wastes are generated or will be beneficially used. However, under § § 78.57 and 78a.57 open top structures are not allowed to store brine and other fluids produced during the operation of a well. The EQB has determined that this appropriately protects the environment and Pennsylvania’s public natural resources together with other applicable sections of this rulemaking and other existing regulations consistent with the Commonwealth’s constitutional mandate under Article I, Section 27 of the Pennsylvania Constitution.

- 937.** Comment: Open pits should be banned. Evaporation of toxic chemicals are harmful to the environment. Technology is available for storage of well materials. (14)

Response: See response to comment 823.

938. Comment: Open storage pits should be prohibited due to the associated water and air contamination incidents. Open pits are not needed, technically or fiscally. Instead, a mandatory closed-loop system reduces spills and contamination of air/water should be used. (104, 1166)

Response: See response to comment 823.

939. Comment: The DEP should insure that the water supply (drilling sites) is protected and standards should be established for pre drilling. Water should not be left in open pits. Please establish standards to keep the water safe and the surrounding areas free from contaminates.(184)

Response: See response to comment 823.

940. Comment: Open pits for waste water storage should be banned due to recorded incidents of contamination of air, water and soil and impacts to human health. Drillers, regardless of their company's financial state, should be required to remediate any contaminated water and/or soil.(16, 46, 67, 401, 470, 595, 596, 916, 956, 1078, 1166)

Response: See response to comment 823. Spill response and remediation is regulated under §78.66.

941. Comment: Standards for frack pits and impoundments (Sections 78.56, 78.57, 78.58, and 78.59). Mounting violations and the potential for water and air pollution have already led some companies to transition away from pits and standardize the use of closed loop systems which utilize above ground tanks to store wastewater. DEP should: Prohibit operators from using open pits for storage of regulated substances, including wastewater, drill cuttings, and substances (like gels and cement) that return to the surface after fracking. Many spills, leaks, and other problems involving pits have occurred statewide that contaminate water, soil and air. Waste should be stored only in closed systems. (17, 18, 19a, 51,62,70,72, 73,79,102,104,125,135,148, 160,161, 162, 169, 200-385, 400, 471, 475, 477, 560, 564, 565, 566, 626, 632, 808, 843, 884, 886, 909, 922, 947, 492a, 992, 1000, 1039, 1047, 1058, 1068, 1078, 1086, 1098, 1102, 1139, 1160, 1161, 4582 – 4584, 17455)

Response: See response to comment 823.

942. Comment: There are many communities who think the issues of Marcellus Shale are not their problem. They live outside the Shale region and are not directly impacted by drilling and fracking wastewater. This thinking is naive and short-sighted.

Although West Chester and Chester County is not located in the Marcellus Shale region, we are downstream from the regions where fracking operations are underway and growing rapidly. Not that many years ago, it was common for people to think about only their own backyards, and not worry themselves about the problems of their neighbors. We have learned through too many tragedies starting with the Chernobyl nuclear accident, that toxins when released can blow and flow around the world. Air and water pollution does not respect national, state or regional boundaries. We all live downstream.

West Chester's water sources and public health are at risk from regional pollution. In addition, West Chester's economic development is directly connected to the success of our region and our state. My sense is that the Chapter 78 sections on "Waste Management at Well Sites" and "Off-site Issues" are the most relevant for residents of Chester County who are concerned about downstream impacts (including regulations for pipelines). It is from this perspective that I urge you to take the time necessary to make careful scientifically based decisions on waste management at well sites

and off-site.

It is important to note that the DEP considered other changes. For instance, they considered eliminating pits and underground tanks for managing wastes, but felt such restrictions were impractical. Are they really? I contend that the health of our people, our children, should be at the top of any list of standards for practicality.

The science appears to support a ban on fracking waste pits at this time. I urge you to follow the science and to ban all fracking waste pits. In addition, while many of us want all fracking to cease, we must stop expansion until the FULL effects of drilling are fully understood. Others will testify to the scientific reasons to ban all fracking waste pits. I speak for the children who are the future of West Chester. I urge you to slow down, study the science and choose only those options that are deemed to be scientifically safe for the children of West Chester and the Commonwealth. Thank you. (112)

Response: See response to comment 823.

- 943.** Comment: Pennsylvania’s continued acceptance of open pits and impoundments poses continued environmental risk. According to Finding III.4 of STRONGER, the DEP’s experience with pits has shown that although their use is decreasing, many liner failures still occur with pits. STRONGER recommends that DEP consider adopting regulations or incentives for alternative to pits to prevent the threat of pollution to the waters of the commonwealth. (886)

Response: See response to comment 823.

- 944.** Comment: The prohibition of open pits is essential to protecting the commonwealth from the proven ills associated with open pits. (886, 1110, 4744 – 5668)

Response: See response to comment 823.

- 945.** Comment: Many constituents desires to ban all types of fracking pits, both temporary and permanent, due to the negative effect that fracking has on wastewater. (1112, 10328 – 17454, 17456)

Response: See response to comment 823.

- 946.** Comment: Pennsylvania’s regulations (Sections 78.56, 78.57, 78.58, and 78.59) should reflect industry best practices, and require the storage of wastewater, flowback, and other contaminated fluids in closed loop systems. Using tanks to store fluids is a reasonable requirement for drillers, who must eventually remove the fluids in containment tanks. Other states such as Maryland, New York and New Mexico already have developed regulations requiring the use of closed loop systems so the proposed regulations lags behind current regulatory advances in other states. (853a, 1100)

Response: See response to comment 823.

- 947.** Comment: DEP does not require individual permits for the use of drilling and production pits (although it does for centralized impoundments)—allowing operators to avoid, for example, providing information on the number, location, and capacity of pits at well sites, as well as complete planning for waste management at the outset of site development. This permitting gap in turn means that pits can be “rolled into” the construction, use and restoration standards for well

sites in general rather being subject to considerations that can increase the safe operation of pits* such as soil stability and setbacks from water resources. Such lax regulatory oversight is unacceptable given that drilling wasted stored at pits and impoundment can be contaminated with chemicals, barium, strontium, heavy metals, radioactive materials and other substances. (853a)

Response: See response to comment 875.

- 948.** Comment: The Department has issued notices of violation in the area of improper management and disposal of drill cuttings at 48 well sites statewide between January 2010 and August 2013. The violations were issued for a range of problems. These documented examples of environmental harms only reflect what is known to have occurred and instance in which problems were recorded by DEP as violations. Because DEP is under staffed, it is virtually impossible for the Department to detect, let along prevent such problems.

STREET ADDRESS 2
CITY, STATE, ZIP

Dear Marcellus Shale Gas Well Operator:

Department inspectors have been documenting a number of violations pertaining to the operation of open pits used for the management of drilling and fracturing fluids at Marcellus Shale wells sites. These violations, which have included both the over topping and leaking of pits, have resulted in the contamination of both soil and the waters of the Commonwealth. Several Marcellus Shale well operators have expressed a desire to move towards a pitless drilling and fracturing system to more effectively manage these fluids in an environmentally sound manner. The management of drilling and fracturing fluids in tanks, rather than open pits, could significantly reduce the possibility of a release of industrial waste to the environment.

Department records indicate that you have drilled at least one gas well into the Marcellus Shale formation within the past year. Department of Environmental Protection Secretary John Hanger respectfully requests that you provide the Department with information regarding what steps, if any, your company has taken to convert to a pitless drilling and fracturing system. Please provide this information to the Department, to my attention at the address above, by October 7, 2010.

If you have any questions, please contact me at 717-772-2199. Thank you for your cooperation in this matter.

Sincerely,

Scott R. Perry
Director
Bureau of Oil and Gas Management

(853a)

Response: See response to comment 823. The Department believes that the current temporary storage requirements are appropriate and recognizes the need to maintain an in-field presence at well sites to ensure that waste is appropriately managed. Staff levels have increased as a result of the well permit fee increase in June 2014 and the Department believes that staff levels are adequate to conduct necessary inspections.

949. Comment: In a September 17, 2013 letter from Director Scott Perry the Department clearly acknowledges the inherent environmental risks of open waste pits – making it illogical and dangerous to continue to allow the practice under Chapter 78. In that letter Director Perry also emphasizes the importance of eliminating pits by saying “Several Marcellus shale well operators have expressed a desire to move towards a pit-less drilling and fracturing system to more effectively manage these fluids in an environmentally sound manner. The management of drilling and fracturing fluids in tanks rather than open pits could significantly reduce the possibility for a release of industrial waste to the environment. This official view by the agency should be reflected in the proposed revisions. (853a)

Response: See response to comment 823.

950. Comment: DEP must NOT allow the storage of wastewater in open pits or impoundments but require the use of closed loop systems based on tank storage, with a backup system to contain and detect leaks, the current best practice standard.(399, 891, 922, 992, 1068)

Response: See response to comment 823.

951. Comment: Open pit storage of regulated substances should be prohibited as should onsite processing drill cuttings. (1148)

Response: See response to comment 823.

952. Comment: A better remedy for the problems created by open pit storage of hazardous waste—one that I would like to see instituted at Beaver Run Reservoir -- would be to require a closed-loop system for handling onsite wastes. The US Department of the Interior advises of pits:

“Use of enclosed tanks and closed loop or semi-closed loop systems is environmentally preferable to the use of open pits.... Open production pits are to be strongly discouraged. Closed tanks and systems minimize waste, entry by wildlife, fugitive emissions that affect air quality, and reduce the risk of soil and groundwater contamination. In addition, the use of tanks instead of pits expedites the ability to complete interim reclamation. Costs may be reduced with the use of tanks, particularly when the pit requires solidification or netting.”

Our review of oil and gas compliance reports, including inspector comments from site visits and violations issued, revealed that problems with waste pits are very common. Eliminating these pits would allow inspectors to spend more time monitoring other areas of concern and would remove the waste pit as a source of contamination. I call on DEP to eliminate the onsite storage of toxic materials in open pits. (402)

Response: See response to comment 823.

953. Comment: Since the technology already exists to contain containments in closed looped systems and tanks, then I urge DEP to propose in their regulations the requirement for closed loop

systems. All open pits should be banned including temporary pits. The suggested 9 month allowance is also too long for temporary storage pits and these should also be prohibited. (848, 922)

Response: See response to comment 823.

954. Comment: The regulations should prohibit the use of open pits or impoundments for storage of fluids, drill cuttings and other wastes. Anything less than closed loop fluid management should not be allowed. These restrictions should not only apply to new operations but should be applied to continued use of existing pits and impoundments as well. (930, 1083)

Response: See responses to comments 823 and 830.

955. Comment: Given the availability of closed loop systems, the use of pits and open topped tanks should be banned for short term storage due to their history of spills and leaks and the potential for air pollution. Some of these pits and tanks have even caught on fire. Many operators are already using closed loop systems. Other operators should be required to adopt these “best management practices. (1066, 1089, 1229)

Response: See response to comment 823.

956. Comment: I wish express concern about section 78.56 which deals directly with soil science. This section states either soil scientists or a “similarly trained person” may do the soil tests to determine the depth to the soil water table. This is undefined at best and would allow SEOs, E&S technicians, or geologists to determine seasonal high water tables in soils. Evaluation of redoximorphic features (mottling) is a skill that requires both field experience and a scientific background in soils.

Additional changes to the regulations that concern me include deleting the definition of a season high water table, though the term continues to use the term throughout the document. (101)

Response: The regulation is written to allow appropriately trained individuals to determine the depth to the seasonal high water table. The Department has not proposed to delete the definition of “seasonal high water table.”

957. Comment: Section 78.56 allows open pits to be used as temporary storage structures for containment of wastes used in the hydraulic fracturing process. Open pits are not acceptable as either temporary or permanent storage structures. Heavy precipitation or earth movement such as from earthquakes or nearby fracking operations could cause wastes in open pits to be released into the surrounding environment including the groundwater. Potentially dangerous substances should be stored in closed containers that have been designed to safely sequester such substances. These containers should be approved by the DEP or engineers hired by DEP at the expense of the well drilling company.(108, 405, 406)

Response: See response to comment 823.

958. Comment: What about wastewater storage in open pits? (Section 78.56) Although DEP regulations allow this kind of storage, better methods should be used in order to avoid contamination. Laws have recently been passed in Illinois that hydraulic fracturing flowback and produced water should be stored in tanks above ground for temporary purposes. Constant monitoring is required to avoid pollution of nearby streams.(111)

Response: See response to comment 948.

959. Comment: Section 78.56 – One of the sources of water contamination is the open pits that hold flowback water. These open pits should be prohibited because inadequate or faulty liners can allow this toxic flowback water to seep underground. Heavy rains, such as those happening around the country, can cause these pits to overflow. Both of these situations have the potential to contaminate our aquifers.(129, 949)

Response: See responses to comments 823 and 855.

960. Comment: No surface impoundments, as open ponds could expose birds and land animals to toxic chemicals, and leaks through faulty liners, floods and overflows could pollute streams, soil, and aquifers for decades or centuries. (156)

Response: See response to comment 823. Onsite pits utilized by the conventional oil and gas industry are significantly smaller and are left open for significantly shorter periods of time than onsite pits used at unconventional oil and gas well sites. As a result of the reduced size and limited timeframe, the Department does not believe that temporary onsite pits at conventional well sites pose a significant threat to birds and land animals. Additionally, federal laws which are administered by the U.S. Fish and Wildlife Service have been enacted to protect migratory birds.

961. Comment: I live in Oklahoma where these fracking pits abound. I can tell you from personal experience that they devastate wildlife (which mistakes it for safe water), but also contaminate soil, contaminate surface and ground water when they overflow and leak, and send toxins into the air that can affect people and animals for miles downwind.(159)

Response: See response to comments 823 and 960.

962. Comment: Please take measures to prevent pollution from frack pits. Waste should be stored in closed systems that utilizes above-ground tanks not open pits.(163, 494)

Response: See response to comment 823.

963. Comment: Processing of residual waste should be done in a ‘closed-loop system’ to prevent contamination. Open pits should not be permitted for regulated substances or for water from mining or sewage. All drilling fluids should be stored and transported in secure containers to be recycled for future drilling at permitted recycling facilities or to be disposed of at licensed landfills where adequate monitoring is provided.(182)

Response: See response to comment 823.

964. Comment: DEP should NOT allow the storage of wastewater in open pits or impoundments. (185, 187, 843, 868, 5782 – 5785)

Response: See response to comment 823.

965. Comment: In addition to the modular tanks receiving prior DEP approval, the tanks must be inspected, the oil and gas company must provide written documentation of date and time of last inspection as well as the name and signed signature of the mechanic inspecting such unit. The person

who inspected the unit shall be held liable, as well as their employer, for any deficits to said storage units punishable under criminal law. (189)

Response: Under §§ 78.56(a)(6) and 78a.56(a)(6), pits, tanks and other approved storage structures must be maintained to be structurally sound and reasonably protected from unauthorized acts of third parties. Operators are required to outline their monitoring and inspection requirements and frequency in site specific PPC Plan under §§ 78.55 and 78a.55.

966. Comment: Open impoundments that store flowback water used in the fracking process pose a health risk to nearby landowners from pollutants that evaporate or degrade from chemicals in pits, or are released into the environment and vaporized into a community's air. For instance, multiple residents in southwest PA who live near a centralized wastewater impoundment had blood and urine analyzed and were told by doctors that they had chronic exposure to volatile organic compounds (VOCs). Some doctors believed their patients' levels were high enough to advise moving away from the impoundments. I support DEP's ban of central wastewater impoundments, but even so-called temporary impoundments storing hazardous chemicals can still have serious health and environmental impacts, are not needed and should not be allowed. While I believe that no allowances should be made for open storage pits, the suggested 9 months would be far too long to allow for temporary storage at a drilling site.

There are many justifications for why DEP should ban all open wastewater impoundments. The technology exists to properly contain hazardous substances in closed-looped systems and tanks immediately after fracking and completion occurs, as some companies in Pennsylvania are already using it. North Dakota and Illinois have already implemented bans on open wastewater impoundments except for emergency situations. Even the conservative and industry supported Center for Sustainable Shale Development includes in their standards a condition to use closed-loop systems to eliminate the use of pits for all wells. In addition, DEP should prohibit operators from storing any solid wastes such as drill cuttings in open pits. Drill cuttings can contain radioactive materials that pose serious health risks to workers and nearby residents. (119,242a,629,950)

Response: See response to comment 823.

967. Comment: DEP regulations continue to allow the storage of wastewater in open pits or impoundments. Open pits are a recipe for disaster and the state needs to ban them altogether. Existing impoundments should be cleaned up and closed. Hydraulic fracturing fluid, flowback and produced water at well sites should be stored in above ground tanks during all phases of drilling and treated as the hazardous waste that it is. (635)

Response: See responses to comments 823 and 830.

968. Comment: Water Used for Fracking (i.e. water to be sent into well) :

- Regulations should not permit open containers or "pits": all fluids should be contained only in closed tanks and closed loop systems.
- The tanks and closed loop systems should be permitted only for a designated, limited time, e.g., during weeks of fracking.
- This water should not be called "fresh water." (609, 938, 938a)

Response: See responses to comments 823 and 830. Some water sources for hydraulic fracturing are freshwater sources.

969. Comment: No open pits, or "frack pits", should be allowed on well sites; no hazardous substances in

pits. No onsite processing of drill cuttings; these cuttings can contain toxic and radioactive materials. No mixing and storage in open impoundments of “reused” or “recycled” water from fracking and drilling with clean water for use in additional operations; “freshwater” Is not defined, leading to “freshwater” impoundments with regulations that do not address their hazardous contents. (787, 843, 1030, 1030a, 1064, 1068, 1073-1077, 1079-1082, 1084, 1101, 1158, 1168, 4584 – 4650, 5936-6089)

Response: See response to comment 823. Freshwater, when mixed with regulated substances is no longer freshwater and cannot be stored in a freshwater impoundment.

970. Comment: We should have no open pits for the storage of chemicals, waste and liquids. But we should have closed-pit recycling. (845)

Response: See response to comment 823.

971. Comment: As you know, the wastewater contains toxic chemicals, metals, .many unknown chemicals, and sometimes radioactive particles. Open pits as storage are an extreme hazard to the health of humans and wildlife. You know from your own records of violations that the liners in those pits LEAK because of inadequate anchorage or the pit overflows because of heavy rains or several other reasons. The toxins in the wastewater will contaminate soil streams nearby or seep into aquifers. In addition, the toxins evaporate into the atmosphere before the wastewater is hauled away, which results in air pollution. I suggest your regulations:

- Prohibit drillers from using open pits for storage of waste water, drill cuttings and all other substances that return to the Surface with the fracking fluid.
- Require drillers to use ONLY closed system storage. (865, 912, 1215)

Response: See response to comment 823.

972. Comment: Determination that a pit bottom is 20 feet above seasonal high water table should be done by an accredited *independent* professional, as is done with pre-drilling water tests. Or consider county Emergency Management personnel. There should be a requirement that they be given a copy of the PPC plan, since they are directly affected by it. (869)

Response: See response to comment 899. PPC plans must be available onsite. Existing regulations under § 78.55 require unconventional operators to submit an emergency plan to county Emergency Management Agency.

973. Comment: As a better environmental and community friendly practice, we support the use of modular above ground containment structures. One operator in Susquehanna County has utilized such structures already [Cabot]. These structures are a viable method to replace the lingering practice of flowback/wastewater earthen impoundments still utilized by an operator within our region. [OHara Centralized Wastewater Impoundment, SWN, Jackson Twp., Susquehanna County, Permits 95- 29-65420-021 and ESG13-115-0126]. We recommend the provisions related to modular above ground containment structures as they can assist operators in their recycling methods and water storage and are a better environmental practice near our homes. (660a)

Response: The Department acknowledges the comment.

974. Comment: The storage of contaminated (to any degree) frack wastewater or drill cuttings should be prohibited. (912)

Response: Proper storage of wastewater and drill cuttings is a necessary component of environmentally protective waste management.

975. Comment: Open air pits used as interim holding area should be prohibited. The contaminated water should be contained in liquid tight containers prior to decontamination treatment and only after treatment should the water be allowed to reenter the ecosystem. This treatment at the point of origin is the most effective and lowest cost method to ensure the safety of the water supply. As we have recently seen in WV's Elk River incident, once chemicals enter the water supply clean up at the point of use is difficult and perhaps impossible. In addition, the cost of needing to replace the entire water distribution system could be enormous and needs to be avoided by instituting a point of origin treatment standard. I would appreciate a reply addressing my concerns and recommendations. (959)

Response: See response to comment 823.

976. Comment: Pits. Temporary or permanent. storing waste of any form including flowback water or contaminated drill cuttings should not be permitted anywhere in the state of Pennsylvania. The standards state that residual waste including contaminated drill cuttings may be disposed of on site.

The US Department of the Interior, advises of pits: "Use of enclosed tanks and closed loop or semi-closed loop systems is environmentally preferable to the use of open pits and is to be encouraged by the BLM. Open production pits are to be strongly discouraged. Closed tanks and systems minimize waste, entry by wildlife, fugitive emissions that affect air quality, and reduce the risk of soil and groundwater contamination. In addition, the use of tanks instead of pits expedites the ability to complete interim reclamation. Costs may be reduced with the use of tanks, particularly when the pit requires solidification or netting."

Waste pits are banned in New Mexico. According to news articles: Antero in Colorado State does not utilize pits, but a closed loop system. Chief and Rex Energy have moved to all closed loop systems. Andarko Petroleum uses close loop systems in Pennsylvania. The EPA Star program recommends a closed loop system. But Pennsylvania's *new, proposed* regulations allow the continuance of frack pits, inviting further pollution and contamination of waters.

Presently DEP permits leakage of toxic chemicals onto residential properties and farmlands from the pits, the amount of leakage permitted being determined by the depth of the fluid in the pits. There should be no legally allowed leakage of fluids onto surrounding land areas.

The proposed regulations will not help to prevent flooding, spills, and leak violations that are commonly occurring.

Stating a required footage of freeboard provides little protection. Violations due to overflow of the required freeboard occur on a regular basis, companies repeatedly are charged with the same violations, and fines are limited or non-existent.

How will condensate tanks be monitored? All gas facilities including tanks, pits, wells, and compressor stations should have monitors designed and operated by a third party, functioning 24 hours a day, and recording findings that are directly available to the DEP and public.
Fumes from tanks must be recaptured so not to pollute the air.

The gas industry should not be responsible for conducting this monitoring but should be financially responsible for payment of the implementation and conduction of that process. (912, 926, 938)

Response: See response to comment 823. Pits are not permitted to leak under any circumstance. Violations for failure to maintain 2 feet of freeboard do not imply that these violations cause containment structures to overflow on a regular basis.

977. Comment: The water prepared to be put into the well is highly variable in chemistry. It can easily contain enough hazardous chemicals to contaminate the site; thus it must be in closed containers.

Note that the requirement for closed containers/closed loop systems will avoid the use of “natural topographic depressions” within the definitions of an allowed “pit” and/or “freshwater impoundment.” No regulations should allow fluids related to oil and gas operations to be managed in “natural depressions.” All temporary and permanent impoundments, storage tanks, pits, that collect discharges from wells must be tested at least quarterly. (938, 938a)

Response: See responses to comment 823 and 932. Water quality monitoring of the contents of temporary pits is not required due to the temporary and transient nature of the pit contents.

978. Comment: Shouldn't the trucks that transport fluids from temporary tanks have to bear the same identification plaques as the tanks? (939)

Response: Chapter 78 does not regulate residual waste transportation. All trucks transporting residual waste are subject to the regulations in Chapter 299.

979. Comment: Under the sections on pits and impoundments, it indicates that at least 2 feet of freeboard space be allowed. This is only two inches more than two sheets of this paper placed end to end. This is not adequate space to prevent potential overflow of the impoundments nor of the standby tanks or pits (945).

Response: Two feet of freeboard is an appropriate standard and must be maintained at all times.

980. Comment: Even with a person continually present at a well site, a fence should surround all impoundments. Many of these impoundments are too large for one person to ensure that no wildlife - or children - get too close or fall in. Bird nets should also be mandatory in order to keep wildfowl out. (945)

Response: See response to comment 960.

981. Comment: Tests for liner compatibility - It is essential that it be demonstrated that liners will not be dissolved by the chemicals they contain. How will these be tested in advance when impoundments contain drilling chemicals, water, heavy metals and other substances from below the surface and when no one seems to know the chemical compounds and reactions that are formed among all of this AND when impoundments are often used for chemicals from multiple wells and each well may have a different cocktail of chemicals used, which then produces yet MORE unknown compounds and chemical reactions? It seems inevitable that liners will eventually fail due to chemical assault, to say nothing of tears from equipment, wildlife, and seam failure. (945)

Response: See response to comment 904.

982. Comment: While the regulatory efforts in this document seem to be focusing on the prevention of water pollution, which is an excellent step, there needs to be as much, if not more emphasis on air

pollution from these impoundments. High levels of VOCs are common from these installations. Given their close proximity to residences, people will be exposed 24/7 to fumes coming off of these installations. This is clearly unsafe and unwise. Steps must be taken to dramatically reduce or eliminate entirely the fumes being emitted from these impoundments and pits. (945)

Response: Air quality issues are addressed under Article III and the outside of the scope of this rulemaking.

983. Comment: We recognize the Department may consider allowing temporary storage of brines or produced water to facilitate recycling in future hydraulic fracturing. If so, storage should only occur at permitted and bonded well sites with robust leak detection, secondary containment, capacity and time limit measures. (997)

Response : See response to comment 823.

984. Comment: The pit requirement for a slope no steeper than 2 horizontal to 1 vertical for conventional wells which are small (contain less than 100 BBL of fluid) and are used for a short period of time (1-2 days) results in substantial larger areas of disturbance and greater costs without benefit.

The requirement for conventional operators to retain soil scientists for certification of pit bottoms relative to the seasonable ground water table adds a significant cost for operators. A performance standard would be appropriate. (998)

Response: See response to comment 821 with regard to pit slopes. The requirements in § 78.56(a)(10) do not include certification of the depth to the seasonal high groundwater table by a soil scientist or other similarly trained person.

985. Comment: We want all pits, especially regarding the use of contaminated substances to be eliminated. Pits do not provide for adequate environmental protection in watershed such as the Mehoopany Creek. We do support the use of modular aboveground storage structures. We also support fencing as proposed. (1035)

Response: See response to comment 823.

986. Comment: The proposed regulations do not sufficiently define allowable modular and aboveground waste structure, nor consider whether their use should be restricted or prohibited under certain conditions. These gaps must be corrected before the revisions are finalized. The proposed regulations should specify the procedures, information, and data that the DEP would use to determine whether or not these structures would ensure protection of water and air quality. (853a)

Response: See response to comment 849.

987. Comment: The proposed regulations do not even acknowledge or address the construction of large tank farms and tank pads. The proposed regulation should clarify that operators would be required to obtain a waste management permit (WMRG123) as well as any other relevant permits and requirements related to E&S control, land disturbance, setbacks and air quality and other concerns. DEP should also consider whether these tank facilities would be large enough or constructed in such a way as to require regulation under 25 Pa. Code Chapter 105. (853a)

Response: Section 3273.1 of the 2012 Oil and Gas Act waives the obligation to obtain a waste permit and post a bond for any “pit, impoundment, method or facility employed for the

disposal, processing or storage of residual wastes generated by the drilling of an oil or gas well or from the production of wells which is located on the well site.” This waiver is conditioned on the well being permitted, the operator having a bond and the operator maintaining compliance with the 2012 Oil and Gas Act and Chapter 78 or Chapter 78a. Any other permits the operator is required to obtain for example “ESCGP-2” are required to maintain compliance with Chapter 78 or Chapter 78a.

988. Comment: Please take care of our water supply by stopping the use of open air frack pits. Unfortunately the government in PA has no regard for our environment. We, the citizens pay our taxes and deserve our water supply and overall environment to be safe. Please do your part to make it happen for us and future. (1045)

Response: See response to comment 823.

989. Comment: Although storage is contemplated to be of a duration of less than 9 month (§ 78.56(d)), time extensions can be issued with the possibility of temporary storage being in service for longer than one year. Procedures should be in place to routinely monitor the integrity of tanks and lining of pits. The following text is recommended. (997a)

- Pits – The liner of a pit with a single liner shall be inspected when the pit has been in service for one year and annually thereafter. The inspection shall be completed by emptying the pit and visually inspecting the liner. If the operator does not propose to empty the pit and inspect the pit liner on at least an annual basis, the operator shall install a double liner and leak detection system. The leak detection system must meet the requirements of § 78.59c(e)(3). (997a)
- Tanks – Each aboveground tank (including modular aboveground storage structures) shall be inspected when the tank has been in service for one year and annually thereafter. The inspection shall be completed by emptying the tank and visually inspecting the inside of the tank. If the operator does not propose to empty the tank and inspect the inside on at least an annual basis, the operator shall install a leak detection system to monitor the integrity of the tank and all interconnected piping on a monthly basis. (997a)

Response: See response to comment 823. The Department disagrees that the scope of monitoring proposed in the comment is necessary to ensure environmental protection.

990. Comment: For pits, the Department should require the use of approved equipment or practices to prevent access by wildlife for which fences are not an adequate deterrent (e.g., cover netting for avian species) (997a)

Response: See response to comment 960.

991. Comment: The Proposed Regulations should: (1) ban the use of pits and open-top structures for storage of regulated substances and wastes; (2) ban the use of centralized impoundments for storage of hazardous materials. §§ 78.56, 78.57, 78.59c address requirements regarding the containment, processing, and storage of regulated substances and wastes associated with well site development and drilling operations. On January 9, 2014, the League of Conservation Voters submitted comments (the “LCV comments”) asking for the Proposed Regulations to impose an across-the-board ban on the use of open pits for waste- storage. I support the LCV comments, which were reiterated by dozens of other commentators, because adopting this approach will strengthen environmental protections as well as impose more predictable and enforceable requirements.

§ 78.56 gives drilling operators the option to temporarily store regulated substances and wastes in

either pits or tanks. Whereas, § 78.57 bans the use of open top structures and pits to store brine and other production fluids, except where permitted by The Clean Streams Law. Both sections dedicate most of their subsections to describing elaborate and prescriptive standards for the approval and construction of pits. Given the scarcity of the DEP's resources, compared to the rate at which new well sites are being developed by drilling operators, it is unrealistic to expect the DEP to efficiently enforce these elaborate standards. Regulations that overburden the DEP with the need to make case-by-case determinations may be even worse than having no regulations at all, because not only do such regulations lead to lax enforcement and raise the risk of environmental harm, but they contribute to a situation where the DEP is perpetually short on resources, understaffed, and without the means to take a proactive approach to enforcing the mandate of the ERA.

On January 22, 2014, the Clean Air Council submitted comments (the "CAC comments"), "calling for a complete ban on open [centralized] wastewater impoundments." See § 78.59c. On January 9, 2014, and on January 19, 2014, both Penn Future and the Appalachian Mountain Club submitted comments (the "Penn Future comments," the "AMC comments") that were amendable to some use of centralized impoundments to store wastewater, but called for enhanced setback requirements. I support a complete ban on centralized wastewater impoundments. In the alternative, I support enhanced setback requirements, specifically with respect to extending setback requirements to all bodies of water. (1070)

Response: The Department has amended the final rulemaking to ban the use of pits for temporary waste storage at unconventional well sites. The Department has determined that it is appropriate to remove this practice because it is not commonly used by unconventional operators. Additionally, the typical type and scope of use by unconventional operators is generally incompatible with technical standards for temporary pits prescribed under §78.56. Conversely, the typical type and scope of use by conventional operators is generally compatible with the technical standards for temporary pits prescribed under §78.56. The Department believes that the technical standards for temporary pits prescribed under §78.56 ensure protection.

See response to comment 1251 regarding Centralized Impoundments.

See response to comment 231 regarding setbacks from waterbodies.

992. Comments: Waste pits are an abomination and should be banned. Some states have already recognized the harm to the environment they have caused and have banned them. Evaporating chemical mixtures of a non-descript nature pose serious health risks to workers as well as residents, not to mention the wildlife that come in contact with this slurry of toxins. Leaking liners and flooding of pits that cannot be controlled contaminate ground water and eventually reach aquifers. Fences and gates do not keep this horrible liquid confined. (1072)

Response: See response to comment 960.

993. Comment: The Department is updating the requirements for both temporary and long-term waste management related to oil and gas development with its proposed Rule. Site containment systems and practices are a key component to reducing potential threats of pollution to the Waters of the Commonwealth as are many of the spill reporting requirements and other practices such as the allowances for large volume modular tanks. Several of the proposed regulations are developed based on sound field experience. (1085)

Response: The Department acknowledges the comment.

994. Comment: Drilling company operators should be prohibited from using open pits for waste storage. (1088)

Response: See response to comment 823.

995. Comment: Limit storage and containment to closed tanks to reduce health hazards and environmental risks; reinsert the word polluttional rather than regulated substances given loopholes in regulations relative to the oil and gas industry; and omit the use of pits, and other approved storage structures throughout the section on containment. [78.56] (855, burden on taxpayers, 1098)

Response: See response to comments 817 and 823.

996. Comment: We represent 72 firms and agencies dealing with the proper development and use of geosynthetic materials including “synthetic flexible liners” which are called “geomembranes” by many other organizations. Among our 18 agency members is the Pennsylvania Department of Environmental Protection with Steve Socash as our contact person. See our website at www.geosynthetic-institute.org for details. This communication has two major points which we ask you to seriously consider as you go forward with your regulations.

- a. The original Subchapter C -Environmental Protection Performance Standards has a 1×10^{-7} cm/sec maximum permeability for the synthetic flexible liner being used. This is a ridiculously high value and represents a typical clay or silt soil. Geomembranes have permeabilities down to 1×10^{-13} cm/sec and should be referenced and regulated as such. The agency is confusing everyone (including the public) by having such a high value representing the liner material for all types of containment pits.
- b. The proposed January 15, 2014 regulation banning the use of lined pits is completely inappropriate. A properly lined geomembrane pit manufactured with polymers such as high density polyethylene (HDPE) will outlast steel storage tanks by decades.’ Attesting to this established fact is that all landfills and surface impoundments for nonhazardous and hazardous solid and liquid wastes are lined accordingly. Their performance has been documented over time and with the use of double lined systems allows for the development of an “action leakage rate” for ultimate security of adjacent land and waters.” Your proposed banning of geomembrane lined pits for flowback and production drilling waters flies in the face of the entire solid and liquid waste technology as practiced by the U.S. EPA and every state agency (including Pennsylvania) as well.

As a Pennsylvania resident my entire life and working with the PADEP since its original founding, I ask you to re-consider your stance insofar as pit lining for flowback and production waters at drilling sites and operations. As you likely know the potential for contamination of these drilling fluids pales into insignificance in comparison to hazardous, and even nonhazardous, leachate from the solid and liquid waste industries.

RESUME

Robert M. Koerner, Ph.D., P.E., NAE
<robert.koerner@coe.drexel.edu>

I. Personal

Date of Birth: December 2, 1933
Married: Wife – Pauline W. Feuerer
Children – Michael R. Koerner (October 2, 1960)
George R. Koerner (February 15, 1962)
Pauline K. Limberg (August 17, 1964)
Grandchildren – David, Paula, Addie, Robert, Max, Helena
Residence: 130 Wood Road, Springfield, Pennsylvania 19064

II. Education

B.S.C.E. – Drexel Institute of Technology – Philadelphia, PA - 1956
M.S.C.E. – Drexel Institute of Technology – Philadelphia, PA - 1963
Ph.D. – Duke University – Durham, NC - 1968

Additional Studies

Soil Mechanics @ Columbia University – New York, NY – 1956-59
Law @ Temple University – 1964
Mathematics @ University of Delaware – Newark, Delaware – 1964-65

III. Teaching Experience

1964 – 1965	Instructor, School of Engineering Pennsylvania Military College, Chester, PA
1965-1967	N.S.F. Teaching Intern in Civil Engineering Duke University, Durham, North Carolina
1968 – present	Drexel University: Assistant Professor - 1968 Associate Professor - 1971 Professor - 1975 H. L. Bowman Professor - 1984 Emeritus Professor - 2003

IV. Institute Experience

1986-present	Founder/Director – Geosynthetic Research Institute
1995-present	Founder/Director – The Geosynthetic Institute

V. Industrial Experience

1956 – 1960	- Engineer and Superintendent (highway and heavy construction in PA, NJ and NY.) The Conduit and Foundation Corp., Philadelphia, PA
1960 – 1962	- Engineer – Analyst (involved in all aspects of soil consulting practice), Dames and Moore, Consulting Soil Engineers, New York, NY
1962 – 1963	- Engineer and Superintendent (industrial foundation design and consultation, and general heavy construction), J. J. Skelly, Inc., Media, PA
1968 – 1986	- Private consultant in Geotechnical and Foundation Engineering, Powder Metallurgy, Powder Processing and Behavior, Nondestructive Testing, Geosynthetics, Professional Witness Investigations and Legal Testifying: (Incorporated as Geotechnical Research Inc., 1976)
1986 – present	- Advisory consultant in geosynthetics to member organizations of the Geosynthetic Research Institute/Geosynthetic Institute

VI. Professional Memberships

American Society of Civil Engineers (ASCE)
American Society for Testing and Materials (ASTM)
International Geotextile Society (IGS)
North American Society of Geosynthetics (NAGS)
Registered Professional Engineer (PE) Pennsylvania #19855-E

VII. Publications (author or co-author)

Books, Book Chapters, Major Reports	-	79
Refereed Journal Articles	-	156
Conference Proceedings Papers	-	226
Misc. Papers and Articles	-	<u>118</u>

IX. Major Professional Offices and Honors

Chairman	-	American Society for Engineering Education (ASEE) – 1974-1975
President	-	Philadelphia Section, American Society of Civil Engineers (ASCE) – 1975-1976
Recipient	-	Outstanding Educators of America – 1972
Recipient	-	Lindback Award for Distinguished Undergraduate Teaching at Drexel University – 1974
Co-Recipient	-	Industrial Research IR-100 Award, Earth Dam Spill Alert Device – 1977
Recipient	-	Inter Fraternity Association Undergraduate Teaching Award – 1977-1978
Recipient	-	Delaware County Chapter, Pennsylvania Society of Professional Engineers, Engineer-of-the-Year – 1978
Co-Recipient	-	1 st Neal Rice Award – Intl. Briquetting and Agglomeration Society - 1979
Recipient	-	Western Electric Fund Award American Society of Engineering Education, 1980
Recipient	-	Delaware Valley, Engineer-of-the-Year, 1981
Recipient	-	Honorary Doctorate of Engineering Science, Spring Garden College, Philadelphia, PA and Commencement Speaker, 1981
Recipient	-	Civil Engineer-of-the-Year, Philadelphia, PA – 1989
President	-	North American Geosynthetics Society (NAGS) – 1989-1991
Recipient	-	Honorary Member in the American Society of Civil Engineers (ASCE) – 1992
Recipient	-	1 st Mercer Lecture (IGS/ISSMFEE) – 1992
Recipient	-	Award of Merit and Fellow (ASTM) – 1994
Recipient	-	Award of Merit in Design (IGS) – 1994
Co-Recipient	-	Award of Excellence (NAGS) – 1995
Recipient	-	32 nd Terzaghi Lecture (ASCE) – 1996
Co-Recipient	-	1 st T. Allen Haliburton Award (ASTM) – 1996
Recipient	-	1 st Giroud Lecture (IGS) – 1998
Member	-	National Academy of Engineering – 1998
Co-Recipient	-	3 rd T. Allen Haliburton Award (ASTM) – 1998
Recipient	-	1 st Burmister Lecture (Columbia Univ.) – 1999
Recipient	-	2 nd Terzaghi Lecture (TU Vienna) - 1999
Recipient	-	8 th Kersten Lecture (Univ. Minnesota) – 2000
Co-Recipient	-	James R. Croes Medal (ASCE) – 2000

Recipient	- 4 th George Sowers Lecture (Geo. Tech) – 2001
Recipient	- 2 nd CAEE Department Alumni Lecture (Drexel Univ.) – 2001
Recipient	- 10 th Jack Hilf Lecture (Univ. Colorado) – 2002
Recipient	- 2 nd U.K. Geosynthetics Lecture (ICE-London) – 2002
Recipient	- College of Engineering Lifetime Achievement Award (Drexel University) – 2003
Honoree	- Symposium on Research Legacy of R. M. Koerner at Drexel University – 2004
Recipient	- 10 th T. H. Wu Lecture (Ohio State Univ.) – 2005
Recipient	- 4 th U.K. Geosynthetics Lecture (ICE-London) – 2005
Honoree	- Robert M. Koerner Symposium on Geosynthetics, ASCE Mechanics Division, Baton Rouge, LA – 2005
Recipient	- 7 th Burmister Lecture (Columbia University) – 2005
Recipient	- Award of “Hero” of GeoInstitute of ASCE – 2005
Recipient	- Drexel University College of Engineering, Engineer-of-the-Year – 2006
Recipient	- 1 st Theodore Sigmon Lecturer (Natl. Acad. Bldg. Insp. Engrs.) – 2007
Recipient	- 11 th Robert L. Schiffman Lecturer (Cornell University) – 2007
Recipient	- 3 rd H. C. Nutting Lecture (Cincinnati, OH) – 2007
Recipient	- 2 nd Distinguished Lecture (Colorado State University) – 2007
Participant	- External Advisory Council (University of Delaware) – 2006 to 2008
Honoree	- Honorary Membership in International Geosynthetics Society – 2008
Recipient	- Diplomat – Geotechnical Engineers Certification – 2009
Co-Recipient	- Best Paper in Journal of Geotextiles and Geomembranes – 2010
Member	- Worcester Polytech Deans Advisory Council – 2011

(1114)

Response: The Department acknowledges the comment. The Department disagrees that the standard for permeability of 1×10^{-10} cm/s is too high. See response to comment 823.

Sections 78.57 and 78a.57 eliminate the use of pits and all other open top structures for the collection of production fluids during the operation of the well. The Department believes that the requirements for control, storage and disposal of production fluids are appropriate to ensure protection. Control, storage and disposal of fluids during other times is regulated pursuant to §§ 78.56 and 78a.56.

997. Comment: The proposed language related to securable tank valves, access lids and other equipment should be clarified to reflect the differences between conventional and unconventional well sites. Furthermore, the language regarding securable equipment should be revised to specify that these upgrades will be required only at new sites and at existing sites when the useful life of the current equipment ends and an upgrade is necessary. (1113, 1115a, 1118, 1120, 1176-1188)

Response: The Department has revised subsection (a)(6) to remove the requirement to install equipment to prevent unauthorized acts of third parties at conventional well sites.

998. Comment: High demand for limited drilling services, delays caused by weather events and other extenuating circumstances make it difficult to establish a definitive timeframe for the drilling and completion of a conventional well. Moreover, the time frames necessary for the drilling and completion of conventional wells are far shorter than unconventional wells. The proposed language should be revised to allow for the single notice already required at the commencement of drilling a conventional well in lieu of the additional notice required under the proposed regulations. (1113, 1115a, 1118, 1120, 1176-1188)

Response: See response to comment 823. The Department has deleted subsection (a)(16), which requires notices to the Department of pit liner installation, from the final-form rulemaking. Subsection 78.56(e) requires an owner or an operator to notify the Department electronically at least 3 business days before commencing construction of a pit used during servicing, plugging or recompleting the well.

999. Comment: 78.56(a)(5) – The presence of workers at the site does not ensure that wildlife will not access a disposal pit. Fencing should be mandatory. In addition, pits containing regulated substances must be covered with netting to prevent birds and bats from inadvertently entering the pit. (1134)

Response: See response to comment 960.

1000. Comment: The current use of all pits should be grandfathered. (1145)

Response: The Department does not believe that an explicit grandfathering is required because existing regulations require removal of onsite pits within 9 months of completion of drilling.

1001. Comment: Frack pits and impoundments of fracture chemicals, water, drill cuttings and other toxic substances should not be left open and exposed to the air where particles may be released. Instead, they should be contained in closed loop systems and properly disposed of according to regulations which should be contained in SB411. (1146)

Response: See response to comment 823.

1002. Comment: It is very important that temporary storage be defined because under 78.57, brine and other well operation fluids have to be in a covered tank, unless these materials are in temporary storage, then they could be in uncovered pit. These pits can be used during the drilling process and up to 9 months after. That is a long time for any of the regulated substances and wastes to be exposed to the elements and environment. There is a risk of contamination even though there is to be a 2' space between the surface and the top of the storage unit. Heavy rains, wind, snow pack, ice formation, evaporation of the stored substances and the risk of wildlife falling in, are all concerns that can have a negative impact to the environment and the liner, by not having these storage units covered.

Diverting stormwater away from the pits should also include provisions that the diversion does not create an erosion and sediment issue and that it is not directed to a stream, watercourse or SWPZ. (1150)

Response: See responses to comments 928 and 930.

1003. Comment: Pits and impoundments should not be allowed at any future well site or production facility and that existing pits and impoundments that are still open should be phased out with all wastes removed and sent, with a manifest system to track each shipment, to a licensed waste handling, treatment and disposal facility approved to handle such waste. For future well sites and production facilities, all materials that previously had been managed in pits or impoundments would now be required to be managed in close-loop above ground systems using tanks or other containment structures. (1151)

Response: See response to comment 830.

- 1004.** Comment: Leakage Rate. The rule should include allowable leakage rates for temporary pit liners and indicate maximum mass loading in that leakage to prevent contamination of groundwater. (852a)

Response: See response to comment 823. Pits are not permitted to leak under any circumstance.

- 1005.** Comment: EQB proposes numerous changes to § 78.56. A change that occurs throughout the regulation is to modify the former reference to “pollutional substances” to now read “regulated substances.” “Regulated substance” is proposed to be added as a new defined term in § 78.1 as follows: “Any substance defined as a regulated substance in section 103 of The Pennsylvania Land Recycling and Environmental Remediation Act (Act 2) (35 P.S. § 6020.103).” However, “regulated substance” is not a defined term under 35 P.S. § 6020.103, and therefore, its meaning in the context of Chapter 78 is unclear. EQB must either define the term “regulated substance” or select an appropriate term that is already clearly defined in another statute or regulation.

Additionally, it is unclear whether the provisions of § 78.56 apply solely to storage of regulated substances or whether some provisions also apply to storage of freshwater. The introductory provision of subparagraph (a) seems to imply that all of the following subparts apply only to storage of regulated substances, but, some of the subparts expressly reference regulated substances and some do not. As drafted it is unclear whether (for example) a freshwater pit must comply with all of the requirements set forth in § 78.56.

Also, if § 78.56 applies to more than just regulated substances (ie, freshwater storage), then where an operator constructs a water impoundment that services multiple well sites, must it satisfy the requirements for a “pit” set forth in § 78.56 considering that the proposed definition of “pit” set forth in § 78.1 limits that term to a facility “that services a single well site.” We assume that is not EQB’s intent for the provisions of § 78.56 to apply to an impoundment as separate provisions for impoundments are addressed under §§ 78.59a, 78.59b and 78.59c, but clarification is needed. (1140)

Response: See response to comment 817. Section 78.56 does not apply to storage of freshwater. Freshwater can store in Well development impoundments and are regulated under §§ 78.59a and 78a.59a.

- 1006.** Comment: **78.56 (d)** – This subsection should be clarified to require removal or filling of pits after the completion of all drilling on a well pad rather than completion of drilling.

Suggested Regulatory Language:

(d) The owner or operator shall remove or fill the pit within 9 months after completion of all drilling on a well site, or in accordance with the extension granted by the Department under section 3216(g) of the act and §78.65(d). Pits used during servicing, plugging and recompleting the well shall be removed or filled within 90 calendar days of construction. (1153)

Response: The regulatory language is consistent with the 2012 Oil and Gas Act.

- 1007.** Comment: **Section 78.56(d)** – This subsection 78.56(d) should be clarified to require removal or filling of pits after the completion of all drilling on a well pad and to acknowledge that pits used for onsite disposal of drill cuttings or residual waste in accordance with Sections 78.61 or 78.62 do not have to be removed and filled under this paragraph (d).

Suggested Language: (d) Except as authorized under §§ 78.61 or 78.62 for disposal of drill cuttings or residual waste, the owner or operator shall remove or fill the pit within 9 months after completion of last well, or in accordance with the extension granted by the Department under section 3216(g) of the act (58 Pa.C.S. 3216(g)) and § 78.65(d). Pits used during servicing, plugging and recompleting the well shall be removed or filled within 90 calendar days of construction.(1137, 1174)

Response: Disposal of drill cuttings or residual wastes in accordance with §§ 78.61 or 78.62 must be accomplished within the timeframes for restoration established in § 78.56.

- 1008.** Comment: The Department allows use of high-density polyethylene liners even though they have only been given a “fair” rating for puncture performance, installation damage resistance and stress cracking by geosynthica.net as well as lower ratings for these aspects than liner low-density polyethylene (LLDPE) liners required in some other states such as New Mexico. (853a)

Response: The Department acknowledges the comment.

- 1009.** Comment: We recommend including technical standards for closed-loop systems to encourage and enforce the use of closed-loop systems where conditions merit and where it would result in reducing environmental impacts. (1031)

Response: The Department has amended the final rulemaking to ban the use of pits for temporary waste storage at unconventional well sites. The Department has determined that it is appropriate to remove this practice because it is not commonly used by unconventional operators. Additionally, the typical type and scope of use by unconventional operators is generally incompatible with technical standards for temporary pits prescribed under § 78.56. As a result, unconventional operators will no longer be permitted to dispose of residual waste including contaminated drill cuttings in a pit at the well, unless the pit is authorized by a permit or other approval is obtained from the Department. Conversely, the typical type and scope of use by conventional operators is generally compatible with the technical standards for temporary pits prescribed under § 78.56. The Department has allowed the disposal of residual wastes including contaminated drill cuttings in a pit at conventional well sites for decades without significant harm to public health and safety or the environment and consequently has not banned the use of pits for temporary waste storage at conventional well sites in this rulemaking.

- 1010.** Comment: The use of pits, ponds for storage of fracturing fluid or waste needs to end completely as these leak and flood into the water table. (806)

Response: The Department has amended the final rulemaking to ban the use of pits for temporary waste storage at unconventional well sites. The Department has determined that it is appropriate to remove this practice because it is not commonly used by unconventional operators. Additionally, the typical type and scope of use by unconventional operators is generally incompatible with technical standards for temporary pits prescribed under § 78.56. As a result, unconventional operators will no longer be permitted to dispose of residual waste including contaminated drill cuttings in a pit at the well, unless the pit is authorized by a permit or other approval is obtained from the Department. Conversely, the typical type and scope of use by conventional operators is generally compatible with the technical standards for temporary pits prescribed under § 78.56. The Department has allowed the disposal of residual wastes including contaminated drill cuttings in a pit at conventional well sites for decades without significant harm to public health and safety or the environment and consequently has

not banned the use of pits for temporary waste storage at conventional well sites in this rulemaking.

The Department agrees that centralized impoundments should be regulated in the same manner as other waste transfer facilities and impoundments are regulated under Chapters 287-289. Therefore, in order to ensure consistency the Department has revised § 78.59c to require any new centralized impoundments to be authorized by a residual waste permit under Article IX. In addition, § 78.59c also requires operators of existing centralized impoundments permitted under a Dam Permit for a Centralized Impoundment Dam to either submit a closure plan to the Department within 6 months and close the centralized impoundment with 3 years of the effective date of the rulemaking or obtain a residual waste permit for the operation of the centralized impoundment with 3 years of the effective date of the rulemaking.

1011. Comment: The pit regulation changes, which are clearly targeted for the unconventional drillers if applied to the shallow conventional drillers, will actually make the pits much larger and the costs unaffordable. (627, 4681 – 4682)

Response: The Department has amended the requirements regarding use of pits for temporary storage by conventional and unconventional operators. The Department has amended the final rulemaking to ban the use of pits for temporary waste storage at unconventional well sites. The Department has determined that it is appropriate to remove this practice because it is not commonly used by unconventional operators. Additionally, the typical type and scope of use by unconventional operators is generally incompatible with technical standards for temporary pits prescribed under § 78.56. As a result, unconventional operators will no longer be permitted to dispose of residual waste including contaminated drill cuttings in a pit at the well, unless the pit is authorized by a permit or other approval is obtained from the Department. Conversely, the typical type and scope of use by conventional operators is generally compatible with the technical standards for temporary pits prescribed under § 78.56. The Department has revised § 78.56(a) to remove minimum slope requirements for a pit with a footprint less than 3,000 ft² or volume less than 125,000 gallons of capacity.

1012. Comment: Waste management at well sites - Sections 78.56, 78.57, 78.58, 78.59a - 78.59c. Section 3273.1 of Act 13 carries forward the provision of the 1984 Oil and Gas Act that Chapter 78, rather than the Pennsylvania Solid Waste Management Act, governs the disposal, processing or storage of residual wastes generated at the well site. This regulatory treatment is critical to the industry because it simplifies compliance requirements and avoids conflicting management standards between the Department's oil and gas management and its solid waste management programs. However, the prescriptive nature of these proposed rules will significantly impact the design, construction and use of impoundments and open top tanks. (1172)

Response: The Department acknowledges the comment.

1013. Comment: We have heard another industry representative refer to the industry as representing the best collective wisdom. I fail to see how an open air pit used to collect massive amounts of poison represents collective wisdom.

Open air pits should be illegal. Burying the wastes on sites should be illegal. These are two things that you can do to help these people whose homes and health have been compromised by an industry that spends millions of dollars on political campaigns and public relations. They can spend that money putting the waste in tanks, keeping it out of these open air pits, to try and protect who live near these places. Let them spend the money to try to do something reasonable for the people

who are suffering now. (1213)

Response: The Department has amended the final rulemaking to ban the use of pits for temporary waste storage at unconventional well sites. The Department has determined that it is appropriate to remove this practice because it is not commonly used by unconventional operators. Additionally, the typical type and scope of use by unconventional operators is generally incompatible with technical standards for temporary pits prescribed under §78.56. As a result, unconventional operators will no longer be permitted to dispose of residual waste including contaminated drill cuttings in a pit at the well, unless the pit is authorized by a permit or other approval is obtained from the Department. Conversely, the typical type and scope of use by conventional operators is generally compatible with the technical standards for temporary pits prescribed under § 78.56. The Department has allowed the disposal of residual wastes including contaminated drill cuttings in a pit at conventional well sites for decades without significant harm to public health and safety or the environment and consequently has not banned the use of pits for temporary waste storage at conventional well sites in this rulemaking.

1014. Comment: The unsafe use of frack ponds should be eliminated and spills should be minimized with safer drilling practices. (104)

Response: See response to comment 823.

§ 78.57 Control, storage and disposal of production fluids

1015. Comment: Section 78.57(a) – The Department uses the terms “operation” and “operation, service and plugging” indiscriminately. The language used throughout the Proposed Rulemaking should be consistent and thus be captured by using the defined term provided in Section 78.1 under “Oil and Gas Operations.” (997a,1142)

Response: The use of the term “operation” in §§ 78.57(a) and 78a.57(a) is intended to limit application of this section to control, storage and disposal of production fluids during the operation of the well. Control, storage and disposal of fluids during other times is regulated pursuant to § 78.56 (see § 78.56(a)) and § 78a.56. The Department has amended subsection (b) in the final-form rulemaking to clarify this requirement.

1016. Comment: DEP’s proposed revision in subsection (e) above fails to account for the extraordinary costs of removing underground storage tanks, which includes far more than labor costs to inspect and test the integrity of pits. All tanks that are removed will have to be replaced by an installation that meets the secondary containment requirements of proposed section 78.57(c). Therefore, the conventional operator will suffer three costs not contemplated in the Analysis: 1) the cost of removing the tank and recovering the site; 2) the cost of installing a replacement tank in a facility that includes secondary containment; and 3) the cost of replacing the tanks for those tanks which will inevitably be damaged by the removal process.

Moreover tank burial is done for functional reasons not considered in the Analysis. In some instances production water is virtually fresh; in these cases the tanks are buried to prevent the water from freezing and to allow its removal in winter. In other instances the tanks are buried to facilitate drainage to the tank. The specific gravity of production water is greater than oil, and production water is drained by gravity to a production water storage tank. For this process to function, the production water tank must be physically lower than the oil tank. Thus, particularly in flat regions, the production water tank is buried. Where burying is no longer permitted under the proposed

regulations, and where the region is relatively flat, the entire storage facility will have to be redesigned to allow for production water separation and storage. One alternative will be to elevate the oil storage tanks on earthen berms or other supports. Another alternative will be to install significant additional tank capacity so that the production water can always be drained into a relatively empty storage tank. In either event the cost will be significant—existing plumbing must be disconnected and re-plumbed, additional tanks or earthwork will be required, and liquids will have to be temporarily removed and stored. Estimates range from \$5,000 to \$20,000 per site depending upon the topography and storage capacity requirements.

Even if only 2,000 buried production tanks are implicated by this new regulatory provision the cost will be significant. At \$6,500 to \$11,000 per tank the cost for replacement alone will range from \$13 million to \$22 million. Even if only ½ of those sites require additional modification because of drainage impracticality the additional cost (at between \$5,000 and \$20,000 per modified site) will be \$5 million to \$20 million for a total cost range of \$18 million to \$42 million for buried production tanks.

In addition, small tanks used to drain drips that are governed by the proposed regulations. There are many thousands of these tanks over and above the numbers discussed above, which tanks are particularly in use in the conventional gas well realm. Many of these tanks are buried as a matter of surface owner request or in order to prevent the tank from being an obstruction to free passage on rights of way. PGCC estimates the existence of 15,000 of these generally smaller tanks, with removal, recovery, replacement and secondary containment costing between \$3,000 and \$9,000 per tank, for a total range between \$45 million and \$135 million.

The cost for both buried production and buried drip tanks ranges from \$63 million to \$177 million. Given the high cost of compliance and given that virtually only small businesses utilize the practice of buried tanks, the DEP failed to consider alternatives as required by the Regulatory Review Act. One of the considerations required under that Act is whether small businesses can be excluded from the requirement altogether. That consideration is appropriate here. Presumably the object of the tank requirement is to help insure that production water is not inadvertently discharged from a leak undiscovered because the tank is buried. A logical question for the DEP to analyze is how frequently discharge from a buried production water tank has been encountered. If the answer is seldom then the benefit of the regulation does not balance the cost. The DEP is in unique possession of those records and the law requires the DEP to consider the same.

The costs of compliance with this section are not in balance with any benefit and reasonable alternatives for Small Businesses were not considered. PGCC understands the objective of this section to be the protection of waters of the Commonwealth from excessive brine impacts, which should be evaluated on a case-by-case basis, rather than through a blanket rule.

Suggested amendatory language:

(c) Secondary containment capable of preventing tank contents from entering waters of the Commonwealth is required for all new, refurbished or replaced tanks or other aboveground containment structures approved by the Department, including their associated manifolds, that contain brine and other liquids [fluids] produced during operation of the well, if such containment is within 100 feet of surface waters of the Commonwealth. If one tank in a series of tanks is added, refurbished or replaced, secondary containment is required for the entire series of tanks, unless exempted as a Small Business or otherwise. The secondary containment area provided by dikes or other methods of secondary containment open to the atmosphere shall have containment capacity sufficient to hold the volume of the largest

single tank, plus an additional 10% of volume for precipitation. Compliance with § 78.64 (relating to containment around oil and condensate tanks) or using double walled tanks capable of detecting a leak in the primary container may be used to shall fulfill the requirements in this subsection.

(d) Tanks, series of tanks or other above ground storage structures approved by the Department used to store brine or other liquids ~~[fluids]~~ produced during operation of the well, shall be designed, constructed and maintained to be structurally sound in accordance with sound engineering practices adhering to nationally recognized industry standards and the manufacturer's specifications. Tanks that are manifolded together shall be designed in a manner to prevent the uncontrolled discharge of multiple manifolded tanks.

(e) ~~[Underground or partially buried storage tanks may not be used to store brine or other fluids produced during operation of the well unless approved by the Department. Existing underground or partially buried storage tanks shall be removed within 3 years of the effective date of this subsection.]~~ A well operator utilizing underground or partially buried storage tanks as of the effective date of this section shall provide the Department with a list of the well sites where the underground or partially buried storage tanks are located. And schedule for removal of the tanks within six months from the effective date of this subsection.

(f) All new, refurbished or replaced permanent aboveground and underground tanks that store brine or other liquids ~~[fluid]~~ produced during operation of the well must comply with the applicable corrosion control requirements in the Department's storage tanks regulations at 25 Pa. Code §§ 245.531-534.

(g) All new, refurbished or replaced tanks storing brine or other liquids fluids produced during operation of the well shall be reasonably protected from unauthorized acts of third parties. Unless the tank is surrounded by a fence or posted with "Danger" and "No Trespassing" signs, tank valves and access lids shall utilize ~~[locks, open end plugs or removable handles and ladders on tanks shall be retractable]~~ or other measures that discourage ~~[prevent]~~ unauthorized access by third parties.

(1135)

Response: The Department does not agree with the suggested language in subsection (c). Secondary containment is important to protect all waters of the Commonwealth, including groundwater. Further, the substances stored at well sites do not depend on the operator's status as a small business or otherwise, so allowing for a distinction based on business size would not adequately protect the environment.

The Department acknowledges the economic impact of the provision requiring removal of underground storage tanks at well sites and has amended the final rulemaking accordingly. Continued use of underground storage tanks at oil and gas well sites will be allowed under the final rulemaking. However, as commentator points out, there are thousands of these underground storage tanks at well sites across the Commonwealth, and proper standards for operation and maintenance of these storage tanks are critical for protection of the environment from spills and releases. For example, Section 3218.4(b) of the 2012 Oil and Gas Act establishes that permanent aboveground and underground tanks must comply with the applicable corrosion control requirements in the Department's storage tank regulations. The final rulemaking includes language establishing these and other appropriate standards.

The Department has added language to the final rulemaking addressing the phase-in of requirements for existing aboveground and buried tanks at well sites.

- 1017.** Comment: 78.57(e) – This section states that an operator must remove underground or partially buried tanks within 3 years of the effective date of the subsection and goes on to state that removal must be scheduled within 6 months of the effective date. Underground tanks are allowed at gas stations and industrial facilities. They should be allowed at well sites also.

Moreover tank burial is done for functional reasons not considered in the Analysis. In some instances production water is virtually fresh; in these cases the tanks are buried to prevent the water from freezing and to allow its removal in winter. In other instances the tanks are buried to facilitate drainage to the tank. The specific gravity of production water is greater than oil, and production water is drained by gravity to a production water storage tank. For this process to function, the production water tank must be physically lower than the oil tank. Thus, particularly in flat regions, the production water tank is buried. Where burying is no longer permitted under the proposed regulations, and where the region is relatively flat, the entire storage facility will have to be redesigned to allow for production water separation and storage. One alternative will be to elevate the oil storage tanks on earthen berms or other supports. Another alternative will be to install significant additional tank capacity so that the production water can always be drained into a relatively empty storage tank. In either event the cost will be significant—existing plumbing must be disconnected and re-plumbed, additional tanks or earthwork will be required, and liquid will have to be temporarily removed and stored.

Suggested Regulatory Language:

(e) A well operator utilizing underground or partially buried storage tanks as of the effective date of this section shall provide the Department with a list of the well sites where the underground or partially buried storage tanks are located. (1153)

Response: See response to comment 1016 regarding the removal of underground or partial buried storage tanks. Continued use of underground storage tanks at oil and gas well sites will be allowed under the final rulemaking.

- 1018.** Comment: 78.57 – We recommend that best technology standards also apply to existing tanks, and that operators be given a period of time to bring the tanks and other aboveground containment structures into compliance.

We support the proposal to require removal of underground or partially buried storage tanks. However, we do not support the waiver clause “unless approved by the Department.” We request that clause be deleted. If the EQB envisions that the PADEP will waive the required removal of underground or partially buried storage tanks and the prohibition on their use, it should explain the circumstances where this would be allowed and define the criteria that would be used in issuing the waivers.

We recommend that buried tanks be prohibited, since they pose a risk of unchecked pollution and aboveground tanks are easier to inspect, maintain, repair, and monitor.

We also recommend incorporating many of the same recommendations we made for temporary storage tanks.

More specifically, we recommend the following changes to the proposed regulations at § 78.57:

§ 78.57. Control, storage and disposal of production fluids.

(a) Unless a permit has been obtained under § 78.60(a) (relating to discharge requirements), the operator shall collect the brine and other fluids produced during operation of the well in a tank or a series of tanks, or other device approved by the Department for subsequent disposal or reuse. Open top structures may not be used to store brine and other fluids produced during operation of the well. Buried tanks are prohibited. All existing open top structures at existing Oil and Gas Operations must be removed by_ (Editor's Note: The blank refers to one year after the effective date of adoption of this proposed rulemaking.). All tanks at existing Oil and Gas Operations must meet the new standards of § 78.57 by _____(Editor's Note: The blank refers to one year after the effective date of adoption of this proposed rulemaking.). Except as allowed in this subchapter, the operator may not discharge the brine and other fluids on or into the ground or into the waters of this Commonwealth.

(b) The operator may not use a pit for the control, handling or storage of brine and other fluids produced during operation, service or plugging of a well.

(c) The operator shall install or construct and maintain the aboveground tank and approved aboveground containment structures in accordance with the following requirements:

(1) All tanks and approved aboveground containment structures shall be constructed and maintained with sufficient capacity to contain all regulated substances and wastes that are used at the Oil and Gas Operation. All tanks shall be located on the well pad so that any spills will be captured by the containment structures and other spill prevention systems.

(2) The operator shall notify the Department at least 3 business days before the planned installation of each tank or approved aboveground containment structure. The notice shall be submitted electronically to the Department through its web site and include the date the installation will begin. If the date of installation is extended, the operator shall renotify the Department of the date that the installation will begin.

(3) All tanks and approved aboveground containment structures containing volatile materials and wastes shall be designed and operated to capture air pollution. All captured vapors shall be used for power, or upon a showing of good cause shall be routed to an incinerator or flare.

(4) All tanks and approved aboveground containment structures shall be designed and constructed at the factory and maintained, routinely inspected and verified to be structurally sound and reasonably protected from unauthorized acts of third parties prior to use. Each tank shall be inspected by a certified tank inspector at least once every five years. Each approved aboveground modular containment structure shall be inspected by a structural engineer at least once every five years. The inspection shall examine structural conditions, document corrosion or damage, and identify necessary repairs before returning it to service.

(5) Overflow alarm systems shall be installed on all liquid storage tanks. The systems shall include high-liquid-level alarms that sound and display in an immediately recognizable manner; high-liquid-level automatic pump shutoff devices, which are designed to stop flow at a predetermined tank content level; and a means of immediately determining the liquid level of tanks.

(6) Unless an individual is continuously present at the Oil and Gas Operation, a fence must completely surround the storage equipment to prevent unauthorized acts of third parties and damage caused by wildlife.

(7) Unless an individual is continuously present at the Oil and Gas Operation, operators shall equip all valves and access lids to regulated substances with reasonable measures to prevent unauthorized access by third parties such as locks, open end plugs, removable handles, retractable ladders or other measures that prevent access by third parties. Each tank and approved aboveground containment structure storing freshwater, fire prevention materials and spill response kits is excluded from the requirements of this paragraph.

(8) The operator shall display a sign on or near the each tank and approved aboveground containment structure identifying the contents and providing an appropriate warning of the contents, such as flammable, corrosive or another description of the relevant danger.

(9) Secondary containment liners capable of preventing tank and approved aboveground containment structures contents from entering waters of the Commonwealth is required for all existing, new, refurbished or replaced tanks or other aboveground containment structures approved by the Department, including their associated manifolds, that contain brine and other fluids produced during operation of the well. New, refurbished or replaced tank and approved aboveground containment structures must meet this standard upon construction or installation. Existing tanks must meet these standards by _____ (Editor's Note: The blank refers to one year after the effective date of adoption of this proposed rulemaking.).

If one tank in a series of tanks is added, refurbished or replaced, secondary containment is required for the entire series of tanks. The secondary containment area provided by dikes or other methods of secondary containment open to the atmosphere must have containment capacity sufficient to hold the volume of the largest single tank, plus an additional 10% of volume for precipitation. Compliance with § 78.64 (relating to containment around oil and condensate tanks) or using double walled tanks capable of detecting a leak in the primary container fulfill the requirements in this subsection.

All tanks and approved aboveground containment structures shall be set on top of a synthetic flexible liner that is sufficient in size to capture any leaks or drips that may occur from the tank or modular structure. Liners shall be impervious, impermeable, at least 30 mils thick; no "alternate methods" allowing for thinner liners shall be allowed. The liner shall be designed, constructed, and maintained so that the physical and chemical characteristics of the liner are not adversely affected by the regulated substance stored therein and the liner is resistant to physical, chemical and other failure during transportation, handling, installation and use. Liner compatibility must satisfy ASTM Method D5747, Compatibility Test for Wastes and Membrane Liners, or other compatibility test approved by the Department for the duration tank or other storage structure is used. Adjoining sections of liners shall be sealed together to prevent leakage in accordance with the manufacturer's directions. The integrity of all seams of the adjoining sections of liner shall be tested prior to use. Results of the tests shall be available upon request.

Prior to placing the tanks and approved aboveground containment structures on the secondary containment liner, the liner shall be inspected for lack of uniformity, damage and other imperfections that may cause the liner to leak. The operator shall correct damages or imperfections before placing the tanks on the liner.

If a liner becomes torn, or otherwise loses its integrity, tanks must be continuously monitored for leaks by onsite personnel while the liner is repaired. If repair of the liner is not practical or possible, the storage tank contents shall be removed and placed in another tank that meets the requirements of this section.

The operator shall notify the Department at least 3 business days before the installation of the liner. The notice shall be submitted electronically to the Department through its web site and include the date the liner will be installed. If the date of installation is extended, the operator shall renotify the Department with the date of installation. A licensed professional engineer or geologist that designed the site shall submit a statement on forms provided by the Department certifying that the liner, as built, is compliant with this section. This certification shall be submitted within 10 business days of installation of the liner.

(d) Tanks, series of tanks or other aboveground storage structures approved by the Department used to store brine or other fluids produced during operation of the well shall be designed, constructed and maintained to be structurally sound in accordance with sound engineering practices adhering to Nationally recognized industry standards and the manufacturer's specifications. Tanks that are manifolded together shall be designed in a manner to prevent the uncontrolled discharge of multiple manifolded tanks.

(e) Underground or partially buried storage tanks may not be used to store brine or other fluids produced during operation of the well. All existing underground or partially buried storage tanks shall be removed by _____ (Editor's Note: The blank refers to 1 year after the effective date of adoption of this proposed rulemaking.). A well operator utilizing underground or partially buried storage tanks as of _____, (Editor's Note: The blank refers to the effective date of adoption of this proposed rulemaking.) shall provide the Department with a list of the well sites where the underground or partially buried storage tanks are located and scheduled for removal of the tanks by _____ (Editor's Note: The blank refers to 6 months after the effective date of adoption of this proposed rulemaking.)

(f) All tanks and approved aboveground containment structures that store materials containing or contaminated with regulated substances must comply with the applicable corrosion control requirements in §§ 245.531—245.534 (relating to corrosion and deterioration prevention). Existing tank bottoms that do not meet the standards of § 245.531(b) shall be taken out of service and repaired or replaced to meet that standard before being returned to use. All existing tanks and approved aboveground containment structures must be evaluated by a corrosion expert by _____ (Editor's Note: The blank refers to one year after the effective date of adoption of this proposed rulemaking) and the corrosion expert's report must be provided to the Department. If the corrosion expert recommends installation of cathodic protection, lining, coating, or other corrosion control measures, the operator must make those repairs within Editor's Note: The blank refers to 18 months after the effective date of adoption of this proposed rulemaking).

(g) All existing, new, refurbished or replaced tanks storing brine or other fluids produced during operation of the well must be reasonably protected from unauthorized acts of third parties. Unless the tank is surrounded by a fence, tank valves and access lids must utilize locks, open end plugs or removable handles and ladders on tanks must be retractable or other measures that prevent access by third parties. (1143)

Response: The Department notes that many of the revisions proposed by the commenter are inappropriate given the applicability of this section of the regulations. This section of the regulations is focused on control, storage and disposal of production fluids at a well site. The scope of this section applies to well sites where wells have been put into production which is fundamentally different than §§ 78.56 and 78a.56. Those sections are focused on temporary storage at a well site which is in the phase of developing oil and gas wells.

See response to comment 1016 regarding the removal of underground or partial buried

storage tanks. Continued use of underground storage tanks at oil and gas well sites will be allowed under the final rulemaking.

The Department disagrees with the proposed revisions to subsection (b). See response to comment 823.

Regarding secondary containment requirements, the Department disagrees with the proposed changes. The existing §§ 78.57(c) and 78a.57(c) address secondary containment including many of the concerns addressed by the commenter through a reference to §§ 78.64 and 78a.64.

The Department disagrees with the proposed changes to subsection (c)(1) because it is not feasible to construct a tank on site that is of sufficient capacity to contain all of the fluids that will be produced through the lifetime of the well.

The Department disagrees with the proposed changes to subsection (c)(2) because the Department does not believe it is necessary for Department staff to receive notification for each and every tank that is installed at an oil and gas production site. The Department has not noted any significant environmental impacts from improper installation of tanks at oil and gas well production sites.

Regarding air pollution concerns, air emissions are regulated under Article III and are beyond the scope of this rulemaking.

Regarding security issues, the Department does not agree with the proposed revisions because of the limited scope of applicability to only production well sites.

Regarding inspections, the Department has amended §§ 78.57 and 78a.57 to require quarterly and monthly inspection of tanks, respectively.

- 1019.** Comment: 78.57: The DEP should entirely prohibit operators from using open pits and impoundments to store flowback, brines and other drilling wastes and instead require that such wastes be stored in tanks and other closed-loop containment systems. (852, 1210)

Response: The Department acknowledges the comment.

- 1020.** Comment: § 78.57(a): The insertion of pits into the wording is ill-advised and contradicts the prohibition of open top structures. Prohibition of open top structures in this clause is welcome and commendable (see point 11 immediately below). A pit is an open top structure. Consequently, the insertion of pits into this clause is contradictory and must be removed. (869a)

Response: Section 78.57(a) and section 78a.57(a) eliminate the use of pits for the collection of production fluids.

- 1021.** Comment: § 78.57(a): Deletion of “service and plugging” from the operations where brine and fluids must be collected is ill advised; the “service and plugging” wording should be put back. (869a)

Response: “Servicing and plugging” are short term operations covered under §§78.56 and 78a.56.

- 1022.** Comment: Another area where the EQB’s proposed regulations fall short concerns the use of open pits on the well pads to store the waste water from the fracking process (Sections 78.56, 78.57, 78.58, and 78.59). Waste water returns to the surface contaminated with toxic chemicals, as well as buried salts and naturally occurring radioactive material and as such needs to be contained to avoid contamination of nearby water sources. To date, Consol Energy has been cited twice for leak violations where, thankfully, the toxic fluids did not enter the reservoir and the ground contaminated was removed from the reservoir site. Also, to Consol Energy’s credit, the operator is using a double layer of plastic to line pits.

The proposed regulations will do little to prevent flooding, spills, and leak violations that may continue to occur at Beaver Run Reservoir and are now commonly occurring at shale gas drilling sites throughout the Commonwealth. Stating a required footage of freeboard provides little protection. Violations due to overflow of the required freeboard occur on a regular basis; companies repeatedly are charged with the same violations; and fines are limited or non-existent. DEP currently permits leakage of toxic chemicals onto residential properties and farmlands from pits, the amount of leakage permitted being determined by the depth of the fluid in the pits. I call on DEP to stop permitting such leakage of fluid on surrounding land and to impose fines that will discourage repeat violations. (402)

Response: The Department acknowledges the comment. Section 78.57(b) and Section 78a.57(b) prohibit the use of pits to store brine or other fluids produced during operation of a well.

- 1023.** Comment: §78.57(a) states: “Open top structures shall not be used to store brine and other fluids produced during operation of the well.” This is commendable but “the well” should be replaced by “a well”. Produced water from some other well should not be stored in an open-top structure either. (869, 869a)

Response: The language in § 78.57(a) mirrors the language contained in section 3273.1 of the 2012 Oil and Gas Act. Produced water from wells not located on the well site may only be stored on another well site so long as all of the produced water so stored will be used at the other well site.

- 1024.** Comment: § 78.57(a): This provision must make it clear that a pit is an open-top structure. Hydraulic fracturing chemicals should not be put into “open-top structures” either. Altogether, pits should only be used for actual fresh water. (869, 869a)

Response: Section 78.57 and section 78a.57 eliminate the use of pits for the collection of production fluids. Hydraulic fracturing additives are not addressed by this section and storage of such materials is regulated under § 78a.64a.

- 1025.** Comment: we support the prohibition on using open top structures to store brine and other produced fluids (78.57(a)); and the need for increased security to prevent vandalism and unlawful discharges from storage tanks pads (§§ 78.56(a) and 78.57(g)). (852)

Response: The Department acknowledges the comment.

- 1026.** Comment: **78.57(a):** This section could be interpreted as excluding the use of centralized impoundments (§ 78.59c). Centralized impoundments play a critical role in facilitating the economics to allow for a robust water recycling program that provides relief to water use and disposal demands in the region. It has been a stated goal for the Commonwealth to promote the

responsible recycling and reuse of oil and gas wastes to reduce the demand on fresh water resources for oil and gas development and operations. Conversely, if forced to abandon the use of centralized impoundments for collecting produced water to stage for reuse, companies would have to supplant that storage with a series of storage tanks that total a much larger footprint or turn to a greater use of freshwater.

Suggested amendatory language:

(a) Unless a permit has been obtained under § 78.60(a) (relating to discharge requirements), the operator shall collect the brine and other fluids produced during operation of the well in a tank or a series of tanks, centralized impoundment, or other device approved by the Department for subsequent disposal or reuse. Open top structures shall not be used to store brine and other fluids produced during operation of the well with the exception of centralized impoundments permitted under § 78.59c. Except as allowed in this subchapter or otherwise approved by the Department, the operator may not discharge the brine and other fluids on or into the ground or into the waters of this Commonwealth. (1099, 1071, 1137, 1147, 1174)

Response: The Department does not agree with the suggested language in subsection (a). All references to pits or open-top structure as an acceptable structure for storing fluids produced during operation of the well are being eliminated from §§ 78.57 and 78a.57.

- 1027.** Comment: 78.57(a)(b) Commentator supports the elimination of the use of pits and the use of a series of pits as used for the collection of brine and other fluids. Commentator also supports measures that provides for more stringent requirements for the storage of brine and other fluids eliminating the use of open top storage. The STRONGER Pennsylvania Follow-Up State Review published September 2013 notes that “The DEP’s current regulations in 25 Pa. Code §§ 78.56 and 78.57 are limited with regard to requirements for location, use, capacity, age and construction of E&P waste tanks.” Further, the Review states, “The review team has determined that a large number of tanks exist throughout Pennsylvania and that the state does not have standards for tank closure and removal.” And finally, the Review states, “The review team finds that the DEP consider adopting regulations that address tank inventory, structural integrity, siting, the use of open top tanks, secondary containment, tank security and removal.” [page 39] (Guideline Section 5.9.2.) We appreciate the Department moving forward with action that implements recommendations from the STRONGER Review. Pursuing action based on the STRONGER Review is one important aspect of addressing regulations in an organized and fluid manner. We support the adoption of these provisions at a minimum as written. (660a)

Response: The Department acknowledges the comment.

- 1028.** Comment: Prohibition of open-air frack pits so that wastewater is stored on site in a closed loop system before being treated or recycled. This will reduce the potential for unintentional runoff of contaminated water and exposure of wildlife to toxic waters. (1033)

Response: The Department acknowledges the comment.

- 1029.** Comment: 78.57(c) – This one size fits all regulation is excessive when applied to many conventional wells. The associated volumes and chemistry/salinity of conventional well brine are different than that of unconventional brine, therefor this regulation should make a distinction as well. We agree that wells that produce liquid hydrocarbons or wells within an agreed-upon distance from surface waters should have tanks equipped with secondary containment. However, wells that produce small amounts of brine with moderate to low salinity located safely away from surface

waters should not need costly and aesthetically unpleasing dikes or double wall tanks. For example, a conventional well with adequate distance from any surface water that produces less than 10 bbl/month of low salinity brine (used for dust suppression and de-icing on local roads) does not need a double wall tank or a tank equipped with a dike. On one hand, the Department encourages the road spreading of conventional brine, but on the other hand, the Department perceives that the environmental risk is great enough that secondary containment is necessary in all cases of new, refurbished, or replaced tanks associated with conventional wells.

This rule should focus on the need for secondary containment on wells, both conventional and unconventional, whose production includes a liquid hydrocarbon component and/or is located within a certain distance from surface water.

Suggested Regulatory Language:

(c) New, refurbished or replaced tanks or other aboveground containment structures approved by the Department, including their associated manifolds, that contain brine and other fluids produced during operation of wells that produce oil, condensate, or other liquid hydrocarbons and are located within 100 feet of surface waters shall be equipped with secondary containment capable of preventing tank contents from entering surface waters. If one tank in a series of tanks is added, refurbished or replaced, secondary containment is required for the entire series of tanks. The secondary containment area provided by dikes or other methods of secondary containment open to the atmosphere shall have containment capacity sufficient to hold the volume of the largest single tank, plus an additional 10% of volume for precipitation. Compliance with § 78.64 (relating to containment around oil and condensate tanks) or using double walled tanks capable of detecting a leak in the primary container shall fulfill the requirements in this subsection. (1153)

Response: See response to comment 1016.

1030. Comment: 78.57(c) (includes Conventional Drillers) – The Commonwealth’s extraordinary amount of water resources is only surpassed by the much larger state of Alaska. Many of us fully didn’t recognize the quantity of water resources all around us until we began noticing in the early years of Marcellus Shale that it almost seemed more common than not to have a well pad located nearby a pond, small stream, creek, wetland, river or some other water body. In order to fully protect our water resources, environmental protection has grown towards the use of secondary containment in many industrial facilities. It is time to implement the use of secondary containment for all aboveground structures which hold brine or other fluids. We realize that the legacy of these structures is primarily a liability of the conventional drillers, whom at times have been complacent to move forward and utilize modern environmental protection methods. According to the regulatory analysis, on a per well basis, this additional cost to the conventional drillers is \$3,000. Given the fact that oil prices/barrel have continually been hovering around \$100, it does seem the time is right to finally address these potential environmental risks. We therefore, support this provision for adoption at the minimum as it is written. (660a)

Response: The Department acknowledges the comment.

1031. Comment: 78.57(c)(1) -This form needs to be produced and reviewed prior to establishment of this section. (411)

Response: The form referenced in the comment is contained in a portion of the existing rulemaking that is being deleted.

1032. Comment: 78.57(c)(2)(vii) - Why should a liner under this section be required to satisfy EPA Method 9090 whereas as liner under section 78.56(a)(9)(iii) must meet ASTM Method D5747? (411)

Response: The standard referenced in the comment is contained in a portion of the existing rulemaking that is being deleted.

1033. Comment: 78.57(c) – This section is rather confusing. Is the section regarding secondary containment for any tanks or above ground structures that contain brine? It seems as though the secondary containment section needs to be a separate clause from 78.57(c). Subsection (c) should only be for pits and not tanks or above ground structures per the succeeding sections. Also, there should be construction guidelines for diking/secondary containment. Is a liner required, etc? (411)

Response: All references to pits as an acceptable structure for storing fluids produced during operation of the well are being eliminated from §§ 78.57 and 78a.57. This subsection applies for all new, refurbished or replaced tanks or other above ground containment structures approved by the Department that contain brine and other fluids produced during production of the well. Compliance with §§ 78.64 and 78a.64 (relating to containment around oil and condensate tanks) fulfills the requirements of this subsection. To be in compliance with §§ 78.64 and 78a.64, diking or other method of secondary containment must satisfy the requirements under 40 CFR Part 112 (relating to oil pollution prevention).

1034. Comment – This section requires secondary containment “sufficient to hold the volume of the largest tank, plus an additional 10% of volume for precipitation.” Considering the likelihood of extreme weather events coupled with the possibility of events resulting in the rupture of more than one tank in any given secondary containment area, the NPS suggests the Department adopt a standard of requiring a secondary containment “with the sufficient perimeter and height to hold 1.5 times the volume of the largest tank.” We believe this enhanced requirement will better protect lands and waters of the Commonwealth and adjacent areas and has long been employed by the National Park Service for nonfederal oil and gas operations conducted under our regulations found at 36CFR Part 9B. We are happy to discuss our experiences with this section of the 9B regulations with PA regulators. (1062, 1133)

Response: If secondary containment is properly designed, constructed, maintained & operated in compliance with these regulations, the Department believes the volume of the largest tank plus an additional 10% of volume for precipitation secondary containment capacity requirement is adequate to protect the environment.

1035. Comment: § 78.57(c): We also request clarification on whether this subsection applies to all existing operations or only new operations? We suggest this more protective standard be required of both existing and new drilling operations. (1062, 1133)

Response: This subsection applies to both new and existing operations at the time when any new, refurbished or replaced tanks or other Department-approved aboveground containment structures are used at the well site.

1036. Comment: Commentators express concern that section 78.57(c) only applies to threats of pollution to the waters of Pennsylvania, whereas the Section 3218.2(a) of Act 13 expressly states that containment also applies to “the ground surface or spills off the well site.” This concern also applies to Section 78.66(b)(1)(i). We ask EQB to ensure that all containment provisions align with intent of the General Assembly and the standards set forth in Act 13. (1099)

Response: The Department acknowledges the comment. Section 3218.2(a) of the 2012 Oil and Gas Act only applies to unconventional wells during drilling and hydraulic fracturing operations, and does not explicitly include fluids produced during the operation of the well in its list of materials subject to the section. Subsection (c) applies to all wells that are in production, whether conventional or unconventional and by its terms only applies to fluids produced during operation of the well.

1037. Comment: 78.57(c) – A requirement of secondary containment for brines would necessitate a large effort on the Commentator’s part to comply with the proposed standard if a large number of those tanks are required to be repaired, upgraded, or retrofitted simultaneously. In order to make this standard more attainable, include language that allows flexibility for the Operator to develop a plan (to be approved by the Department) to upgrade the containment at their locations in a phased, risk based approach. (1103)

Response: Sections 78.57(c) and 78a.57(c) require secondary containment for new, refurbished and replaced tanks at well sites. Operators must employ secondary containment when conducting such operations and the language is retained in the final rulemaking.

1038. Comment: The original rule provided that compliance with section 78.57(c) constituted compliance with section 78.64a. The proposed changes to section 78.57 remove any discussion of pits as an option to control, store, or dispose of production fluids. The proposed changes to section 78.64a caused that section to only apply to unconventional well sites. It is not clear how the Department plans to address operation, maintenance, and closure of existing production pits in the new regulations. (852a)

Response: The Department has added language to the final rulemaking requiring any pit for storage of production fluids in operation at the time of the effective date to be identified and properly closed in accordance with restoration standards with a set timeframe (one year).

1039. Comment: 78.57: The commentator strongly advocates that open top structures be prohibited for the containment of all produced fluids, flowback, volatile organics, and other wastes. (980, 1098)

Response: Section 78.57 and Section 78a.57 eliminate the use of open top structures for the collection of brine and other fluids during the operation of the well.

1040. Comment: 78.57(c): This should be without exception. No pit should be allowed – even under the Clean Streams Law – except for a very limited time (no more than 30 days) during an emergency. (980, 1098)

Response: The Department acknowledges the comment. Section 78.57 and Section 78a.57 eliminate the use of pits for the collection of brine and other fluids during the operation of the well, without exception.

1041. Comment: 78.57(d) – All liners and waste products must be disposed using best practices at off-site locations certified for hazardous materials. (980, 1098)

Response: The Department does not agree with the commenter’s assertion that all liners and waste products generated at well site are characteristically hazardous. See response to comment 1493 regarding on-site disposal. Off-site disposal of waste materials is managed by the Department’s Waste Management program and such materials must be handled in

accordance with applicable statutes and regulations.

- 1042.** Comment: 78.57(e): In addition to the secondary containment and additional safeguards around tanks to prevent unauthorized access, all tanks must be installed above ground for easy access and monitoring (980, 1098).

Response: See response to comment 1016.

- 1043.** Comment: Supplemental precautions must be added to avoid consequences like those from the January 2014 chemical tank leak in West Virginia. (980, 1098)

Response: The Department acknowledges the comment.

- 1044.** Comment: We applaud the DEP for amending § 78.57 to specifically: (1) prohibit the storage of brine and other fluids produced during operation of a well in an open top structure or in permanent pits; (2) require secondary containment for all new, refurbished or replaced tanks or other associated manifolds, or for additions to an existing series of tanks, for brine or other fluids produced during operation of well; and (3) prohibit the future use of underground or buried storage tanks, and removal of existing underground or buried storage tanks within three years. (1157)

Response: The Department acknowledges the comment. See response to comment 1016.

- 1045.** Comment: We recommend the adoption of the improvements regarding secondary containment. (1035)

Response: The Department acknowledges the comment.

- 1046.** Comment: § 78.57(c), (d), (f), and (g) – There is no indication of when flowback water is considered to be “brine or other fluids produced during operation of the well.” For the waste regulations, flowback (804) waste is generated for 30 days after fracturing. After that, it is considered to be production fluids (801).

Response: The distinction in waste fluids is driven by determining which stage of well development generated the fluids. Section 78.57 and section 78a.57 only apply to brine and other fluids produced when the well is in operation. Section 78.56 and section 78a.56 apply to substances and wastes from the drilling, alteration, completing, recompleting, servicing and plugging of the well. This distinction is clear enough and the Department has not amended this section.

- 1047.** Comment: § 78.57(c), (d), (f), and (g) – At what point, if any, is flowback water considered “brine or other fluids produced during operation of the well”? For the waste regulations, flowback (804) waste is generated for 30 days after fracturing. After that, it is considered production fluids (801). The manifolding and security requirements especially will become cumbersome if intended to apply during the initial flowback period. (124a, 913a)

Response: See response to comment 1046.

- 1048.** Comment: 78.57(d) -This requirement is too vague and leaves too many specific requirements up to interpretation. (411)

Response: See response to comment 1051.

1049. Comment: 78.57(d) C.O.G.E.N.T. recommends the adoption of this provision which creates design standard for tanks and above ground storage structures. (660a)

Response: The Department acknowledges the comment.

1050. Comment: Replace “fluids” with “liquids” wherever the term is used in this section. (1135)

Response: The term “produced fluids” is a common industry term used to describe all fluids produced from a wellbore.

1051. Comment: **Engineer’s certification and submissions of plans.** Section 78.57(d) should require that design plans for the tank system and secondary containment are certified and sealed by a licensed professional engineer. The design plans should be submitted to the Department as part of the permit application with a narrative explaining how the system is compatible with all stored production fluids, controls gas emissions, and otherwise complies with the regulations. (852a)

Response: The Department’s standards are performance based, and do not require review prior to permitting. The Department’s waste management regulations concerning tank storage of residual waste in 25 Pa. Code § 299.122 do not require prior review or licensed professional engineer certification for storage of residual waste in tanks. The final rulemaking includes language establishing these and other appropriate standards.

1052. Comment: Flowback should be stored in more secure, close-loop systems to prevent groundwater and air contamination.(24, 909)

Response: This section only applies to fluids produced during the operation of the well, and not flowback. Section 78.57 and section 78a.57 eliminate the use of pits for the collection of brine and other fluids during the operation of the well, without exception.

1053. Comment: **78.57(e)** – This section states that an operator must remove underground or partially buried tanks within 3 years of the effective date of the subsection and go on to say you must schedule the removal within 6 months of the effective date. The time frames are conflicting. (411)

Response: See response to comment 1016.

1054. Comment: 78.57(e): Underground tanks are allowed at gas stations and other industry facilities so why should tanks at well sites not be allowed? (411)

Response: See response to comment 1016.

1055. Comment: **78.57(e)** – The DEP intends to force operators to remove below ground brine storage tanks with this proposed regulation. Operators typically use buried brine tanks for gravity draining to minimize pumping, valves, and fittings. If above ground brine tanks are installed next to oil tanks, brine must be pumped from one tank to another, increasing the risk of pollution from vandalism or from freezing. I recommend the DEP study the potential environmental effects of freezing pipes and pumps associated with above ground brine tanks and fluid transfer. If the environmental benefits associated with removing buried brine tanks outweighs the potential pollution caused by frozen pipes and pumps, only then should this portion of regulation should be implemented.(450)

Response: The Department acknowledges the economic impact of the provision requiring removal of underground storage tanks at well sites and has amended the final rulemaking accordingly. Continued use of underground storage tanks at oil and gas well sites will be allowed under the final rulemaking. However, there are thousands of these underground storage tanks at well sites across the Commonwealth and proper standards for operation and maintenance of these storage tanks are critical for protection of the environment from spills and releases. For example, Section 3218.4(b) of the 2012 Oil and Gas Act establishes that permanent aboveground and underground tanks must comply with the applicable corrosion control requirements in the department's storage tank regulations. The final rulemaking includes language establishing these and other appropriate standards.

- 1056.** Comment: **78.57(e)** (includes Conventional Drillers) - We hereby emphasize our support for 78.57(e). We recognize that this provision mainly pertains to conventional drillers. With the advent of conventional horizontal drilling, it is of significant importance that attention be paid to underground or partially buried storage tanks. It is unclear at this point how conventional horizontal drilling will affect the conventional driller's operations.

It is well documented that underground and partially buried storage tanks create greater environmental risks than above ground storage tanks with secondary containment. Providing operators with a three year time frame provides them with adequate opportunity to do appropriate and needful business planning. Many of these tanks are very old. They are subject to weather and seasonally changing soil conditions and thus corrosion. The environmental harm that may be created by old and leaky tanks far outweighs the replacement cost.

Considerable discussion occurred during the TAB subcommittee meeting regarding removal and replacement of these tanks. There was not sufficient, factual information put forward that effectively demonstrated why these tanks need not be removed. During the meeting it was suggested that a certification of discontinuation of use should be accepted in lieu of tank removal. This is not acceptable. In cases where former gas stations have ceased operations, tanks most often are removed. Often, upon removal of these old tanks it is discovered that they had been leaking. Filing certificates for dotted fields of abandoned "tank litter" is not an acceptable environmental practice.

The September, 2013 STRONGER review noted that there may be as many as 200,000 tanks currently in statewide. "The review team has determined that a large number of tanks exist throughout Pennsylvania and that the state does not have standards for tank closure and removal. They further recommended that the DEP consider adopting regulations that address tank inventory, structural integrity, siting, and the use of open top tanks, secondary containment, tank security and removal." (Guideline Section 5.9.2.)[page 39] Much of what is proposed here meets that recommendation.

We support the recording initiative that will essentially create a partially underground and buried tank inventory. We strongly urge the adoption of this provision with the intent as it is presently written. This provision aids the Department in ensuring that our environment, especially that our water resources are adequately protected. (660a)

Response: The Department acknowledges the comment. See response to comment 1055.

- 1057.** Comment: Our production system consists of a number of wells producing oil, water and gas into gathering lines that are tied into a tank battery which typically includes 2 - 210 barrel above ground oil storage tanks, 1buried or bunkered 200 barrel brine storage tank, a gas separator and a gas meter

all contained within an area surrounded by a berm (dike) 2.5 to 3.0 feet in height. Brine produced into the oil storage tanks is transferred to the brine storage tank by gravity drainage. A Spill Prevention control and Countermeasure (SPCC) Plan certified by a professional engineer is prepared and implemented for each lease. The plan includes recommendations for periodic inspections of all production equipment including the storage tanks to ensure there are no fluid or gas leaks.

Proposed regulation § 78.57(e) states that underground or partially buried storage tanks may not be used to store brine or other fluids produced during operation of the well unless approved by the Department and that existing underground or partially buried storage tanks shall be removed within 3 years of the effective date of this subsection. To date, Dallas Energy has not experienced any leaks from its buried brine storage tanks and believes that the periodic inspections it carries out ensures the brine storage tanks are well maintained.

We recently prepared an estimate to remove the buried brine storage tanks and replace them with an alternate oil-brine separation system which would comply with the applicable corrosion control requirements. The low end of the estimate was \$12,000.00 which works out to 130 barrels of oil at today's price of \$90 per barrel. This in turn works out to over 4 months production from one of our 1 barrel of oil per day wells (not including operating costs). (885)

Response: See response to comment 1055.

1058. Comment: 78.57(e) – Underground or partially buried tanks that store brine have to be identified and exemption required to be requested to preclude the required removal within 3 years is a significant concern given the reason that most buried or partially buried tanks exist. These tanks have been sited in this matter to accept gravity flow from production tanks, provide resistance to freezing and for surface right of ways. Removal of these tanks results in many additional costs including tank removal (and likely replacement from damage during removal) new tanks, secondary containment construction, larger use of the surface and concerns over how to prevent the production water from freezing. (998)

Response: See response to comment 1055.

1059. Comment: 78.57(e) is new language addressing the removal of existing underground or partially buried storage tanks. Commentators assert that this new requirement is unnecessary and unjustified, and that EQB did not consider the cost of replacing the tanks in its analysis of the fiscal impact of the regulation. Other commentators state that this new requirement contradicts the grandfathering provision of Act 13. We ask EQB to explain how this provision aligns with the intent of the General Assembly and Act 13. We also ask EQB to explain in the Preamble and RAF of the final-form regulation how this subsection reasonably and adequately balances protection of the public health and natural resources against the fiscal impact on the oil and gas industry. (1099)

Response: The Department acknowledges the economic impact of the provision requiring removal of underground storage tanks at well sites and has amended the final rulemaking accordingly. Continued use of underground storage tanks at oil and gas well sites will be allowed under the final rulemaking. However there are thousands of these underground storage tanks at well sites across the Commonwealth and proper standards for operation and maintenance of these storage tanks are critical for protection of the environment from spills and releases. For example, Section 3218.4(b) of the 2012 Oil and Gas Act establishes that permanent aboveground and underground tanks must comply with the applicable corrosion control requirements in the department's storage tank regulations. The final rulemaking

includes language establishing these and other appropriate standards.

- 1060.** Comment: 78.57(e) - The obligation to remove existing underground or partially buried storage tanks within three years of the effective date of this subsection imposes excessive and unnecessary costs on legally adopted and utilized equipment and procedures for the storage of brine or other production fluids. The Department has not provided justification for a blanket rule that would impact hundreds of existing operations. Such justification would require analysis and review of a highly factual and site specific nature, which is entirely absent. Nor has the Department included any cost estimate in the Regulatory Analysis Form associated with removal and replacement of those tanks; only an estimate for registering those tanks (RAF19). Suggested language: (e) A well operator utilizing u underground or partially buried storage tanks as of the effective date of this section shall provide the Department with a list of the well sites where the underground or partially buried storage tanks are located within six months from the effective date of this subsection. (1137, 1174)

Response: See response to comment 1055.

- 1061.** Comment: The proposed Section 78.57(e) would require the removal of all underground or partially buried brine tanks. PADEP fails to realize that these underground tanks serve as a gravity drain from above ground oil tanks. If you force us to put these tanks at the same elevation as oil tanks, many more lines, fittings, and pumps would need to be in place to transfer brine. In the winter, these lines and pumps will freeze and pose a pollution hazard. Leaving tanks below ground is much less of a potential environmental hazard. (613)

Response: See response to comment 1055.

- 1062.** Comment: Production Fluid Corrosion Control Requirements- Support with Risk-Based Guidance : Subsection 78.57(f)'s requirement that all new, refurbished or replaced tanks that store brine or other fluid produced during operations of the well must comply with the applicable corrosion control requirements in 25 Pa. Code §§ 245.531-245.534 is a major expansion on Pennsylvania tank regulations and, therefore, the Board should provide a protocol or guidance for a risk-based implementation schedule. We ask for guidance on how an operator can reasonably manage and prioritize inspections based on the vast expansion of tanks falling under the scope of the Department's Chapter 245 Administration of the Storage Tanks and Spill Prevention Program. Under Chapter 245, the Department currently exempts tanks which are used to store brines, crude oil, drilling or frac fluids and similar substances or materials and are directly related to the exploration, development, or production of crude oil or natural gas regulated under Act 13. In its current proposal, the Department is interpreting § 3218.4(b) of Act 13, which requires all permanent aboveground and underground tanks to comply with the applicable corrosion control requirements in the Department's storage tank regulations, to mean compliance with §§ 245.531-245.534 (relating to corrosion and deterioration prevention).

An internal tank inspection, after the tank has been producing, requires specialist inspectors, in-depth cleaning and waste disposal procedures, confined space permits as well as other additional precautions and procedures to ensure safe and environmentally responsible inspection. Excessive inspection of tanks can result in damage to the internal coating of tank systems via access of personnel and inspection to the tank. This damage can exacerbate corrosion in the tank due to introduction of coating holiday tests. The overall cost to inspect atmospheric storage tanks on-site, considering the various requirements necessary to inspect the tank in a safe and environmentally prudent manner can easily exceed 50% of the cost to simply replace the existing tank with a new tank.

Therefore, to provide the maximum environmental gain of the proposal, while avoiding unnecessary risks, costs and inefficiencies, we advocate that the Board provide language addressing the following: (1) options for phased implementation with tank operators whose tanks are currently exempt from Chapter 245, (2) a method for providing data from the Department outlining issues seen from recently installed Marcellus-dedicated production tanks specifying that the tanks are experiencing rapid deterioration, and (3) a method in which the Department will work with operators to obtain inspection data with operators to ascertain whether there is a pronounced “risk” to tank integrity on new Marcellus infrastructure. In summary, we suggest the Board consider a risk-based inspection approach to better focus inspection activities on atmospheric storage tanks where a leak could create a tangible environmental, personal safety, and/or negative impact on the community. (1085)

Response: Section 3218.4(b) of the 2012 Oil and Gas Act requires corrosion control for tanks. The requirements build on established regulations governing aboveground storage tanks. The established regulations are based on industry standards and best practices. Routine inspections are a standard part of every tank installation program and are retained in the final rulemaking; however the timeframes have been adjusted to more closely match the inspection timeframes in Chapter 245.

- 1063.** Comment: 78.57(f) - Corrosion is an important factor with both the tanks and the brines and other fluids that may be stored. Commentator recommends the adoption of this provision as written. (660a)

Response: The Department acknowledges the comment.

- 1064.** Comment: 78.57(g): As previously referenced in our general comments about the drawbacks of overly prescriptive language, it is our suggestion that the prescriptive language be stricken. The requirement for reasonable protection from unauthorized acts of third parties should suffice while allowing the operator the flexibility to determine the best approach for each particular circumstance that avoids inadvertently creating occupational safety concerns. (1071)

Response: See response to comment 1217. The Department agrees that changes to § 78.57(g) to remove the requirement to install equipment to prevent unauthorized access by third parties are appropriate for conventional operations.

- 1065.** Comment: 78.57 (g): We support requiring security around storage vessels at well pads (113)

Response: The Department acknowledges the comment.

- 1066.** Comment: 78.57(g) - Landowners are concerned about third parties gaining access to sites and tank areas. Tanks may contain a variety of substances that in the event of an authorized action may place at risk our water supplies or even nearby properties. C.O.G.E.N.T. recommends that these security measures and all others be adopted in order to provide for adequate protections for our water supplies and properties. (660a)

Response: The Department acknowledges the comment.

- 1067.** Comment: All of our well sites are visited at least once per week by company personnel. Routine site inspections are made regarding well conditions as well as onsite containment. Tank measurements are tracked to ensure no fluid is being lost. If there are any issues regarding tanks or

valves they are caught very early. We disagree with the need to construct dikes around our tank facilities as we believe it will disguise any early signs of deterioration from being detected. Specifically, during the rainy season the dikes will collect rain water and during the winter months drifting snow; both of which will obscure the lower portions of the tank and make early detection of problems impossible. Earthen dikes around tanks associated with oil bearing wells make some practical sense as oil will float to the surface of pooled water. Earthen dikes around brine tanks associated with gas wells do not as it will be very difficult to distinguish pooling rain water from tank discharges.

It has always been our goal to reduce our well site foot print as much as practicable, the addition of a tank dike will require the tank to be placed farther from the well head, drip and meter. The proposed regulation requires a dike large enough to hold the largest tank plus 10%. On a standard gas well there is typically one - 100 barrel brine tank, the dike area required to contain this 110% capacity will encompass a very large area and will necessitate a large finished platform. For existing wells where a producer needs to change or fix a tank it will require enlarging the existing location which will create more disturbed areas and potential run off. The environmental impacts resulting from disturbing this stabilized existing location for the relocation of a tank and construction of a dike far outweighs the benefits. (416, 418)

Response: The Department believes that secondary containment provides a necessary environmental protection measure in the event of a tank rupture.

- 1068.** Comment: With regard to 78.57 (g) we see many safety issues with what is proposed. The use of locks on tank valves and access lids create a hazard especially in the winter months when they are prone to freeze. Thawing of locks in a potentially gaseous environment around a well head will certainly lead to a higher percentage of accidents. The Department's primary concern should be at the tank discharge and the most prudent and safe way for all Involved to secure tanks are through the use of solid hex head plugs in the drain valve outlet and removal of the handle from the drain valve body. (416, 418)

Response: The Department agrees that changes to § 78.57(g) to remove the requirement to install equipment to prevent unauthorized access by third parties are appropriate for conventional operations.

- 1069.** Comment: Additional safety concerns with 78.57 (g) involve the use of retractable ladders on tanks. Currently the industry standard incorporates a step type system (double handrail) which allows personnel to access the top of a tank to obtain needed measurements of fluid levels. Use of a retractable ladder will only add to fall hazards and accidents especially during the winter months when the retractable ladder becomes frozen or the rungs iced over. The double handrail stair system is the best and safest way to protect our employees from fall hazards. If the main concern driving the use of retractable ladders is the general public than tank signage should continue to serve the purpose of putting them on notice as to potential hazards. (416, 418)

Response: See response to comment 1068.

- 1070.** Comment: § 78.57 should prohibit the burial of tanks used to store liquid waste as the tanks may corrode and leak.(853a)

Response: See response to comment 1016.

1071. Comment: 78.57: The Department should impose a time limit, such as 60 days, for on-site storage of production fluids. (997a)

Response: The Department does not believe an arbitrary time limit is necessary for on-site storage of production fluids so long as the requirements of this section are being followed.

1072. Comment: 78.57: If storage (of production fluids) exceeds one year, the same pit/tank integrity inspection requirements we recommend in our comments for § 78.56 should be applied here as well. (997a)

Response: The Department acknowledges the comment. Section 78.57 and section 78a.57 eliminate the use of pits for the collection of production fluids. The current and proposed regulations adequately address the inspection of tanks for the storage of production fluids.

1073. Comment: Commentator is calling for a complete ban on open wastewater impoundments.(119)

Response: The Department acknowledges the comment.

1074. Comment: Waste water from drilling must have very strict handling procedures enforced by stiff fines if not explicitly followed. A trust fund needs to be established for any necessary cleanup. (186)

Response: The Department has regulations that cover the handling of wastewater and require operators to perform any necessary cleanup. The Department has the authority to order cleanups or corrective action to be conducted or impose fines in the event noncompliance.

1075. Comment: 78:57: Please refer back to Pages 3-5 of these comments under “Temporary Storage” and comments pertaining to the “Seasonal High Water Table” as most, if not all, of the suggestions and considerations there also apply as to what comments should be made here. (189) Cross reference comments in 78.56 from this commentator.

Response: Seasonal high water table in § 78.56 applies to pits. Section 78.57 and section 78a.57 eliminate the use of pits for the collection of brine and other production fluids.

1076. Comment: Be assured that I care deeply for the earth. Please make sure that laws reflect proper disposal of the chemicals and liquids that are used to drill deep into our earth. (584)

Response: The Department acknowledges the comment.

1077. Comment: Fumes, Mists and Liquids Discharged from Storage Tanks: There should be no legally allowed leakage or release of vapors, mists or fluids. (609, 938, 938a)

Response: Air quality is regulated under Article III and is beyond the scope of this rulemaking.

1078. Comment: Containers that might accumulate vapors, such as condensate tanks or produced water tanks, must have vapor capture mechanisms that prevent the escape of any fumes, especially known toxins such as benzene. (609, 938, 938a)

Response: See response to comment 1077.

1079. Comment: Air quality monitors that operate continuously must be installed to verify and report to

the DEP that harmful gases are not escaping from the site. (609, 938, 938a)

Response: See response to comment 1077.

1080. Comment: Limits for chemical emissions from tanks must take into account

(1) The density of tanks in an area as aggregate air pollution sources.

(2) Their proximity to buildings with sensitive populations (e.g., schools, hospitals). (609, 938, 938a)

Response: See response to comment 1077.

1081. Comment: A major concern has to be our water supplies - particularly after the poorly regulated situation in Charleston, WV that just occurred. A simple chemical spill took out the water supply for 300,000 people because of the lack of regulations and oversight. Open pits and wastewater impoundments, also lacking sadly in WV, have a tendency to fail - from poor construction or by forces of nature - which imply that the safest feature that would minimize environmental hazards would be the requirement for a closed loop system as a basic water handling technique. It must be appreciated that somewhere between 1 million and 7 million gallons of water are needed to frack a single well - which may be tracked over the course of its lifetime possibly up to 6 or 7 additional times. Water - even abundant here in PA compared to the western part of the US is still a valuable resource and must be protected from inadvertent mishaps. (916)

Response: The Department acknowledges the comment. Section 78.57(a) and section 78a.57(a) ban the use of open-top structure to store brines and other fluids produced during operation of the well.

1082. Comment: Sections 78.56 and 78.57 strengthen the standards for the storage of liquid and solid wastes, but do not set forth a regulatory scheme that will adequately protect the residents and resources of the Commonwealth from the risks associated with contaminated waste products. These sections should require DEP to apply US RCRA Subtitle C standards to regulate hazardous materials contained in pits, and should prohibit the use of any pits and open tanks. The bottom line is that the use of pits and open tanks is an irresponsible practice that must not be allowed to continue. (918)

Response: The Department acknowledges the comment. Section 78.57(a) and section 78a.57(a) ban the use of open-top structure to store brines and other fluids produced during operation of the well.

1083. Comment: Open storage pits, of any kind, should never be allowed. A pit lined with plastic has an inevitability of failure. For example, WPX contaminated the well water of at least one family in Donegal Twp, Westmoreland County through the tearing, or forming of holes, in the liner of a waste pond. For over a year the impacted family has been utilizing a temporary source of water and the DEP has yet to issue a determination, in spite of having ample water tests which show an increase in barium after drilling activities began. From my review of O&G compliance reports, including inspector comments from site visits and violations issued, problems with waste pits are very common. Eliminating these pits would allow inspectors to spend more time monitoring other areas of concern and would remove the waste pit as a source of contamination. (919, 943)

Response: The Department acknowledges the comment. Section 78.57(a) and section 78a.57(a) ban the use of open-top structure to store brines and other fluids produced during operation of the well.

- 1084.** Comment: Produced Water (i.e. water returned from fracking well) All facilities used to hold fluids that may contain potential water pollutants should be closed and specifically engineered for the task.

Produced water contains chemicals from the prior shale deposits (e.g., salts, heavy metals, organic compounds and radio nucleotides) as well as chemicals introduced by the tracking company (e.g., acids and preservatives). Produced water poses a threat to the water, soil and air.

- Water threat: Concentrations of the chemicals listed above are up to 1000 times the allowed limits in surface or drinking water supplies. Numerous cases of harm to well water, municipal water, and stream life have been recorded in PA and in every formation in the US where deep shale operations have occurred.
- Soil threat: The heavy metals and radio nucleotides will permanently contaminate any soil where produced water is spilled. The salts might be washed out, but this simply transfers the problem to water supplies.
- Air threat: Produced water often contains organic compounds released as volatiles such as the carcinogen, benzene, that travel in plums off site. These toxic clouds are hard to measure, but scientists have begun to document their presence downwind from operations, resulting in a prediction of increased cancer risk to residents living near shale gas operations.

The many threats to water, soil and air will not be eliminated with containers and closed loop systems, but this will reduce the most obvious problems. The US Department of the Interior, advises of pits: “Use of enclosed tanks and closed loop or semi-closed loop systems is environmentally preferable to the use of open pits and is to be encouraged by the BLM. Open production pits are to be strongly discouraged. Closed tanks and systems minimize waste, entry by wildlife, fugitive emissions that affect air quality, and reduce the risk of soil and groundwater contamination. In addition, the use of tanks instead of pits expedites the ability to complete interim reclamation. Costs may be reduced with the use of tanks, particularly when the pit requires solidification or netting.” Waste pits are banned in New Mexico. According to news articles: Antero in Colorado does not utilize pits, but a closed loop system. Chief and Rex Energy have moved to all closed loop systems. Andarko Petroleum uses close loop systems in Pennsylvania. The EPA Star program recommends a closed loop system. But Pennsylvania’s *new proposed* regulations allow the continuance of frack pits, inviting further pollution and contamination of waters. (938, 938a)

Response: The Department acknowledges the comment. Section 78.57(a) and section 78a.57(a) ban the use of open-top structure to store brines and other fluids produced during operation of the well.

- 1085.** Comment: Produced Water (i.e. water returned from fracking well)
- A. Regulations should not permit any open containers.
 - B. Produced water should be in closed tanks and closed loop systems designed for the broad array of chemicals possible in produced water.
 - C. The tanks and closed loop systems should be permitted only for a designated, limited time, e.g., during weeks of fracking.

Note that the requirement for closed containers/closed loop systems will avoid the use of “natural topographic depressions” within the definitions of an allowed “pit” and/or “freshwater impoundment.” No regulations should allow fluids related to oil and gas operations to be managed in “natural depressions.” (938a)

Response: The Department acknowledges the comment. Sections 78.57(a) and 78a.57(a) ban the use of open-top structure to store brines and other fluids produced during operation of the well.

1086. Comment: Fumes, Mists and Liquids Discharged from Storage Tanks

Discharges of vapors and mists during tank checks and leaks during storm water flow are common sources of pollutants. These are occasionally detected by citizens or the DEP, and receive little penalty. Such chronic, small releases add up for the people and animals near the well or industry facility.

The proposed regulations will not prevent flooding, spills, and leak violations that are commonly occurring, but they will motivate operators to plan ahead with a greater margin of safety for liquid and vapor releases. For example, allowing open pits and tanks cordoned off within some general freeboard space, allows a company to receive a lower penalty for a discharge of chemicals if storm water exceeds the freeboard. Even now, violations due to overflow of the required freeboard occur on a regular basis, companies repeatedly are charged with the same violations, and fines are limited or non-existent. (938, 938a)

Response: See response to comment 1077. Sections 78.57(a) and 78a.57(a) ban the use of open-top structure to store brines and other fluids produced during operation of the well.

1087. Comment: These amendments do offer better choices for storage and disposal of production fluids, but language is not clear regarding the use of advanced leak detection systems, secondary capture strategies, and significant bonding practices to promote deterrence and improved operation and maintenance to achieve full compliance was the hazardous waste program, under RCRA Subtitle C, 40 CFR- Parts 260-282. (1063)

Response: The Department believes that the requirements in this section combined with § 78a.64a are adequate to provide necessary protection to the environment and public health and safety.

1088. Comment: Frack fluid should be made a “hazardous waste” since it contains chemicals that are shown on the Governments list of hazardous chemicals to be dangerous to our health and with some highly carcinogenic. Mixing of chemicals is also a very dangerous act since no one can be sure what kind of reaction or toxic soup you will render. It also exhibits radioactive characteristics that are above allowed exposure limits in some of the flowback.(Thanks mr cheney). (1072)

Response: The Department believes that the requirements in this section combined with § 78a.64a are adequate to provide necessary protection to the environment and public health and safety.

1089. Comment: A full and documented cradle to grave chain of custody must be implemented for all drill cuttings, produced water, flowback, and misc. waste materials. (1078)

Response: See response to comment 1747.

1090. Comment: Monitor radioactivity of all oil and gas well products– solids, liquids, and gases on an on-going basis. Include tracers to all chemicals used to frack wells for liability purposes (1098)

Response: The Department acknowledges the comment.

1091. Comment: Prohibit wastewater storage in open pits or impoundments. (1106)

Response: Sections 78.57(a) and 78a.57(a) ban the use of open-top structure to store brines and other fluids produced during operation of the well.

1092. Comment: 78:57: The residents of this Commonwealth have expressed their concerns regarding the impact that fracking has on their communities. Due to the fact that fracking produces enormous volumes of toxic wastewater, there is great concern that the toxins that are stored in open-air waste pits contain cancer-causing and radioactive material. Banning all toxic waste pits and restricting the pumping of toxic materials from fracking into wells would ensure that PA residents are not exposed to these toxic substances. As such, it is my hope and desire that PA DEP will mitigate any negative effects that fracking may have on the wastewater of this Commonwealth and protect our residents. (1112, 10328 – 17454)

Response: Sections 78.57(a) and 78a.57(a) ban the use of open-top structure to store brines and other fluids produced during operation of the well.

1093. Comment: Commentator supports the prohibition on using pits to manage brine and production fluids. (852a)

Response: The Department acknowledges the comment.

1094. Comment: 78:57: The proposed language related to open-top storage of brine and other production fluids should be clarified to reflect that such storage containers may be used during the drilling and completion of oil and gas wells. (1113, 1118, 1120, 1115a, 1176-1188)

Response: Sections 78.56 and 78a.56 cover drilling and completion of wells. Sections 78.57 and 78a.57 are strictly for produced fluids.

1095. Comment: Four years ago, before retiring, I owned a manufacturing and wholesale canvas business. I learned of the gas industry's need for pit liners. I was familiar with liners of waste lagoons for dairy operations. And we had the equipment to handle rolls of films and fabric up to 3,000 lbs. This new opportunity seemed a natural for our business. In order to make an intelligent sales proposal, I studied lining design and materials. To my surprise, the Pennsylvania regs. were so lax compared with liners engineered for safety, like it was of consequence. The 30 mil and sometimes 20 mil, single layer, un-monitored, plastic liner is weak planning. But weaker still are the rules for cleaning up after drilling. In most cases, PA regs. Allow the operator to bury the drill cuttings, sludge of flow back chemical waste, and the liner on site in a shallow grave. I guess that is what is meant by, "cradle to grave" toxic material responsibility. Someone aptly compared this practice to creating thousands of little Love Canals. (1126)

Response: Section 78.57(a) and section 78a.57(a) ban the use of open-top structure to store brines and other fluids produced during operation of the well.

1096. Comment: The Department provides no rational explanation for its restricted use of open topped containment.(1172)

Response: Under § 78.56 open pits are allowed to temporarily store regulated substances and wastes from the drilling, altering, completing, recompleting, servicing and plugging wells at the well site where the substances or wastes are generated or will be beneficially used.

However, under §§ 78.57 and 78a.57 open top structures are not allowed to store brine and other fluids produced during the operation of a well. The Department notes this section of the regulations is focused on control, storage and disposal of production fluids at a well site. The scope of this section applies to well sites where wells have been put into production which is fundamentally different than §§ 78.56 and 78a.56. Those sections are focused on temporary storage at a well site which is in the phase of developing oil and gas wells. It is appropriate to restrict the use of open topped containment in §§ 78.57 and 78a.57 because closed containers are less likely to spill or overtop and require less maintenance to ensure they are in proper working condition. In addition, closed containers do not allow precipitation to enter the waste which reduces the volume of wastewater that must be managed at the operation.

1097. Comment: The complexity of the impoundment standards as well as the restrictions on open top tanks will either discourage reuse and recycling or make it more expensive.(1172)

Response: see response for 1766

1098. Comment: We all strongly oppose any permits to open and maintain frack waste pits. (1034)

Response: The Department acknowledges the comment.

§ 78.58 Onsite processing

1099. Comment: 78.58 (a) thru (f) – The regulations should encourage and facilitate the processing, recycling and beneficial reuse of fluids and other waste materials at well sites. The Department has maintained on several occasions that it is a goal for the Commonwealth, where appropriate, to promote the responsible recycling and reuse of oil and gas wastes to reduce the demand on fresh water resources for oil and gas well development and operations. The establishment of regulatory provisions to govern the recycling and reuse of oil and gas wastes will protect public health, safety and the environment, as well as be a benefit to the oil and gas industry. The commenters' suggested language below clarifies that operators may conduct processing, recycling and beneficial reuse activities at well sites and such operations under the jurisdiction of the Department's Office of Oil and Gas Management. The commentators support the Department's proposed Subsection 78.58(b), and suggest that the physical removal of free phase hydrocarbons and the addition of biocides to reuse fluids be included as activities that would not require approval from the Department. Additionally, the commentators are in favor of allowing the Department to post other activities on its website, as appropriate, that would not require approval from the Department if conducted at a well site or centralized impoundment permitted pursuant to Section 78.59c. Processing of drill cuttings under Subsection 78.58(c) should be included as one of the activities in Subsection 78.58(d) that does not require compliance with the requirements of the Solid Waste Management Act. See suggested regulatory language below. (1137, 1174)

Response: The Department does support the processing, recycling and beneficial reuse of fluids and other waste materials at well sites. However, certain activities present enough of an environmental hazard that the Department should have the opportunity to review and approve those activities prior to implementation. Therefore, the Department has retained the rulemaking language in this section. The Department notes that operators may receive deemed approval for use of a prior approved fluid processing procedure under subsection (g) with only notice to the Department.

1100. Comment: **78.58** – We support deletion of alternative rules for pits constructed prior to July 29, 1989. We support the proposed notification and reporting requirements for the operator to keep the

PADEP informed of onsite processing plans or transportation of materials to another well site. (1143)

Response: The Department acknowledges the comment.

1101. Comment: We do not support the use of centralized impoundments because of the potential for air and water pollution. (1143)

Response: Air emissions from oil and gas facilities are regulated under Article III. Changes to Article III are beyond the scope of this rulemaking. Additionally, the final rulemaking requires all centralized impoundments to comply with permitting requirements in Article IX which will ensure that Chapter 78 does not result in disparate requirements or disproportionate costs on one particular economic or extractive sector.

1102. Comment: We recommend that the operator provide more information in its notification to the PADEP about the procedures and tests used to characterize waste. This will ensure the waste is properly treated, handled, and disposed. (1143)

Response: The Department acknowledges the comment. The Department believes that the §§ 78.58(h) and 78a.58(h) requirement to characterize sludges, filter cake, or other solid waste remaining after the processing or handling of fluids under § 287.54, along with other waste characterization requirements (see, e.g., § 78.62(b)) is sufficient for proper handling of the wastes. Waste characterization procedures are relatively standardized and do not need to be identified by the operator at the time the processing approval request is submitted.

1103. Comment: Pre-approval to aerate fluids should be limited to non-volatile materials and wastes. Aeration of volatile materials and wastes can contribute to air pollution and should be conducted only in closed-loop tank systems capable of capturing air pollution and using vapors for power (preferably), or alternatively routing them to an incinerator or flare. (1143)

Response: Air emissions from oil and gas facilities are regulated under Article III. Changes to Article III are beyond the scope of this rulemaking.

1104. Comment: Based on the information contained in comments 1100 through 1103, above, Commentator recommends the following changes to the proposed regulations at §78.58:

§ 78.58. Onsite processing.

(a) The operator may request approval by the Department to process fluids generated by the development, drilling, stimulation, alteration, operation or plugging of oil or gas wells at the well site where the fluids were generated or at the well site where all of the fluid is intended to be beneficially used to develop, drill or stimulate a well. The request shall be submitted on forms provided by the Department and demonstrate that the processing operation will not result in pollution of land or waters of the Commonwealth.

(1) The operator shall provide the Department with a copy of the procedures and tests that will be used to characterize waste, to ensure it is properly treated, handled, and disposed.

(2) Onsite processing of volatile materials and wastes shall be conducted in closed-loop tank systems capable of capturing air pollution and using vapors for power (preferably), or, upon a showing of good cause, routing vapors to an incinerator or flare.

(b) Approval from the Department is not required for the following activities conducted at a well site within lined containment areas:

(1) Mixing fluids with freshwater.

(2) Aerating of non-volatile fluids.

(3) Filtering solids from fluids.

(c) The operator may request to process drill cuttings only at the well site where those drilling cuttings were generated by submitting a request to the Department for approval. The request shall be submitted on forms provided by the Department and demonstrate that the processing operation will not result in pollution of land or waters of the Commonwealth.

(d) Processing residual waste generated by the development, drilling, stimulation, alteration, operation or plugging of oil or gas wells other than as provided for in subsections (a) and (b) shall comply with the Solid Waste Management Act (35 P.S. §§ 6018.101—6018.1003).

(e) Processing of fluids in a manner approved under subsection (a) will be deemed to be approved at subsequent well sites provided the operator notifies the Department of location of the well site where the processing will occur prior to the beginning of processing operations. The notice shall be submitted electronically to the Department through its web site and include the date activities will begin.

(f) Sludges, filter cake or other solid waste remaining after the processing or handling of fluids under subsection (a) or (b), including solid waste mixed with drill cuttings, shall be characterized under §287.54 (relating to chemical analysis of waste) before the solid waste leaves the well site. (1143)

Response: See responses to comments 1100 through 1103.

1105. Comment: **78.58** – Chapter 78 should encourage the processing, recycling and beneficial reuse of fluids and waste at well sites. Regarding waste and water management at a well site, the natural gas industry has been recycling and/or reusing water and minimizing fresh water use for quite some time now, and unfortunately the new regulations are forcing operators to rethink this option. In order to increase the amount of water being reused/recycled in the Commonwealth, the regulations need to provide an avenue for the operator to document, move, or reuse water from one site to another. In addition, the Office of Oil and Gas should have its own regulations concerning water management, which should not conflict or be confused with those of the Office of Waste Management.

Details regarding the approval process of processing fluids by the Department are needed, as is a reference to the storage or reuse of fluids consistent with §78.56. The regulations should encourage and facilitate the processing, recycling and reuse of water at well sites. The changes suggested above would clarify that operators may conduct such processing at well sites and such operations are under the jurisdiction of the Department's Office of Oil and Gas Management and do not require approval under the Solid Waste Management Act and the Department's Waste Management program. See suggested regulatory language that follows. (1153)

Response: The Department does support the processing, recycling and beneficial reuse of fluids and other waste materials at well sites. However, certain waste management activities present enough of an environmental hazard that the Department believes additional oversight is appropriate. The rulemaking language balances ease of recycling and reuse with necessary environmental protections and has been retained in the final rulemaking. The rulemaking is consistent with and implements section 3273.1 of the 2012 Oil and Gas Act, which establishes the relationship between the Solid Waste Management Act and the Oil and Gas Act oversight of waste management activities on well sites.

1106. Comment: **§78.58** – The regulations should encourage and facilitate the processing, recycling and beneficial reuse of fluids and other waste materials at well sites. The establishment of regulatory provisions to govern the recycling and reuse of oil and gas wastes will protect public health, safety and the environment, as well as be a benefit to the oil and gas industry.

Processing of drill cuttings under Subsection 78.58(c) should be included as one of the activities in

Subsection 78.58(d) that does not require compliance with the requirements of the Solid Waste Management Act.

Suggested amendatory language:

(a) The Department supports the processing, recycling, and beneficial reuse of fluids and other materials generated by the development, drilling, stimulation, alteration, operation or plugging of oil or gas wells, where the processing of the fluids or other materials for recycling or beneficial reuse will not result in pollution of land or waters of the Commonwealth. The operator may process fluids generated by the development, drilling, stimulation, alteration, operation or plugging of oil or gas wells at the well site where the fluids were generated or at the well site where all of the fluid is intended to be beneficially used to develop, drill or stimulate a well. Such processing may not result in pollution of land or waters of the Commonwealth.

(b) Approval from the Department is not required for the following activities conducted at a well site or centralized impoundment permitted under § 78.59c:

- (1) mixing fluids with freshwater;
- (2) aerating fluids;
- (3) filtering solids from fluids;
- (4) physical removal of free phase hydrocarbons;
- (5) the addition of biocides to reuse fluids; or
- (6) any other activity approved by the Department and posted on its website.

(c) An operator may temporarily store and/or process fluids generated by the development, drilling, stimulation, alteration, operation or plugging of an oil or gas well at a well site other than the well sites where the fluids were generated or are to be ultimately reused, so long as the following conditions are met:

- (1) The well site where the storage or processing is to occur is permitted and bonded;
- (2) The well site maintains a current PPC plan that is consistent with the Department's regulations;
- (3) The operator maintains accurate transportation records of the fluids entering and leaving the well site, consistent with Section 3218.3 of Act 13 ;
- (4) Temporary storage complies with applicable requirements of the act and regulations relating to tanks;
- (5) Temporary storage occurs in approved storage structures in accordance with applicable requirements of Sections 78.56 and 78.57;
- (6) Processing of fluids is conducted in accordance with this section;
- (7) Temporary storage and/or processing will not exceed a single consecutive twelve month period; all onsite activity incidental to temporary storage and/or processing must occur within this timeframe;
- (8) The operator must notify the Department of locations where temporary storage and/or processing will occur a minimum of three (3) days prior to the commencement of activity. This notice shall be submitted electronically to the Department through its website and include the intended date(s) of activity commencement;
- (9) An operator that stores, processes or beneficially reuses fluids pursuant to this section in accordance with this paragraph shall be deemed to have a residual waste permit by rule under Article IX of Title 25;
- (10) An operator subject to a permit by rule under this section is not required to apply for a permit under Article IX of Title 25 or comply with the operating requirements of Article IX of Title 25 so long as the authorized storage, processing and beneficial reuse activities are conducted in accordance with this Chapter.

(d) An operator may request approval from the Department to temporarily store and/or process fluids generated by the development, drilling, stimulation, alteration, operation or plugging of an oil or gas well at a location other than a well site or centralized impoundment. The request shall

be submitted on forms provided by the Department, accompanied by a written consent from the landowner, and subject to the following conditions:

- (1) The operator prepares and maintains a current PPC plan that is consistent with the Department's regulations for the location;
 - (2) The operator maintains accurate transportation records of the fluids entering and leaving the location consistent with consistent with Section 3218.3 of Act 13;
 - (3) Temporary storage complies with applicable requirements of the act and regulations relating to tanks;
 - (4) Temporary storage occurs only in above ground tanks subject to applicable requirements of Section 78.56 and 78.57;
 - (5) Any processing is conducted in accordance with this section;
 - (6) Temporary storage and/or processing will not exceed a single consecutive twelve month period and all onsite activity incidental to temporary storage and/or processing must occur within this timeframe;
 - (7) The operator must notify the Department of the locations where temporary storage will occur a minimum of three (3) days prior to the commencement of activity. This notice shall be submitted electronically to the Department through its website and include the intended date(s) of activity commencement;
 - (8) An operator that stores, processes, or beneficially reuses fluids pursuant to this section in accordance with this paragraph shall be deemed to have a residual waste permit by rule under Article IX of Title 25;
 - (9) An operator subject to a permit by rule under this section is not required to apply for a permit under Article IX of Title 25 or comply with the operating requirements of Article IX of Title 25 so long as the authorized storage and beneficial re-use activities are conducted in accordance with this Chapter.
- (e) An operator may process drill cuttings at the well site where those drill cuttings were generated where such processing will not result in pollution of land or waters of the Commonwealth.
- (f) Sludges, filter cake or other materials remaining after the processing or handling of fluids pursuant to this Section, including materials mixed with drill cuttings, shall be characterized pursuant to 25 Pa. Code § 287.54 before the material leaves the well site. (1147, 1153)

Response: See response to comment 1105.

1107. Comment: This provision was discussed at length at the TAB subcommittee meetings this past summer. We are supportive of recycling efforts, as they greatly benefit our community, environment and the industry. Industry suggestions during the TAB subcommittee meetings regarding the duration of on-site processing at well sites in many cases near our homes, schools and perhaps hospitals provide us with concerns. These concerns are not without substance. The MAZZARRA site, Washington Township, Wyoming County during 2013 had a 9,000 gallon spill of treated flowback water that was contained in a basement of a nearby home. That is not proper secondary containment. North Dakota has had a number of brine spills just in the recent months alone. We need to be adequately prepared so we can avoid these situations.

It is important to note, that while these are temporary onsite processing facilities, with the long-term view and fluctuations in drilling due to a variety of reasons, centralized WMGR123 facilities are the preference. Regulations need to encourage the use of these facilities over the temporary on-site processing.

We want to be clear, whatever the end result that facilitates the industrial onsite processing, equal consideration needs to be given to locations where there are nearby homes, schools or hospitals.

This is imperative in locations where there are no local ordinances that would supply basic guidelines providing nearby residents measures that would extend to them being comfortable within their homes. Thus, as an attempt to provide a pathway towards reaching that delicate balance where all may thrive, we offer these recommendations on this section.

- As proposed, these sites are somewhat different than either the OG-071 or WMGR123 facilities. In the case of 78.58, we recommend that the Department develop two new permits and a corresponding guidance document.
- The first permit is the EZ permit. These are facilities located either at an adjacently expanded area to a well site to accommodate processing or on an existing well site. Regardless, in either case, the distance from the edge of the pad or expanded area to the nearest occupied dwelling is 1500' or greater. This is a more isolated location and thereby processing is more respectful towards the community and local impact. We need to give the industry an incentive to make better location choices. This is a way of achieving that goal. These are intermittent facilities. These locations the operator obtains a one year permit. With a minimum of nine months of absence or no activity, they can apply for a renewal for another year period. In that fashion, they can renew the permit up to two times, facilitating a total of 3 years of processing at that location. This provides sufficient opportunity to service wells nearby.
- The second permit is a restricted permit.
 - This permit is only issued for locations that are less than 1500' from the nearest occupied dwelling. There are cases where well pads have been sited too near homes and have resulted with unreasonable local impacts to the nearby neighbors. Often, it is these same cases where municipalities lack local zoning and planning. It is even more likely that these same municipalities will not address planning and zoning for a number of localized reasons, one being it may be very few families affected. However, the fact remains that well sites are located too near some homes and the impacts are unreasonable in terms of intolerable noise and at times air quality issues due to diesel exhaust fumes. Since there is a regulatory opportunity here, we are recommending that the opportunity be taken. If the operator is able to obtain waivers from all the neighbors within the 750' then they do not have to do the required mitigations as outlined below.
 - This permit is a one-time temporary permit, three months with an option for a three month renewal. However, in the case of the neighbor's waving the mitigations, for the three month renewal the operator will need to obtain renewal waivers from all occupied dwellings within the 750'. This is to provide the neighbors with the opportunity to have mitigations in place now that they've had the experience, and perhaps an unreasonable impact.
 - Due to variations in topography, temperature, season and localized wind patterns there is a variety of experiences in which noise and air quality impacts affect the nearby neighbors. There are cases where homes at a 300' distance from a well site are not that inconvenienced. On the other hand, there are cases where a 500' distance is not adequate. It is not unusual for the nearby homeowner to not have had any contact with the operator regarding the site location since it is not located on their property, but rather on their neighbor's property. Generally, only the landowner where the well site is located had input into the well site location. It is clear that in some cases, based on experienced localized impact, neither 300' nor

500' distance is adequate. Now, there is a necessity to do more industrial activities on these sites that in some case may not be such a desirable location in regards to impacting the nearby neighbors. We are not opposed to the activity, but rather we desire to address impacts in such a way that all may thrive. This is the exact reasoning for these two options.

- Notification – this is a different type of facility. Neighbors within 750' need to be given a notice that the permit is being applied for, what the facility is, and a contact person – name & phone number to contact in case of a problem. Presently, not all operators return calls of their neighbors. A neighbor may have a legitimate need to contact them. For example, in case of too much idling diesel traffic and the result is they are having air impacts inside their home. This situation has been experienced the gas fields and it is one that an operator can handle with proper vehicle queuing. They may not necessarily know what is happening in the field lacking that phone call from an impacted neighbor. Included in this mailing is a fact sheet created by the Department that outlines noise and lighting impacts and available mitigations. The fact sheet also outlines the waiver process.
- Lighting – needs to be respectful of the neighbors. The lighting needs to be directed on the facility not a thousand feet to the neighbor's homes. Some operators are employing the use of Lunar Lighting while many are not. Lunar Lighting is an emerging technology in the oil and gas fields. When operators choose to establish sites in close proximity to homes, within 750' they are simultaneously choosing to mitigate their impacts in every possible way to ensure that the neighbors are comfortable within their homes and that our rural and agricultural integrity remain in place. The fact is that operators have determined most often to comply with local ordinances at a minimum, or have not taken any steps towards mitigation regarding either lighting or noise issues in communities where there are no local ordinances. If the Commonwealth of Pennsylvania is going to be a leader in a world class shale gas play, then the operators need to be functioning as world class, appreciating and respecting the communities where they operate regardless of whether local ordinances exist. We know from experience that we are not able to be effective with every operator 'doing it right' every time. Therefore, the Department needs to create a basic floor of regulations that consider those whom now dwell within 750' of well pads and facilities and have experienced unreasonable impacts related to such issues as lighting and noise. The zoned communities may choose to build upon these mitigation regulations, but nevertheless, those that dwell within non- zoned communities still deserve and need these basic and reasonable mitigations should their municipality or county fail to act upon doing so.
- Noise - it is difficult to assess what types of noise beyond traffic may be created by a temporary waste fluids processing facility. We note that C.F.R. has a basic and reasonable regulation that applies to drilling, and in reality, should also apply to drilling and fracturing well sites in Pennsylvania. The regulation we refer to is C.F.R. Title 18, Chapter I, Subchapter E, Subpart F, 157.206 Standard Conditions (b)(5)(iii) Any horizontal directional drilling or drilling of wells which will occur between 10 p.m. and 7 a.m. local time must be conducted with the goal of keeping the perceived noise from the drilling at any pre-existing noise-sensitive area (such as schools, hospitals, or residences) at or below a night level (Ln) of 55 dBA. This may require the operator to erect a temporary, portable sound barrier or sound

curtain. There is a Pennsylvania based company that offers such services. Oeler Industries, Inc. offers portable sound barrier products that may be used in both drilling and fracturing sites. Their products would also be useful at temporary waste fluids processing sites. When such products are indeed available, the neighbors need to be considered. The operator needs to do such mitigations. The fact of the matter is the operator chose the well site location, and they will be choosing the temporary waste fluids processing location. When they choose to operate within 750' of occupied dwellings, they have determined in the same mode to utilize noise abatement technologies. The Department needs to protect the environment of the neighbors who live within 750' of an active site.

- Volume – there needs to be a maximum processing volume attached to the permit to avoid these from becoming the size, scope and activity of a WMGR123 facility.
- Leak detection – we recommend the operator perform daily visible inspections and employ leak detection technologies along with secondary containment. Secondary containment requirements need to be consistent with the Department's most stringent and effective tank secondary containment requirements.
- We desire that more consideration be given to those that dwell within 750' of well site locations. This is a first step in doing so. We are very seriously engaged in advocating the attainment of a delicate balance that allows all - public health and safety, community, the environment and the industry, to thrive. The flexibilities we have built into our recommendations create that opportunity. With consideration and adoption of our recommendations, we are able to support this provision. (660a)

Response: The Department believes that the OG-71 and WMGR 123 waste processing permits adequately address the risks associated with waste management at or related to well sites. OG-71 is only available for operators to use when processing wastes generated at the well site or processing wastes brought to the well site and completely used at the well site (typically, flowback or produced water being used in the stimulation of wells at that site). By its nature, OG-71 only allows for temporary and limited processing during the period of well development. The rulemaking language is consistent with section 3273.1 of the 2012 Oil and Gas Act. For more permanent processing facilities, approval under WMGR 123 and the Solid Waste Management Act is required. The setbacks and other conditions associated with each of these authorizations adequately address the potential risks and disruptions posed by the authorized activity.

Regarding noise, see response to comment 2913.

- 1108. Comment: 78.58(a)** The permit should specifically require that the processed fluids be either generated at the site or are intended to be used at the site.

We recommend that recordkeeping be involved in order that fluids are tracked. For example, in cases where fluids are generated at the site, there is recordkeeping of where the fluids are taken/used. In cases where the fluids are transported to the well site for use there is recordkeeping detailing the source of the fluids? This information needs to be interfaced with the Department's wastewater tracking system. (660a)

Response: As written, subsection (a) provides the requirement that the processed fluids be either generated at the site or is intended to be used at the site. Operators are required to

report to the Department the waste volumes produced and ultimate disposal/reuse location for that waste (both fluids and solids) on a monthly basis. In addition, unconventional operators are required to account for wastewater in their water management plans.

1109. Comment: **§ 78.58(a)** The operator may request approval by the Department to process fluids generated by the development, drilling, stimulation, alteration, operation or plugging of oil or gas wells at the well site where the fluids were generated or at the well site where all of the fluid is intended to be beneficially used to develop, drill or stimulate a well. It is suggested that the following language is added to encourage the beneficial reuse of fluids:

(a) An operator may request authorization from the Department to process and beneficially reuse fluids generated by the development, drilling, stimulation, alteration, operation or plugging of an oil and gas well to develop, drill or stimulate an oil and gas well. The Department shall approve of an operator's request to process and beneficially reuse fluids so long as the following conditions are met:

- (1) The well site where the fluids are to be reused is permitted and bonded under the Act;
- (2) The operator provides prior notice to the Department on forms prepared by the Department, which notice shall be submitted electronically to the Department through its web site and include the date(s) processing activities will commence at the site;
- (3) The operator possesses an approved water management plan that meets the criteria set forth in Section 78.69 and the operator conducts processing activities in compliance with its approved plan; and
- (4) The operator has prepared and maintains a site specific Preparedness. Prevention and Contingency (PPC) Plan that meets the criteria set forth in Section 78.55.

(b) An operator may manage fluids described in Section 78.58(a) in an impoundment registered under 78.59b or permitted under Section 78.59c so long as any such impoundment is operated and maintained in accordance with those sections and any applicable permit or registration.

(c) An operator may manage fluids described in Section 78.58(a) in an aboveground storage tank located at the well site so long as the tank is operated and maintained in accordance with Section 78.56 and 78.57.

(d) An operator that processes and beneficially reuses fluids pursuant to this section at a well site in accordance with this paragraph shall be deemed to have a residual waste processing permit by rule under Article IX.

(e) An operator subject to this section is not required to apply for a permit under Article IX or comply with the operating requirements of Article IX so long as the authorized processing and beneficial reuse activities are conducted in accordance with this Chapter.

(f) The Department may require an operator to apply for and obtain an individual or general permit under Article IX or take other appropriate action when the Department determines that the processing activity harms or threatens to harm the health, safety or welfare of the people of the Commonwealth or results in pollution of land or waters of the Commonwealth.

It is further recommended that the existing **§ 78.58 (b) through (f)** be retained and renumbered as **§ 78.58 (g) through (k)**. (913a, 124a, 1057)

Response: The amendments are unnecessary because the additional requirements are already addressed in other portions of the 2012 Oil and Gas Act or Chapter 78 and Chapter 78a.

- 1110.** Comment: Section 78.58(a) appears to formalize the current practice of using form OG-71 to approve the processing of residual waste on well-sites to promote reuse of production fluids. Commentator supports the incorporation of this practice into regulations. However, the regulations should set out the process in greater detail and include the more detailed standards that must be met for approval.

The Department should use this opportunity to establish by regulation what the applicant must demonstrate to obtain the Department's approval, beyond that there will no harm to the environment. The Department should be using some objective standard for determining what constitutes legitimate beneficial reuse. The Department may want to consider establishing by rule and plainly stating in the rule that reuse of certain fluids in a specific list of on-site processes constitute beneficial reuse. Beyond that, the regulation should require the application address what processing will occur, what measures will be taken to ensure the processing does not result in environmental harm, how the wastewater will be transported, storage at the receiving site if transported, how any waste such as sludges from the treatment process will be managed, management of air emissions such as volatile hydrocarbons during aeration, and final disposition.

The Department should use this opportunity to establish the standards against which the application will be measured and approval will be granted. A requirement that a person request approval without an explanation of what standard will be used to grant or deny approval is no requirement at all. (852a)

Response: The regulation sets an appropriate performance standard which must be met to obtain approval prior to onsite waste processing. Because waste processing technology evolves over time, the performance standard allows the necessary flexibility in the approval process.

- 1111.** Comment: §78.58 addresses processing activities that may take place in conjunction with oil and gas operations. As such, the provision will play a critical role in the ability of the oil and gas industry to maximize the potential for recycling and reuse of materials associated with oil and gas operations. In certain instances, such materials can be reused or recycled "as is." In other instances, however, some level of processing is necessary before the materials can be reused.

Regulations that encourage the beneficial reuse of fluids and drill cuttings in an efficient, environmentally-responsible, and cost-effective manner that is practicable to implement in the field should be a shared objective of both the EQB and the regulated community. Section 3273.1(a) of Act 13, 58 Pa.C.S.A. § 3273.1(a), circumscribes the applicability of requirements under the Solid Waste Management Act ("SWMA") that might otherwise hinder the recycling and beneficial use of materials from oil and gas operations. This provision was lifted largely unchanged from the Oil and Gas Act of 1984 and reflects a long-standing legislatively-endorsed approach for streamlining the regulatory process relating to the disposal, processing and storage of residual wastes at oil and gas well sites by placing those activities within the purview of the oil and gas program rather than under the SWMA. Specifically, Section 3273.1(a) of Act 13 provides that requirements for permits and bonds under the SWMA are deemed to be satisfied for "any pit, impoundment, method, or facility employed for the disposal, processing or storage of residual wastes generated by the drilling of an oil or gas well or from the production of wells which is located on the well site" if the well site is permitted and bonded under Act 13, and the requirements of Act 13 and regulations thereunder are met.

While the proposed version of §78.58 contains certain positive features, it falls short of the framework envisioned in Act 13. As drafted, §78.58(a) authorizes the processing of fluids at the well site where they are generated or at the well site where they will be beneficially used, provided that such processing is approved by PADEP on a case-by-case basis. Under the proposed version of §78.58(b), the mixing of fluids with freshwater, aerating fluids, and filtering solids from fluids are activities that do not require prior approval from PADEP. Both of these provisions are good steps but do not fulfill the vision that the General Assembly had in mind for streamlining the interface between the oil and gas program and requirements under the SWMA. This is particularly evident under the proposed version of §78.58(d) which states that except as provided in Sections 78.58(a) and (b), all processing of residual waste must be done in accordance with the SWMA, regardless of whether the processing takes place at a well site.

To address these concerns, we recommend that the proposed version of §78.58(a) be expanded to include processing of solids, including drill cuttings, that occurs at the well site where they are generated. We also recommend that the universe of activities identified in the proposed version of §78.58(b) be expanded to include the physical removal of free phase hydrocarbons, the addition of biocides to fluids that will be reused, and other activity that PADEP has evaluated and determined to be appropriate as indicated by a posting on its website. If these changes are made, the proposed version of §78.58(c) can be eliminated as redundant. In any event, the proposed version of §78.58(d) should be removed because it is inconsistent with the streamlined approach reflected in Section 3273.1(a) of Act 13.

The Marcellus Shale Coalition in its comments on behalf of the oil and gas industry relating to the proposed version of §78.58(a) has recommended that the proposed regulations be modified to include two separate permits-by-rule for activities that would otherwise require, in PADEP's view, a permit under the SWMA. We support this proposal. (1173)

Response: See response to comment 1105.

- 1112.** Comment: These proposed amendments add a new section to address onsite processing. However, the amendments lack any detail on what criteria DEP will use to approve onsite processing facilities. Commentator recommends adding language clarifying what conditions DEP may place on an operator who requests to process fluids generated by the development, drilling, stimulation, alteration, operation or plugging of oil and gas wells, to ensure that the processing operation will not result in pollution of land or waters.(1157)

Response: See response to comment 1110.

- 1113.** Comment: Under §78.58(e), after an operator is initially approved for onsite processing at one site, the operator is deemed to have approval for onsite processing on all subsequent sites, as long as the operator notifies DEP. We are concerned that the automatic approval of subsequent onsite processing facilities will not factor in site-specific factors—such as whether subsequent wells are located in HQ or EV watershed or a water supply area, the proximity to a stream, or other sensitive environmental features.(1157)

Response: Site specific factors are accounted for at the time of initial siting of the well site during the well permit review.

- 1114.** Comment: As written, the amendments do not appear to reserve the right of DEP to withdraw the approval for future onsite processing activities. We strongly recommend that this section be revised to require approval, on a case-by-case basis, for all onsite processing operations and that a

reservation clause be added to ensure that DEP has the authority to withdraw approval of onsite processing operations, if needed. (1157)

Response: The review process strikes an appropriate balance between process and performance. Where the Department has already completed a technical review on a given process, a second review is redundant. The Department has ample authority to withdraw approval of onsite processing operations, if needed.

1115. Comment: The Commentator objects to new requirements that are not justified by a compelling environmental need and impose unnecessary additional costs on oil and gas operations. The edits below are consistent with an appropriate balancing of costs and benefits.

Suggested amendatory language:

(c) The operator may ~~[request to]~~ process drill cuttings ~~[only]~~ at the well site where those drilling cuttings were generated~~[, by submitting a request to the Department for approval. The request shall be submitted on forms provided by the Department and demonstrate]~~ where that the processing operation will not result in pollution of land or waters of the Commonwealth.
~~[(d) Processing residual waste generated by the development, drilling, stimulation, alteration, operation or plugging of oil or gas wells other than as provided for in subsections (a) and (b) shall comply with the requirements of the Solid Waste Management Act.]~~ (1135)

Response: See response to comment 1105. Additionally, subsection suggested to delete is appropriate to clarify requirements under §3273.1 of the 2012 Oil and Gas Act which are intended to prevent operation of unpermitted centralized waste treatment facilities.

1116. Comment: 78.58(d) improperly alters a legislatively created exemption from Solid Waste Management requirements for activities conducted on bonded and permitted well sites. The subsection must be stricken. Suggested regulatory amendments:

~~[(d) Processing residual waste generated by the development, drilling, stimulation, alteration, operation or plugging of oil or gas wells other than as provided for in subsections (a) and (b) shall comply with the requirements of the Solid Waste Management Act.]~~

~~[(e)]~~ (d) Processing of fluids in a manner approved pursuant to subsection (a) shall be deemed to be approved at subsequent well sites provided the operator notifies the Department of location of the well site where the processing will occur prior to the commencement of processing operations. This notice shall be submitted either electronically to the Department through its website or by hard copy U.S. Mail if the operator is a Small Business registered with the Department. and include the date activities will commence.

~~[(f)]~~ (e) Sludges, filter cake or other solid waste remaining after the processing or handling of fluids pursuant to subsections (a) or (b), including solid residual waste mixed with drill cuttings, shall be characterized pursuant to 25 Pa. Code §287.54 before the ~~[solid]~~ waste leaves the well site. Such characterization is not required for every well where operator knowledge can be utilized to confirm waste constituents. (1135)

Response: See responses to comments 216, 1105 and 1115. Residual waste characterization requirements are established under Chapter 287. Revisions to residual waste characterization requirements are beyond the scope of this rulemaking.

1117. Comment: The Proposed Rulemaking would revise 25 Pa. Code §78.58(a) to empower the Department to authorize a well operator to process fluids generated or used in a well at the well site. The Proposed Rulemaking would also add to a Section 78.58(e), pursuant to which the Department's authorization for a well operator to process fluids at one of its well sites would be deemed approval for that operator to process fluids at any of its subsequent well sites, provided only that the operator notify the Department of its intent to process fluids at such sites. There are many reasons why it might be inappropriate for an operator to process drilling fluids at a given well site. Accordingly, Section 78.58(e) should be deleted from the Proposed Rulemaking. Instead, Section 78.58 should require an operator that wishes to process fluids at a particular well site to seek the Department's authorization to do so on a case-by-case basis. (1159)

Response: See response to comment 1113.

1118. Comment: We support regulations that encourage operators to beneficially reuse fluids and drill cuttings in an efficient, environmentally-responsible, and cost-effective manner. As such, Subsection 78.58(b) should be expanded to include other activities that can be conducted without prior approval. These should include settling as well as filtration of solids and removal of free-phase hydrocarbons. In addition, the regulations should include a residual waste storage and processing permit-by-rule option pursuant to the Marcellus Shale Coalition's (MSC's) suggested modifications to the PADEP's proposed Section 78.58 provided by the MSC to the Technical Advisory Board (TAB) for consideration at the August 14-15, 2013 Subcommittee Meeting. This permit-by-rule would provide unconventional operators with authority and flexibility to store and process fluids generated by the development, drilling, stimulation, alteration, operation, or plugging of a well for reuse by the operator. Additionally, the permit-by-rule would significantly reduce truck traffic and air pollution, caused by additional handling and by unnecessary transport of fluids by operators. (1103, 1147, 1174)

Response: See response to comment 1105.

1119. Comment: **78.58(b)** – The Board should amend this provision to specify that solidification and bulking of waste on the well site is permissible; thus, codifying the Department-approved practice. The Board could also ask the Department to publish a list of pre-approved bulking agents on their website. Accordingly, Commentator recommends the following amendatory language: “(4) bulking waste with Department- approved bulking agents.” (1085)

Response: The notice-only approach contemplated by subsection (g) addresses the commentators concerns. In addition, see response to comment 1105.

1120. Comment: Section 78.58(b) should be expanded to allow adding lime or other non-hazardous substances (as approved by DEP) to flow-back in order to neutralized in pH level for disposal, where necessary without prior approval from DEP. (1154)

Response: See responses to comments 1105 and 1119.

1121. Comment: **78.58(b)** Activity approval – these are standard processing operations. Any are suitable under these prospective permits. (660a)

Response: The Department acknowledges the comment.

1122. Comment: **78.58(c)** Process of drill cuttings – We are agreeable to the processing of cuttings at the well site. (660a)

Response: The Department acknowledges the comment.

1123. Comment: **78.58(c)** – What is meant by “process drill cuttings”? Does that mean adding solidification material such as sawdust or wood pellets? Solidification material should be permitted to be used without Department approval. The form for this process should be produced and reviewed prior to establishment of this section. (411, 1153)

Response: See responses to comments 1105 and 1119.

1124. Comment: Even though Department approval is not required for mixing fluids with freshwater or filtering them, DEP should at a minimum be informed if any of this activity is occurring. However, DEP approval should be required for any aeration of fluids. Due to the potential composition of these fluids, aeration can lead to the release of concentrated, volatile and toxic gases, that will eventually precipitate back to the surface. The Department approval should be contingent upon the composition of the fluids to be aerated, the method and rate of aeration so it does not allow the fluids to spill out of the container and to include a provision that prohibits the aeration prior to so many hours of a precipitation event.

This approval could also incorporate the provisions for storing mine influenced water, 78.59b(g), that addresses the concern of air, land and water pollution and testing of the water. If these measures are utilized for mine water, it should also apply to process fluids. (1149, 1150)

Response: The activities described in subsection (b) pose a minimal risk of environmental harm and are standard industry practice related to oil and gas wastewater. Therefore the Department does not need to be notified every time one of these activities occurs. Air emissions from oil and gas facilities are regulated under Article III. Changes to Article III are beyond the scope of this rulemaking. The Department does not believe that fluid aeration poses a significant risk of spills.

1125. Comment: Prohibit the onsite processing of shale drill cuttings, which often contain hazardous substances and radioactive materials and require thorough analysis and special handling.(17, 18, 79, 102, 148, 160, 161, 168, 169, 195, 475, 492a, 564, 565, 626, 649, 808, 843, 865, 884, 912, 922, 926, 947, 1000, 1039, 1058, 1102, 1161, 1168, 4582 – 4584)

Response: Onsite processing as authorized under subsection (e) is limited to processing drill cuttings only at the well site where the drill cuttings were generated. Therefore, this processing is temporary in nature and is intended to facilitate proper handling and disposal of the drill cuttings. In addition, the Department has revised §§ 78.58 and 78a.58 to require operators that conduct waste processing activities on a well site to develop an action plan specifying procedures for monitoring, for and responding to radioactive material produced by the treatment processes. The Department believes the existing and new regulations for on-site processing ensures the protection of the environment.

1126. Comment: **78.58(d)** Residual waste – We are agreeable that the processing of generated residual waste shall comply with the requirements of the Solid Waste Management Act, including waste characterizations. (660a)

Response: The Department acknowledges the comment.

- 1127.** Comment: Drill cuttings should not be processed on site, nor should they be buried in waste pits; instead the cuttings should be properly transported to special radioactive waste sites as proposed by the DEP. Gas companies should be held responsible to properly dispose of waste and contaminants. (104)

Response: The Department agrees that operators should be held responsible to properly dispose of waste and contaminants that they generate. The Department believes the existing and new regulations for on-site processing ensures the protection of the environment.

- 1128.** Comment: While we recognize the principle behind §78.58(e), operators should be required to submit, and the Department should review, requests to process drill cuttings at each individual well site. Although operators may use standard processes, the suitability of each site for fluids processing depends on a variety of site-specific facts that must be considered on a case-by-case basis. (997a)

Response: See response to comment 1113.

- 1129.** Comment: 78.58(e) Ease of operation – Any effort the Department may make to do electronic permitting to assist the industry is reasonable. It is also reasonable that the public be able to access this information online rather than have to do an in-person visit to the regional office. (660a)

Response: The Department acknowledges the comment and agrees that public access to information online is important and is working to develop those capabilities.

- 1130.** Comment: There should be no processing of drill cuttings on site nor should cuttings should be stored in pits. Disposal of brine, drill cuttings, and any residual waste should not be allowed for wells drilled on property not previously designated as a waste site.
No burial of waste should occur on private or public forests, farms, parks, airport buffer, school property, etc. Any burial of materials should occur only in sites designated as waste sites and, when burial is thus validated, it should meet the standards of the US Resource Recovery and Conservation Act. (609, 938, 938a)

Response: See response to comment 1125.

- 1131.** Comment: Section 78.58(e) should be eliminated or make clear that any changes to how the fluid is processed or used must require a separate approval. We oppose the proposition that an approval need only be granted on one occasion, and can then that same process can be used by the same company throughout the Commonwealth at an unlimited number of sites. The Department's experience demonstrates that the geology encountered at well sites will differ, as will the chemical composition of production fluids. This will likely necessitate changes in processing prior to reuse, and this should trigger a requirement for a new approval. The proposed regulation provides that processing of fluids "in a manner approved" at one well site will be deemed to approved, if notification is made to the Department; however, it is unclear how the Department will determine how the bounds of any particular "manner" of processing. If a manner of processing uses the same equipment but different chemicals, or significantly different amounts of the same chemicals, is it the same "manner"? If the Department seeks to allow successive uses of a particular approval, then the regulation should specify that any changes to how the fluid is processed or used must require a separate approval. (852a)

Response: The Department believes the comment actually pertains to 78.58(g). Section 78.58(g) eliminates the need for redundant approvals for the on-site processing of fluids for

beneficial reuse or disposal. The Department only needs to review and approve the same treatment process once for an operator. As long as there is not significant deviation(s) with the process and notification occurs in 3 days as to where it is occurring, the Department is confident it will be able to field inspect the process to ensure it is in accordance with the approved process. Should any significant changes be made to the treatment process, the operator will need to apply for a new approval.

1132. Comment: Section 78.58(f) - Onsite Processing - states “(f) Sludges, filter cake, or other solid waste remaining after the processing or handling of fluids pursuant to subsections (a) or (b), including solid waste mixed with drill cuttings, shall be characterized pursuant to 25 Pa. Code §287.54 before the solid waste leaves the well site.”

- This section refers to Residual Waste regulation which requires a full chemical analysis that can take up to approximately 27 days to get the results for certain parameters. Keeping this material onsite for this length of time is not practicable or would require much larger well pads be built.
- If an operator is taking this residual waste to a recycling facility rather than a landfill, it does not make sense to do a chemical analysis where the liquid waste will be mixed with other liquid waste and then treated. Therefore, we suggest that DEP adds to the end of this paragraph “for disposal.”
- In TAB meetings, it was unclear if these tests were to be completed on every truck load or once per waste stream based upon the justification for the proposed rule. (636a)

Response: Residual waste characterization requirements are established under Chapter 287. Revisions to residual waste characterization requirements are beyond the scope of this rulemaking. Characterization must be conducted in accordance with Chapter 287.

1133. Comment: **78.58(f)** – Sludges, filter cake or other solid waste remaining after the processing or handling of fluids at a well site may still be considered liquid waste if it fails the paint filter test. Thus if the material is classified as liquid waste, then this material may be taken to a treatment or recycling facility for further treatment. If this is the case, it can take up to approximately 27 days to get the results for certain parameters needed to characterize a waste for disposal. If an operator takes the residual waste to a recycling facility rather than a landfill, it makes sense to do simply the chemical analysis the recycling facility needs for its permit, where the liquid waste will be mixed with other waste and then treated for either reuse and/or disposal. The recycling facility must complete its own characterization pursuant to the residual waste regulation. Requiring that an operator keep this material onsite until a full chemical analysis can be done (up to 27 days) is not practicable or would require much larger well pads be built in order to store this material or would cause massive delays in operations. Therefore, we suggest that DEP adds to the end of this paragraph “for disposal.” (1153)

Response: The subsection requires a waste characterization to be conducted in accordance with Chapter 287.54. The Department believes that this is an appropriate cross-reference, as the subsection only concerns those wastes that will be leaving the well site where they were generated. Once the waste leaves the well site, the exemptions under section 3273.1 no longer apply and the Waste Management program regulations govern testing and handling of the waste. Amendment of the Waste Management requirements in this section is beyond the scope of the rulemaking.

- 1134.** Comment: **78.58(f)** requires an operator to hold sludges, filter cake or other solid waste remaining after the processing of certain fluids at the well site until they are characterized. A commentator states that requiring an operator to hold these solid waste remains during this timeframe is not practical and suggests revising the provision to add “for disposal” to the end of the paragraph. We ask EQB to explain why this requirement is reasonable or consider revising it. (1099)

Response: The subsection requires a waste characterization to be conducted in accordance with Chapter 287.54. The Department believes that this is an appropriate cross-reference, as the subsection only concerns those wastes that will be leaving the well site where they were generated. Once the waste leaves the well site, the exemptions under section 3273.1 no longer apply and the Waste Management program regulations govern testing and handling of the waste. Amendment of the Waste Management requirements in this section is beyond the scope of the rulemaking. The Department believes that the requirement to characterize the waste before it leaves the well site is appropriate. This is reasonable and necessary to ensure that waste is properly transported and disposed of off the well site. .

- 1135.** Comment: **78.58(f)** Characterization of waste – During the TAB meetings, the industry questioned the number of characterizations to be completed. One per well, or per truck; also noted was the time lag in obtaining the results and the transporting of the waste. They had discussed transfer stations, and one member of the public noted that present transfer stations were not working well in their county. Thus, this needs to have further discussion. There needs to be more information provided – what are the current characterizations indicating? Lacking this information, we recommend the Department err on the side of more stringent rather than less in the number of required characterizations. Concerning the time lag, that needs to be considered with the characterizations. It may be possible to pull all the samples as the solid waste is accumulating such that by the time the results are available the waste is ready to be hauled out. That may eliminate the need for a transfer station. Another option would be to ensure the temporary processing site is large enough to contain the waste until the waste may be hauled. Finally, the Department could review the appropriateness of transfer stations and possibly develop yet one more permit and guidance for such a location. (660a)

Response: See responses to comments 1132 and 1133.

- 1136.** Comment: No waivers to waste disposal regulations should be issued. There is no evidence that DEP actually checks whether “alternative waste management practices” are “equivalent or superior” to Chapter 78 regulations- or in practice anything but a convenience for operators. (853)

Response: The Department reviews all requests to utilize alternative waste management practices to ensure that they provide equivalent or superior protection.

- 1137.** Comment: **78.58** – Onsite processing is unacceptable. Processes, such as aerating fluids, should not be done at all in an open storage unit, pit or other unenclosed structure since it has the potential of adverse health impacts on humans, animals and possibly crops growing nearby. Methods of processing drill cuttings here and elsewhere in the document must address impacts on air, land and water and mandate best practice techniques. Because of federal loopholes that categorize oil and gas wastes as non-hazardous, the Solid Waste Management Act fails to provide adequate protection. Further, the Department cannot assess the risks involved due to the unknown results of combining injected solutions with heavy metals, radioactive materials and other substances from deep below the earth. We support full disclosure of pollution data. Given expanding number of wells, the magnitude of unknown byproducts, and the numerous processing techniques, more staff must be hired to monitor and enforce all the proposed rules. (980, 1098)

Response: The provisions in the section are appropriate. Onsite processing as authorized under this section is limited to processing fluids or drill cuttings only at the well site where the fluids or drill cuttings were generated or where the fluids will be beneficially reused. Therefore, this processing is temporary in nature and is intended to facilitate proper handling and disposal of the fluid and drill cuttings and facilitate recycling of the fluid. In addition, operators must make a demonstration that the processing will not result in pollution of the land or waters of the commonwealth prior to obtaining approval. The Department believes the existing and new regulations for on-site processing ensures the protection of the environment.

- 1138.** Comment: We recommend that onsite requests to process waste from drill cuttings from the borehole be considered on a case-by-case basis so that site-specific conditions can be considered in determining the suitability for processing on site. (1031)

Response: See response to comment 1113.

- 1139.** Comment: While we are favorable to industry recycle/reuse, we are also cautious about onsite processing. We are aware that the TAB meetings revealed the industry is interested in doing more processing at sites, potentially located within our watershed and near our homes. We request that DEP be very clear on both the OG071 and WMGR123 permits such that the most stringent requirements be in place when operating within watersheds such as Mehoopany and near our homes. In the long run centralized processing facilities are the preferred option over sites located too close to homes. (1035)

Response: See response to comment 1137.

- 1140.** Comment: Commentator requests that this section provide for the temporary offsite treatment and/or processing of 804 and/or 802 fluids for the express purpose of recycling/beneficial use in other fracing/completions operations without obtaining a transfer station permit for the offsite location. Offsite is defined as a location other than where the residual waste was generated and/or where it will be re-used. This language would also fill the existing gap associated with the OG71 process that hinders recycling: OG71s are specific to the generating waste location and/or the receiving, re-use location. They also only apply for the drilling and completions phases of well development.

This language could be added to the current 78.57; it would also be appropriate to utilize the currently reserved 78.59. If neither, it could be added to 78.58 but with change to the 78.58 title. This proposed language is NOT to be confused with, nor intended to replace, the existing allowance to (and associated regulation of) temporarily store residual waste offsite per 25 Pa Code Chapter 299. Rather, it creates a transfer station “lite” process that recognizes the spatial diversity, mobile nature, and temporal brevity of upstream oil and gas operations; the current transfer station permitting process does not facilitate oil and gas wastewater recycling.

An operator may temporarily store and /or process brines and/or fracing fluid at a wellsite to be beneficially used at a wellsite other than where the fluids were generated, so long as the following conditions are met:

- a. The wellsite:
 - i. is permitted and bonded under the Act; and
 - ii. maintains a current Preparedness, Prevention and Contingency (PPC) plan that is

- consistent with the Department's regulations; and
- b. Operators maintain accurate transportation records to demonstrate that fluids are being temporarily stored and /or processed for beneficial re-use, consistent with Section 3218.3 of the Act;
- c. Temporary storage and/or processing:
 - i) complies with the applicable requirements of the Act and regulations promulgated thereunder;
 - ii) occurs in approved storage structures in accordance with applicable requirements of sections 78.56 and 78.57;
 - iii) is conducted in accordance with subsections (a) or (b) of 78.58; and
 - iv) will not exceed a single consecutive twelve month period (all onsite activity incidental to temporary storage and/or processing must occur within this timeframe);
- d. The operator must notify the Department of locations where temporary storage and/or processing will occur a minimum of three (3) days prior to the commencement of activity. This notice shall be submitted electronically to the Department through its website and include the intended date(s) of activity commencement; and
- e. An operator that stores, processes and /or beneficially reuses brine or fracturing fluids pursuant to this section in accordance with this paragraph shall be:
 - i. deemed to have a residual waste permit by rule under 25 Pa. Code Chapters 287-299 (Article IX); and
 - ii. is not required to apply for a permit under Article IX or comply with the operating requirements of Article IX so long as the authorized storage, processing and beneficial reuse activities are conducted in accordance with this chapter. (1049)

Response: The Department disagrees and believes that the language appropriately implements section 3273.1 of the 2012 Oil and Gas Act and the Solid Waste Management Act. See response to comment 1105.

1141. Comment: The Department has maintained on several occasions that it is a goal for the Commonwealth to promote the responsible recycling and reuse of oil and gas wastes to reduce the demand on fresh water resources for oil and gas well development and operations. We share this goal and believes regulations that encourage and facilitate this practice will ultimately protect public health, safety and the environment, as well as be a benefit to the oil and gas industry. As such, we suggest the language below to clarify that operators may conduct processing, recycling and beneficial reuse activities at well sites and related operations under the jurisdiction of the Department's Office of Oil and Gas Management.

Suggested regulatory language:

(a) The Department supports the processing, recycling, and beneficial reuse of fluids and other materials generated by the development, drilling, stimulation, alteration, operation or plugging of oil or gas wells, where the processing of the fluids or other materials for recycling or beneficial reuse will not result in pollution of land or waters of the Commonwealth.

(b) Approval from the Department is not required for the following activities conducted at permitted sites related to oil and gas development operations:

- mixing fluids with freshwater;
- aerating fluids;
- filtering solids from fluids;
- physical removal of free phase hydrocarbons;
- the addition of biocides to reuse fluids; or

- any other activity approved by the Department and posted on its website. (1071)

Response: See response to comment 1105.

1142. Comment: The new language of this section governs the disposal, processing and storage of residual wastes generated at well sites. Commentators express concern that the requirements of this section should align with the requirements of the Solid Waste Management Act in order to simplify compliance requirements and avoid conflicting management standards between the Department's oil and gas management and its solid waste management programs. We ask EQB to ensure that the provisions of this section do not conflict with or duplicate statutes or existing regulations. We also ask EQB to explain in the Preamble and RAF of the final-form regulation how the requirements for onsite processing in this section reasonably and adequately balance protection of the public health and natural resources against the fiscal impact on the oil and gas industry.(1099)

Response: The Department has ensured that the provisions of this section do not conflict with or duplicate statutes or existing regulations. While the provisions of this section and the Solid Waste Management Act both allow for processing of residual wastes from oil and gas operations, they allow for different modes of operation and allow appropriate flexibility for operators while still providing environmental protection.

1143. Comment: The processing of fluids on site allows and prolongs the handling and reuse of hazardous materials at the well site. Due to the current exemption of oil and gas activities from the U.S. Resource Conservation and Recovery Act Subtitle C standards, these materials are not classified as hazardous and are not required to be handled as hazardous substances despite their hazardous properties. we oppose the reuse and injection of liquid and solid waste produced by hydraulic fracturing ("fracking") or by the development, drilling, stimulation, alteration, operation, or plugging of oil or gas wells on a well site unless Safe Drinking Water Act standards are applied to the reused or "recycled" materials.

Safe Drinking Water Act water quality standards must be applied to ensure the fluids being reused do not exceed safe limits because these fluids are being injected through the aquifer and can leak into the groundwater from pits or tanks or as a result of casing or cement leakage or construction flaws, can spill on the surface and seep into the ground or migrate through underground fissures and fractures to groundwater, surface water, or the surface of the land. This exposes aquifers, water supplies, and the environment to an unacceptable risk of contamination.

As explained in a report by hydrogeologist Paul Rubin, aquifers need to be protected into the future and the long life of aquifers and their irreplaceable nature require that the measures used to isolate gas and pollutants from water must be long-lived as well. Cement and steel casing now available and employed will fail in 100 years or less. This means that wells will inevitably leak gas and contaminated fluids into aquifers within 100 years, adversely impacting the use of groundwater by future generations.

Even if cement were to successfully isolate contaminants from aquifers and surface waters and land, naturally occurring and seismically induced vertical fractures or other conduits such as water wells or abandoned gas wells, or frack-induced fractures that leave the target zone and enter other formations can be expected to allow contaminated fluids and gas to migrate to water supplies, to the land surface, and to other non-target receptors.

As explained by hydrogeologist Tom Myers, fluids can be expected to migrate from the Marcellus formation to aquifers and the surface from fracked shale gas wells, potentially contaminating water

sources.

The lack of water quality standards for produced water or flowback that is reused poses a substantial water quality problem. Operators reported to the GAO that they “treat the water to meet their own operating requirements” and that “...they had previously treated the water to a very high quality before reusing it for hydraulic fracturing, they are currently experimenting with lower levels of treatment.” For example, one operator reported that they used to remove the salt but no longer go to that expense to reduce operating costs and are considering eliminating other treatment if the reused wastewater can still meet their individual operating needs.

One problem caused by reuse is the resulting concentration of certain contaminants. Reuse of this produced water will generally increase the contaminant load in the produced water in the subsequent well, both from additives and formation contaminants because there will be no dilution of the contaminants. If a leak occurs in the top few hundred feet in the well being fractured, the leak will contain very contaminated water under high pressure, and even a small leak can release large amounts of contaminants that can pollute aquifers and usable domestic water.

Fluids containing chemicals come along with formation fluids and the toxic contaminants they naturally contain during the construction, drilling, stimulation (such as fracking), and extraction and production of gas from the gas well. Drill cuttings and muds that are produced by drilling and fracking also mix with these fluids during well development and may be stored together in pits or tanks. The chemical additives used in fracking are examined in New York State’s Draft Supplemental Generic Environmental Impact Statement (DSGEIS). Table 5-3 lists many of the fracking chemicals, which include biocides, friction reducers, scale inhibitors, proppants, stabilizers, gelling agents, surfactants, corrosion inhibitors, cross linkers, iron control, and acids.

Chemical suppliers operating in Pennsylvania’s Marcellus Shale, West Virginia, and other states provided additive product compositional information to New York which includes approximately 260 unique chemicals whose CAS numbers have been disclosed to the New York Department of Environmental Conservation (DEC) and an additional 40 compounds which require further disclosure since many are mixtures. Table 5.4 of the DSGEIS lists products which only partial chemical composition information has been provided to the DEC. Table 5.6 is a list of chemical constituents and their CAS numbers that have been extracted from complete chemical compositional information and MSDS information submitted to New York and includes nearly 200 products used or proposed for use in hydraulic fracturing operations. Compound specific toxicity data are limited for many of the chemical additives so chemicals are grouped together based on their chemical structure in Table 5-7.

According to the GAO, produced water is “generally of poor quality, with levels of contaminants varying widely”. Fracking can yield poorer quality produced water than other extraction processes. A previous study from the U.S. Department of Energy concludes that produced water from gas drilling is 10 times more toxic than those from off shore oil drilling.

Adding to pollution dangers posed by the reuse or recycling of frack fluids, Marcellus Shale contains radionuclides including uranium-238, thorium-232, and their decay products. Radioactive concentrations in the Marcellus Shale formation are at concentrations 20 to 25 times background, making shale gas wastewater extremely radioactive. The produced water from Marcellus Shale has higher levels of radionuclides than water from Barnett Shale wells, according to the GAO.

In a letter to PADEP in 2011, EPA highlighted the presence of radionuclides, along with other contaminants, as present in wastewater resulting from gas drilling operations and emphasized the

importance of investigating the presence of radionuclides in public water supplies and their persistence in wastewater effluent.

Sampling and data-gathering by New York State detected radiological parameters in Marcellus Shale flowback, including Radium-226, the longest lived isotope of radium with a half-life of 1600 years. Gross Alpha, Gross Beta, Total Alpha Radium and Radium-228 were also found. Radioactivity levels may more often than not exceed safe drinking water levels but with no testing or treatment required before reuse, these dangerous contaminants will not be controlled.

Reused frack fluid may also contain constituents found in frack wastewater. New York's DSGEIS contained a list of constituents in gas drilling Marcellus shale wastewater from Pennsylvania and West Virginia. Many are hazardous, some have known harmful health impacts, some are carcinogenic. New York tested flowback from these shale gas extraction operations in Pennsylvania and West Virginia and found 154 parameters.

Attached is a table with 20 chemicals commonly used in fracking with data culled from a Marcellus Shale Coalition Report (the Hayes Report) (Attachment 1). These chemicals were also disposed of at the Love Canal site in Niagara Falls, New York, one of the most infamous hazardous waste health disasters in the U.S. in the last 50 years. It is important to note the levels detected in flowback water as reported in the Hayes Report compared to maximum contaminant levels for the regulated chemicals listed. This table illustrates the public health risks that arise from the handling, use and reuse of these dangerous and toxic materials.

Furthermore, there may be constituents in flowback and produced waters from gas development that are not regulated under the Safe Drinking Water Act even though they have human health risks and ecosystem/environmental impacts. Some substances are chemicals that are unregulated and for which there is no maximum contaminant level (MCL) yet set by U.S. Environmental Protection Agency (EPA) or the State for drinking water quality. Many of these are known as "emerging contaminants" and have known harmful human health effects but standards are still in the process of being developed. These pose additional unacceptable risks because they may be released into the environment without detection or any requirement for monitoring, detection, or treatment. Some of these are endocrine disruptors (EDC) or pharmaceuticals that may occur in gas drilling wastewater.

EDCs used in hydraulic fracturing fluids and found in flowback are of special concern due to the biological effects of these constituents at extremely low concentrations. Suspected EDC's found in gas drilling wastewater include arsenic and selenium; hydraulic fracturing fluids may contain others such as 2BE, 2-Ethylhexanol, and Crystalline Silica. Scientists and health professionals are beginning to analyze these materials and measure their impacts on human health in a different way, testing these compounds at very low levels in the range of human exposures and at various endpoints.

In an effort to protect human health from these very dangerous materials, scientists are concluding that there are no safe doses for endocrine disruptors; the fact that they have biological effects proves that EDC's have biological activity – what the induced effects are is the question. As stated by Linda Birnbaum, Director, National Institutes of Health, "It is time to start the conversation between environmental health scientists, toxicologists, and risk assessors to determine how our understanding of low-dose responses influence the way risk assessments are performed for chemicals with endocrine-disrupting activities. Together, we can take appropriate actions to protect human and wildlife populations from these harmful chemicals and facilitate better regulatory decision making".

The track record of the industry in terms of spills, well bore failures, and other pollution incidents as reported in numerous investigative reports, on *SKYTRUTH* and *FRACKTRACKER*, and as evidenced by PADEP's on-line reporting platform, is poor in terms of compliance and frequency of accidents that result in adverse environmental impacts and/or pollution to the waters of the Commonwealth..

Pollution incidents from accidents and the mishandling of frack fluids and other produced fluids that would be reused or recycled on site in Pennsylvania continue to occur. The poor record of operators reinforces our lack of support for the handling and reuse of this material on well sites. Unless Safe Drinking Water Act water quality standards are required to be met for fluids that are reused and unless the handling is done with maximum oversight and in highly controlled conditions, it is an unacceptable risk to Pennsylvania's public and the environment to allow the processing and use, reuse or recycling of any materials that are produced by natural gas drilling or fracking.

Table 2: Partial comparison of chemicals buried at the Love Canal site in NYS, USA with gas industry flowback water chemicals used in hydraulic fracturing on 19 gas wells. Chemical migration occurred outward from Love Canal, as it does from state regulated gas wells. DW: Drinking Water

Table prepared by HydroQuest for Delaware Riverkeeper Network. 1-30-14

(1156)

Response: The Department disagrees that hydraulic fracturing should only be conducted using water meeting safe drinking water act water quality standards. The Department recognizes that flowback and produced water may pose a threat of environmental harm. In order to address that potential harm, the rulemaking establishes an approval process and safe handling and storage requirements. The Department reviews all requests to utilize alternative waste management practices to ensure that they provide equivalent or superior protection to

the standards specified in §§ 78.56(a) and 78a.56(a).

- 1144.** Comment: The Department proposes to provide approvals to process drill cuttings at the well site where they were generated (§ 78.58(c)). The Department should consider a permit-by-rule for this activity. (1172)

Response: See response for comment 1124.

- 1145.** Comment: The Department would similarly consider permit-by-rule approvals to process fluids generated during well completion activities at the well site (§ 78.58(a)). The Department should expand the list of approved activities listed under Section 78.58(b) to include activities to remove solids and the removal of hydro-carbons. (1172)

Response: See response to comment 1105.

- 1146.** Comment: The broad requirement to characterize, in the manner set forth by the residual waste regulations, residue remaining after the on-site processing or handling of drilling fluids is potentially unnecessary and will be very expensive to operators. (1172)

Response: Characterization requirements are necessary to properly transport and dispose of this waste material.

§ 78.59a. Impoundment embankments

- 1147.** Comment: This section prevents the industry from making quick changes when improved designs and materials are made available. The Department should establish “performance standards” and allow the industry to propose methods and alternatives to meet the standards. (1103)

Response: The regulations allow operators to request approval for alternatives to the regulatory standards. Approvals will be granted when proposed alternatives are shown to provide equivalent or superior protection to the requirements provided.

- 1148.** Comment: 78.59a – We support improved design and construction standards for freshwater impoundments. We oppose the use of centralized impoundments for waste handling, as is explained above.

We recommend that § 78.59a and § 78.59b be combined into one regulation that addresses freshwater impoundments. However, for simplicity we have kept the freshwater impoundment embankment regulations (§ 78.59a) separate from the freshwater impoundment registration, performance, safety and security standards regulations (§ 78.59b) in our comments below. The regulations can be combined by the PADEP in the final draft.

Impoundments that include construction of embankments should be subject to the requirements of Chapter 105, Subchapter B, Dams and Reservoirs. Specifically, impoundments should be subject to the requirements of § 105.91 - § 105.99 related to classification and design criteria for approval of construction, operation, modification, and maintenance; § 105.101 - § 105.109 related to construction requirements and procedures; § 105.111 related to the commencement of storage of water, fluid, or semifluid; § 105.123 related to the restoration of aquatic life; and § 105.131 - § 105.136 related to operation, maintenance, and emergencies.

We recommend that existing impoundments that do not meet these new standards be removed within one year from the date the regulations are approved, and be replaced to meet the new standard.

We recommend the following changes to the proposed regulations at § 78.59a:

§ 78.59a. Freshwater Impoundments Embankments.

New embankments constructed for freshwater impoundments for oil and gas activities shall meet the applicable requirements of 25 Pa. Code Chapter 105, Subchapter B. Dams and Reservoirs. (1143)

Response: The regulations impact only dams that are not regulated under Chapter 105. Therefore all applicable requirements in Chapter 105 are addressed by the regulation.

- 1149.** Comment: Subsections 78.59a and 78.59b unnecessarily target the oil and gas industry with respect to the storage of freshwater, in a manner that would impose excessive cost with unclear environmental benefit. The Department has not provided any justification or harms analysis with respect to freshwater impoundments. These sections should be deleted from the proposed rule. (1135)

Response: The scope and type of use of well development impoundments by the oil and gas industry is significantly different than the scope and type of use of impoundments by other industries in such a manner that the Department has determined that the regulations are appropriate. Subsection 78.59a relates to the structural integrity of the impoundment to provide adequate public safety. Subsection 78.59b provides reasonable assurances that the water placed in the impoundments does not pose an environmental hazard.

- 1150.** Comment: **78.59a** – The proposed regulations have extensive new requirements for impoundment embankments, freshwater impoundments, and centralized impoundments beyond those any other industry must follow for impoundments, regardless of what is contained in them. The Dam Safety and Encroachments Act extensively regulated freshwater impoundments and the Solid Waste Management Act extensively regulates residual waste impoundments. DEP has significantly underestimated the cost of designing, constructing and maintaining impoundments to the standards in sections 78.59a through 78.59c. Further, no other industry has been singled out for specific rules on the use of impoundments; persons conducting operations in any non-oil and gas context are governed by the existing laws and regulations of general applicability. Delete Section 78.59a entirely. (1153)

Response: See response to comment 1149.

- 1151.** Comment: The Department is proposing new regulations for activities that have been implemented through forms, approvals and policies for several years. As a regulation, flexibility must be added to address changes that may become necessary to address unforeseen issues that may arise or to address other practical issues that may be very onerous if implemented as absolute regulatory requirements. Specific requirements should remain in guidance documents and forms.(1071, 1137, 1174)

Response: See the reply to comment 1147.

- 1152.** Comment: Under this proposal, the Department will be regulating freshwater impoundments which are not regulated under Chapter 105 or any other portion of Title 25 Environmental

Protection. Regulating only Oil & Gas freshwater impoundments and no other person, group, or industry's freshwater impoundments is arbitrary and capricious. Consequently, freshwater impoundments must either be removed from the proposed Oil & Gas regulations, or Title 25 needs to be revised to regulate all persons, groups, or industries equally. (1137, 1147, 1174)

Response: See response to comment 1149.

1153. Comment: The requirements of Section 78.59a are too prescriptive and do not provide the Department with the flexibility to approve alternate methods. (1137, 1174)

Response: See response to comment 1147.

1154. Comment: Both freshwater and centralized impoundments are defined in this Chapter and do not need to be qualified in this section as being used “for oil and gas activities.” (1137, 1174)

Response: There is a possibility that an operator could install a freshwater and/or centralized impoundment for use other than for oil and gas related activities, therefore the statement “for oil and gas activities” is retained.

1155. Comment: §78.59a(a) should be modified to allow alternate methods to be approved by the Department. (1137, 1147, 1174)

Response: See response to comment 1147.

1156. Comment: The industry has a huge need for water. Our rural, farmland and forested communities benefit from impoundments where in some cases due to freshwater withdrawal directly flowing freshwater lines, inbound water hauling may be eliminated from our roads. This greatly improves traffic congestion and air quality issues related to heavy diesel traffic. Impoundments also provide a storage component for the industry providing opportunities to store water for use during the seasonal low water periods when they may desire to fracture wells and any water withdrawal locations may be placed on pass-byes. C.O.G.E.N.T. fully supports the impoundment embankment standards and recommends their adoption at a minimum as is written. (660a)

Response: The Department acknowledges the comment.

1157. Comment: §78.59a(a)(1) should be revised to explicitly allow deviation from the stripping and grubbing standards if approved by the Department. (1147)

Response: See response to comment 1147.

1158. Comment: §78.59a(a)(2) should be revised to allow for the use of coarse aggregate with a permeability of 1×10^{-3} cm/sec or an alternate material approved by the Department in any embankment foundation drain in addition to PennDOT Type A sand. (1137, 1147, 1174)

Response: Type A sand provides a filter for all types of soils in PA. So not only does it drain occasional seeps, it also filters out any soil particles that would flow with the spring.

1159. Comment: §78.59(a)(5) should be revised to change the required soil sampling frequency from 1 sample per 1,000 cubic yards to a frequency of 1 sample per soil type. (1137, 1147, 1174)

Response: See response to comment 1173.

- 1160.** Comment: §78.59a(a)(5) should be revised to clarify that the soils used in embankment should have a minimum of 20 percent retained on a No. 200 sieve. (1137, 1147, 1174)

Response: While the wording concerning the percent of fines in the soil has been confusing in past standards/requirements, the current wording is more descriptive and seems to be understood by the designers. The Department has not changed the wording for this standard. See response to comment 1175.

- 1161.** Comment: §78.59a(a)(5) should be revised to allow use of other soil types as part of an alternate design. (1147)

Response: See response to comment 1147.

- 1162.** Comment: §78.59a(a)(9)(ii) should be revised to allow to require a geotextile underlayment only when a coarse aggregate with very few fines is used as fill. (1147)

Response: The geotextile underlayment provides protection for the embankment materials.

- 1163.** Comment: (a)(1) - This section is overly detailed and prescriptive. If not altered to allow performance based standards, flexibility must be provided in the rule. In many cases this requirement would cause an unnecessary excavation through suitable subgrade material. In some cases this requirement may allow unsuitable subgrade material to remain. It is suggested that the citation be revised to require the removal of unsuitable material prior to fill placement, and add a suggestion to retain a Professional Engineer to provide foundation construction oversight. Suggested Language: (1) The foundation for each embankment must be stripped and grubbed to a minimum depth of 2 feet below existing contour prior to any placement and compaction of fill, or as otherwise approved by the Department. (1137, 1174)

Response: See response to comment 1147. Additionally, under no circumstances should this provision be interpreted to allow unsuitable subgrade material to remain. If stripping and grubbing to a minimum depth of 2 feet below existing contour does not reveal suitable subgrade material, excavation should continue until all unsuitable subgrade material is removed prior to any placement or compaction of fill.

- 1164.** Comment: Section 78.59a(a)(2) impliedly allows impoundments and/or embankments to be constructed on top of springs. The regulation should prohibit construction of embankments over springs because it increases the potential for erosion and spills. (852a)

Response: Section 78.59a(a)(2) accommodates drainage of springs and seeps encountered during construction using appropriate engineered controls. In some cases springs and seeps are not revealed until construction begins. Additionally, the engineered controls prescribed by §§ 78.59c and 78a.59c prevent erosion and ensure stability of the embankment.

- 1165.** Comment: (a)(2) - This section is overly detailed and prescriptive. If not altered to allow performance based standards, flexibility must be provided in the rule. The use of PennDOT Type A sand in this application poses the following design issues: (1) Due to the small grain size of the sand particles, those particles can migrate into the pipe perforation of piping typically used in the drain. Sand migration/erosion could cause void space to develop in the pipe bedding. Or, sand could block the pipe perforations or block flow in the pipe; and (2) the sand's permeability is low as compared to other more available aggregates. The sand is a slower draining material that could cause adjacent

soils to become saturated. It is suggested that “coarse aggregate” and minimum permeability of 1×10^{-3} cm/sec be specified.

The use of a geotextile wrap around the aggregate should be allowed when designed by a Professional Engineer. Geosynthetic design calculations for geotextiles used as a separator, such as this application, are available.

Suggested Language: (2) Any springs encountered in the embankment foundation area shall be drained to the downstream toe of the embankment with a drain section 2 foot by 2 foot in dimension consisting of PennDOT Type A sand, compacted by hand tamper; coarse aggregate with a minimum permeability of 1×10^{-3} cm/sec; or an alternate material approved by the Department. Geotextiles shall not be used around sand, unless approved by the Department. The last 3 feet of this drain at the downstream slope shall be constructed of AASHTO #8 material. (1137, 1174)

Response: See response to comments 1147 regarding design flexibility and 1158 regarding type A sand.

- 1166.** Comment: In addition to pollution hazards, impoundments result in significant compaction of the soil due to the weight of stored liquids. (980, 1098)

Response: Proper impoundment construction requires compaction of embankment and sub-base material.

- 1167.** Comment: The embankments, as specified [78.59a], are problematic in the draining of streams to downstream locations rather than moving the embankment to another site. [78.59a (a)(2)] (980, 1098)

Response: The Department acknowledges the comment. The embankment standards accommodate drainage of springs and seeps encountered during construction but do not allow for stream relocation.

- 1168.** Comment: The stabilization practices [78.59a (9)] should be enhanced to prevent erosion and sedimentation problems stemming from cumulative impact of development and frequent severe weather emergencies.(980, 1098)

Response: The stabilization practices in § 78.59a meet the requirements of Chapter 102.

- 1169.** Comment: There are no generally accepted Engineering standards that require/mandate a top width of 12 feet nor are there any that require slopes no steeper than 3 horizontal to 1 vertical. Thousands of impoundments have been and continue to be constructed by various Government agencies and others without these construction limitations. These design standards are normally determined by a registered Professional Engineer and are not standards that should be made up by Regulation writers who are NOT Registered Engineers.(92)

Response: The design standards were developed by registered engineers. See response to comment 1147.

- 1170.** Comment: My belief is that this section should only apply to unconventional well sites. In (4) of this section it states that the slopes should be no steeper than 3 horizontal to 1 vertical. This is impossible to achieve on a small conventional well site measuring 150'x150' total. The conventional operators, in the last 20 years have been trying to reduce the size of the well pads, which in turn have

obviously reduced the drill/frac pit size on location. We've had a great deal of success drilling conventional wells on smaller pads, while pleasing everyone involved, including the PADEP, landowners as well as the investors and operators. A smaller pad means less money to build. Win, win for all parties. This section would need rewritten to accommodate the conventional operator's needs.(145)

Response: See response to comment 1147. Additionally, the provisions in §§ 78.59a, b and c address centralized impoundment which are not required to be located on a well site. On-site pits for temporary storage are regulated under § 78.56. The specifications are appropriate for centralized impoundments regardless of whether they are utilized for conventional or unconventional well development.

1171. Comment: 78.59a(4) -The inside slope should be allowed to be 2:1 to try and cut down on the overall earth disturbance. (411)

Response: The soil types prescribed by the regulation have not been proven to be stable when placed steeper than a 3:1 slope.

1172. Comment: 78.59a(5) -The rate of soil sampling of one sample per 1,000 cubic yards is unreasonable and cost prohibitive to the operator. A single composite sample from the embankment material should suffice. (411)

Response: The Department does not agree that a single composite sample from the embankment material is sufficient to classify soil embankment materials. See response to comment 1173.

1173. Comment: 78.59a(a)(5) - The testing frequency specified is excessive and in most cases would generate redundant results. At the proposed frequency, preconstruction sampling would not be economically feasible. Consequently, sampling and testing at 1 per 1,000 cubic yards would need to be performed during the course of the earthwork and could cause expensive construction delays while waiting for test results. For a typical impoundment, approximately 70,000 cubic yards of earthwork would be required. Pursuant to the proposed section, 70 samples would be required for testing. It is suggested that the specification be change to state "Soil samples shall be classified at a frequency of 1 sample per soil type." (1137, 1174)

Response: The Department agrees that laboratory soil testing at a rate of 1 per 1,000 cubic yards of placed fill may not be necessary in all cases. The regulatory language has been revised to require laboratory testing at a minimum rate of 1 sample per 10,000 cubic yards of placed fill, 1 sample per soil source and one sample when the soil type changes for a given source. To ensure oversight of source material quality the regulation will also require soils to be visually classified (ASTMD-2488) at a rate of 1 sample per 1,000 cubic yards of placed fill.

1174. Comment: **78.59a(a)(6)** – Acceptable slope stability factors of safety can be achieved using soils with less than 20% of the particles retained on the No. 200 sieve, and an acceptable factor of safety can be achieved with soils that do not meet the textural classifications specified. Therefore, it is recommended that the section be modified to allow site-specific soils to be evaluated within the proposed design by an appropriately qualified professional utilizing laboratory analysis (if needed) and supporting calculations. (1137, 1174)

Response: See response to comment 1147.

1175. Comment: Section 78.59a(a)(6) should read “soils shall contain 20% or more material passing the #200 sieve.” (852a)

Response: Often soils are described by the weight of material passes certain sieve sizes; however, for this standard, the requirement is that the soil contain at least 20% of material larger than the No. 200 sieve for the following reasons. The acceptable soils listed in § 78.59a(6) by the Unified Soil Classification System (USCS) must already meet certain criteria related to the No. 200 sieve. In other words, GM and GC soils (gravels with fines) must have at least 12% fines, and SM and SC soils (sands with fines) must also have at least 12% fines. Also CL and ML soils (Inorganic fines) must have at least 50% fines. The amount of fines for these materials, as specified by USCS, is sufficient for dam embankment construction. The reason for this standard, is for CL and ML soils that contain more than 80% fines and may result in embankments with instable side slopes. In other words, ML and CL soils must have between 50%-80% fines to meet this requirement.

1176. Comment: Section 78.59a(a)(8) does not include field quality control/quality assurance requirements such as in-situ compaction density and optimum moisture tests to confirm that these larger impoundments are built with suitable structural integrity. (852a)

Response: The Department agrees. An additional standard for field density testing has been added to the regulation. The regulation will require a satisfactory density test for every lift and for every 2,000 square yards on a single lift.

1177. Comment: § 78.59a(9)(i) – To ensure consistency across Commonwealth regulations, § 78.59a(9)(i) should refer to requirements found at 25 PA Code, Chapter 102, Section 102.4, Erosion and Sediment Control. Additionally, we recommend the use of native trees and shrubs. Requiring the use of native plant species to stabilize impoundment embankments will reduce the introduction of non-native invasive species on oil and gas sites and would help limit the potential spread of non-native or other invasive species to adjacent private or public lands such as units of the National Park System. (1062, 1133)

Response: Section 78.59a(a)(9)(i) requires compliance with § 102.22 which address permanent stabilization requirements. The Department encourages the use of native plant species for all projects where vegetative cover is used for permanent stabilization.

1178. Comment: 78.59a(a)(9) - In most cases the rock layer placed on the out-slope of the embankment will consist of a well graded soil consisting of oversized rock with fines from the site excavation , which will not be susceptible to stormwater infiltration and erosion of the embankment-to-rock-fill interface. Due to the time consuming effort necessary to install a geotextile separation layer and the added cost, it is recommended that Class 2, Type A geotextile is only necessary when a course aggregate with very few fines is used as fill.” (1137, 1174)

Response: See response to comment 1162.

1179. Comment: The new language of this section establishes requirements related to impoundments and has generated significant interest from the regulated community. Commentators express concern that the requirements of this section are much more stringent than the design criteria for residual waste or hazardous waste under the SWMA. Commentators also note that the Dam Safety and Encroachments Act regulates freshwater impoundments. Some commentators assert that EQB has significantly underestimated the cost of the standards imposed by these requirements. Other commentators suggest additional requirements regarding soil testing and volume limits. We ask EQB to ensure that

the provisions of this section do not conflict with or duplicate statutes or existing regulations. We also ask EQB to explain in the Preamble and RAF of the final-form regulation how the requirements in this section reasonably and adequately balance protection of the public health and natural resources against the fiscal impact on the oil and gas industry. We have similar concerns related to impoundment requirements in Sections 78.59b and 78.59c, and ask EQB to ensure that these sections do not conflict with or duplicate statutes or existing regulations. We also ask EQB to explain in the Preamble and RAF of the final-form regulation how the impoundment requirements in these sections reasonably and adequately balance protection of the public health and natural resources against the fiscal impact on the oil and gas industry. (1099)

Response: The Department believes that centralized impoundments should be regulated in the same manner as other waste transfer facilities are regulated under Article IX. Therefore, in order to ensure consistency the Department has revised § 78.59c to require any new centralized impoundments to be authorized by a residual waste permit under Article IX. In addition, § 78.59c also requires operators of existing centralized impoundments permitted under a Dam Permit for a Centralized Impoundment Dam to either submit a closure plan to the Department within 6 months and close the centralized impoundment within 3 years of the effective date of the rulemaking or obtain a residual waste permit for the operation of the centralized impoundment within 3 years of the effective date of the rulemaking. Regarding the need to regulate well development impoundments, the scope and type of use of well development impoundments by the oil and gas industry is significantly different than the scope and type of use of impoundments by other industries in such a manner that the Department has determined that the regulations are appropriate. Subsection 78.59a relates to the structural integrity of the impoundment to provide adequate public safety. Subsection 78.59b provides reasonable assurances that the water placed in the impoundments does not pose an environmental hazard.

- 1180.** Comment: The regulation should establish, but does not have, a height and total volume limit for minimum embankment construction standards. (852a)

Response: By definition, well development impoundments are not regulated under §105.3. Therefore the regulations do establish height and volume limits for well development impoundments.

- 1181.** Comment: Soil test results should be reported to the Department rather than only having the results submitted ‘upon request’. The Department’s failure here and elsewhere to require the submission of information that must be generated by the operator prevents the public from obtaining access to the information. (852a)

Response: The embankment standards are applicable to only well development impoundments. The Department does not review or authorize construction of well development impoundments.

- 1182.** Comment: The Department should consider tying berm width to the height of impoundment built above grade – with wider widths for taller impoundments. (852a)

Response: The specified standards are appropriate to ensure structural integrity of impoundment embankments. See response to 1180.

- 1183.** Comment: Requires an engineer to certify construction of any proposed impoundment - essentially requiring full time supervision by the engineer of the construction phase.(1172)

Response: As a result of the modifications to §§ 78.59c and 78a.59c, the certification reports identified by the commenter have been deleted.

1184. Comment: The design criteria and construction standards for impoundments are more stringent than those required for residual and hazardous waste containment.(1172)

Response: Chapters 78 and 78a have been revised to require oil and gas operators to construct and operate centralized impoundments under the SWMA. See response to comment 1251.

§ 78.59b Well development impoundments

1185. Comment: 78.59b – We support improved registration, performance, safety, and security standards for freshwater impoundments. (1143)

Response: The Department acknowledges the comment.

1186. Comment: We oppose the use of centralized impoundments for waste handling, including mine influenced water. We do not support the storage of mine influenced water in a freshwater impoundment. A “freshwater” impoundment by its title is only designed to store uncontaminated “freshwater” that meets the definition that we proposed at § 78.15 above. (In our comments at § 78.15 above, we recommended that following definitions. Freshwater means “fresh surface water” and “fresh groundwater.” Fresh Groundwater means: “Uncontaminated water in that portion of the generally recognized hydrologic cycle which occupies the pore spaces and fractures of saturated subsurface materials and all underground sources of drinking water, as defined in 40 CFR §§ 144.3, 146.4, including all primary and principal aquifers.” Fresh surface water means “Uncontaminated water in that portion of the generally recognized hydrologic cycle which occupies the surface of the Earth.) Mine influenced water should be handled as wastewater. All water stored in a freshwater impoundment should be tested and verified to meet a “freshwater” standard prior to storage, and that test data should be provided to the PADEP. (1143)

Response: The Department has modified Chapters 78 and 78a to change “Freshwater Impoundment” to “Well Development Impoundment” to clarify the meaning of the term. In regards to storage of mine influenced water in a well development impoundment, the quality of mine influenced water varies greatly throughout the Commonwealth and the term includes mine influenced water that has been treated, which may be very high quality. Before mine influenced water is allowed to be stored in a well development impoundment, the Department must review and approve the storage based on a variety of factors including the quality of the water and the risks of storage of the water.

1187. Comment: We recommend that § 78.59a and § 78.59b be combined into one regulation that addresses freshwater impoundments. (1143)

Response: The sections address different issues.

1188. Comment: We recommend that existing impoundments that do not meet these new standards be removed within one year from the date the regulations are approved, be replaced to meet the new standard. (1143)

Response: The provision has been revised to require a certification that the existing

impoundments meet the new standards when registering existing impoundments.

1189. Comment: We recommend improvements in the liner design, quality, installation, and maintenance requirements. (1143)

Response: The Department acknowledges the comment.

1190. Comment: We do not support § 78.59b(e), allowing for the artificial lowering of the seasonal high water table. The use of an artificial underdrain system is likely to affect the adjoining groundwater system beyond the impoundment, including potentially damaging impacts on wetlands and headwater streams through the lowering of the groundwater. Soil moisture conditions are almost certain to be affected by the centralized impoundment construction, and an artificial underdrain system would further exacerbate these impacts. Altered groundwater and soil moisture conditions will directly impact established woodland vegetation. Additionally, the presence of a seasonal high groundwater table indicates a hydrologic connection to adjacent streams and wetlands, and hence, an additional path for direct contamination, should a leak or discharge from the impoundment occur.

Chapter 73 of the Pennsylvania Code (related to Standards for On-lot Sewage Treatment Facilities) prohibits the installation of on-lot sewage facilities if the seasonal high water table is within 20 inches (§ 73.14(5)). There is no option for an alternate underdrain system if a seasonal high-water table condition exists. The same standards should apply to impoundments.

Impoundments should not be permitted within 20 inches of a seasonal high groundwater table, and should not be allowed to artificially lower the seasonal high groundwater table. The water quality implications from an impoundment can be far more significant than an on-lot sewage treatment system; the standards should not be less stringent. (1143)

Response: The comparison between on-lot sewage treatment facilities and well development impoundments is not appropriate because on-lot sewage treatment systems are disposal facilities that rely on soil to effectively treat wastewater. Well development impoundments are not waste disposal facilities and do not rely on soil to provide treatment of wastes. The 20 inch separation requirement allows for a physical barrier between the seasonal high groundwater table and the bottom of the impoundment to prevent mixing of impounded water and groundwater and to ensure structural integrity of the impoundment. The Department does not anticipate any significant environmental harm from passive drainage systems that are installed to divert seasonal high groundwater tables away from well development impoundments.

1191. Comment: We do not support impoundment site waivers, even if the landowner consents. Sites must be fully restored to protect interconnected water supplies, forests, and habitats. The impoundment site should be restored based on a survey of existing conditions prior to disturbance, to ensure that the ecological integrity and habitat values of a forested or naturally vegetated area are fully restored. Impoundments require maintenance and inspection for continued safety of the structure, and the landowner may not be fully aware of these requirements. The required removal of the liner will alter the impoundment capacity to retain water and the impoundment structure itself. The PADEP should require restoration to original contours. (1143)

Response: This section allows landowners to make a request to the Department to waive the requirement to restore a well development impoundment site to approximate original conditions provided that the liner is removed from the impoundment. Since, by definition, well development impoundments do not require a dam permit under Chapter 105,

landowners could potentially construct identical impoundments on their property without any notification to the Department at all. The Department believes that it is appropriate to allow a landowner to maintain a dam embankment which was used for a well development impoundment on their property if they choose and notes that there would likely be a greater environmental impact should the operator be required to restore the well development impoundment site to approximate original conditions just to have the landowner reconstruct the impoundment.

In addition, restoration to approximate original conditions, capable of supporting original uses to the extent practicable is the best practice to achieve site restoration within reasonable operational parameters. It is not necessary to include technical performance standards including requirements for type and density of perennial vegetation, soil characteristics and drainage patterns in this section because those issues are already appropriately addressed by the requirements. Projects meeting the requirements will satisfy the statutory restoration requirements and include performance requirements that will protect waters of the Commonwealth.

1192. Comment: Suggested amendatory language: § 78.59b(a) Impoundments may be constructed for freshwater (as defined in § 78.15). Only freshwater may be stored in a freshwater impoundment. Centralized waste impoundments are prohibited. (1143)

Response: See response to comment 1186.

1193. Comment: Suggested amendatory language §78.79b(b) In addition to meeting the requirements of § 78.59a (relating to impoundment embankments), all new freshwater impoundments must be in compliance with this section and any existing freshwater impoundments must meet these standards by _____. (Editor's Note: The blank refers to one year after the effective date of adoption of this proposed rulemaking.). (1143)

Response: See response to comment 1188.

1194. Comment: Suggested amendatory language: §78.59b(e) Unless the operator or its contract staff is continuously present at a freshwater impoundment, a fence must completely surround the freshwater impoundment to prevent unauthorized acts of third parties and damage caused by wildlife. (1143)

Response: The Department disagrees that specifying that the individual present at the site must be the operator or contract staff.

1195. Comment: Suggested amendatory language: §78.59b(f) Freshwater impoundments shall be restored by the operator by removing excess water and the synthetic liner and returning the site to approximate original baseline conditions to ensure that the ecological integrity and habitat values of a forested or naturally vegetated area are fully restored, including preconstruction contours, and can support the land uses that existed prior to oil and gas activities to the extent practicable within 9 months of completion of drilling the last well serviced by the impoundment. A 2-year restoration extension may be requested under section 3216(g) of the act (relating to well site restoration). If written consent is obtained from the landowner, the requirement to return the site to approximate original contours may be waived by the Department if the liner is removed from the impoundment. (1143)

Response: See response to comment 1191.

1196. Comment: Suggested amendatory language: §78.59b(g) The Department may require the operator to test water sources proposed to be stored in a freshwater impoundment prior to storage to verify that the water quality meets the § 78.15 freshwater standard. The water test data must be provided to the Department 10 days prior to storing freshwater in the freshwater impoundment. (1143)

Response: The existing proposal adequately addresses water quality testing prior to storage.

1197. Comment: To truly safeguard the groundwater and reduce the risk of a pit liner floating, all pits and impoundments should be required to have a professional determine the seasonal high groundwater table. This is not mentioned under all of the potential pit applications. (1150)

Response: The Department agrees. The section has been amended to require a soil scientist or other similarly trained person to determine the depth to seasonal high groundwater.

1198. Comment: The 2' freeboard is not mentioned under freshwater or centralized impoundments. It is important that some space is provided for all pits and impoundments. (1150)

Response: The Department agrees that maintaining freeboard is important for safe operation of pits and impoundments. Given the benign nature of liquids stored in well development impoundments, however, the Department is not adding the 2' freeboard requirement to sections 78.59b or 78a.59b.

1199. Comment: Fencing should also be required for all pits and impoundments for human and wildlife safety. (1150)

Response: Section 78.59b(e) requires fencing or continuous presence at the site to prevent unauthorized acts of third parties and damage caused by wildlife.

1200. Comment: Because there is not a clear definition for freshwater, freshwater impoundments should not be allowed as proposed. (649)

Response: See the response to comment 1186 regarding the change from “freshwater impoundment” to “well development impoundment”

1201. Comment: Section 78.59b allows an operator or owner to store mine influenced water in a freshwater impoundment, with DEP approval. By DEP’s own definition, mine influenced water is water that pollutes, or may create a threat of pollution to, waters of the Commonwealth. We recommend prohibiting the storage of mine influence waters in freshwater impoundment, and rather requiring that mine influenced water be stored in centralized impoundments, which have stronger environmental requirements and protections. (1142, 1157)

Response: See response to comment 1186.

1202. Comment: 78.59b – The proposed regulations have extensive new requirements for impoundments storing freshwater that are often unnecessary and go beyond those any other industry must follow for storing fresh water. Regulating freshwater impoundments for only the oil and gas industry, despite their use by many other industries, is arbitrary and capricious. Freshwater impoundments should either be removed from the proposed oil and gas regulations, or Title 25 needs to be revised to regulate all persons, groups, or industries equally. (952, 1071, 1137, 1147, 1153, 1174)

Response: The scope and type of use of well development impoundments by the oil and gas

industry is significantly different than the scope and type of use by other industries in such a manner that the Department has determined that the regulations are appropriate.

1203. Comment: 78.59b – The proposed regulations have extensive new requirements for impoundments storing fresh water, beyond those any other industry must follow for storing fresh water. Freshwater impoundments are already regulated under the Dam Safety and Encroachments Act. (1153)

Response: See response to comment 1202. The regulations supplement the existing requirements under the Dam Safety and Encroachments Act.

1204. Comment: We are interested in these particular provisions because FWIs are becoming more common in our rural, farmland and forested communities. The water contained within the FWI may not in all cases be similar to that of the local aquifer. We need to ensure that our groundwater is adequately protected maintaining the integrity of our private water supplies. FWIs are a large part of the industry recycling methods. FWIs also provide water storage areas to prepare for seasonal low water periods. We certainly want to encourage recycling. In some cases where waterlines connect water source withdrawals with FWIs local residents greatly benefit from reduced truck traffic. (1035)

Response: The Department acknowledges the comment.

1205. Comment: Suggested amendatory language: §78.59b(d) For unconventional well sites, unless an individual is continuously present at the well site, a fence or fences shall completely surround all pits to discourage unauthorized acts of third parties and damage caused by wildlife. (1147)

Response: It is appropriate to regulate all well development impoundments in the same manner.

1206. Comment: §78.59b(e) - This subsection requires the same groundwater table determination practices for freshwater impoundments as for produced water pits. This proposal seems unreasonable for freshwater. This subsection should be removed. (1147)

Response: The 20 inch separation requirement allows for a physical barrier between the seasonal high groundwater table and the bottom of the impoundment to prevent mixing of impounded water and groundwater and to ensure structural integrity of the impoundment. It is appropriate to ensure that this requirement is met in order to prevent significant environmental harm.

1207. Comment: §78.59b(f) Freshwater impoundments, when not needed for operations and not wanted by the surface owner, should be restored in accordance with applicable site restoration plans.

Suggested amendatory language: Freshwater impoundments shall be restored by the operator to whom the impoundment is registered by removing excess water and the synthetic liner and restoring the site in accordance with a site restoration plan within nine months of completion of the last well serviced by the impoundment. A restoration extension may be requested consistent with the extension requirements described under section 3216(g) of the act (58 Pa.C.S. § 3216(g)) that apply to well site restoration obligations. (1147)

Response: The restoration period and standards are defined by the 2012 Oil and Gas Act. Restoration must occur within 9 months of completion of drilling. Additionally, the regulation allows well development impoundments to remain unrestored if consent is obtained from the

landowner and the liner is removed from the impoundment.

1208. Comment: Suggested amendatory language:§78.59b(g)(1)(i)

A demonstration that the escape of the mine influenced water stored in the freshwater impoundment will not result in water or land pollution or endanger persons or property and include the following; (1147)

Response: The language in this section is consistent with language in § 105.3(a)(3) which is used to determine if an impoundment requires a permit under the Dam Safety and Encroachments Act. Any impoundment that contains fluids or semifluids other than water, the escape of which will result in air, water or land pollution or endanger person or property requires a permit under the Dam Safety and Encroachments Act. Therefore the language regarding air pollution is appropriate.

1209. Comment: 78.59b(b) – The form for this process should be produced and reviewed prior to establishment of this section. (411)

Response: The Department agrees that forms required by the regulations should be developed prior to the regulations being finalized.

1210. Comment: 78.59b(b) – We recognize and appreciate the Department’s effort to create an inventory of existing freshwater impoundments. While some counties such as Bradford County has done an excellent job in mapping Marcellus Shale infrastructure that is not true of all counties. The Department recently introduced a new mapping system, and ideally all oil and gas infrastructure, including impoundments and compressor stations etc. need to become part of that mapping system. Achieving such a statewide mapping will provide an accurate resource for counties that have not created current mapping of facilities. Ideally, we’d also like to see an as built gathering line layer available. Many operators would willingly provide such valuable information to the Department. It will also assist those that dwell within the gas fields to have access to information concerning their changing rural, farmland and forested communities. We are also glad to see the Department recognizing the transfer of impoundments as we do know such cases have already occurred. (660a)

Response: The Department acknowledges the comment. The Department will continue to work to improve online data availability.

1211. Comment: 78.59b(b) – I agree with the DEP proposal to have freshwater impoundments be registered with the department and I suggest this information also be made available online along with open pits, temporary open pits, and underground/partially buried storage tanks etc. (848)

Response: The Department acknowledges the comment.

1212. Comment: 78.59b(c) – There is no valid reason to mandate synthetic liners be used for the storage of freshwater. If however, the PA DEP insists on calling “mine influenced water” as freshwater then liners should only be required for impoundments that will contain such polluted water. Due to normal high levels of Total Dissolved Solids.(92)

Response: See response to comment 1186.

1213. Comment: 78.59b(c) – This subsection should not be included. Synthetic liners should not be required because onsite soils may provide sufficient permeability for use as a liner for freshwater.

Suggested amendatory language:

(c) Freshwater impoundments shall be designed to hold water without significant leaks that could affect the integrity of the embankment. (1103, 1137, 1147, 1174)

Response: The Department acknowledges that some native PA soils have sufficiently low permeability to contain water without significant leaks however, the Department declines to make this change because the revisions would require extensive planning, oversight and demonstrations to ensure that appropriate soils and procedures were utilized. This revision would exacerbate concerns raised by commenters in comment 1202.

1214. Comment: Section 78.59b(c) requires a ‘synthetic impervious liner’ without providing maximum permeability or allowable seepage or a type of liner material. The regulations should establish parameters for the synthetic liner. (852a)

Response: The section provides adequate protection without being overly prescriptive.

1215. Comment: 78.59b(c), (e), (f) – We support these well needed construction and restoration provisions. As the industry continues to expand in our region, impoundments are an integral part of the development infrastructure and therefore construction and restoration regulation are necessary to adequately protect our water resources. (660a)

Response: The Department acknowledges the comment.

1216. Comment: 78.59b(d) – We are concerned about unauthorized individuals gaining access to the many sites located within our region. Landowners have been dismayed by third parties trespassing on well pads and impoundments fully knowing that such locations may be dangerous for the general public. Landowners have not readily understood why it is that some consider it their prerogative to not only trespass on their lands but also, an industrial work site at that. Landowners also have concerns about a variety of third party damage issues some of which have occurred that resulted in environmental damage on their property. Such an occurrence was recorded in March, 2012 regarding a spill of diesel fuel at a gas well in Bradford County’s Springfield Township, Houseknecht 3H well site. Ten to Twenty gallons of diesel fuel were found in a farm field around the well, and some was discovered in a nearby unnamed tributary. In our region, where agriculture does continue to play a role in our regional economy, and includes organic producers, unauthorized third party access is an important concern. Therefore, we fully support the fencing provision at a minimum as it is written. (660a)

Response: The Department acknowledges the comment.

1217. Comment: 78.59b(d) – Since no fence can absolutely ensure “prevention” of unauthorized acts by third parties or damage by wildlife, the Department should replace “prevent” with “discourage.” (1137, 1174)

Response: The intent of the section is to prevent unauthorized acts by third parties. The Department acknowledges that fencing will not prevent unauthorized acts of third parties in all cases but replacing “prevent” with “discourage” would not satisfy the intent of the section.

1218. Comment: 78.59b(d) – Commentator is concerned related to the timeline for implementation, the

reasonableness of equating the presence of a person to a fence, the cost of installing a fence, and whether a person or fence can ensure prevention of damage or access. EQB should clarify the implementation procedures related to this provision. EQB should also explain in the Preamble and RAF of the final-form regulation how the security requirements in this section reasonably and adequately balance protection of the public health and natural resources against the fiscal impact on the oil and gas industry. (1099)

Response: The Department has clarified the intent of the section in the RAF and the Preamble.

- 1219.** Comment: 78.59b(e) –Impoundments and pits that contain any type of chemical should not be located anywhere near the high seasonal water table. Additional reasoning includes concern for plausible health impacts, “Although most additives are greatly diluted in the drilling process, organic compounds (with the exceptions of DBNPA and DBAN) tend to be lighter than water; therefore they float to the surface of holding pits, where they concentrate to essentially 100% of the surface. From there they volatilize or aerosolize into the air, from which they may be inhaled by neighbors and on-site industry workers. Partly for this reason, the states of Colorado (58) and New Mexico (59) have prohibited the use of impoundments for flowback fluids.”(189)

Response: The section referred to by the commentator relates to well development impoundments. See response to comment 1206.

- 1220.** Comment: 78.59b(e), 78.59c(d) – Anticipated climatic factors call for additional distances between the bottom of an impoundment and the seasonal high groundwater table. To permit engineering controls to alter the ground water table erodes drinking water protection. (980, 1098)

Response: See response to comment 1190.

- 1221.** Comment: More stringent parameters must be put in place regarding restoration of impoundment areas. Restoration to “approximate” original conditions and “to the extent practical” is not adequate. Restoration should be to set to best-known practice or standards. (980, 1098)

Response: Restoration to approximate original conditions to the extent practicable is the best practice to achieve site restoration within reasonable operational parameters.

- 1222.** Comment: The regulation does not provide any additional setback from seasonal high groundwater when storing ‘mine influenced water’. The Department should increase the setback from groundwater if the operator plans to store acid mine drainage or “mine influenced water” in the impoundment. (852a)

Response: See responses to comments 1186 and 1190

- 1223.** Comment: 78.59b(e) – This section requires the same groundwater table determination practices for freshwater impoundments as for produced water impoundments. This proposed subsection is excessive and unreasonable for freshwater. The cost in time, resources, and capital funding will be excessive to perform the studies required by this subsection and it is unreasonable to require the separation. This proposed subsection is excessive and unreasonable. The comentators recommend that it be removed. (1071, 1137, 1174)

Response: See response to comment 1206.

1224. Comment: 78.59b(f) - Freshwater impoundments, when not needed for operations and not wanted by the surface owner, should be restored in accordance with applicable site restoration plans. There is no obligation to return such sites to approximate original contours. In addition, the use of impoundments for operations at multiple well sites requires additional flexibility in the rule. For example, the phrase “completion of drilling” should be changed to “completion of the last well.” Also, section 3216(g) does not directly address freshwater impoundments, so extensions would not be limited to two years. Suggested Language: (f) Freshwater impoundments shall be restored by the operator to whom the impoundment is registered by removing excess water and the synthetic liner and restoring the site in accordance with a site restoration plan within nine months of completion of the last well serviced by the impoundment. A restoration extension may be requested consistent with the extension requirements described under section 3216 of the act (58 Pa.C.S. § 3216(g)) that apply to well site restoration obligations. (1071, 1137, 1174)

Response: See response to comment 1207.

1225. Comment: § 78.59b(f)(4): Seasonal High Groundwater Table (SHGT) is not engineerable. The whole concept that SHGT can be “engineered” is simply fallacious on its face. The clause “or if the seasonal high water table will be adjusted using engineering controls in order to accommodate the impoundment” must be stricken. The whole concept of SHGT is based on an understanding that “water will do what water wants to do” notwithstanding a well operator’s engineering. SHGT can no more be “engineered” than can floodplains. There is simply no environmental protection rationale for allowing a measurement of “engineered” SHGT under any circumstances. All such wording must be stricken. (869a)

Response: Drainage structures are commonly installed around and beneath structures to direct groundwater away from the structure.

1226. Comment: 78.59b(f) Stringent requirements to line and fence FRESH water impoundments really are counterproductive as these site features would be great for long-term post development use as farm ponds, irrigation ponds, and fire water supply ponds if not lined and made useless for such uses. (404)

Response: See response to comment 1202. Additionally, in accordance with the regulations, if requested by the surface land owner and the liner is removed, the impoundment may remain unrestored.

1227. Comment: 78.59b(f) addresses restoration of freshwater impoundments. Commentators state that these impoundments should be restored in accordance with applicable site restoration plans rather than to “approximate original conditions.” (1099)

Response: The Department agrees that impoundments should be restored in accordance with site restoration plans but the applicable site restoration plans should specify restoration to approximate original conditions unless otherwise allowed by the regulations.

1228. Comment: Commentators state that the provision does not address how or where the removed water is to be disposed. We ask EQB to clarify for the regulated community how this provision is to be implemented and to what standards. (1099)

Response: The Department has sufficient policies, guidance and regulations in place to address the handling and proper disposal of excess water from well development impoundments.

1229. Comment: 78.59b(f) also provides for a two-year restoration extension under Section 3216(g) of Act 13. Commentators assert that Act 13 does not directly address freshwater impoundments, so extensions under this subsection should not be limited to two years. We ask EQB to explain how this provision aligns with the intent of the General Assembly and Act 13. We also ask EQB to explain in the Preamble and RAF of the final-form regulation how the restoration requirements in this subsection reasonably and adequately balance protection of the public health and natural resources against the fiscal impact on the oil and gas industry. (1099)

Response: The basic restoration requirement is 9 months after completion of drilling of the last well serviced by the impoundment. The two year extension provides a reasonable and balanced amount of time to account for industry operations while setting an outside time limit on restoration and is consistent with requirements for well site restoration in §3216(g).

1230. Comment: 78.59b(f) include additional precautions related to restoration of freshwater impoundments that held mine influenced water, given that Subsection (g) allows for such storage. We ask EQB to explain in the Preamble and RAF of the final-form regulation how the requirements related to restoration of impoundments that held mine influenced water in this section reasonably and adequately balance protection of the public health and natural resources against the fiscal impact on the oil and gas industry. (1099)

Response: See response to comment 1186.

1231. Comment: Restoration should address mine influenced waters. Section 78.59b(f) allows for ‘restoration’ of the impoundment by removing excess water, but it does not address how and where the water would be disposed and any additional precautions that must be taken if ‘mine influenced water’ was stored in the impoundment, or if precipitate and heavy metals deposit at the bottom of the impoundment. (852a)

Response: See responses to comments 1186 and 1228.

1232. Comment: While we support the principle that use of mine influenced water can offset freshwater consumption when performed pursuant to proper safeguards, we believe Section 78.59b (g)- which permits storage of mine influenced water in designated freshwater impoundments - fails that protection standard. At a minimum, the safeguards for storage of mine influenced water should equal those required for wastewater. (997)

Response: See response to comment 1186.

1233. Comment: 78.59b(g): Although the Proposed Regulations do require testing of the mine influenced water prior to storage in the impoundment, this does not provide enough protection from potential breaches of the impoundment system. Breakdown of a mine influenced water containment system has potential impacts that far exceed those for a breach of containment of freshwater. As such, pre-treatment standards for mine influenced water must be developed to allow the use of freshwater impoundment systems for storage, or more stringent containment standards must be required for the storage of mine influenced water which are equivalent to wastewater containment systems. (1142)

Response: See response to comment 1186.

- 1234.** Comment: 78.59b.(g) We support the use of AMD in fracturing operations. When storing mine influenced water in a freshwater impoundment, we do have some concerns. We do not want to create new environmental issues created due to inadequate handling of MIW in freshwater impoundments. Frankly, we are concerned about AMD leaking into areas that are not historical coalfields where such pollution would be a new point source. We do agree with the testing of MIW at its source along with the record keeping component. Raw AMD, MIW of necessity must not be stored in a freshwater impoundment lacking testing that indicates that there is no contamination risk to nearby water resources. It is reasonable to store AMD, MIW in freshwater impoundments near the source as it would not create a new environmental problem considering the historic nature of the location.

According to the definition of freshwater impoundment, the FWI is designed to only contain fluids such as surface water, ground water and other Department approved sources. Our only concern is that in consideration of AMD and MIW a reliable standard is applied that sufficiently and adequately protects our water resources in the event the FWI succumbs to unintended leakage. We also desire that appropriate consideration be given to the seasonal high groundwater table as indicated. We request that the Department consider our concerns with the aspects of this provision. (660a)

Response: See response to comment 1186.

- 1235.** Comment: 78.59b(g): In addition to the impoundments, this article also advises proposed storing regulations to ensure mine influenced water in freshwater impoundments does not result in pollution to the water of the Commonwealth. This is simply another reason why the previous statements above need to be taken into high consideration. If there is the risk, the chance, the small possibility, that contaminated water and chemicals can pollute the waters of our Commonwealth then we need to simply figure out a way to completely avoid this process all together. If a multi-billion dollar company can figure out how to horizontally fracture the earth, at depths greater than 7,000 feet down and across, then we need for them to be accountable in developing responsible means for the waste that they create. They need to be responsible and accountable prior to any adverse events. This process is not for the state of Pennsylvania to create, they need to create alternative methods and then submit their proposals to the State and Federal government for review followed by independent research, followed by public hearings and approvals. The time frame could be unknown and vast, but the time frame of delivering water to the 300,000 residents of West Virginia recently was not quite known either. (189)

Response: See response to comment 1186.

- 1236.** Comment: 78.59b(g) - Mine influenced water does not always have to be a pollutant or a threat of pollution to waters of the Commonwealth. An example is a limestone mine pool that contains water that meets or exceeds drinking water standards. (411)

Response: The Department acknowledges the comment. See response to comment 1186.

- 1237.** Comment: 78.59b(g)(1) - The form for this process should be produced and reviewed prior to establishment of this section. (411)

Response: The Department agrees that all necessary forms and guidance should be finalized prior to promulgation of these regulations.

- 1238.** Comment: § 78.59b(g): Mine influenced water is not “fresh water” and should not be stored in a “freshwater impoundment”. To a citizen, describing mine influenced water as “fresh water” is quite

simply an Orwellian travesty. It stands the meaning of the word ‘fresh’ on its head. Does the Environmental Quality Board really intend for the word ‘fresh’ to mean “contaminated by prior industry” as opposed to “contaminated by current industry”? (869a)

Response: See response to comment 1186.

1239. Comment: The freshwater impoundment requirements are not sufficient for the storage of “mine influenced water.” Absent explicit requirements for pre-treatment of the mine influenced water, the standards for the storage of freshwater would be wholly inadequate for the storage of mine influenced water. We recommend that standards for the storage of mine influenced water should meet those for wastewater and that requirements should be similar to those for leachate at municipal waste landfills. (1142)

Response: See response to comment 1186.

1240. Comment: We believe it is wholly inappropriate to apply freshwater impoundment standards for storage of “mine influenced water” in impoundments without express criteria for pretreatment. The language provided in § 78.59b(g) is currently insufficient as it only requires testing of the mine influenced water prior to storage. Unless there are pretreatment standards provided in rulemaking, the standard applied for storage of mine influenced water should be at least as stringent as those used for storage of wastewater. (997a)

Response: See response to comment 1186.

1241. Comment: “Freshwater” must be clearly defined for the purposes of regulation. Otherwise, operators will improperly use, process, and dispose of harmful substances such as effluent, mining water, and flowback. (853)

Response: See response to comment 1186.

1242. Comment: Freshwater impoundments must not be used for the storage of mine-influenced water. [78.59b(f) (g)(h)]. If used, this mine drainage or mine pooling water must be stored in closed tanks. Operators should be required to pretest these hazardous fluids to determine their composition and radioactivity. Tracers should be added so that liability can be assigned when contamination occurs. (980, 1098)

Response: See response to comment 1186.

1243. Comment: We recommend pre-treatment standards for storage of “mine influenced water” in impoundments at least as stringent as those used for storage of wastewater to protect the waters of the commonwealth. Applying freshwater impoundment standards for storage of “mine influenced water” is unsuitable. (1031)

Response: See response to comment 1186.

1244. Comment: § 78.59b (g) (1)(i) - This section includes the requirement to demonstrate that the impoundment will prevent air pollution. It is suggested that, since air pollution control falls within the jurisdiction of another program, the reference to air pollution be deleted. (124a)

Response: See response to comment 1208.

1245. Comment: 78.59b(g) allows for storing mine influenced water in a freshwater impoundment. Commentators question whether the storage standards in this provision are sufficiently stringent with regard to mine influenced water. We ask EQB to explain in the Preamble and RAF of the final-form regulation how this provision reasonably and adequately balance protection of the public health and natural resources against the fiscal impact on the oil and gas industry. (1099)

Response: The Department has modified Chapters 78 and 78a to change “Freshwater Impoundment” to “Well Development Impoundment” to clarify the meaning of the term. In regards to storage of mine influenced water in a well development impoundment, the quality of mine influenced water varies greatly throughout the Commonwealth and the term includes mine influenced water that has been treated, which may be very high quality. Before mine influenced water is allowed to be stored in a well development impoundment, the Department must review and approve the storage based on a variety of factors including the quality of the water and the risks of storage of the water.

1246. Comment: 78.59b(g)(1)(i) requires a demonstration that the escape of mine influenced water stored in the freshwater impoundment will not result in air pollution. Commentators assert that the regulation of air falls under the jurisdiction of another program. We ask EQB to provide its authority and to ensure that the provisions of this section do not conflict with or duplicate statutes or existing regulations. (1099)

Response: See response to comment 1208.

1247. Comment: 78.59b(g) -- Given the current efforts of the industry, the DEP and legislature to develop a strategy for the reuse of mine influenced water, there needs to be more flexibility in the storage if it is located within the same watershed as the site of the MIW. (1103)

Response: The regulation provides sufficient operational flexibility to allow reuse of mine influenced water. See response to comment 1186.

1248. Comment: 78.59b(g) - The reference to air is unnecessary and should be removed. Chapter 78 is not the place to insert obligations related to air emissions, which are addressed at length in other State and Federal regulations. Suggested Language: (i) a demonstration that the escape of the mine influenced water stored in the freshwater impoundment will not result in water or land pollution or endanger persons or property include: (945, 1137, 1174)

Response: See response to comment 1208.

1249. Comment: Precipitate. The regulation does not address how the precipitate, which will likely result from mixing acid mine water with other less polluted water, must be managed. At the very least, the operator should be required to prepare for such an event. (852a)

Response: See response to comment 1186. The Department has sufficient policies, guidance and regulations in place to address the handling and proper disposal of excess water and wastes from well development impoundments.

1250. Comment: “Mine influenced water is defines as -Water contained in a mine pool or a surface discharge of water caused by mining activities that pollutes, or may create a threat of pollution to, waters of the Commonwealth. The term may also include surface waters that have been impaired by pollutional mine drainage as determined by the Department.”

The industry has been working with DEP and the legislature to be able to use MIW, commonly referred to as Acid Mine Drainage Water or AMD, for fracking to help offset the use of high quality stream water through legislation and a White Paper. Both attempt to limit the liability for the use of this water with respect that if a company takes MIW from a source, that company is not responsible to continue to treat that water for forever. Current law states once you touch it, you are responsible for it forever. The industry appreciates both efforts; however, the proposed regulation has very strict standards for testing, storing and monitoring that continues to make the use of MIW non-economical. I am familiar with one gas company that has an impoundment next to the stream in which it withdrawals the MIW. It doesn't make sense to monitor the stream from which the water came from. To encourage the use of MIW, there needs to be more flexibility in storage if the storage is located in the same watershed. (636a)

Response: The Department's concern and need for strict standards for testing, storing and monitoring of mine influenced water is based on the potential for mine influenced water to cause pollution to both surface waters and groundwater. Even when stored in the same watershed as it was withdrawn, mine influenced water has the potential to impact groundwater in the vicinity of the storage facility.

§ 78.59c Centralized impoundments

- 1251.** Comment: Because centralized wastewater impoundments may not be considered to be on “well sites,” the requirements for these impoundments in section 78.59c must be at least as stringent as the applicable requirements for wastewater impoundments in 25 Pa. Code Chapters 287- 299.

As the Department has previously recognized, centralized impoundments are – by virtue of not being located on well sites – subject to regulation under the Department's Solid Waste Management Act (SWMA) regulations set forth at 25 Pa. Code Chapters 287-299. Under section 287.2(g) of the Department's SWMA regulations, pits and impoundments are regulated exclusively under Chapter 78 (and not also under Chapter 287) *only* when they are located on well sites. The Department recognized that centralized wastewater impoundments do not qualify for the section 287.2(g) exemption in a 1993 Fact Sheet titled “The Residual Waste Regulations for Off-Site Disposal of Wastes from Oil and Gas Wells,” which appears as Appendix E to a 1994 Department report titled “Characterization and Disposal Options for Oilfield Wastes in Pennsylvania.” PennFuture received this report from the Department in response to a Right to Know Law request. In the Fact Sheet, the Department stated: “Storage impoundments which are not located on the well site are subject to the ... requirements and standards of 25 Pa. Code 287.111, 287.112, and 299.141-299.145.” The Fact Sheet also notes that operators of centralized impoundments “must comply with the operating requirements of 25 Pa. Code 299.144 (operating requirements).”

Under 25 Pa. Code § 299.142, a person storing residual waste in a surface impoundment must hold a valid permit from the Department under the Clean Streams Law, and must comply with 25 Pa. Code Chapter 105. Application requirements for impoundment permits are set forth in section 299.143, and operating requirements, which largely track the operating requirements for disposal impoundments set forth at 25 Pa. Code Chapter 289, are set forth in section 299.144.

The Department must revise proposed section 78.59c to ensure that all of the requirements for centralized wastewater impoundments therein are at least as stringent as the applicable requirements in Chapters 299 and 289. One example of how proposed section 78.59c is currently *not* as stringent as these chapters is subsection 78.59c(n), which proposes restoration requirements for centralized wastewater impoundments.

Subsection 78.59c(n) states that an impoundment must be restored within nine months of the date that the last well serviced by the impoundment is drilled, and establishes four restoration criteria. First, “any impermeable membrane, concrete and earthen liner” must be removed “so that water movement to subsoils is achieved.” Second, the site “shall be restored to approximate original conditions including preconstruction contours.” Third, the site “shall support the original land uses to the extent practicable.” Fourth, excavated impoundments shall be backfilled above finished grade to allow for settlement and so the impoundment will no longer impound water.”

Proposed section 78.59c(n)(1) also provides the extension of the nine-month restoration period: “A two year restoration extension may be requested pursuant to section 3216(g) of the act.”

There are two problems with these restoration criteria. First, as noted above, centralized wastewater impoundment cannot be considered to be located on “well sites”; consequently, the restoration extension provision of section 3216(g) is inapplicable. Second, the other restoration criteria are inconsistent with, and less stringent than, 25 Pa. Code § 299.144(a)(7) (“relating to closure”). This provision requires compliance with 25 Pa. Code § 289.312 (“Closure”), and section 289.312 in turn requires compliance with 25 Pa. Code § 289.172 (“Closure Plan”).

Sections 289.312 and 289.172 together establish a comparatively thorough and protective planning and execution process for the closure and restoration of wastewater storage impoundments. These criteria are no less applicable to centralized wastewater impoundments used in oil and gas operations than they are to wastewater impoundments used in other industrial operations. Section 78.59c must either incorporate these criteria (and all applicable requirements under 25 Pa. Code Chapters 287-299), or establish criteria and requirements that comply with these criteria by being even more stringent. (852a)

Response: The Department agrees that centralized impoundments should be regulated in the same manner as other waste transfer facilities are regulated under Article IX. Therefore, in order to ensure consistency the Department has revised §§ 78.59c and 78a.59c to require any new centralized impoundments to be authorized by a residual waste permit under Article IX. In addition, §§ 78.59c and 78a.59c also require operators of existing centralized impoundments permitted under a Dam Permit for a Centralized Impoundment Dam to either submit a closure plan to the Department within 6 months and close the centralized impoundment within 3 years of the effective date of the rulemaking or obtain a residual waste permit for the operation of the centralized impoundment within 3 years of the effective date of the rulemaking.

1252. Comment: 78.59c: I am emailing you because I am very much against the open wastewater pits that you currently are deciding about. I believe that the wastewater, full of toxic chemicals such as benzene and even radioactive material, must be disposed of in an environmentally responsible way, and it is up to you to make that happen. I have lots of family in northern PA, and they hear the rumble of the Water trucks running day and night, and it is not a pleasant thing. But if these same water trucks are hauling away waste water to a treatment facility that will clean the water in a responsible way, all of us can sleep better at night. (1059)

Response: See response to comment 1251 regarding construction and operations of centralized impoundments. Impoundments are not used for disposal, but rather storage prior to reuse, recycling, treatment or eventual disposal. Engineered impoundments play an important role in the reuse and recycling system for oil and gas waste water. When used in conjunction with well development pipelines, centralized impoundments can actually reduce the amount of truck traffic necessary to stimulate an unconventional well.

1253. Comment: Wastewater from fracking operations contains toxic chemicals that have been linked to a variety of negative health effects. The chemical components of fracking fluids, for example, have been linked to cancer, endocrine disruption, and neurological and immune system problems. Wastewater brought to the surface by drilling can contain substances such as volatile organic compounds (VOCs) with potential impacts on air quality and human health. The practice of storing such substances in open air pits is a threat to the environment and our health. These wastewater pits can, and do fail. When they do, they may put the quality of our drinking water at risk, and present hazards to wildlife and our environment. In some cases, they are so volatile that they may catch on fire or explode, putting the lives of nearby residents and their property in danger. Best industry practices use closed loop systems which utilize tanks to store wastewater. The DEP can, and should, hold the industry to this same standard. (1110, 1139, 1160)

Response: See response to comment 1251 regarding centralized impoundments. Air emissions from oil and gas facilities are regulated under Article III. Changes to Article III are beyond the scope of this rulemaking. See responses to comments 855 and 976 regarding the use of open pits on well pads.

1254. Comment: Another area where the EQB's proposed regulations fall short concerns the use of open pits on the well pads to store the waste water from the fracking process (Sections 78.56, 78.57, 78.58, and 78.59). Waste water returns to the surface contaminated with toxic chemicals, as well as buried salts and naturally occurring radioactive material and as such needs to be contained to avoid contamination of nearby water sources. To date, Consol Energy has been cited twice for leak violations where, thankfully, the toxic fluids did not enter the reservoir and the ground contaminated was removed from the reservoir site. Also, to Consol Energy's credit, the operator is using a double layer of plastic to line pits.

The proposed regulations will do little to prevent flooding, spills, and leak violations that may continue to occur at Beaver Run Reservoir and are now commonly occurring at shale gas drilling sites throughout the Commonwealth. Stating a required footage of freeboard provides little protection. Violations due to overflow of the required freeboard occur on a regular basis; companies repeatedly are charged with the same violations; and fines are limited or non-existent. DEP currently permits leakage of toxic chemicals onto residential properties and farmlands from pits, the amount of leakage permitted being determined by the depth of the fluid in the pits. I call on DEP to stop permitting such leakage of fluid on surrounding land and to impose fines that will discourage repeat violations. (402)

Response: See responses to comments 855 and 976 regarding the use of open pits on well pads. See response to comment 1251 regarding construction and operations of centralized impoundments.

1255. Comment: 78.59c – The proposed regulations have extensive new requirements for centralized impoundments that in several respects are more stringent than the requirements for residual waste and even hazardous waste impoundments. The proposed standards may be in direct conflict with the Act 97/Chapter 287 standards, including siting limits. Another example is the proposed synthetic liner permeability standard in section 78.59c(e)(2), which is three orders of magnitude more stringent than residual waste impoundments. These proposed requirements are beyond those any other industry must follow to manage produced water and residual waste. Moreover, DEP's cost estimate considers only the cost of fencing around existing impoundments, ignoring all the other requirements associated with both existing impoundments and the construction of new impoundments. Likely costs may be five times DEP's figure.

The overall review of this section and its associated requirements makes it impractical, if not impossible, to construct a centralized impoundment. The up-front costs and site evaluation places the operator in a high risk position with no guarantee of permit issuance for central impoundment construction. Given the potential time frame of up to one year lead time for such an evaluation, the operator will likely seek other options for fluid management. Delete Section 78.59c entirely. (1153)

Response: The Department disagrees that Section 78.59c should be deleted entirely but agrees that Centralized Impoundments should be regulated in a manner consistent with requirements in Article IX. See response to comment 1251 and 1252.

- 1256.** Comment: § 78.59c(h)(6): Water samples must be tested at least to the standard of DEP Suite Code 944. DEP conducted extensive tests of produced water, and created a water testing standard based on actual emissions from unconventional wells known as Suite Code 944. This research is already available to DEP. They should use it. There is no excuse for the testing standard for monitoring wells under this clause to be any less stringent than Suite Code 944. The Environmental Quality Board must require DEP to enumerate the parameters of Suite Code 944 and insert them into this clause. (869a)

Response: The Department believes that it is not appropriate to reference a particular laboratory suite code in a regulation. Form 26R identifies specific chemical analyses for listed compounds that operators of centralized impoundments must conduct and the samples must be representative of the volume of wastewater stored in the impoundment.

If multiple loads of wastewater are removed from the same impoundment or tanks for transfer, processing, treatment or disposal, the same chemical analysis of the wastewater may be used repeatedly without further analysis, provided the analysis remains representative of the impoundment. If large volumes of water, wastewater or other fluids are added to the impoundment, a new chemical analysis must be performed that is representative of the impoundment.

- 1257.** Comment: 78.59c – We oppose the use of centralized impoundments for waste handling. The PADEP can promote recycling, reduce the need for freshwater, and reduce disposal requirements without permitting centralized impoundments. We recommend that § 78.59c replaced with the following text:

§ 78.59c. Centralized Impoundments.

Centralized impoundments, as defined in this chapter and used to hold contaminated fluids or semi-fluids associated with oil and gas activities are prohibited. All existing centralized impoundments must be removed and the impoundment site remediated by ____ (Editor's Note: The blank refers to one year after the effective date of adoption of this proposed rulemaking). (1143)

Response: See response to comment 1251 and 1252.

- 1258.** Comment: 78.59c – If the EQB disagrees with comment 1257 and considers the continued use of centralized impoundments, we request that the EQB provide a written scientific and technical analysis justifying the proposal, including:

(1) A quantitative technical assessment of the amount of air pollution (by pollutant type) that will

be emitted to the atmosphere from these impoundments and estimate the corresponding impact on human health and the environment;

(2) The amount of pollution that could potentially impact groundwater sources from these pits;

(3) Data on the historic use of centralized impoundments in Pennsylvania, including those known to have leaked or overflowed, and quantification of the cumulative adverse impact of these impoundments on air, soil, surface water, groundwater and animal life; and

(4) A projection of future cumulative impact if the use of pits continues. (1143)

Response: See response to comment 1251 regarding centralized impoundments. Air emissions from oil and gas facilities are regulated under Article III. Changes to Article III are beyond the scope of this rulemaking.

1259. Comment: Maximum Impoundment Size: The use of large centralized impoundments requires large areas of surface excavation (cut) and embankment placement (fill). The proposed regulation does not include any upper limit on the size or depth of centralized impoundment. We request limits be set as follows:

the greatest water depth at maximum storage is limited to 15 feet, and the greatest storage capacity at maximum storage elevation is less than or equal to 50 acre feet. (1143)

Response: See response to comment 1251.

1260. Comment: Stream Setbacks: None of the proposed setback distances in § 78.59c provide sufficient protection for water quality in the event of a centralized impoundment overtopping or surface discharge. A dam breach analysis should be required for all centralized impoundments, including a water quality analysis component to determine the appropriate project specific setbacks for centralized impoundments on an individual structure basis.

Stream setbacks should use the watercourse definition in 25 Pa. Code Chapter 105.1. Chapter 105 defines a watercourse as: “A channel or conveyance of surface water having defined bed and banks, whether natural or artificial, with perennial or intermittent flow.” The United States Geological Society 7.5 minute topographic quadrangle map blue lines do not have a formal process associated with their determination or documentation. Topographic blue lines should not provide a minimum setback standard for Pennsylvania streams.

Each centralized impoundment should provide documentation and analysis to support and justify the project-specific setbacks for that installation, sufficient to protect water quality. (1143)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

1261. Comment: Distances separating impoundments from wetlands, dwellings, and other vital resources are too small. (153)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

1262. Comment: Seasonal High Water Table: 25 Pa. Code Chapter 73 (Standards for Onlot Sewage Treatment Facilities) prohibits the installation of onlot sewage facilities if the seasonal high water

table is within 20 inches (§ 73.14(a)(5)). There is no option for an alternate underdrain system if a seasonal high water table condition exists. The presence of a seasonal high groundwater table indicates a hydrologic connection to adjacent streams and wetlands, and hence, an additional path for direct contamination, should a leak or discharge from the impoundment occur. At a minimum, the Chapter 73 standards should apply to centralized impoundments under Chapter 78.

Centralized impoundments should not be permitted within 20 inches of a seasonal high groundwater table, and should not be allowed to artificially lower the seasonal high groundwater table. The water quality implications from a centralized impoundment can be far more significant than an on-lot sewage treatment system; the standards should not be less stringent. Additionally, 25 Pa. Code §§ 289.121—289.123 define site analysis requirements for geology, soils, and hydrology for Residual Waste Impoundments. The data collection does not negate the potential impacts of constructing a centralized impoundment within 20 inches of soil mottling and potential seasonal high water table. We strongly oppose the allowance of any centralized impoundment within 20 inches of a seasonal high water table.

The use of an artificial underdrain system is likely to affect the adjoining groundwater system beyond the impoundment, including potentially damaging impacts on wetlands and headwater streams through the lowering of the groundwater. Soil moisture conditions are almost certain to be effected by the centralized impoundment construction, and an artificial underdrain system would further exasperate these impacts. Altered groundwater and soil moisture conditions will directly impact established woodland vegetation. (1143)

Response: The comparison between onlot sewage treatment systems and centralized impoundments is not appropriate because onlot sewage treatment systems are disposal facilities that rely on soil to effectively treat wastewater. Centralized impoundments are not intended for the final disposal of waste and do not rely on soil to provide treatment of wastes. See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the groundwater separation requirements specified in those chapters.

- 1263.** Comment: Recordkeeping and Reporting: Centralized impoundments should be subject to the full recordkeeping and reporting requirements of §§ 289.301—289.303, including with respect to the type and amount of material stored in the centralized impoundment, records of activity, transporters and generators, materials rejected and reason, material removed from the centralized impoundment, etc. (1143)

Response: See response to comment 1251.

- 1264.** Comment: Site Restoration Plan: A centralized impoundment site restoration plan should be a required permitting and approval component. This restoration plan should document existing (preconstruction) site conditions with supporting photographs, and include data related to existing soils types, depth of topsoil, organic content and compaction, type and extent of vegetation within a 100-foot perimeter of the disturbed area. Existing topographic conditions should be documented and restored to the 2-foot contour level. A post-construction topographic survey should be required to confirm restoration. (1143)

Response: See response to comment 1251. New centralized impoundments constructed under Article IX will be required to meet the restoration requirements specified in those chapters. Site restoration for existing centralized impoundments is addressed under subsection (b). Restoration to approximate original conditions, capable of supporting original uses to the

extent practicable is the best practice to achieve site restoration within reasonable operational parameters. It is not necessary to include technical performance standards including requirements for type and density of perennial vegetation, soil characteristics and drainage patterns in this section because those issues are already appropriately addressed by the requirements. Projects meeting the requirements will satisfy the statutory restoration requirements and include performance requirements that will protect waters of the Commonwealth. Projects that trigger the Chapter 102 requirements for an erosion and sediment control permit must submit a Site Restoration/Post Construction Stormwater Management Plan to the Department for review and approval prior to construction of the site. Additionally, this section has been revised to require operators to submit an impoundment closure to the Department 60 days after the effective date of this rulemaking which will address many of the site restoration issues raised by the commentator.

- 1265.** Comment: Chapter 105 Compliance. The proposed regulation exempts centralized impoundments of hazard potential 4 and size Category C (up to 40 feet embankment) from the regulatory and permitting requirements of the Chapter 105, Subchapter B, dam safety and waterway management. The proposed regulation would require compliance with the requirements of Chapter 105 only for impoundments of 40 feet or greater in depth (Size Category A or B) or hazard potential 1, 2, or 3. All other centralized impoundments used for oil and gas operations would be required only to obtain a Chapter 78 permit. The Chapter 78 permit does not address most of the important elements of Chapter 105. For example, Subsection § 78.59c(l) proposes that an engineer certify that the impoundment was built in accordance with the construction standards of Chapter 105; however, this certification does not provide the same standard of design, regulatory review, and construction oversight required by Chapter 105, nor does it assure that the certifying engineer is qualified in the area of impoundment design and construction.

Pennsylvania's history of dam failure has resulted in rigorous regulatory requirements for the design, review, and construction of impoundments under Chapter 105. The PADEP staff in the Dam and Waterways section is experienced in the issues related to impoundment design, construction, and maintenance. We do not support by-passing the important requirements of Chapter 105 for oil and gas impoundments. The proposed Chapter 78 regulations do not guarantee an equivalent level of review to protect public health, safety, and welfare.

Given the EQB's proposal to store regulated substances in centralized impoundments, it is imperative that all requirements of Chapter 105 related to dam safety be applied as a minimum baseline standard for all impoundments. The implications of an impoundment failure or overtopping for a centralized impoundment have all of the same health, safety, and welfare concerns as any other impoundment, with the added concern that the contents of a centralized impoundment can include compounds that are hazardous to both human and ecological health.

The EQB has not provided justification for the proposed Chapter 78 permit process, which seeks to streamline and eliminate key components of the Chapter 105 permit process for most oil and gas impoundments, including all of the Chapter 105 regulations listed below. We request that all centralized impoundments used for oil and gas operation be required to apply for a Chapter 105 permit, or that the key components of the Chapter 105 requirements listed below be included in Chapter 78 for centralized impoundments used for oil and gas operations:

§ 105.81. Permit applications for construction and modification of dams and reservoirs.

(a) ~~In addition to the information required under § § 105.13, 105.13a, 105.13b and 105.15,~~ permit applications under this subchapter for the construction or modification of dams and reservoirs must provide the following information:

- (1) Reports and data detailing the conduct and results of investigations and tests necessary to determine the safety, adequacy, and suitability of design, including:
 - (i) Data concerning subsoil and rock foundation conditions.
 - (ii) Data concerning exploratory pits, drilling, coring and tests to determine seepage rates.
 - (iii) Data concerning the strength tests necessary to measure the physical properties and behavior of foundations and embankment materials at the dam or reservoir site.
 - (iv) Data concerning the geology of the dam site or reservoir area, indicating possible hazards such as faults, weak seams and joints.
 - (v) Data concerning availability and quality of construction materials.
 - (vi) A "Dam Stability Report" ~~as required under § 105.97~~ (relating to stability of structures).
 - (vii) Other information as may be necessary to determine the safety, adequacy and suitability of the design, including the design calculations for the dam, which shall be made available to the Department on request.
- (2) Site plan and cross sectional ~~views required under § 105.13(d)(1)(i) (relating to permit applications information and fees).~~
- (3) Construction plans, specifications and design reports to evaluate the safety, adequacy and suitability of the proposed dam, reservoir and appurtenant works in order to determine compliance with this chapter.
- (4) A schedule indicating proposed commencement and completion dates for construction.
- (5) For projects involving storage of fluids or semifluids other than water, information concerning the chemical content, viscosity and other pertinent physical characteristics of the fluid or semifluid impounded.
- (6) An instrumentation plan including justification and design for the installation of permanent monitoring instruments to measure the performance of the dam. If no instrumentation is considered necessary, justification shall be provided.
- (7) A hydrologic and hydraulic analysis, submitted as a separate report, which includes:
 - (i) The size, shape and characteristics of the drainage basin.
 - (ii) Current precipitation data and precipitation distribution information as required by the Department.
 - ~~(iii) Streamflow records.~~
 - ~~(iv) Flood flow records and estimates.~~
 - (v) An incremental dam breach analysis, storage capacity and reservoir surface area for normal pool and maximum storage elevations.
 - (vi) Other hydrologic and hydraulic determinations necessary for the design and operation of the dam.
- (8) For existing dams, copies of the structure's most recent inspection reports.
- ~~(9) EAP if required under § 105.134 (relating to EAP).~~
- ~~(10) Proof of title or adequate flowage easements for land area below the top of the dam elevation that is subject to inundation.~~
- (11) An Operation and Maintenance Manual for the dam ~~as required under § 105.131 (relating to operation, maintenance and monitoring).~~
- (12) Other information the Department may require.
- (b) The Department may waive specific information requirements of this section in writing, if the Department finds that specific information is not necessary to review the application.

§ 105.92. Foundations.

- (a) The foundation of a dam or reservoir must be stable under all probable conditions.
- (b) In analyzing the stability of the foundation of a proposed or existing dam or reservoir, the applicant shall consider the following factors:
 - (1) The seismic forces and liquefaction potential at the site.
 - (2) The shear strength of the foundation.

- (3) Settlement, subsidence, and carbonate karst solution features, such as sinkholes and solution channels.
- (4) Seepage potential through the soil and rock components of the foundation.
- (5) The dispersive characteristics of the soil foundation and borrow areas.

§ 105.93. Design stress.

In the construction of dams and reservoirs, allowable stresses must conform to the current standards accepted by the engineering profession.

§ 105.95. Freeboard.

Sufficient freeboard may be required to prevent overtopping of the dam and to allow for wave and ice action.

§ 105.97. Stability of structures.

(a) Dams must be structurally sound and be constructed of sound and durable materials. The structure must be stable during and at the completion of construction.

(b) As part of the permit application for the construction or modification of a dam, the design engineer shall submit to the Department, under professional seal and certification, a report entitled “Dam Stability Report” which clearly demonstrates to the Department that the requirements of subsection (a) have been satisfied. At a minimum, this report must address the following considerations:

- (1) The physical properties of the materials available for construction.
- (2) A stability analysis based on the properties of the structure’s materials and on the seismic forces and seepage conditions affecting the structure.
- (3) The methods of construction.
- (4) The conditions of operation of the dam and reservoir.
- (c) Earthfill dams must be demonstrated to be stable for the following conditions:
 - (1) Normal pool with steady-state seepage conditions with a factor of safety of 1.5.
 - (2) Maximum pool with steady-state seepage conditions with a factor of safety of 1.4.
 - (3) Sudden drawdown from normal pool conditions with a factor of safety of 1.2.
 - (4) Normal pool with steady-state seepage conditions under seismic forces produced by the maximum credible earthquake with a factor of safety of 1.1.
 - (5) Completion of construction with no pool with a factor of safety of 1.3.
- (d) Gravity dams must be demonstrated to be stable for the following conditions:
 - (1) Normal pool with appropriate uplift pressures, ice loads and silt loads with a factor of safety of 2.0.
 - (2) Maximum pool with appropriate uplift pressures and silt loads with a factor of safety of 1.7.
 - (3) Normal pool with appropriate uplift pressures and silt loads under seismic forces produced by the maximum credible earthquake with a factor of safety of 1.3.
- (e) For gravity dams, the overturning stability is acceptable when the resultant of all forces acting on the dam is located as follows:
 - (1) Within the middle third of the structure for normal pool conditions.
 - (2) Within the middle half of the structure for maximum pool conditions.
 - (3) Within the structure for earthquake conditions.
- (f) For gravity dams, the foundation bearing pressures must be less than or equal to the allowable for no pool, normal pool and maximum pool conditions and less than 133% of the allowable for earthquake conditions.
- (g) The factors of safety for earthfill dams or gravity dams must be the higher of:
 - (1) The factors of safety in subsections (c) and (d).
 - (2) The factors of safety in the most recent Engineering Manuals developed by the United States Army Corps of Engineers relating to stability of dam structures.

(h) The Department may, in its discretion, consider a revised factor of safety for a class of dams or reservoirs when it can be demonstrated that the factor of safety provides for the integrity of the dams or reservoirs and adequately protects life and property.

§ 105.102. Personnel and supervision.

(a) The permittee or owner shall file with the Department, at least 15 days prior to the commencement of construction, a statement setting forth the name and employer, including contact information, of the following:

(1) The professional engineer responsible for oversight and supervision of construction.

(2) Representatives of the professional engineer.

(3) Contractors conducting the work authorized by the permit, Letter of Amendment or Letter of Authorization as required by the Department.

(b) Work must be conducted under the oversight and supervision of a professional engineer. The professional engineer or a representative of the professional engineer shall be on the work site during significant construction activities until the completion of the dam.

§ 105.103. Weather and ground conditions.

(a) No earth or other embankment material may be covered, placed, compacted, or graded when in a frozen condition.

(b) Masonry and concrete may not be placed in freezing weather except under conditions approved by the Department.

§ 105.104. Removal and disposal of vegetation.

(a) Work shall be conducted in a manner to minimize the destruction of or damage to trees and other vegetation on and adjacent to the construction site.

(b) Vegetation cleared and removed from the site shall be disposed of in accordance with applicable laws and regulations.

§ 105.106. Activities and facilities on the construction site.

Activities and facilities on the construction site must be conducted and operated in a manner to avoid pollution of the air and waters of this Commonwealth and in accordance with applicable laws and the provisions of this title.

§ 105.107. Final inspection.

Within 10 days after the completion of work on a dam authorized by the Department, the permittee or owner shall schedule a final project inspection with the Department. The final inspection must include the permittee or owner, the permittee or owner's supervising engineer, and the Department's field representative. Upon conclusion of this final inspection, the Department's field representative will present the permittee or owner with a list of any deficient items, if necessary. A follow-up final inspection may be required by the Department. At the discretion of the Department, the final inspection may be waived for projects authorized by Letter of Amendment or Letter of Authorization.

§ 105.111. Commencement of storage of water, fluid or semifluid.

(a) The permittee shall notify the Department, in writing, at least 7 days in advance of the date proposed for the commencement of storage of water, fluid or semifluid in the reservoir created by the dam for which the permit is issued.

(b) The Department may require that a reservoir filling plan be developed and approved by the Department prior to commencement of storage of water, fluid or semifluid. This plan will provide the acceptable rate of rise of the reservoir and, if necessary, elevations and durations for constant reservoir levels within the filling period. This plan may also require lowering of the reservoir level

if the prescribed rate of rise is not controlled or attained. The plan may also require monitoring of instrumentation of the dam.

(c) The Department may require that a representative of the Department be at the site before or during the filling of the reservoir.

(d) The initial storage in the reservoir of new dams and refilling of reservoirs of rehabilitated dams may not commence prior to the submission of the information required in § 105.108 (relating to completion certification and project costs) and the acceptance of the certification, in writing, from the Department.

§ 105.131. Operation maintenance and monitoring.

(a) ~~In addition to the requirements of § § 105.51—105.54 (relating to operation, maintenance and inspection), the permittee or owner of a dam shall follow the operation and maintenance manual for the dam, and the emergency action plan if required under § 105.134 (relating to EAP), as approved by the Department and shall implement a monitoring plan as required under § 105.81(a)(4) (relating to permit applications for construction and modification of dams and reservoirs).~~

(b) A permittee or owner of a dam or reservoir may not modify or cease implementation of all or part of the approved plans and methods of operation or monitoring without the prior approval of the Department by permit, Letter of Amendment, or Letter of Authorization. ~~The permit will be issued in accordance with § 105.82 (relating to permit applications for operation and maintenance of existing dams and reservoirs).~~ The Letter of Amendment or Letter of Authorization will be issued only after review and approval of necessary engineering calculations, construction plans and construction specifications. If the project impacts wetlands or exceptional value waters, or if the project requires 401 water quality certification, an environmental assessment shall also be submitted to the Department for review and approval ~~under § 105.15 (relating to environmental assessment).~~ Modifications of a dam are subject to the construction requirements and procedures under Subchapters A and B (relating to general provisions; and dams and reservoirs), unless specifically waived by the Department.

(c) The permittee or owner of a dam or reservoir shall operate and maintain the dam in accordance with the authorized plans and specifications. Routine maintenance of the dam and the reservoir's design storage capacity will not require further authorization under this chapter except as relating to drawdown of impounded waters.

§ 105.133. Directed repairs.

The permittee or owner shall immediately take steps that the Department may prescribe as necessary to preserve the structural stability and integrity of the dam and protect health, safety, property and the environment.

§ 105.135. Dam hazard emergencies.

(a) For the purposes of this section, a dam hazard emergency means a condition which the Department, permittee or owner of the dam reasonably finds constitutes an imminent threat to life or property above or below a dam, whether arising from the condition of the dam and appurtenant works or extraordinary natural conditions, affecting the safety and stability of the dam, including flood, earthquake and ice jam.

(b) ~~The emergency procedures and the EAP required under § § 105.63 and 105.134 (relating to emergency procedures; and EAP)~~ shall be followed by the permittee and owner of a dam or reservoir in the event of an actual or potential dam hazard emergency.

(c) If a dam hazard emergency exists, the permittee or owner of the dam shall immediately notify appropriate emergency management officials identified in the emergency action plan ~~required under § § 105.63 and 105.134~~ of the existence of the hazard and request the authorities to initiate appropriate action to assure protection of life and property; and the permittee or owner shall immediately take actions as authorized by the Department necessary to prevent dam failure or loss

of life or property.

(d) The Department, upon determining that a dam hazard emergency exists, will notify the owner immediately to take actions the Department determines are necessary to prevent dam failure or loss of life or property.

§ 105.136. Unsafe dams.

(a) For purposes of this section, an unsafe dam means a dam which meets one or more of the following criteria:

(1) A dam with deficiencies of such a nature that if not corrected could result in the failure of the dam with subsequent loss of lives or substantial property damage. This determination is based on good engineering judgment or the application of the guidelines established for the National Dam Inspection Program.

(2) A dam classified as unsafe under the National Dam Inspection Program.

(3) A dam declared as unsafe by the Department.

(b) The owner of an unsafe dam shall do the following:

(1) Immediately notify the Department upon receipt of any information indicating the dam is unsafe.

(2) Drain the reservoir as required and approved by the Department ~~and in accordance with § 105.122 (relating to drawdown of impounded waters).~~

(3) Within time limits established by the Department, submit a plan for removal of the dam, a plan for repair of the dam or an application for a permit authorizing modification of the dam under subsection (c).

(4) Following approval of the plan or permit by the Department, undertake and complete actions to remove or repair the dam or implement the modifications to the dam within the time limits set by the Department.

(c) The Department may issue a permit for modification of an unsafe dam, ~~under section 9 of the act (32 P. S. § 693.9),~~ which authorizes the owner of an unsafe dam to modify the dam within the time prescribed in the permit to meet the requirements of the act and this chapter. The permit shall be conditioned upon:

(1) Compliance by the owner of the dam with a prescribed schedule for correction or modification of the unsafe condition within the shortest time period technically feasible and economically achievable.

(2) Implementation by the owner of the dam of measures deemed necessary by the Department to reduce risks to health, safety and the environment pending correction or modification of the unsafe condition, including, but not limited to, special provisions relating to operation, emergency planning, monitoring and warning systems, and development of an alternative source of water supply if the dam serves as a water supply dam.

(d) In determining whether to require removal of an unsafe dam or to permit the owner to modify the dam, the Department will consider whether there is a substantial adverse impact to the public health, safety and the environment which will result from the draining and removal of the dam. If the Department determines that this adverse impact outweighs the danger to public health, safety and the environment resulting from leaving the dam in place, the Department may decide to allow the unsafe dam to remain until it has been modified.

(e) At the discretion of the Department, a public hearing may be held in the affected area prior to the issuance of a permit authorizing modification of an unsafe dam over a period of more than 6 months, to inform affected communities of the risks which may result from allowing the unsafe dam to remain standing or to impound water during the time necessary to complete the modifications.

(f) If the Department finds that conditions upon which the permit, Letter of Amendment, or Letter of Authorization was issued have substantially changed or that the owner does not meet the schedule for modification contained in the permit, Letter of Amendment, or Letter of Authorization, the Department will review the status of the dam. An extension of the time period for completion of

a modification may be issued by the Department if the owner has proceeded in good faith with the previous schedule of modification and the requirements of subsections (c) and (d) are met.

(g) Nothing in this section may be construed to limit the power of the Department to take immediate action, prior to public hearing, to do one or more of the following:

(1) Revoke or suspend a permit, Letter of Amendment, or Letter of Authorization when deemed necessary by the Department to protect public health, safety and the environment.

(2) Order correction or abatement of a dam hazard emergency.

(3) Take another action authorized by law. (1143)

Response: See response to comment 1251 and 1252. Accordingly, centralized impoundments constructed under Article IX will be required to meet the structural requirements specified in those chapters.

1266. Comment: 78.59c – We oppose the use of centralized waste impoundments. Centralized impoundments cause unnecessary large-scale surface disturbance, present an unnecessary risk of ground and surface water contamination, and contribute to local air pollution. We encourage the Board to eliminate the use of centralized waste impoundments altogether. (649, 1152)

Response: See response to comment 1251.

1267. Comment: Engineer On-site. A properly trained Department engineer should be onsite during construction of all centralized impoundments and during placement of liner and leachate collection systems. (852a)

Response: See response to comment 1251.

1268. Comment: While it is understood why the proposal includes regulation for centralized wastewater impoundments, after lengthy discussion, our members determined that this is a method that needs to be prohibited. Our watershed has been fortunate to this point, to not have flowback centralized waste impoundments. The primary operator uses 100% closed loop system. However, we have a new operator in town; Southwestern now owns many former Chesapeake Energy leases. Chesapeake did not utilize centralized flowback impoundments in our watershed. However, Southwestern, we've discovered, does have permits for such facilities in both Bradford and Susquehanna Counties. We do not desire to see this practice in our watershed or anywhere in Pennsylvania for that matter when superior practices are available. DEP needs to have an inventory of these CI's and inspect them for compliance with the upgraded regulations. Any deficient CI needs to be closed post haste, followed by soil and water sampling for nearby homeowners. (1035)

Response: See response to comment 1251. The Department does maintain facility and permit files for each centralized impoundment and regularly inspects these facilities. Where an inspection or incident reveals non-compliance with the Act, regulations or permit conditions, the Department can and does take appropriate enforcement action.

1269. Comment: This section should only affect unconventional operators. I know of very few conventional operators that use one large, (2 million gallon) central impoundment. Most of our work is done right on the conventional well pad, again about 150'x150'. It is not cost effective to build a large impoundment pit for smaller conventional well drilling. This relates back to my first point, which in an attempt to cover what the PADEP feels is "all the bases" they have overlooked the needs and work already done by the small conventional operators. *Remove this section for conventional operators. (145)

Response: To the extent that a conventional operator constructs a centralized impoundment, the standards for construction, operation and maintenance of centralized impoundments are appropriate.

1270. Comment: 78.59c – I am concerned about the holding water pool that could poison wildlife and surface soil and water. (584)

Response: See response to comment 1251.

1271. Comment: 78.59c – As a better environmental and community friendly practice, we support the use of modular above ground containment structures rather than centralized impoundments (CWI). We prefer the use of 100% closed loop systems whereby all fluids are appropriately contained in a manner that eliminates risks to public health and safety and the environment. There are operators that recycle 100% of their fluids without the use of centralized wastewater impoundments. We are not aware of any recent permits for centralized wastewater impoundments our region.

These provisions are most needful indeed. We support the requirements of monitoring wells, secondary liner and a leak detection system. We are however, concerned about operator's inadequate attention paid to the leak detection system and the opportunity to recirculate leaked fluids rather than correct the problem. The leak detection system actively engaged must be the exception not the daily method of operation. We are also concerned that the Department may not have adequate staffing to maintain as close an eye as may be necessary to such facilities due to the recirculation issue. The field staff generally is focused on the sites of action, drilling and fracturing, and rightly so. Often the CWI is located off the focus of risk activity, thus a leak detection system engaged and not regularly inspected by the Department may provide the operator with opportunities to be complacent rather than actively concerned about the environment in which they operate. After all, it is the same operator who is choosing to use antiquated centralized wastewater impoundments as opposed to 100% closed loop systems. This is not to imply that these standards are antiquated, as they are in part at least currently recommended construction practices being codified. To be clear, what we do mean is that the concept of CWI is a method of the old ways. This is a world class shale play as has been pointed out many times. We, the residents whom live near such facilities, deserve them to be world class as well, and thus, 100% closed loop systems are the preferred practice.

While we are in support of these provisions, we also note that there are better practices utilized by many unconventional operators and therefore, we prefer to see the industry be encouraged to move away from this practice through regulation. There is one operator, Southwestern, that we are aware continues to apply for permits for such facilities in our region. There are other operators across the state, such as Range Resources who are complacent in not moving towards better technology than these CWIs. This practice, in terms of shale gas and the great strides that have been made in our Commonwealth since the drilling began with a variety of technologies can be considered an antiquated process. We advocate that all CWIs at a minimum be evaluated and where deficient, be upgraded to meet these provisions or the CWI be closed. Ideally, we prefer to see the practice of CWIs cease in practice. When most operations are not utilizing these facilities, it makes sense to create more stringent requirements as are noted here, and move towards creating a level playing ground where public health and safety and the environment is equally considered by all operators with such facilities.

Generally, operators have definite terms with landowners as to the longevity of the agreement, such as ten years for example. We recommend that the landowner be provide with a fact sheet/ information prior to the renewal of such an agreement that explains alternative procedures that may be employed to reach the same goal, and that is the processing of waste water. An informed

landowner may prefer to have the impoundment location converted into a facility with aboveground storage containment or a series of tanks which provide for superior environmental protection. Generally, in more recent times, CWIs have been permitted with reference to servicing specifically named gas wells. We urge the Department to review the CWI inventory for where this information may be lacking and require the operator to provide such information. We urge the Department to create a linking database in order that once the named wells have been placed into production, that the CWI be restored to its prior land use/function. In the event the Department is unable to completely prohibit the CWI practice, we urge that a gradual phase out be initiated. In the view of adequately protecting water resources, it just makes no sense to allow this antiquated method to continue when closed loop and superior aboveground containment systems are fully capable of processing and storing large quantities of water with less environmental risk to our water resources, public health and safety and the environment. We request that the Department consider our concerns with this provision. We request as a better protection the elimination of CWIs, but at a bare bones minimum, reluctantly recommend the provisions as written. (660a)

Response: See response to comment 1251.

1272. Comment: 78.59c – Consideration should be given to ruling out the use of open impoundments for storage of produced liquids, treated water, hydraulic fracturing fluid or industrial waste. (846, 1109)

Response: See response to comment 1251.

1273. Comment: 78.59c – Existing impoundments and pits should not be grandfathered under the old regulations and be ordered to convert them to closed systems. (884)

Response: See response to comment 1251.

1274. Comment: 78.59c – One area of explicit concern to my constituents is the use of open air impoundments to hold hydraulic fluids until permanent disposal. My understanding is that the Department of Environmental Protection has already cited drillers more than 200 times for improper construction of wastewater impoundments. In the case of an improperly constructed liner failing, toxic chemicals may enter into our groundwater system, with negative health consequences far downstream from the original leak. An impacted water supply can have disastrous consequences for our communities, while restoring water quality can be difficult, and expensive. It is in the best interest of the Commonwealth that these leaks are prevented, rather than having DEP addresses leaks and contaminated water after an event occurs. (1100)

Response: See response to comment 1251.

1275. Comment: 78.59c – Centralized impoundments should be eliminated entirely and not permitted. This section was the lengthiest in the Proposed Chapter 78 changes document- ten pages of regulations on this section alone. The storing of flowback fluids in an impoundment area provides inadequate protection of groundwater resources. Industry can do better and has done better. Many operators do not use centralized impoundments. The industry should be required to use the above ground containment systems outlined in Section 78.57 of the Code. Protection of groundwater and other water resources should be one of the Commonwealth's greatest concerns. Leaks can go undetected in these centralized impoundments, why take the chance? Since there are other methods available to the industry- why not require them to do the safer alternative? (870)

Response: See response to comment 1251.

- 1276.** Comment: The overall review of this section and its associated requirements makes it impractical, if not impossible, to construct a central impoundment. The up-front costs and site evaluation places the operator in a high risk position with no guarantee of permit issuance for central impoundment construction. Given the potential time frame of up to one year lead time for such an evaluation, the operator will likely seek other options for fluid management.

The requirements of 25 PA Code 289.121-123 are extremely stringent requiring a minimum of a year of water quality and quantity testing as well as the requirements of boring and cores. The time frame set forth for the investigation and up-front costs for an evaluation makes this section impractical for the operator. As strict as the construction requirements are with a series of liners and a leak detection system, there should be no effect of the hydrologic system at any depth below the central impoundment. (411)

Response: The planned operational life of a centralized impoundment as well as the potential for environmental harm requires strict attention to design, operation and maintenance standards. See response to comment 1251.

- 1277.** Comment: **78.59c** – A commentator questions why EQB does not require security measures for centralized impoundments as EQB requires security for temporary storage in Section 78.56(a)(5). We note that EQB requires security for freshwater impoundments in Section 78.59b(d). We ask EQB to explain in the Preamble and RAF of the final-form regulation how this provision adequately protects public health and natural resources without a provision for security. If a security provision is added in the final-form regulation, we ask EQB to explain in the Preamble and RAF of the final-form regulation how the security requirements in this section reasonably and adequately balance protection of the public health and natural resources against the fiscal impact on the oil and gas industry. (1099)

Response: See responses to comments 1251 and 1252. Accordingly, new centralized impoundments constructed under Article IX will be required to meet the site access and security requirements specified in those chapters.

- 1278.** Comment: **78.59c** – Consideration should be given on the type of fencing utilized around impoundments to prevent unauthorized access to third parties and wildlife. Some operators utilize four foot high orange plastic snow fencing around impoundments which does not effectively deter public and wildlife access. The PGC has developed best management practices to help operators deter wildlife use of impoundments on State Game Lands. (1170)

Response: See response to comment 1251. Accordingly, new centralized impoundments constructed under Article IX will be required to meet the site access and security requirements specified in those chapters.

- 1279.** Comment: **78.59c** – The Department should require air monitoring and reporting requirements for any centralized impoundment used for storage of produced, flowback, or wastewater. This is consistent with § 3227 of Act 13. (997a)

Response: See response to comment 1253.

- 1280.** Comment: **78.59c** – To remain consistent with Section 3227 of Act 13, the Department should require air monitoring and reporting requirements for any centralized impoundments used for the storage of produced, flowback, or wastewater. See. 58 Pa.C.S. § 3227. The Department should also consider pre-treatment, or other control standards, of stored wastewater to minimize or eliminate air

emissions from centralized impoundments. (1142)

Response: See response to comment 1253.

1281. Comment: 78.59c – The Department should consider pre-treatment, or other control standards, of stored wastewater to minimize or eliminate air emissions from centralized impoundments. (997a)

Response: See response to comment 1253.

1282. Comment: 78.59c – Centralized impoundments should be prohibited because they are inefficient, cause large-scale surface disturbance, pose a risk of surface and ground water contamination, and contribute to local air pollution. (1068)

Response: See response to comments 1251, 1252 and 1253.

1283. Comment: 78.59c – This section is an example where regulations and standards should be performance oriented rather than prescriptive. The prescriptive nature of this section limits operator the flexibility to determine the best approach for each particular circumstance. (1071)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the requirements specified in those chapters.

1284. Comment: 78.59c – Centralized impoundments should be replaced by enclosed tanks because of the nature of hazardous substances stored within them. Proposed regulations are inadequate to prevent catastrophic risks to public health and the environment. Oversight of liner installation by manufacturers rather than Department inspectors is not appropriate. Even the most sophisticated detection systems, sump pumps, monitoring wells, and requirements to fill out forms to monitor leakage cannot prevent irreparable damages from impoundment releases. Water testing parameters need to be expanded throughout the document to include petroleum distillates, heavy metals, and radiation levels [78.59c(6)]. This is particularly true when provisions provide for “allowable” leaks through the primary liners that in some instances are dealt with “case by case!” [78.59c(4)(ix)]. Such language is not the intent of our recommendation for “site-specific” plans. To prompt strict compliance, certified statements vouching for the testing, construction, and integrity must be tied to personal as well as corporate accountability with direct liability for any contamination. [78.59 (l)]. Pictures and drawings submitted by operators can be deceptive [78.59(m) (4, 7)].

When it comes to restoration, centralized impoundments should be treated as superfund sites [(78.59 (n)]. The possible 2-year restoration period beyond the 90-day timeline is unacceptable and fails to remove public risk in a timely manner. To meet citizen expectation, words such as “approximate” and “to the extent practical” must be eliminated in regard to restoration. Further, the ability of operators to ask for deviations from these requirements is asking for trouble [(78.59 (o)]. Best practices in restoration must be the standard. (1093, 1098)

Response: See response to comment 1264.

1285. Comment: Section 78.59c should specify that operators of centralized wastewater impoundments must post bonds in accordance with 25 Pa. Code Chapter 287.

Under the Department’s SWMA regulations, a person may not own or operate a “residual waste disposal or processing facility” unless the person has obtained a permit from the Department under Chapter 287, and the Department may not issue a permit “unless the applicant first submits to the

Department a bond in accordance with this subchapter, and the bond is approved by the Department.” The term “residual waste disposal or processing facility” is defined as “[a] facility for disposing or processing of residual waste” and the term “processing” includes residual waste transfer facilities. Bonds submitted under section 287.311 must “provide for continuous liability from the initiation of operations at the facility,” and bond amounts must be calculated under section 25 Pa. Code § 287.331.

Centralized wastewater impoundments constitute residual waste disposal or processing facilities within the meaning of section 287.101 of the Department’s regulations because they are both “transfer facilities” and disposal facilities. An impoundment is a transfer facility because it “receives and processes or temporarily stores ... residual waste at a location other than the generation site, and ... facilitates the transportation or transfer of ... residual waste to a processing or disposal facility.” An impoundment is a disposal facility because invariably, some amount of the waste stored in centralized wastewater impoundment enters the environment – if not by leaks, then by the evaporation of pollutants dissolved in the wastewater.

It follows that operators of centralized wastewater impoundments used for oil and gas operations must obtain bonds under Chapter 287. The bonding exception in section 3273.1 of Act 13 that applies to pits and impoundments on well sites does not apply because, again, centralized impoundments are by nature (if not currently by Department definition) not located on well sites. Proposed section 78.59c should be revised accordingly. (852a)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the bonding requirements specified in those chapters.

- 1286.** Comment: Standards for storing mine influenced water. Chapter 105 standards were designed for dams built to store freshwater, and not mine influenced water. The Department should assess whether the construction standards in Chapter 105 require any changes or modifications for the storage of mine influenced water. (852a)

Response: The hazard potential category of a dam under Chapter 105 takes into consideration the potential economic impacts and loss of life in the event of a dam breach. The hazard potential category of a dam is not dependent upon the materials impounded by the dam.

- 1287.** Comment: Setbacks should be progressive. To protect public health and safety, the setback requirements to occupied dwellings and businesses should be commensurate with the size of the impoundment and volume the water retained, with larger impoundments having larger setbacks. In addition, the rule should provide for variable setbacks for downgradient structures, as compared to upgradient structures. (852a)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

- 1288.** Comment: Elimination of municipal notification and other requirements. Currently a checklist is required to be completed and enclosed with the dam permit application for a centralized impoundment dam that includes proof of municipal notification, cultural resource notice, natural heritage program notice, color photographs and maps, erosion and sediment control plan adequacy letter, proof of title/flowage easements, maps/plans/profiles/cross-sections, impacts from dam failure

statement, construction information, groundwater protection requirements, monitoring plan, professional engineer's seal and certification, and applicant certification and signature. It appears that the vast majority of these requirements were not included in the language of section 78.59c. The Department should ensure these requirements are set forth in Chapter 78. (852a)

Response: See response to comments 1251 and 1252.

- 1289.** Comment: Our concern regarding this section requires reference back to the proposed definition of centralized impoundments in § 78.1. The definition of centralized impoundments expressly includes "mine influenced water." Hence, the EQB seems to be equating mine influenced water to wastewater, which is an inappropriate classification. Also, including mine influenced water in the definition for centralized impoundments conflicts with § 78.59b(g), which allows for mine influenced water to be stored in a *freshwater* impoundment upon submission and approval of a water storage plan to DEP. To clarify this matter, We recommend that the EQB delete the reference to mine influenced water from the definition of centralized impoundments. Besides, contrary to the definition of centralized impoundment, mine influenced water is not a "fluid or semi-fluid associated with oil and gas activities." (1140)

Response: The quality of mine influenced water varies greatly throughout the Commonwealth and the term includes mine influenced water that has been treated, which may be very high quality. Before mine influenced water is allowed to be stored in a freshwater impoundment, the Department must review and approve the storage based on a variety of factors including the quality of the water and the risks of storage of the water. Mine influenced water that is not of sufficient quality to be stored in a freshwater impoundment may be stored in a centralized impoundment.

- 1290.** Comment: Section 78.59c incorporates comprehensive requirements to limit the threat of an impoundment causing soil or water pollution or contamination, but does not include any requirement or limitation that would directly address the air pollution (including malodors) that centralized impoundments can produce. Section 78.59c should require the installation of air pollution control devices and/or other practices to avoid malodors and other air pollution at centralized impoundments. (1159)

Response: See response to comment 1253.

- 1291.** Comment: § 78.59c(a) – A permit is required prior to construction of a centralized impoundment, but we do not see any notification requirements to neighbors, adjacent landowners or those downstream or downhill of such an impoundment. We believe the regulations should clearly specify such notification, especially since all size and hazard potential categories under 25 PA Code 105.9 are allowed, even where substantial loss of life or substantial economic loss is possible. As managers of units of the National Park System which attract visitors and include our own staff and volunteers, as well as buildings and resources of national importance, we request notification of the application for a centralized impoundment within one mile of all National Park System units and affiliated areas in the Commonwealth so that we can assess possible impacts; ensure safety for our visitors, staff and volunteers; and so that we might engage in discussion with the applicant and the state to ensure safety and lessen potential impacts. We recommend one mile as the notification distance as it corresponds to the application information requirements for a permit to construct a dam or other waterway management structure under 25 PA Code 105.13(e)(1)(ii). (1062, 1133)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the public notice requirements specified in those chapters.

1292. Comment: The proposed regulations should prohibit the storage of fluids related to oil and gas operations in all natural depressions, notably to the extent that these open impoundments create a high risk of contamination of the air, the water and the soil. These provisions conflict with section 78.57, presented as banning open top storages. Indeed, the storage of waste in larger, open top pits such as “centralized impoundments” are much more dangerous than smaller ones. The proposed regulation should instead state that wastewater, brine, flowback, and mine influenced water should always be stored in closed systems, with a secondary containment and a leak detection system, without exceptions. (1161)

Response: The provisions in §§ 78.57 and 78a.57 address on-site production facilities and §§ 78.59c and 78a.59c address centralized impoundments. See response to comment 1251.

1293. Comment: The Dam Safety and Encroachments Act and the regulations promulgated by the Environmental Quality Board pursuant thereto reiterate the General Assembly’s intent to protect both perennial and intermittent streams. (1152)

Response: The Department acknowledges the comment.

1294. Comment: We appreciate the addition of a new section regulating centralized impoundments and the extensive detail included in § 78.59c. To protect water resources, the proposed amendments prohibit the placement of centralized impoundments in the 100-year floodplain and within 100 feet of a stream, spring or body of water. We recommend increasing the distance required between a centralized impoundment and a stream, spring or water body, to at least 500 feet, to reduce the risk of contamination should the centralized impoundment breach or fail. (1157)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

1295. Comment: § 78.59c(c)(1) – Given the importance of floodplains in protecting the waters of the Commonwealth, we recommend a more detailed description, and more protective measure, for avoidance of floodplains be used. We recommend additions (in bold italics) to subsection (1) read, “At least 300 feet from a floodplain of waters of this Commonwealth as defined in section 3215(f)(5) of the act.” The definition at 58 PA C.S. 3215(f)(5) would still serve as the base measurement, but the additional distance would serve to account for more recent periods of increased precipitation and flooding due to increasingly erratic weather events. Additionally, we contend that centralized impoundments pose at least as great a threat to water quality as an unconventional well site and as such the use of the greater set-back distance would provide greater consistency with the minimum set-back distances proposed in PA Act 13 Section 3215. (1062, 1133)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

1296. Comment: Sections 78.59c(c)(2-7) contains multiple references directing measurements, but clarity is needed as to the measurement points. For example, between what two points should horizontal measurements be taken? Additionally, section 78.59c(c)(3) appears to have been copied

from Pennsylvania 's Solid Waste Regulations , which include this provision due to the acidic nature of landfill leachate. Flowback, production brine, and other waters encountered during operations are pH neutral, however, and would not affect limestone in the same fashion. Additionally, duplicative requirements for activities already addressed through other regulatory programs should not be added to Chapter 78. It is our suggestion that subsection (c)(3) be deleted.(1071)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

1297. Comment: § 78.59c (c)(3): The proposed excerpt appears to have been copied from Pennsylvania's Solid Waste Regulations, which include this provision due to the acidic nature of landfill leachate. Duplicative requirements for activities already addressed through other regulatory programs should not be added to Chapter 78.(1103, 1137, 1147, 1174)

Response: See response to comment 1251.

1298. Comment: § 78.59c (c)(4) Suggested amendatory language: Within 500 feet measured horizontally from an occupied dwelling to the inside crest of the impoundment's embankment without the written consent of the owner of the building. (1147)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

1299. Comment: § 78.59c(c)(4) - This section is focused on "occupied dwellings", which is undefined in the regulations. We are concerned that this term not be construed to preclude protection of historic buildings and structures, which are not always "occupied" in a residential sense, but are nonetheless deserving of protective measures. We prefer the term "existing building" as used in § 78.62(a)(6), or "existing structure" in order to more accurately account for the presence and protection of historic structures. These structures may be temporarily occupied by park visitors and NPS staff and volunteers, or they may be "out buildings" at historic sites which are integral features of the historic character of the site though rarely or never occupied. The NPS owns or manages a large number of historic structures throughout the Commonwealth. We also partner with private property owners to ensure their continued protection. In the case of National Historic Landmarks (NHLs), we are an active partner with the State Historic Preservation Office (SHPO) at the Bureau for Historic Preservation (BHP). Should there be a federal nexus in any Commonwealth oil and gas development we have an obligation under Section 106 of the National Historic Preservation Act (NHPA) to participate in consultation if there is a potential for an adverse effect to an NHL. Absent a federal nexus we are still concerned with reducing impacts and adverse effects to the historic structures we own or manage.

We are concerned that 500 feet may not be a sufficient distance to protect historic structures, including those we own or manage. Leaving aside the impacts from catastrophic failure of the impoundment, there are numerous potentially adverse effects to historic structures from the truck traffic and construction activities that take place in building an impoundment. The water truck traffic to and from such an impoundment during its operation could also result in adverse effects. Historic structures feature a wide range of foundation and structural systems, many of which are vulnerable to vibration and other potential impacts from construction and operation activities.

We would recommend a generally greater distance, but adequate setback distances are best determined on a case-by-case basis. This is where the addition of a notification requirement and the application requirements at 25 PA Code 105 could potentially resolve our concerns. 25 PA Code 105.13(e)(1)(ii) requires submission of a location map in an application to build a dam or other water feature. “The location map must show all natural features including the names and boundaries of regulated waters of this Commonwealth, natural areas, wildlife sanctuaries, natural landmarks, political boundaries, locations of public water supplies and other geographical or physical features including cultural, archeological and historical landmarks within 1 mile of the site.” (25 PA Code 105.13(e)(1)(ii), emphasis added.)

Were a notification requirement added to the provisions of § 78.59c, we might then have the time for our structural engineer and historical architect to identify potential effects, suggest mitigation measures and set up monitoring protocols. The applicant would have already completed the identification and mapping work, so there wouldn’t be an additional data collection burden. The inclusion of these features in the application requirements under 25 PA Code 105 makes it clear the Commonwealth has an interest in protecting cultural, archeological and historic landmarks. A notification provision for centralized impoundments would allow us to carry on a dialogue with the applicant to reduce effects and/or implement appropriate monitoring, and allow the NPS, the SHPO and other managers and owners of historic structures to fulfill our responsibilities to protect these important features. We would be interested in further discussion with PA regulators on this topic. (1062, 1133)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

- 1300.** Comment: 78.59c(c)(4): The term “occupied dwelling” needs to be explained as to whether it refers only to buildings occupied by human inhabitants or also agriculture buildings which may house livestock, for example. (1071)

Response: See response to comment 1251. As a result of changes described in that response, the term “occupied dwelling” is no longer used in the regulation.

- 1301.** Comment: 78.59c(c)(4) - A point of reference is needed for consistency. Suggested Language: (4) Within 500 feet measured horizontally from an occupied dwelling to the inside crest of the impoundment’s embankment without the written consent of the owner of the building.(1137, 1174)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

- 1302.** Comment: 78.59c(c)(5) - A point of reference is needed for consistency. Suggested Language: (5) Within 100 feet measured horizontally from any solid blue line stream, spring or body of water, except wetlands, identified on the most current 7.5 minute topographic quadrangle map of the United States Geological Survey to the limit of disturbance unless a stream encroachment permit is acquired.(1137, 1174, 1147)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

1303. Comment: 78.59c(c)(5)The Department must fulfill its statutory obligation to protect all of the Commonwealth’s water resources by prohibiting centralized impoundments within 100 feet of any stream, not just perennial streams. (1152)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

1304. Comment: We acknowledge that Act 13 referred to “solid blue line streams,” which are streams that flow continuously. However, we believe that this reference is imprudent and contrary to existing law and regulation. The legislative declarations of both the Encroachments Act and the Clean Streams Law make it abundantly clear that the General Assembly sought to protect large and small streams, continuously flowing or not, without exception to the type of activity. For these reasons, the Section 78.59c of the Proposed Rulemaking must be revised to prohibit centralized impoundments within 100 feet of any water of the Commonwealth. (1152)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

1305. Comment: The prohibition on construction of fluid storage areas within 100 feet of certain water bodies should be extended to all water bodies. (Section 78.59c). The DEP should not allow natural springs to take the place of engineered monitoring wells used to measure the effects of fluid storage areas. (Section 78.59c(g)(2)). The DEP should strengthen its regulatory mechanisms for ensuring that pits and impoundments are constructed in a structurally sound manner and according to regulation. (Section 78.59c(m)) (19, 21, 23, 26, 55, 165, 180, 181, 391, 429a, 609, 843, 851, 938, 946, 958, 1005)

Response: See response to comment 1251. Accordingly, new centralized impoundments constructed under Article IX will be required to meet the groundwater monitoring requirements specified in those Chapters.

1306. Comment: I think impoundment pits for brine storage should be further away than 100 feet from a stream or other body of water. Is there any independent oversight on how these new regulations will be implemented? I think we need independent, honest oversight to avoid corruption and ensure that the PA State constitution is not further violated by the gas industry, and by the politicians that cater to them. (98)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters. The Department believes the revisions to Chapters 78 and 78a are consistent with the Constitution and applicable statutes, and provide appropriate protections for public health and safety.

1307. Comment: The current draft regulations prohibit well operators from building “centralized impoundments” for wastewaters within 100 feet of any “solid blue line stream” identified by the United States Geological Survey. Solid blue line streams flow consistently year round. This 100 foot buffer is important, but it should be extended to other streams that do not flow continuously. Although we recognize that Act 13 unwisely referred to “solid blue line streams,” intermittent and ephemeral streams need to be protected as well. Some of our most vulnerable waters are intermittent portions of high quality streams. Those waters would not be adequately protected by these

regulations. Furthermore, the DEP has an obligation to protect intermittent streams under the Clean Streams Law. Rather than attempt to make that decision on a case by case analysis, the DEP should extend this buffer to all Pennsylvania streams. (23, 26, 90, 142, 189, 192, 391, 843, 938, 938a, 946, 958, 1005)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

1308. Comment:

- A. “(c) Centralized impoundments may not be constructed in any portion of the following areas:
(1) In a floodplain of waters of the Commonwealth as defined in section 3215(f)(5) of the act (relating to well location restrictions)”.
- Numerous Impoundments holding Industrial wastewater or holding sewage are located in floodplains in Pennsylvania. Locating similar structures to hold water for gas well operations in a floodplain is regulated by local floodplain ordinances and should not be regulated by PA DEP.

- B. “(c) Centralized impoundments may not be constructed in any portion of the following areas:
(2) In or within 100 feet measured horizontally of a wetland greater than 1 acre in size.”

Why not? How is the impoundment going to adversely affect a wetland?

- C. “(c) Centralized impoundments may not be constructed in any portion of the following areas:
(5) Within 100 feet measured horizontally from any solid blue line stream, spring or body of water, except wetlands, identified on the most current 7.5 minute topographic quadrangle map of the United States Geological Survey.”

The term, “any solid blue line” is NOT a commonly accepted term in any Engineering, Environmental, or Hydraulic Profession. Topographical maps are not always correct. Due to Flooding, Restoration activities, or unauthorized construction work, many waterways are NOT in the location noted as a “Blue Line” on a Topographical map. In addition, on many older topographical maps, small headwater waterways, which may be designated High Quality or Exceptional Value, are NOT shown as “Blue lines” on Topographical maps. (92)

Response: The Department regulates floodplain development under a number of environmental statutes and regulations to protect the waters of the Commonwealth as well as the structural integrity of the permitted facility.

Wetlands 1 acre in size or greater are environmentally significant and play an important role in the hydrologic cycle as well as maintaining and enhancing water quality. Development in the vicinity of such wetlands can disrupt the hydrologic regime leading to degraded water quality.

As for siting restrictions for centralized impoundments, see response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

1309. Comment: Section 78.59(c) prohibits building impoundments for wastewaters within 100 feet of “solid blue line” streams, but does not extend the 100 foot buffer to intermittent and seasonal streams. Obviously, this oversight must be corrected.(108)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

1310. Comment: The prohibition of construction of fluid storage within 100 feet of certain water bodies should be extended to ALL water bodies! (951,1019)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

1311. Comment: The current draft regulations prohibit well operators from building “centralized impoundments” for wastewater within 100 feet of any “solid blue line stream” identified by the United States Geological Survey. Although we recognize that Act 13 unwisely referred to “solid blue line streams,” which are streams that run continuously, intermittent and ephemeral streams that do not necessarily run at all times of the year need to be protected as well. Some of our most vulnerable waters are intermittent portions of high quality streams. Those waters would not be adequately protected by these regulations. Furthermore, the DEP has an obligation to protect intermittent streams .under the Clean Streams Law. Rather than attempt to make that decision on a case by case analysis, the DEP should extend this buffer. (113, 165)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

1312. Comment: We generally support the idea behind § 78.59(c) to prohibit fluid storage areas in close proximity to water, however, we call on you to strengthen this requirement by increasing the 50 foot buffer zones on intermittent streams, as described in § 3215(f)(5), to at least100 feet, which science shows to be the minimum distance required to see protective benefits. Intermittent streams are a primary source of drinking water for back country hikers and trail users. By improving this section of the proposed regulations, we can ensure that hikers and other outdoor recreationists continue to safely enjoy spending time in Pennsylvania’s wilderness. (188)

Response: Section 3215(f)(5) of the 2012 Oil and Gas Act controls the setbacks for well sites and wells drilled in floodplains. The provisions in this section is consistent with the Act. See response to comment 1260.

1313. Comment: Section 78.59c, of the current draft regulations; prohibit well operators from building “centralized impoundments” for wastewaters within 100 feet of any “solid blue line stream” identified by the United States Geological Survey. Having a fluid storage area as close as 100 feet of ANY stream, whether the Allegheny River or an intermittent seasonal stream, is way too close. If there’s a leak, the 100 foot buffer could be completely inadequate to assure that the leakage does not enter the stream. Even if it’s a dry creek 364 days a year, once leaked frac fluid gets into it, it becomes a stream and that frac fluid will flow downhill, eventually to a solid blue-line stream. A dry creek bed is a channel into the water system and frac fluid must be kept out of it. Even 1000 feet is too close if the impoundments are at a higher elevation than freshwater sources. (808)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

1314. Comment: The current draft regulations in Section 78.59c prohibit well operators from building “centralized impoundments” for wastewater within 100 feet of any “solid blue line stream” that flows year round. The buffer should be extended to intermittent streams as well. The DEP has an obligation to protect intermittent streams under the Clean Streams Law. (846, 1109)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

1315. Comment: § 78.59c(c)(5); Not all solid “blue line streams” shown on a 7.5 minute topographic quadrangle represent actual streams. Many of these features can have intermittent flow or only flow as a result of surface runoff. This rule should be expanded to allow for verification of streams based on actual site specific conditions determined from field surveys. (175)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

1316. Comment: Impoundments should NOT be permitted AT ALL in the Commonwealth of Pennsylvania. They are not industry best practice, they are not allowed in some other states. The risk that they bring to the groundwater and also to the air is just too substantial. Regarding the disposal of wastewater, sludge, and drill cuttings, it should be noted that in addition to the toxic chemicals and heavy metals these contain, radioactivity is also a concern. To allow disposal of these materials 200 feet from a building or water supply or 100 feet from a stream is less than responsible and will result in unnecessary soil and water contamination. Given the toxic and radioactive nature of these materials, they should not be disposed of on or in the land or water, and should be dealt with as a hazardous, radioactive waste. (945)

Response: See response to comment 1251.

1317. Comment: One of my concerns is 78.59c which prohibits fluid storage areas within 100 feet of certain bodies of water. “Intermittent and ephemeral streams”-- streams which do not run all year long also need to be protected, under the Clean Streams Act. Like vulnerable wildlife and plant life, vulnerable water sources are not protected by these regulations. (1003)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

1318. Comment: § 78.59c(c)(5) – Protection for blue line (perennial) streams is provided, but we believe intermittent streams should be protected from impacts as well. Intermittent streams typically do not appear on standard USGS 7.5 minute topographic quad maps, but nonetheless provide critical seasonal habitat for aquatic flora and fauna and connect to blue line streams which flow into many of our National Park System units and affiliated areas. Intermittent streams could be identified during on-the-ground surveys needed to determine the suitability of an area for a centralized impoundment. As such, we recommend centralized impoundments not be constructed within 100 feet of intermittent streams. (1062, 1133)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

1319. Comment: 78.59 (c)(5) It is common knowledge that not all streams are depicted as a blue line on a 7.5 minute topographic quadrangle map of the United States Geologic Survey. We recommend changing the language in this item from “Within 100 feet measured horizontally from any solid blue line stream, spring or body of water”, to “Within 100 feet measured horizontally from the bank of any watercourse or body of water or wetland” as defined in 25 Pa Code § 105.1 Dam Safety and Waterway Management. (1006)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

1320. Comment: This section appears to lack the fencing clause present for pits and freshwater impoundments. The clause needs to be added and revised as recommended for 78.56(5).
78.59 (c)(5) Not all streams are depicted as a blue line on a 7.5 minute topographic quadrangle map of the United States Geologic Survey. The Service recommends changing the language in this item from “Within 100 feet measured horizontally from any solid blue line stream, spring or body of water .., to “ Within 100 feet measured horizontally from the bank of any watercourse or body of water or wetland”“ as defined in 25 Pa Code § 105.1 Dam Safety and Waterway Management. (1134)

Response: See responses to comments 1260 and 1277.

1321. Comment: § 78.59c (c)(6) Suggested amendatory language: Within 500 feet measured horizontally from a private water supply to the inside crest of the impoundment’s embankment without the written consent of the owner of the water supply. (1147)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

1322. Comment: Setbacks to water supplies should not be capable of being waived. Section 78.59c(c)(6) allows property owners to waive setbacks. If the purpose of the setback is to protect water supplies and the aquifer for this and future generations, then the property owner should not be allowed to waive the setback requirement. (852a)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

1323. Comment: 78.59c(c)(6) - A point of reference is needed for consistency . Suggested Language: (6) Within 500 feet measured horizontally of a private water supply to the inside crest of the impoundment’s embankment without the written consent of the owner of the water supply.(1137, 1174)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

1324. Comment: 78.59c(7) - A point of reference is needed for consistency. Suggested Language: (7) Within 1,000 feet measured horizontally of an existing water well, surface water intake, reservoir or other water supply extraction point used by a water purveyor to the inside crest of the impoundment's embankment without the written consent of the water purveyor.(1137, 1147, 1174)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the setback requirements specified in those chapters.

1325. Comment: Groundwater protection. 78.59c(d): As with disposal pits, the Department should increase the distance between the centralized impoundments and shallow groundwater. Twenty (20) inches is not sufficient distance to protect shallow groundwater from any seepage from the secondary liner (i.e., allowable seepage that leaves the liner system rather than flowing towards the sump pump). Generally such a small separation is intended to protect the liner from backpressure only. The separation distance should be analyzed by a licensed professional engineer to determine if 20 inches is sufficient to guarantee that backpressure from rising shallow groundwater will not damage the liner and that the removal of shallow groundwater can be documented with perimeter tile drainage system. (852a)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the groundwater separation requirements specified in those chapters.

1326. Comment: Wastewater storage. Section 78.59c(e) should require operators to state in their submissions whether they intend to store in the centralized impoundment any wastewater processed under WMGR123. (852a)

Response: See response to comment 1251 and 1252.

1327. Comment: The new language of this section provides requirements for centralized impoundments and generated significant interest from the regulated community. Commentators note that certain provisions, such as Clause (e)(3)(viii)(B) which allows operators to direct leak collection from failed impoundment systems back into the same failed system, are improper or inadequate. Other commentators express concern that certain requirements, such as Subparagraph (e)(2)(vi) which requires an authorized representative of a liner manufacturer to supervise the installation of the liner, are unreasonable or excessive. We ask EQB to explain in the Preamble and RAF of the final-form regulation how the requirements in this section reasonably and adequately balance protection of the public health and natural resources against the fiscal impact on the oil and gas industry. (1099)

Response: The final rulemaking requires all centralized impoundments to comply with permitting requirements in Article IX which will ensure that Chapter 78 does not result in disparate requirements or disproportionate costs on one particular economic or extractive sector. Therefore, in order to ensure consistency the Department has revised §§ 78.59c and 78a.59c in the final-form rulemaking to require any new centralized impoundments to be authorized by a residual waste permit under Article IX. In addition, §§ 78.59c and 78a.59c also require operators of existing centralized impoundments permitted under a Dam Permit for a Centralized Impoundment Dam to either submit a closure plan to the Department within 6 months and close the centralized impoundment within 3 years of the effective date of

the rulemaking or obtain a residual waste permit for the operation of the centralized impoundment within 3 years of the effective date of the rulemaking. Accordingly, centralized impoundments constructed under Article IX will be required to meet the leak detection requirements and liner installation requirements specified in those chapters.

1328. Comment: Capacity of the leak detection system. Section 78.59c(e)(3) should require that the leak detection system be designed for the anticipated allowable seepage rate for the liner, and shown in engineering plans and specifications to be capable of collecting and transporting that leakage volume to the sump pump. The plans and specifications should include calculations of daily leakage flow to the sump and the capability of the sump to store said leakage volume without spillage. (852a)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the leak detection requirements specified in those chapters.

1329. Comment: § 78.59c (e)(1) Suggested amendatory language: A sub-base that meets the following, or is otherwise approved by the Department: (1147)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the construction requirements specified in those chapters.

1330. Comment: 78.59c(e)(1) -- The soil quality specified below may not be available on or near many proposed locations. Consequently, this subsection should include an allowance for the use of alternative materials such as Geosynthetic Clay Liners (GCLs) and/or soil amendments.

Suggested amendatory language:

(1) A sub-base that meets the following, or is otherwise approved by the Department: (1071, 1103, 1137, 1174)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the construction requirements specified in those chapters.

1331. Comment: 78.59c(e)(1)(vi) - Can the material on site be used as a sub-base? What is the definition of a natural clay material? Can material on location be screened to meet this requirement? (411)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the construction requirements specified in those chapters.

1332. Comment: 78.59c(e)(1)(vi)(C) -- The soil compaction test (i.e., moisture/density testing) frequency is excessive, where one test per 2,500 square feet results in 18 tests per acre. Typically, the 6-inch thick subbase layer in a landfill liner system is tested at a frequency of one test per acre. We recommend that the test frequency be one test per acre per soil type.

The soil permeability testing in the proposed subsection is excessive. In addition, the subsection could be misinterpreted to require field permeability testing which is impractical. We recommend that laboratory permeability testing be performed at a frequency of 1 sample per soil type. In addition, it is suggested that the proposed subsection be changed to utilize a correlation between

laboratory Proctor and Permeability testing that is used to specify parameters for field compaction testing.

Suggested amendatory language:

§ 78.59c (e)(vi) (C) No more permeable than 1.0×10^{-6} cm/sec. Laboratory Standard Proctor and Permeability testing shall be used to delineate limits for field moisture/density testing. Field limits shall be delineated for each soil type used, and at least one Standard Proctor and Permeability test per soil type shall be performed. Field moisture density testing shall be performed at a frequency of one sample per acre per 6-inch thick lift per soil type. (1071, 1103, 1137, 1174)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the construction requirements specified in those chapters.

1333. Comment: § 78.59c (e)(1)(vii)(C) Comment: Typically, the 6-inch thick sub base layer in a landfill liner system is tested at a frequency of one test per acre. We recommend that the test frequency be one test per acre per soil type. (1147)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the construction requirements specified in those chapters.

1334. Comment: § 78.59c (e)(1)(vii)(C) Suggested amendatory language: No more permeable than 1.0×10^{-6} cm/sec. Laboratory standard Proctor and permeability testing shall be used to delineate limits for field moisture/density testing. Field limits shall be delineated for each soil type used, and at least one Standard Proctor and Permeability test per soil type shall be performed. Field moisture density testing shall be performed at a frequency of one sample per acre per 6-inch thick lift per soil type. (1147)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the construction requirements specified in those chapters.

1335. Comment: In § 78.59c(vi)(D), it is standard practice to capitalize the P in Proctor. Suggested Language: (D) Is compacted to a density of at least 95% standard Proctor. (1137)

Response: See response to comment 1251. Due to the changes described in that response, the term “Standard Proctor” is no longer used in this section.

1336. Comment: 78.59c(e)(2) - Manufacturers in the geosynthetics industry utilize geomembrane manufacturing standards specified by the “Geosynthetic Institute,” which utilize nominal and not minimum values. It is suggested that manufacturing specifications follow the “Geosynthetic Institute’s” manufacturing standards.(1174)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the construction requirements specified in those chapters.

1337. Comment: 78.59c(e)(3)(ix)(D): The requirement that centralized impoundment lines be installed under the supervision of an authorized representative of the manufacturer in sections

78.59c(e)(2)(vi) and 78.59c(e)(4)(xii) raises a significant concern for an operator's ability to comply without potentially causing significant delays. It is unknown how many manufacturer representatives exist and are available to perform this supervision. We suggest that this requirement be removed. (1071)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

- 1338.** Comment: § 78.59c (e)(2)(vi) Suggested amendatory language: Is installed according to manufacturer's specifications under the supervision of an appropriately trained professional. A Department approved quality assurance and quality control plan shall be implemented in the field during the installation of the liner. (1147)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

- 1339.** Comment: § 78.59c (e)(2)(vi) -This section requires an authorized representative of the liner manufacturer to supervise the installation of the liner, and then goes on to require a Department approved quality assurance and quality control plan to be implemented during construction. This is overkill. It would be more reasonable to require either the manufacturer representative supervision or a Department approved plan, but not both. It is recommended that this section be revised to allow either, but not require both. (124a, 861)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

- 1340.** Comment: 78.59c(e)(2) (vi): The requirement that centralized impoundment lines be installed under the supervision of an authorized representative of the manufacturer in sections 78.59c(e)(2)(vi) and 78.59c(e)(4)(xii) raises a significant concern for an operator's ability to comply without potentially causing significant delays. It is unknown how many manufacturer representatives exist and are available to perform this supervision. We suggest that this requirement be removed and replaced with the requirement that installation be performed under the direction of an appropriately trained professional. (1071)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

- 1341.** Comment: In § 78.59(e)(2)(vi), the commentator recommends that an appropriately trained professional can supervise installation. Requiring an authorized representative of the manufacturer imposes an unnecessarily strict and potentially expensive requirement. Suggested Language: (vi) Is installed according to manufacturer's specifications under the supervision of an appropriately trained professional. A Department approved quality assurance and quality control plan shall be implemented in the field during installation of the liner. (1137)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

1342. Comment: 78.59c (e)(2)(vi) -- An appropriately trained professional can supervise installation. Requiring an authorized representative of the manufacturer imposes an unnecessarily strict, and potentially expensive, requirement.

Suggested amendatory language:

(vi) Is installed according to manufacturer's specifications under the supervision of an appropriately trained professional. A Department approved quality assurance and quality control plan shall be implemented in the field during the installation of the liner. (1103)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

1343. Comment: 78.59c(e)(2)(vi) - The proposed section, as written, gives governing supervision or authority to geosynthetics manufacturers. It is suggested that the section be changed to indicate that Quality Assurance shall be performed under the direction of an appropriately trained professional. Due to the unique nature of geosynthetics manufacturing and construction, a Construction Quality Assurance and Quality Control Plan (CQAQC Plan) needs to be prepared under the direction of a qualified professional with geosynthetics experience. It is recommended that the Department work with the MSC to develop a standard CQAQC Plan. If the standard plan were to be used, review and approval would not be required for each application. (1174)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

1344. Comment: 78.59c(e)(3): Field testing of the flow zone would require an extremely complex testing scenario that would be very difficult to develop and acquire approval at the Department's regional office. The proposed subsection as written is therefore impractical. The permeability/permittivity of geosynthetic flow zone products and aggregate meeting standard AASHTO gradation are well known and documented. Suggested language: "(vii) Creates a flow zone between the secondary liner and the primary liner equal to, or more permeable than, 1.0×10^{-2} cm/sec., based on manufacturer/supplier's published specifications." (1103, 1137, 1071, 1147, 1174)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the leak detection requirements specified in those chapters.

1345. Comment: 78.59c(e)(3)(i) – A leak detection system is required that rapidly detects and collects liquid entering the leak detection zone, and rapidly transmits the liquid to a sump. Though it is not specified how the system to run the monitoring and pump is powered, it is recommended to have a backup power system requirement. (846, 1109)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the leak detection requirements specified in those chapters.

- 1346.** Comment: 78.59c(e)(3)(viii)(B) – This paragraph improperly allows a “[d]ischarge from the sump pump [to] be directed back into the impoundment....” A discharge that occurs should not be redirected back into a failing containment system. (997a, 1142)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the leak detection requirements specified in those chapters.

- 1347.** Comment: 78.59c(e)(3)(viii) – Due to the extremely high flow volumes that can be transmitted through geosynthetic flow zone products and many aggregates, they can, in nearly every instance, more than adequately transmit flow without piping. The requirement for the use of transmission piping significantly complicates grading and liner configurations to accommodate piping. Suggested Language: (viii) If the leak detection zone cannot adequately transmit detection zone flow, the system shall contain a perforated piping system capable of detecting and intercepting liquid within the leak detection zone and conveying the liquid to a collection sump.(1071, 1103, 1137, 1147, 1174)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the leak detection requirements specified in those chapters.

- 1348.** Comment: Capacity calculations. Section 78.59(e)(3)(viii)(B) should require the engineering design plans and specifications to include calculations that support the size of the sump and the pump capacity for the maximum allowable seepage rate. (852a)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the leak detection requirements specified in those chapters.

- 1349.** Comment: 78.59c (e)(3)(ix)(B) Suggested amendatory language: The pipes shall be installed as close to perpendicular to the flow as practicable and shall have a minimum post-settlement grade of at least 1%. (1147)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the leak detection requirements specified in those chapters.

- 1350.** Comment: 78.59c(e)(3)(ix)(B) - A minimum slope of 2% was borrowed from the solid waste regulations, which was specifically developed for landfills due to the limitations of aggregates that were originally used in their designs. In the last 25 years, geosynthetic drainage layers have been developed that have superior performance to aggregates. For oil & gas impoundments, pipes can be operated with a 1% slope with the use of geosynthetics. Consequently, it is suggested that the minimum slope be changed to 1%. Suggested Language : (B) The pipes shall be installed as close to perpendicular to the flow as practicable and shall have a minimum post-settlement grade of at least 1%. (1137, 1174)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the leak detection requirements specified in those chapters.

1351. Comment: 78.59c(e)(3)(ix)(C) - The wall thickness specified is significantly over designed for most impoundments that the industry is expected to design and build. Suggested Language: (C) The pipe (if needed) shall be designed under the direction of an appropriately trained professional, or if a design is not prepared, the minimum diameter of the perforated pipe shall be 4 inches with a wall thickness of Schedule-80 or greater as specified by ASTM, or equivalent.(1137, 1147, 1174)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the leak detection requirements specified in those chapters.

1352. Comment: 78.59c(e)(4)(ix): We are concerned that the requirement that operators document leakage rates weekly is overly burdensome. Additionally, the language refers to making available upon request twice - redundant and one should be deleted. (1071)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the leak detection requirements specified in those chapters.

1353. Comment: 78.59c (e)(3)(x) Suggested amendatory language: A minimum bottom slope of 1%. (1147)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the leak detection requirements specified in those chapters.

1354. Comment: Repairs and design. Section 78.59c(e)(4)(x) implies that the centralized impoundment containing millions of gallons of wastewater could easily be drained for repairs. The rule does not provide guidance on how that wastewater will be held or disposed of during liner repair. The rule does not address the difficulty of putting the centralized impoundment off-line for repairs. One solution would be to require a minimum of two cells for centralized impoundments to allow for the repair of one cell liner system while still being able to collect and contain wastewater generated from active drilling sites. It should be noted that dividing up the total storage capacity of the centralized impoundment into smaller subsections or cells would reduce the catastrophic risk of berm failure. (852a)

Response: See response to comment 1251 and 1252.

1355. Comment: 78.59c (e)(3)(xii) Comment: The waters handled in the oil and gas industry are typically pH neutral and would not affect a carbonaceous aggregate. For an oil and gas impoundment, detection zone problems can be repaired because the contents are not permanently stored. Therefore, it is recommended that this proposed subsection be deleted. (1147)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the leak detection requirements specified in those chapters.

1356. Comment: 78.59c (e)(3)(xii) Suggested amendatory language: Delete subsection (e)(3)(xii). (1147)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the leak detection requirements specified in those chapters.

1357. Comment: Section 78.59c(e)(3)DEP inspectors should routinely review the operator’s leak detection system weekly monitoring reports, and plan unscheduled inspections to ensure that centralized impoundments are not leaking, beyond allowable leakage rates. (1157)

Response: The Department acknowledges the comment.

1358. Comment: 78.59c (e)(4)(ix) describes allowable leakage rates for the primary liner, and we recommend adding language in this section that specifies that the secondary liner shall not allow leakage. (1157)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the leak detection requirements specified in those chapters.

1359. Comment: 78.59c(e)(3)(xii) -Under normal construction standards, a drain system installation would require the use of carbonate stone to allow for permeability. Why prohibit the use of this type of material? What is the alternative? (411)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the leak detection requirements specified in those chapters.

1360. Comment: 78.59c (e)(3)(xii) -- This subsection was borrowed from the solid waste regulations, and “not contain carbonate” is a specification relevant to that industry where the acidic nature of landfill leachate can dissolve carbonate aggregate and affect leachate collection systems. Due to the fact that all aggregate has some carbonatious content and “not contain carbonate” is an impractical specification, a small percentage of carbonate content in aggregates is allowed in solid waste projects.

The waters handled in the oil and gas industry are typically pH neutral and would not affect a carbonatious aggregate. In addition, landfills permanently store waste. For an oil and gas impoundment, detection zone problems can be repaired because the contents are not permanently stored. Therefore, it is recommended that this proposed subsection be deleted. Suggest deletion of subsection (3)(xii). (1103, 1137, 1174)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the leak detection requirements specified in those chapters.

1361. Comment: Monitoring frequency/reporting. Section 78.59(e)(3)(xiii) requires the operator to monitor the leak detection system weekly without regard to the expected volume of allowable seepage that could be collected during that week and the ability of the sump and pump to properly transfer that volume back into the impoundment. The leak volume collected and pumped should be documented and submitted to the department quarterly along with discussion of whether or not the leakage rate is exceeding the allowable seepage rate and if repairs to the liner or leak detection system are warranted. (852a)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the leak detection requirements specified in those chapters.

- 1362.** Comment: 78.59c (e)(4)(vi) -- An appropriately trained professional can supervise installation. Requiring an authorized representative of the manufacturer imposes an unnecessarily strict, and potentially expensive, requirement.

Suggested amendatory language:

(vi) Installed according to manufacturer's specifications under the supervision of an appropriately trained professional. A Department approved quality assurance and quality control plan shall be implemented in the field during the installation of the liner. (1103)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

- 1363.** Comment: 78.59c(e)(4)(vi) - The proposed subsection empowers geosynthetics manufacturers where that industry should not have any governing supervision or authority. It is suggested that the subsection be changed to indicate that Quality Assurance shall be performed under the direction of an appropriately trained professional. Due to the unique nature of geosynthetics manufacturing and construction, a Construction Quality Assurance and Quality Control Plan (CQAQC Plan) needs to be prepared under the direction of a qualified professional with geosynthetics experience. It is suggested that the Department work with the MSC to develop a standard CQAQC Plan. If the standard CQAQC Plan were to be used, review and approval would not be required in each application. Suggested language: (vi) Installed according to manufacturer's specifications under the supervision of an appropriately trained professional. A Department approved quality assurance and quality control plan shall be implemented in the field during the installation of the liner.(1174)

Response: See responses to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

- 1364.** Comment: In § 78.59c(e)(4)(iv) the commentator recommends that an appropriately trained professional can supervise installation. Requiring an authorized representative of the manufacturer imposes an unnecessarily strict, and potentially expensive, requirement.

MSC's suggested amendatory language:

(vi) Installed according to manufacturer's specifications under the supervision of an appropriately trained professional. A Department approved quality assurance and quality control plan shall be implemented in the field during the installation of the liner (1137).

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

- 1365.** Comment: 78.59c(e)(4)(x) -Have the necessary electronic reporting setup in GreenPort prior to the implementation of this section. (411)

Response: The Department agrees and will ensure that the electronic reporting system will be in place prior to implementation of the regulations.

1366. Comment: 78.59c (e)(4)(vi) Suggested amendatory language: Installed according to manufacturer’s specifications under the supervision of an appropriately trained professional. A Department approved quality assurance and quality control plan shall be implemented in the field during the installation of the liner. (1147)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

1367. Comment: § 78.59c (e)(4)(vi) - This section is similar to § 78.59c (e)(Z)(vi) above, so the comment is the same. (124a)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

1368. Comment: 78.59c(f): We ask that the Department clarifies its expectations with the requirement that an operator perform a second “round” of hydrogeologic investigation. “Round” needs to be defined for example; is it referring to 1 additional set of samples? (1071)

Response: See response to comment 1251.

1369. Comment: Qualified geologist. Section 78.59c(f) should require that the baseline hydrogeologic study be performed by a licensed professional geologist or certified hydrologist familiar with the local geology and aquifer formations. The study should be based on a sufficient number of soil borings that can be used to describe the subsurface materials located below the intended location of the centralized impoundment and to identify soil properties indicative of high seasonal groundwater. (852a)

Response: See response to comment 1251 and 1252.

1370. Comment: Submission of results. Section 78.59c(f)(1) and (2) should require that the analytical results shall be submitted to the Department with all applicable chain of custody forms, a map that clearly shows the sampling locations, the depth of groundwater sampled, the distance from the water well tested and the location of the centralized impoundment, and the laboratory analytical reports. (852a)

Response: See response to comment 1251 and 1252.

1371. Comment: Parameters for water tests. Section 78.59c(f)(3) establishes the parameters for water quality testing. The list in (i)(6) should include methane, total petroleum hydrocarbons, BTEX, and any pollutants associated with the expected hydraulic fracturing fluid recipe. The parameters should also include a water quality suite that includes all traditional cations and anions instead of just chlorides and sulfates. (852a)

Response: See response to comment 1251. Accordingly, new centralized impoundments constructed under Article IX will be required to meet the groundwater monitoring requirements specified in those chapters.

1372. Comment: 78.59c(f)(4): The requirement for an extension of four quarterly tests if soil mottling is apparent is burdensome and could add a year to the already lengthy permitting process. Soil mottling

does not provide conclusive evidence of the seasonal high water table. Suggested amendatory language:

“(4) If during the groundwater elevation study, groundwater elevation determined by surface water or wells, or soil mottling in the absence of surface water or well data, is apparent within the intended confines of the impoundment or within 20 inches of its base, or if the seasonal high water table will be adjusted using engineering controls in order to accommodate the impoundment, the requirements of 25 Pa. Code §§ 289.121-289.123 (relating to phased application requirements -site analysis) must be followed and the groundwater elevations data must be collected within the first five months of the year.” (1071, 1147)

Response: See response to comment 1251. Accordingly, new centralized impoundments constructed under Article IX will be required to meet the groundwater monitoring requirements specified in those chapters.

- 1373.** Comment: 78.59c(f)(4) -- Soil mottling does not provide conclusive evidence of the seasonal high water table . In fact, 289.432(a)(1), of the solid waste regulations, states “Soil mottling may indicate the presence of a seasonal high water table .” Therefore, it is recommended that this section be revised to allow groundwater elevation data in place of soil mottling, as an option, to delineate the seasonal high water table.

Regarding the period over which groundwater elevation data is needed prior to its manipulation, “four quarterly tests” is not required by the solid waste regulations for permanent waste disposal facilities, and is excessive for the temporary storage of flowback and production water. Based on empirical evidence, the seasonal high groundwater condition occurs within the first five months of the year. Consequently, it should be sufficient to proceed with manipulation if groundwater data has been collected during that period. Or, at the very least, data from that period should be sufficient to proceed with the permitting process (including permit issuance). (1103)

Response: See response to comment 1251. Accordingly, new centralized impoundments constructed under Article IX will be required to meet the groundwater monitoring requirements specified in those chapters.

- 1374.** Comment: § 78.59c(f)(4); Soil mottling can occur as a result of infiltration from precipitation or be an artifact of past geologic conditions that are no longer relevant (such as the affects from glaciation). Additional groundwater sampling requirements should be based solely on water table measurements and impoundment design specifications. (175)

Response: See response to comment 1251. Accordingly, new centralized impoundments constructed under Article IX will be required to meet the groundwater monitoring requirements specified in those chapters.

- 1375.** Comment: 78.59c(f)(4) - Soil mottling does not provide conclusive evidence of a seasonal high water table. In fact, Section 289.432(a)(1), of the solid waste regulations, states “Soil mottling may indicate the presence of a seasonal high water table.” Therefore, it is recommended that this section be revised to allow groundwater elevation data in place of soil mottling, as an option, to delineate the seasonal high water table. Regarding the period over which groundwater elevation data is needed prior to its manipulation, “four quarterly tests” is not required by the solid waste regulations for permanent waste disposal facilities, and is excessive for the temporary storage of flowback and production water, based on empirical evidence that the seasonal high groundwater condition occurs within the first five months of the year. Consequently, if groundwater data has been collected during

that period, it should be sufficient to proceed with manipulation. Data from that period should be sufficient to proceed with the permitting and approval process.

Suggested Language: (4) If during the groundwater elevation study, groundwater elevation determined by surface water or wells, or soil mottling in the absence of surface water or well data, is apparent within the intended confines of the impoundment or within 20 inches of its base, or if the seasonal high water table will be adjusted using engineering controls in order to accommodate the impoundment, the requirements of §§ 289.121-123 (relating to description of geology, soils and hydrology; general requirements; geology and groundwater description ; and groundwater quality description) shall be followed and the groundwater elevations data must be collected within the first five months of the year.(1137, 1174)

Response: See response to comment 1251. Accordingly, new centralized impoundments constructed under Article IX will be required to meet the groundwater monitoring requirements specified in those chapters.

- 1376.** Comment: 78.59c(g) - The requirements in Subsection 78.59c(g) below would prevent the use of Best Available Technology. Due to the size of centralized impoundments (approximately 4 acres or less), a drainage layer beneath the impoundment with discrete monitoring points would provide complete coverage, provide leak information in the shortest possible time, and could be used as a control. (1147)

Suggested amendatory language: An operator that operates a centralized impoundment shall install, operate and maintain a water quality monitoring system that can detect the entry of substances contained in the impoundment into the groundwater or surface water. The water quality monitoring system shall accurately characterize groundwater flow, groundwater chemistry and flow systems on the site and adjacent area. (1147)

Response: See response to comment 1251. Accordingly, new centralized impoundments constructed under Article IX will be required to meet the groundwater monitoring requirements specified in those chapters.

- 1377.** Comment: Section 78.59c(g) does not clearly state whether the operator has to install the water quality monitoring system prior to filling the centralized impoundment. The proposed amendments are silent on when the monitoring wells must be constructed and installed, and functioning, and whether or not monitoring has to be completed prior to when the final certification report is approved. We recommend clarifying this section to ensure that monitoring systems are in place, and functioning, prior to final approval by DEP. (1157)

Response: See response to comment 1251. Accordingly, new centralized impoundments constructed under Article IX will be required to meet the groundwater monitoring requirements specified in those chapters.

- 1378.** Comment: 78.59c(g): Monitoring wells near “centralized impoundments” are essential tools for determining whether the stored fluids are polluting groundwater in the surrounding area. The draft regulations wisely require three monitoring wells, but give the DEP the discretion to allow the operator to substitute natural springs for monitoring wells. This is inappropriate. Natural springs are not engineered to provide reliable and repeatable data on groundwater conditions because, among other things, they are susceptible to variability based on precipitation events and subject to contamination from surface flow. Monitoring of natural springs down gradient of centralized impoundments is appropriate, but that monitoring should be done in addition to, not instead of,

construction and maintenance of monitoring wells. (23, 26, 90, 142, 189, 192, 391, 843, 938, 946, 958, 1005)

Response: See response to comment 1251. Accordingly, new centralized impoundments constructed under Article IX will be required to meet the groundwater monitoring requirements specified in those chapters.

- 1379.** Comment: 78.59c(g) -While you propose the installation of monitoring wells, nothing is noted about the long term management or responsibility of the monitoring wells. Once the central impoundment is reclaimed, the existing monitoring wells pose a risk of contamination entry. Permanent monitoring wells will not fit back into the prior land use, especially agriculture. Will the department require the operator to plug these wells? As strict as the construction requirements are with a series of liners and a leak detection system, there should be no effect of the hydrologic system at any depth below the central impoundment that should require monitoring well installation. (411)

Response: See response to comment 1251. Accordingly, new centralized impoundments constructed under Article IX will be required to meet the groundwater monitoring requirements specified in those chapters.

- 1380.** Comment: 78.59c(g): As previously referenced in our general comments we believe this section is an example where regulations and standards should be performance oriented and flexible rather than prescriptive. The prescriptive nature of this section prevents the use of Best Available Technology. It is our belief that the language should be revised to allow alternatives. In addition, the use of the term “regulated substance” in this subsection creates a confusing and perhaps impossible standard to meet. A centralized impoundment may have a system that detects leaks, but it is not clear what monitoring system could detect “the entry of regulated substances into the groundwater or surface water” if those substances are not from the impoundment itself, and it is equally unclear why an operator would be obligated to detect the entry of all such substances. Suggested amendatory language:

“(g) An operator that operates a centralized impoundment shall install, operate and maintain a water quality monitoring system that can detect the entry of substances contained in the impoundment into the groundwater or surface water. The water quality monitoring system shall accurately characterize groundwater flow, groundwater chemistry and flow systems on the site and adjacent area. The system shall include the following:” (1071)

Response: See response to comment 1251. Accordingly, new centralized impoundments constructed under Article IX will be required to meet the groundwater monitoring requirements specified in those chapters.

- 1381.** Comment: 78.59c(g) - The requirement in this subsection would prevent the use of Best Available Technology. Due to the size of centralized impoundments (approximately 4 acres or less), a drainage layer beneath the impoundment with discrete monitoring points would provide complete coverage, provide leak information in the shortest possible time, and could be used as a control. The proposed subsection is too definitive for regulation and should be in a Department issued guidance document. At the very least, the language should be revised to allow alternatives.

The design and operating methods for monitoring wells are still evolving. Considering the inflexible, static nature of regulations, it does not make sense to include such detailed specifications. It is strongly recommended that the design, construction and operation of groundwater monitoring wells be specified in guidance and not be included in regulation.

In addition, the use of the term “regulated substance” in this subsection creates a confusing and perhaps impossible standard to meet. A centralized impoundment may have a system that detects leaks, but it is not clear what monitoring system could detect “the entry of regulated substances into the groundwater or surface water” if those substances are not from the impoundment itself, and it is equally unclear why an operator would be obligated to detect the entry of all such substances.

Suggested Language: (g) An operator that operates a centralized impoundment shall install, operate and maintain a water quality monitoring system that can detect the entry of substances contained in the impoundment into the groundwater or surface water. The water quality monitoring system shall accurately characterize groundwater flow, groundwater chemistry and flow systems on the site and adjacent area. The system shall include the following: (1103, 1137, 1174)

Response: See response to comment 1251. Accordingly, new centralized impoundments constructed under Article IX will be required to meet the groundwater monitoring requirements specified in those chapters.

1382. Comment: § 78.59c(g)(1); Expand this rule to allow for intra-well data evaluation. Intra-well evaluations are well specific and eliminate the need for an upgradient well (inter-well evaluations).(175)

Response: See response to comment 1251. Accordingly, new centralized impoundments constructed under Article IX will be required to meet the groundwater monitoring requirements specified in those chapters.

1383. Comment: In Section 78.59c(g)(2) the draft regulations require one monitoring well hydraulically upgradient from a centralized impoundment and a minimum of 3 three monitoring wells downgradient. Due to the allowable definition of “freshwater” to contain pollutional substances, those ponds built to lesser construction standards should too require the minimum monitoring wells described for the higher standard of construction centralized impoundments.(846, 1109)

Response: See response to comment 1251. Accordingly, new centralized impoundments constructed under Article IX will be required to meet the groundwater monitoring requirements specified in those chapters.

1384. Comment: 78.59c(h)(2) - What is the definition of ‘routine operations’? (411)

Response: See response to comment 1251. As a result of the changes described in that response, the term “routine operations” is no longer used in this section.

1385. Comment: § 78.59c(e)(4)(vi) - This section is similar to § 78.59c(e)(2)(vi) above, so the comment is the same. (861)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

1386. Comment: § 78.59c(i)(4)(i) - This section should be written more clearly. First, it requires the monitoring well casing to be enclosed in a protective casing that will protect the well from damage by heavy equipment. There are few, if any, protective well casings that can stand up to heavy equipment, especially when it is to be around the upper 10 feet of the monitoring well. Most heavy

equipment will make short work of any casing that is constructed around a monitoring well as described. It is recommended that this standard be made more realistic.(124a, 861)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

- 1387.** Comment: § 78.59c(i)(4)(v) requires the protective casing to protrude above the monitoring well casing. If that is done, it will be difficult to do any maintenance on the well, sample the well, repair the well, and eventually plug the well, especially if the protective casing will withstand heavy machinery. It is recommended that this section be rewritten in a manner that is practical and reasonable. (124a, 861)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

- 1388.** Comment: § 78.59c(h)(5); In cases where seasonal aquifers outcrop and the depth to groundwater is >50 feet, groundwater monitoring wells may not detect a release from an impoundment. Surface inspection for seeps and or other design considerations may be needed in these cases. (175)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

- 1389.** Comment: § 78.59c(i)(3)(iv) - This section requires monitoring wells to be “filter-packed” with chemically inert materials. It is recommended that the term “filter-packed” should be defined or more descriptive text should be used.(124a, 861)

Response: See response to comment 1251. As a result of the changes described in that response, the term “routine operations” is no longer used in this section.

- 1390.** Comment: **78.59c(i):** Typically a 2-inch diameter pipe is used for groundwater monitoring wells. It is our understanding that a 4-inch diameter pipe is being specified solely to allow the well to be used as an extraction well point, if needed, for a future remediation. However, it is unlikely that a monitoring well itself would be used for this purpose. We are concerned that the added cost to drill a larger bore and for increased materials to construct a well are not reasonable. We recommend that the minimum well diameter be changed to 2-inches. (1071)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

- 1391.** Comment: 78.59c (i)(2) A 2-inch diameter pipe is often used for groundwater monitoring wells. We recommend that the minimum well diameter be changed to 2-inches. (1147)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

1392. Comment: 78.59c (i)(2) Suggested amendatory language: The minimum casing diameter shall be 2 inches unless otherwise approved by the Department in writing. (1147)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

1393. Comment: § 78.59c.(i)(2); Two inch wells are more than adequate for monitoring purposes and can be equipped with dedicated sampling equipment. Eliminate 4-inch well requirement. (175)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

1394. Comment: 78.59c(i)(2) - A 2 inch diameter pipe can and is often used for groundwater monitoring wells. It is our understanding that a 4 inch diameter pipe is being specified solely to allow the well to be used as an extraction well point, if needed, for a future remediation. Since it is unlikely that the wells in and of themselves would be used for this purpose, the added cost to drill a larger bore and for increased materials to construct a well are not reasonable. In addition, standard groundwater monitoring procedures include well purging. Use of a 2 inch well increases the likelihood of being able to collect a sample from a well. Consequently, it is strongly recommended that the well diameter be changed to 2 inches. Suggested Language: 2) The minimum casing diameter shall be 2 inches unless otherwise approved by the Department in writing.(1103,1137, 1174)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

1395. Comment: Depth of screened interval. Regarding section 78.59c (i)(3), the minimum depth of the screened interval should intercept the top of the shallow groundwater aquifer to ensure that changes in water table do not affect the ability to take a sample quarterly. (852a)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

1396. Comment: 78.59c(i)(4): Conditions are often encountered where 10 feet of casing cannot be installed, therefore it is our suggestion that this requirement be removed. Guidance could be included in the Department's policy document for well construction. (1071)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

1397. Comment: § 78.59c.(i)(4)(ii); The requirement for a ten foot long outer protective steel casing is excessive. A five foot length is adequate. (175)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

1398. Comment: 78.59c(i)(4)(ii) - Sites are evaluated often through the use of a groundwater monitoring well in advance of any correspondence with the Department. Considering that conditions are often encountered where 10 feet of casing cannot be installed, this requirement should be removed, and guidance should be included in a Department guidance document for well construction. Suggested Language : Delete Subsection (4)(ii). (1137, 1174)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

1399. Comment: § 78.59c(i)(4)(iii) – A three foot deep cement collar is not necessary to secure an outer steel casing. It is suggested that this rule be revised to require “be held firmly in place”.(175)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

1400. Comment: 78.59c (i)(4)(ii) Considering that conditions are often encountered where 10 feet of casing cannot be installed, this requirement should be removed. Guidance could be included in the Department’s policy document for well construction. (1103, 1147)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

1401. Comment: Chain of custody for water samples. Section 78.59c (i)(5) should require the operator to maintain and submit to the Department chain of custody forms for each sampling event. (852a)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

1402. Comment:78.59c(i)(6): The water samples collected from monitoring wells should be tested for, at minimum, the same parameters as the road application brine. Since the brine testing includes these parameters, it must be expected that the brine will contain them. Therefore, there is reason to believe the fluids in the CIs would also contain these compounds. (1149, 1150)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

1403. Comment: Groundwater samples for impoundments storing acid influenced water. Section 78.59c (i)(6) establishes minimum parameters for analyzing groundwater samples. This list should be expanded to a full suite of heavy metals if the operator proposes to store acid influenced water in the impoundment. Otherwise, the Department will not have an adequate baseline for determining whether the facility adversely affected groundwater. Additionally, because of the heavy equipment that will be used to construct these facilities, and the increased truck traffic often associated with centralized impoundments, the operator should analyze the groundwater samples for total petroleum hydrocarbons or total organic carbon, turbidity, odor, and color, as well as methane. (852a)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

- 1404.** Comment: 78.59c(j) -- An appropriately trained professional can prepare and certify plans, specifications and reports for site characterization and groundwater testing systems required by this section. Requiring preparation and certification (seal) from a registered professional geologist imposes an unnecessarily strict, and potentially expensive, requirement. (1103)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

- 1405.** Comment: In § 78.59c(j) An appropriately trained professional can prepare and certify plans, specifications and reports for site characterization and groundwater testing systems required by this section. Requiring preparation and certification (seal) from a registered professional geologist imposes an unnecessarily strict, and potentially expensive, requirement.

Suggested Language: Plans, specifications and reports for site characterization and groundwater testing systems required by this section shall be prepared and certified by an appropriately trained professional. (1137)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

- 1406. Comment:** 78.59c(k): Requiring oversight by “the design engineer” unnecessarily restricts the flexibility of operators to manage the construction of centralized impoundments.

Suggested amendatory language:

“(k) The design engineer, or an appropriately trained professional, shall provide oversight for all aspects of impoundment construction to ensure that construction is completed in accordance with the design and quality assurance and quality control plan.” (1071, 1137, 1174)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the construction and operation requirements specified in those chapters.

- 1407.** Comment: In § 78.59c(l), the commentator recommends that an appropriately trained professional can prepare and certify plans, specifications and reports pertaining mechanical integrity of the structure and function for centralized impoundments required by this section. Requiring preparation and certification (seal) from a registered professional engineer imposes an unnecessarily strict, and potentially expensive, requirement. Suggested amendatory language: (l) Plans, specifications and reports for centralized impoundments required by this section shall reasonably ensure mechanical integrity of the structure and function, shall be prepared by an appropriately trained professional and include a certification which shall read as follows: I (name) do hereby state to the best of my knowledge, information and belief that the information contained in the plans specifications and reports have been prepared in accordance with accepted environmental practices and the design and construction standards for centralized impoundment dams and Chapters 105 and 78 of the Rules and Regulations of the Department of Environmental Protection and is true and correct. (1137)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the construction and operation requirements specified in those chapters..

1408. Comment: 78.59c(l): The rulemaking proposes to allow engineer certifications that pits and impoundments have been correctly constructed in lieu of DEP inspections. If the DEP is not itself capable of ensuring proper construction of facilities such as centralized impoundments, these certifications should be submitted under penalty of law for unsworn falsification to authorities (18 P.S. § 4904) so that any intentional falsification can be prosecuted criminally. The DEP should also mandate better self-monitoring by requiring that photographs or video be taken of the finished construction so that there is evidence of the site construction that can be reviewed after the fact. (22, 26, 55, 90, 142, 192, 391, 483, 946, 958, 1005)

Response: See responses to comments 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the construction and operation requirements specified in those chapters.

1409. Comment: 78.59c(l) -The hydrogeologic investigation should be eliminated in its entirety. The time frame set forth for the investigation and up-front costs for an evaluation makes this section impractical for the operator. As strict as the construction requirements are with a series of liners and a leak detection system, there should be no effect of the hydrologic system at any depth below the central impoundment. (411)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the quality assurance and quality control requirements specified in those chapters.

1410. Comment: 78.59c(f)(l) - This is the first mention of a permit application associated with constructing a central impoundment. (411)

Response: See response to comment 1251.

1411. Comment: 78.59c(l)(2) -Is the time frame of the permit issuance consistent with the Permit Decision Guarantee Program? (411)

Response: See response to comment 1251. The regulations do not contemplate the Permit Decision Guarantee Policy.

1412. Comment: 78.59c(m): Subsections 78.59c(m)(5-7) list detailed requirements for the impoundment construction final certification report. As the engineer is required to certify already, For the purpose of this section, the engineer stamp should suffice. (1071)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the construction and operation requirements specified in those chapters.

1413. Comment: 78.59c(m)(8): The requirement prohibiting an impoundment's use until certification is received by the Department should be limited to "wastewater" as there is no reason , nor environmental exposure associated with an impoundment's use for fresh water storage. (1071)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the construction and operation requirements specified in those chapters.

1414. Comment: 78.59c(m)(8) -Indication that there is considerable risk to be shouldered by the operator if the central impoundment is already built, monitoring wells installed, etc. and the Department then denies the use of the impoundment. Who at the Department is qualified to review and evaluate such plans? If there is a requirement for the operator to utilize licensed professionals to oversee and evaluate the site, then a licensed professional from the Department should be required to review the report. Does the department employ licensed professionals? (411)

Response: The Department employs licensed professionals.

1415. Comment: 78.59c(n): The language should be modified to allow for an existing temporary impoundment to be reused for a new well pad location. Allowing for reuse can help facilitate less a water storage program that is less impactful on the landscape. Otherwise a larger operation would be forced to build more impoundments. We also request clarification on the Department's expectations for an operator to maintain records of existing well permits or well servicing activities. Additionally, in subsections 78.59c(n)(2-4) regarding restoration of temporary impoundment sites, Language should be modified to allow for circumstances where a landowner does not wish to have the land returned to preconstruction contours or original condition. (1071)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the construction and operation requirements specified in those chapters.

1416. Comment: In § 78.59c(m)(1), An appropriately trained professional can complete and certify a facility completion and final certification report upon completion of construction of the impoundment. Requiring completion and certification (seal) of the report from a licensed Pennsylvania professional engineer imposes an unnecessarily strict, and potentially expensive, requirement.

Suggested amendatory language:

(m) Upon completion of construction of the impoundment, a facility completion and final certification report must be submitted to the Department. The report must be completed and sealed by an appropriately trained professional who provided oversight for construction and must contain the following items at a minimum:

(1) A statement that the appropriately trained professional provided oversight for all aspects of construction. (1137)

Response: See response to comment 1251. Accordingly, centralized impoundments constructed under Article IX will be required to meet the construction and operation requirements specified in those chapters.

1417. Comment: Proposed section 78.59c unlawfully assumes that centralized impoundments are located on well sites, and must be revised to provide that the Department will not consider centralized impoundment sites to be well sites *even when a centralized impoundment is co-located with one or more oil or gas wells.*

Proposed section 78.59c(n) provides that an impoundment must be restored within nine months of

the date that the last well serviced by the impoundment is drilled, but also provides that “[a] two year restoration extension may be requested pursuant to section 3216(g) of the act.” This provision is contrary to law because section 3216 of Act 13 governs only the restoration of “well sites,” and centralized impoundment sites cannot reasonably be considered to be “well sites” within the meaning of section 3216(h).

Section 3216(h) provides that “[a]s used in this section, the term ‘well site’ means areas occupied by all equipment or facilities necessary for or incidental to drilling, production or plugging a well.” Centralized impoundments – i.e., impoundments that serve multiple well sites – cannot be well sites under this definition because they are neither “necessary for” nor “incidental to” drilling, production, or plugging activities. That centralized wastewater impoundments are not *necessary* for the drilling, production, or plugging activities goes without saying: many, if not most of the gas wells that have been drilled and hydraulically fractured in the Commonwealth have been developed without the use of centralized impoundments. Nor may centralized wastewater impoundments be considered “incidental to” drilling and fracturing operations, because “incidental” means “happening as a *minor* part or result of something else” or “being likely to ensue as a chance or *minor* consequence.” Not only are centralized impoundments too large to be considered “minor” in any sense; their function is by definition to serve many well sites and therefore to function independently of any particular well site. Consequently, a centralized wastewater impoundment cannot reasonably be considered to be a “part” of a well site requiring restoration under section 3216 of Act 13 – let alone a “minor part.”

There may be cases in which centralized wastewater impoundments are co-located with oil or gas wells. The Department should not consider the co-location of an oil or gas well to convert the centralized impoundment site into part of a well site, because the presence of the oil or gas well will change neither the size nor the functionality of the impoundment. (852a)

Response: See responses to comments 1251.

- 1418.** Comment: 78.59c(n)(2) - There is no obligation under Act 13 or elsewhere to return impoundments to approximate original conditions or to preconstruction contours. Such sites should be restored in accordance with approved site restoration plans. Suggested Language: Delete subsection (2). (1103, 1137, 1174)

Response: See response to comment 1251. The Department disagrees that there is no obligation under the 2012 Oil and Gas Act or elsewhere to return impoundments to approximate original conditions. Site conditions need to be as near as possible to preconstruction contours once the site is stabilized to mimic pre-existing drainage patterns and to minimize accelerated erosion on all reclaimed areas.

- 1419.** Comment: 78.59c(n)(2) Such sites should be restored in accordance with approved site restoration plans. (1147)

Response: See response to comment 1251.

- 1420.** Comment: 78.59c(n)(3) - This proposed Subsection 78.59c(n)(3) addresses only the restoration of centralized impoundments. To avoid any confusion, we propose that the Department avoid use of the Chapter 102 defined term “oil and gas activities” in this subsection. Suggested Language: (3) The site shall support the land uses that existed prior to construction of the impoundment to the extent practicable. (1137, 1174)

Response: See response to comment 1251.

- 1421.** Comment: 78.59c(n)(3) Suggested amendatory language: The site shall support the land uses that existed prior to construction of the impoundment to the extent practicable. (1147)

Response: See response to comment 1251.

- 1422.** Comment: 78.59c(n)(4) -- Clarification is required for the phrase “above finished grade.” The interpretation that could be made is that restoration fill must be placed to an elevation higher than the predevelopment contour. Replacement of fill may result in a soil density higher than the soil density prior to site development. Consequently, the soil could be packed into a smaller volume and never reach “finished grade.”

Suggested amendatory language:

(4) During impoundment reclamation, backfill shall be placed to promote positive post-settlement drainage. (1103, 1137, 1147, 1174)

Response: See response to comment 1251.

- 1423.** Comment: § 78.59c(o): A request for alternate practice must be subject to Public Comment. § 78.59(o) as drafted provides a complete “escape hatch” from the rules of § 78.59. It is unacceptable that such deviations can simply be approved by DEP on an ad hoc basis. Why do we even have a rulemaking if a well site operator can simply apply to use whatever rules the operator desires and DEP rubber stamps? This provision is simply unacceptable. If the Environmental Quality Board is unwilling to simply strike § 78.59(o) in its entirety, it must amend this clause and allow deviations from the rules only after Public Comment and a hearing. (869a)

Response: See response to comment 1251.

§ 78.60 Discharge requirements

- 1424.** Comment: The proposed amendments to this section specify that operators discharging tophole water by land application shall document compliance with the regulatory requirements, including those under the Dam Safety and Encroachments Act, make the records available to the Department upon request, and submit the relevant information in the well site restoration report. This seems to be a reactive regulation rather than a proactive regulation. Per the Pennsylvania State University College of Agricultural Sciences, Cooperative Extension, School of Forest Resources, while top hole water is usually representative of groundwater used for local water wells and springs, the remaining water encountered during gas well drilling (bottom hole, stimulation and production fluids) may be contaminated with various water pollutants (3). Operators should not be permitted or allowed to discharge tophole water by land application as it poses a risk for contamination. (189)

Response: Tophole water is isolated from the well bore during well construction and, by definition in the regulations, is fresh groundwater or water from a body of surface water that does not contain additives, brine, oil or man induced conditions other than drill cuttings from the formation being penetrated. Therefore, tophole water does not present an environmental harm when land applied.

- 1425.** Comment: 78.60 – We do not support discharge of tophole water, unless it meets the standard of “uncontaminated freshwater.” Tophole water that is contaminated must be classified, handled, and

disposed of as “wastewater.” We recommend, therefore, that the quality of tophole water and precipitation that accumulates in clean, uncontaminated storage areas be tested and verified prior to discharge and that the test data be provided to the PADEP. (1143)

Response: Land application of tophole water can only occur if the operator determines that the tophole water meets the quality requirements specified in the regulations. It is necessary for the operator to test tophole water to ensure that it is not contaminated and meets applicable requirements prior to discharge. The operator is required to document compliance with these requirements and submit that documentation to the Department upon request.

- 1426.** Comment: We do not support the use of a sheen test to determine whether tophole water can be discharged to land. Water can contain some amount of oil and grease and still pass a sheen test. Water also can contain contaminants that do not leave a sheen. Water discharged to land must contain no oil or grease at all or any other contaminant introduced by Oil and Gas Operations. (1143)

Response: The absence of a sheen on the tophole water, in combination with the other requirements of §§ 78.60 and 78a.60 in the final regulations, ensure that this water can be safely applied to the land. The “sheen test” is a reliable means to quickly determine the presence of hydrocarbons in water.

- 1427.** Comment: No land application of tophole water, pit water, fill, or dredged material from drilling and fracking. The chemicals and sediments in this material should not be allowed to pollute the air we breathe, the soil in which we grow food, and the water we drink.(5936-6089)

Response: See response to comments 1426 and 1493.

- 1428.** Comment: The waiver provision of § 78.60(b)(7) must be deleted, and the wetland setback must be retained, pursuant to the Pennsylvania Supreme Court’s recent decision in Robinson Township v. Pa., 2013 WL 6687290. (1143)

Response: The Department has deleted the waiver provision and has revised §§ 78.60(b)(7) and 78a.60(b)(7) to restrict waste disposal from within 100 ft of a water course or body of water or within the floodplain. Also see response to comment 1431.

- 1429.** Comment: We recommend the following changes to the discharge requirements at § 78.60.

§ 78.60. Discharge requirements.

(a) The owner and operator may not cause or allow a discharge of a substance, fill or dredged material to the waters of this Commonwealth unless the discharge complies with this subchapter and Chapters 91—93, 95, 102 and 105, The Clean Streams Law (35 P. S. §§ 691.1—691.1001), the Dam Safety and Encroachments Act (32 P. S. §§ 693.1—693.27) and the act.

(b) The owner and operator may not discharge tophole water or water in a pit as a result of precipitation that accumulates in clean, uncontaminated storage areas by land application unless only if the discharge is in accordance with the following requirements:

(1) Tophole water shall not contain any of the following in excess of Pennsylvania Safe Drinking Water Act standards: No additives, chemicals, brine, oil, grease, drilling muds, pollution materials, regulated substances, Naturally Occurring Radioactive Material (NORM), Technologically Enhanced Naturally Occurring Radioactive Material (TENORM), or other

toxins, or any drilling fluids other than air or fresh water that have been added to or are contained in the water.

(2) The pH is not less than 6 nor greater than 9 standard units, or is characteristic of the natural background quality of the groundwater.

(3) The specific conductance of the discharge is less than 1,000 µmHos/cm.

(4) The discharge water shall be spread over an undisturbed, vegetated area capable of absorbing the tophole water and filtering solids in the discharge, and spread in a manner that prevents a direct discharge to surface waters and complies with § 78.53 (relating to erosion and sedimentation control).

(5) Upon completion, the area complies with § 78.53.

(6) The area of land application is not within 200 feet of a water supply or within 100 feet of a watercourse, body of water or a wetland.

(7) If the water does not meet the requirements of paragraphs (1) – (4) of this subsection, discharge to the land surface is prohibited.

(8) The operator shall test water proposed to be discharged prior to discharge to verify that the water quality meets the § 78.60 standards. The water test data must be provided to the Department within 7 days of the test.

(c) Compliance with subsection (b) shall be documented by the operator and made available to the Department while conducting activities under subsection (b) and submitted under § 78.65(f)(1) (relating to site restoration). (1143)

Response: Most of the suggested changes weaken the protections currently provided under §§ 78.60 and 78a.60. The Department has clarified that tophole water or accumulated precipitation cannot contain any regulated substance as defined in the Land Recycling and Environmental Remediation Act. In addition, the Department has prohibited land application of such water within a floodplain and has eliminated the ability to waive these requirements. For these reasons, as well as those provided in responses to comments 1424 and 1425, tophole water and accumulated precipitation can be safely applied to the land under the final regulation.

1430. Comment: If the Department does not reflect and agree with the above recommendation, the release of tophole water by land application should be greater than 500 feet from a water supply, stream, watercourse or body of water [or a wetland], and there should be no exceptions regardless of well location restrictions. The Department proposals of 100-200 feet from these locations are not as substantial as they should be when taking into account the possible risks involved as stated above. (189)

Response: See response to comment 1424.

1431. Comment: The reference in section 78.60(b)(7) to section 3215(b) and setbacks from watercourses and wetlands should be stricken per *Robinson Twp. et al. v. Commonwealth of Pennsylvania et al.* (1135)

Response: The Department has retained setbacks from a water supply, watercourse or body of water for land application of tophole water or accumulated precipitation, and has prohibited land application within a floodplain. The Department has authority to impose these restrictions to protect waters of the Commonwealth through the Clean Streams Law and the Dam Safety and Encroachments Act. The Department has eliminated the language in this section that provided an exception if a waiver had been granted by the Department under section 3215(b) of the act.

1432. Comment: 78.60(b)(7) – In *Robinson Twp. et al. v. Commonwealth of Pennsylvania et al.*, the Pennsylvania Supreme Court invalidated Section 3215(b) in Act 13. All references to this section should be deleted from Chapter 78. However, Commentator supports a setback of 100 feet from the edge of the well site measured horizontally to any solid blue lined stream, spring or body of water as identified on the most current 7 ½ minute topographic quadrangle map of the United States Geological Survey, together with provisions for reasonable waivers upon submission of a plan identifying additional measures to protect these waters. This comment applies wherever section 3215(b) is referenced in these draft regulations. (1153)

Response: See responses to comments 265 and 1431.

1433. Comment: In *Robinson Twp. et al. v. Commonwealth of Pennsylvania et al.*, the Pennsylvania Supreme Court invalidated Section 3215(b) in Act 13. Commentator supports setback distances from surface waters as previously provided in Section 3215(b) of Act 13, in addition to the Department’s provision that reasonable waivers may be granted where appropriate. The references to this Section 3215(b) should be deleted from Chapter 78 as a matter of legal accuracy. (1137)

Response: See responses to comments 265 and 1431.

1434. Comment: We fully support the inclusion of Chapter 105 requirements in conjunction with proposed provisions regulating CWIs. This includes the referenced definition in 105.1 for watercourse which is consistently applied in this proposed revision. We therefore, recommend this provision for adoption as presented. (660a)

Response: The Department acknowledges the comment.

1435. Comment: In Sections 78.60, 78.61, 78.62, 78.63, and 78.70, wherein the issue of Disposal of Brine, Drill Cuttings, and Residual Waste is referenced, we recommend the DEP should include the following statement:
Prohibit the disposal of any “flowback water” or any materials associated with the drilling industry into current coal mines, abandoned coal mines, slurry impoundments, coal mine discharges and coal refuse piles. (492a)

Response: Sections 78.60, 78.61, 78.62, 78.63, 78a.60, 78a.61, 78a.62, 78a.63 address waste management on well sites. Disposal of wastes into active or abandoned coal mines, slurry impoundments, coal mine discharges and coal refuse piles is beyond the scope of these sections. Section 78.70 addresses road-spreading of brine for dust control and road stabilization.

1436. Comment: 78.60 – In examining discharge requirements and other sections of the proposal, Commentator requests that references to other related Pennsylvania codes by number be excerpted and placed as footnotes to promote understanding. (1093, 1098)

Response: Cross referencing other statutes and regulations is a necessary and acceptable practice in drafting regulations. All of the cross referenced authorities are made available electronically by the Commonwealth. Chapters 78 and 78a would be unreasonably long and repetitive if all of the other applicable statutes and regulations were repeated in these chapters. Finally, cross referencing other applicable authorities allows immediate updating of Chapter 78 and Chapter 78a should those cross referenced authorities be amended or changed in the future.

1437. Comment: Land application of any residual waste substance, fill, or dredge must be prohibited. In most cases, the composition of these wastes and their risks are unknown. We cannot afford to poison our land. It is the source of our leading industry – agriculture. (1093, 1098)

Response: See response to comment 1424.

1438. Comment: Bonds must be set higher to cover potential costs of consequences over a minimum of one hundred years. (1093, 1098)

Response: Discharges under this section must either comply with statutes and regulations designed to protect waters of the commonwealth and prevent pollution or consist solely of tophole water or water in a pit as a result of precipitation. Discharge of uncontaminated tophole and precipitation water does not present a threat to the environment.

1439. Comment: Finally, restoration to lands where residual wastes have been applied should go beyond “revegetation” to best practice. While the regulations include compliance for chemical analyses based on documentation by the operator, consistent, boots-on-the-ground monitoring and enforcement promotes greater public trust [78.60 (d)]. (1093, 1098)

Response: Restoration to approximate original conditions, capable of supporting original uses to the extent practicable is the best practice to achieve site restoration within reasonable operational parameters. It is not necessary to include technical performance standards including requirements for type and density of perennial vegetation, soil characteristics and drainage patterns in this section because those issues are already appropriately addressed by the requirements. Projects meeting the requirements will satisfy the statutory restoration requirements and include performance requirements that will protect waters of the Commonwealth.

1440. Comment: 78.60(b)(7) -- The Pennsylvania Supreme Court invalidated Section 321 S(b) in Act 13 in Robinson Twp. et al v. Commonwealth of Pennsylvania et al.

Remove “or within 100 feet of a [stream] watercourse [,] or body of water [or a wetland] unless approved as part of a waiver granted by the Department under section [205(b)] 321S(b) of the act [(58 P. S. § 601.205(b))] (58 Pa.C.S. § 321 S(b)).” (1103)

Response: See responses to comments 265 and 1427.

§ 78.61 Disposal of drill cuttings

1441. Comment: One area of concern is the revised regulations in 78.61 and 78.62. Under conventional well current practice, drill cuttings (from both above and below the casing seat) are disposed of on site without any special notification requirements. Under the new regulations, the conventional operator is required to ascertain the ground water table (using a geologist or soil scientist) and provide 3 business days’ notice to DEP before disposing of cuttings. This means that the entire site will pretty much have to shut down and wait for the soil scientist to assess the ground water elevation and then wait three business days before completing the well. The regulations were proposed without addressing the additional cost to the operator for the soil scientist or for waiting. (84a)

Response: The determination as to the depth to the groundwater table should take place

prior to, or during construction of the drill pit. Therefore, the 3 business day notice would come after drilling was complete and the pit dewatered but prior to disposing of the cuttings (i.e. burial of the drill cuttings).

- 1442.** Comment: 78.61 – We oppose the land application of all drill cuttings. We oppose long-term onsite burial of any drill cuttings generally contaminated with chemicals, oil, grease, pollutational materials, regulated substances, water-based drilling muds that contain chemical additives, oil-based drilling muds, polymer based drilling muds containing mineral oil lubricants, NORM, TENORM, mercury, heavy metals, and other chemical additives or toxins. (1143)

Response: Drill cuttings from above the casing seat do not create a significant threat to the environment if the requirements in §§ 78.61 or 78a.61 are met. The requirements include that the drill cuttings are not contaminated with a regulated substance, including brines, drilling muds, stimulation fluids, well servicing fluids, oil, production fluids or drilling fluids other than tophole water, fresh water or gases.

- 1443.** Comment: Apply regulations related to the disposal of ALL drill cuttings, no matter where they were obtained (865)

Response: Drill cuttings from above the casing seat do not create a significant threat to the environment if the requirements in §§ 78.61 or 78a.61 are met. The requirements include that the drill cuttings are not contaminated with a regulated substance, including brines, drilling muds, stimulation fluids, well servicing fluids, oil, production fluids or drilling fluids other than tophole water, fresh water or gases.

Section 78.61 only allows uncontaminated drill cuttings to be buried or land applied at the well site while contaminated drill cuttings may be buried on site in accordance with section 78.62(a)(5)-(16) and (b) (relating to disposal of residual waste – pits) or land applied at the site in accordance with Section 78.63(a)(5)-(20) and (b) (relating to disposal of residual waste – land application). Burial or land application of cuttings at an unconventional well site may only occur with a permit or other approval obtained from the Department.

- 1444.** Comment: We recommend the following changes to the discharge requirements at §78.61.

(a) Closed-loop tank systems shall be used to handle and store drilling muds and cuttings. All drill cuttings must be disposed of at an offsite approved waste disposal facility or injected into an EPA-approved subsurface waste disposal well using cuttings reinjection technology. (1143)

Response: See response to comment 1443.

- 1445.** Comment: Disposal of all drilling muds and drill cuttings, regardless if from above or below the surface casing seat, in pits is prohibited. (1143)

Response: See response to comment 1443.

- 1446.** Comment: 78.61(a)(2) – The use of the term “regulated substance” in this subsection provides unclear direction to the oil and gas industry and is unnecessarily broad in this context. The use of the term “regulated substances” here produces the unintended and unreasonable result that no drill cuttings, regardless of content, can be disposed under this section. Regulated substances, as defined in Act 2, could include the drill cuttings themselves and the use of the term here would effectively prohibit the disposal of drill cuttings at the well site, which is contrary to the intent of the section.

The provision should be revised to reflect the intent that drill cuttings not be contaminated with the substances listed in this section, all of which are reasonably related to oil and gas operations.

Suggested Regulatory Language:

78.61(a)(2) The drill cuttings are not contaminated with brines, drilling muds, stimulation fluids, well servicing fluids, oil, production fluids or drilling fluids other than tophole water, fresh water or gases. (1135, 1137, 1147, 1153, 1174)

Response: Drill cuttings are not considered “contaminated” unless they are incorporated with material other than drill cuttings.

- 1447.** Comment: The reference in §§ 78.61(a)(3) and (b)(3) to section 3215(b) and setbacks from watercourses and wetlands should be stricken per *Robinson Twp. et al. v. Commonwealth of Pennsylvania et al.* (1135)

Response: The Department has retained setbacks from a water supply, watercourse or body of water for land application of tophole water or accumulated precipitation, and has prohibited land application within a floodplain. The Department has authority to impose these restrictions to protect waters of the Commonwealth through the Clean Streams Law and the Dam Safety and Encroachments Act. The Department has eliminated the language in this section that provided an exception if a waiver had been granted by the Department under section 3215(b) of the act.

- 1448.** Comment: Subsection (f) is unnecessary for conventional operations where notice of drilling and disposal of drill cuttings is essentially the same thing because both activities will occur together. Delete this subsection or amend it to exclude conventional operators from this requirement. (1135)

Response: Drilling must be completed before the drill pit can be dewatered which could take a number of days depending upon the condition of the drill cuttings in the drill pit.

- 1449.** Comment: Prohibit the burial or land application of drill cuttings, which can contain polluting and radioactive substances. DEP proposes different conditions for disposal of drill cuttings from above and below the well casing, but neither makes the practice safe. Cuttings from deep underground may contain more pollutants, but chemical additives and contaminated fluids are also found in drill cuttings from shallower areas.(17, 18, 19a, 72, 73, 79, 102, 104, 125, 160, 161, 168, 169, 195, 402, 475, 564, 565, 626, 808, 843, 884, 912, 922, 926, 938, 947, 492a, 1000, 1039, 1058, 1102, 853a, 1161, 4582 – 4584)

Response: See response to comment 1442.

- 1450.** Comment: Section 78.61 – Drill cuttings should not be processed onsite and onsite burial of the cuttings should not be permitted.(163, 185, 187, 1106, 1148, 1215)

Response: Onsite processing, when done properly, can reduce truck traffic with its environmental and safety concerns and save sometimes limited space in local approved landfills. Regarding onsite disposal, see response to comment 1443.

- 1451.** Comment: Section 78.61 – No disposal of drill cuttings containing any amount of radioactivity above background levels should be permitted. It is well known that the Marcellus Shale is radioactive, and that hydraulic fracturing chemicals can leach radionuclides from the shale. Drill cuttings, produced water, and any other material from unconventional gas production which contain

radioactivity should be treated as what they are: hazardous radioactive materials. These materials should only be disposed of in a facility designed to handle such material, and should only be transported in trucks properly labeled according to the actual (tested at the point of origin) radioactive content. (869a)

Response: Drill cuttings from above the casing seat do not create a significant threat to the environment if the requirements in §78.61 or §78a.61 are met. The requirements include that the drill cuttings are not contaminated with a regulated substance, including brines, drilling muds, stimulation fluids, well servicing fluids, oil, production fluids or drilling fluids other than tophole water, fresh water or gases.

Section 78.61 only allows uncontaminated drill cuttings to be buried or land applied at the well site while contaminated drill cuttings may be buried on site in accordance with section 78.62(a)(5)-(16) and (b) (relating to disposal of residual waste – pits) or land applied at the site in accordance with Section 78.63(a)(5)-(20) and (b) (relating to disposal of residual waste – land application). Burial or land application of cuttings at an unconventional well site may only occur with a permit or other approval obtained from the Department.

Additionally, the Department's 2015 TENORM Study Report presented several observations and recommendations regarding radioactive material associated with the oil and gas industry. While the study outlines recommendations for further study, it concluded there is little potential for harm to workers or the public from radiation exposure due to oil and gas development. The Report observed that there is little potential for radiological exposure to workers or members of the public from the handling, hauling, and temporary storage of vertical and horizontal drill cuttings on natural gas well sites and recommended that the Department conduct research and investigation of vertical and horizontal drill cuttings for beneficial use, onsite disposal, and future landfill disposal protocols. The Department remains committed to protecting the public from unnecessary exposure to radiation and is actively pursuing the recommendations of the 2015 TENORM study report. The Department has added § 78.58(d) to this rulemaking which requires an operator processing fluids onsite to develop a radiation protection action plan which specifies procedures for monitoring and responding to radioactive material produced by the treatment process. This section also requires procedures for training, notification, recordkeeping, and reporting to be implemented.

- 1452.** Comment: Sections 78.61 and 78.62. – Any disposal of waste materials at well sites should require that representative samples of the material be taken and analyzed and submitted to the agency to demonstrate that, for example, the drill cuttings are not contaminated, or that residual waste meets the regulatory standards. Disposal practices should be subject to on-site inspections by the Department. The regulations do not currently require that the operator use any scientific methodology to demonstrate compliance. (1, 19, 23, 26, 90, 142, 165, 189, 192, 391, 843, 851, 946, 958, 997a 1005)

Response: Section 78.61 only allows uncontaminated drill cuttings to be buried or land applied at the well site while contaminated drill cuttings may be buried on site in accordance with section 78.62(a)(5)-(16) and (b) (relating to disposal of residual waste – pits) or land applied at the site in accordance with Section 78.63(a)(5)-(20) and (b) (relating to disposal of residual waste – land application). Burial or land application of cuttings at an unconventional well site may only occur with a permit obtained from the Department.

1453. Comment: Section 78.61 distinguishes between drill cuttings from above, and below the casing seat. While we agree that disposal options for drilling wastes may differ for the various types of waste, we suggest regulatory distinctions that accurately reflect the primary issue of concern. For example, water- or air-based mud cuttings vs. oil-based mud cuttings may be a more accurate and durable distinction for regulatory purposes. (997a)

Response: The section has been revised to clarify that referenced casing seat is the surface casing seat. Section 78.83c and Section 78a.83c requires use of air, freshwater or freshwater based drilling fluids when drilling the surface hole which is the portion of the hole above the surface casing seat.

1454. Comment: If the Department is concerned about cuttings from a particular formation, the regulations should specifically address disposal of cuttings from those formations. Using the casing seat as a proxy for either of these issues—drilling mud or formation constituents—may be useful in some situations, but it does not necessarily lead to a proper result. (997a)

Response: Section 78.83c and Section 78a.83c requires use of air, freshwater or freshwater based drilling fluids when drilling the surface hole which is the portion of the hole above the surface casing seat. With regard to drill cuttings, the Department does not believe there is currently a technical basis for introducing regulations beyond those that already exist or were proposed for topole cuttings.

1455. Comment: Section 78.61 – Drill cuttings need to be tested for radioactivity. By its nature, unconventional gas drilling released naturally occurring radioactive material, which then comes to the surface in the drill cuttings. It doesn't make logistical sense to permit radioactive wastes to travel to recycling centers, only to be turned away; nor does it make sense to send them to landfills that are not licensed to handle such waste. Haulers of drilling waste should be directed to the nearest appropriate disposal site. All drill cuttings should be tested for radioactivity before being disposed of and should be properly disposed of in waste disposal sites that handle radioactive material. With the estimated amount of unconventional gas drilling to occur in PA, this could prove to be a big public health issue. (10, 129, 182, 185, 187, 399, 400, 401, 891, 916, 922)

Response: The Department's 2015 TENORM Study Report presented several observations and recommendations regarding radioactive material associated with the oil and gas industry. While the study outlines recommendations for further study, it concluded there is little potential for harm to workers or the public from radiation exposure due to oil and gas development. The Report observed that there is little potential for radiological exposure to workers or members of the public from the handling, hauling, and temporary storage of vertical and horizontal drill cuttings on natural gas well sites and recommended that the Department conduct research and investigation of vertical and horizontal drill cuttings for beneficial use, onsite disposal, and future landfill disposal protocols. The Department remains committed to protecting the public from unnecessary exposure to radiation and is actively pursuing the recommendations of the 2015 TENORM study report. Landfill disposal is outside of the scope of this rulemaking.

1456. Comment: The drill cuttings contain heavy metals and radioactive elements that leach out after every rainfall. I am concerned that EQB's proposed changes (Sections 78.60, 78.61, 78.62, and 78.63, and 78.70) do not address the risks posed by hazardous materials and do little to improve current regulations or ensure safe disposal. (402)

Response: Drill cuttings from above the casing seat do not create a significant threat to the environment if the requirements in §§ 78.61 or 78a.61 are met. The requirements include that the drill cuttings are not contaminated with a regulated substance, including brines, drilling muds, stimulation fluids, well servicing fluids, oil, production fluids or drilling fluids other than top-hole water, fresh water or gases.

Section 78.61 only allows uncontaminated drill cuttings to be buried or land applied at the well site while contaminated drill cuttings may be buried on site in accordance with section 78.62(a)(5)-(16) and (b) (relating to disposal of residual waste – pits) or land applied at the site in accordance with Section 78.63(a)(5)-(20) and (b) (relating to disposal of residual waste – land application). Burial or land application of cuttings at an unconventional well site may only occur with a permit or other approval obtained from the Department.

Additionally, the Department's 2015 TENORM Study Report presented several observations and recommendations regarding radioactive material associated with the oil and gas industry. While the study outlines recommendations for further study, it concluded there is little potential for harm to workers or the public from radiation exposure due to oil and gas development. The Report observed that there is little potential for radiological exposure to workers or members of the public from the handling, hauling, and temporary storage of vertical and horizontal drill cuttings on natural gas well sites and recommended that the Department conduct research and investigation of vertical and horizontal drill cuttings for beneficial use, onsite disposal, and future landfill disposal protocols. The Department remains committed to protecting the public from unnecessary exposure to radiation and is actively pursuing the recommendations of the 2015 TENORM study report. Landfill disposal is outside of the scope of this rulemaking.

1457. Comment: Section 78.61(a) deals directly with drill cuttings that are generated at the well site from above the casing seat and disposed into pits. With the precautions that are provided for as part of the casing and cementing plan § 78.83c the cuttings may be disposed of in a pit at the well site providing they are not contaminated with a regulated substance as detailed and the disposal is not within 100' of a watercourse as noted in the language change. As noted above, and throughout this entire rulemaking, we support the definition of watercourse as noted in Chapter 105.1 as it lends to consistency across the regulations.

In regards to drill cuttings that are generated at the well site above the casing seat which are not contaminated with any regulated substance and the disposal is not within the stipulated setback of a watercourse or water supply providing they meet all other requirements such as removing the liquid fraction, etc. a land application is reasonably suitable. The new provision, which provides for a soil ratio along with the requirements of not spreading in saturated, snow covered or frozen ground lends success to an environmentally sound land application disposal method. (660a)

Response: The Department acknowledges the comment.

1458. Comment: For drill cuttings generated at the well site from below the casing seat, where such waste is considered residual waste, it is necessary to take a closer look into what this actually means in concert with the quantity of cuttings generated and the environmental practice of safe and responsible disposal methods. These are contaminated drill cuttings that may qualify for both disposal as residual waste in pits or land application at the well site. The proposal is to create an approved listing of solidifiers, which certainly makes the process easier for both the Department and the operator. The proposal also provides for a three day advanced notification prior to disposal which may allow for adequate planning for the Department's staff to be onsite and perform an inspection of

the work. Standing alone, those two provisions are both reasonable, and therefore, we do recommend both provisions for adoption. (660a)

Response: The Department acknowledges the comment.

- 1459.** Comment: The burial and land application of drill cuttings should be prohibited. Different regulations are proposed for drill cuttings from above and below the well casing seat, but this distinction does not make the practice safe. Drill cuttings contain chemicals and-as demonstrated by alarms often going off at landfills- can be radioactive. (842, 853)

Response: See response to comment 1443.

The Department’s 2015 TENORM Study Report presented several observations and recommendations regarding radioactive material associated with the oil and gas industry. While the study outlines recommendations for further study, it concluded there is little potential for harm to workers or the public from radiation exposure due to oil and gas development. The Report observed that there is little potential for radiological exposure to workers or members of the public from the handling, hauling, and temporary storage of vertical and horizontal drill cuttings on natural gas well sites and recommended that the Department conduct research and investigation of vertical and horizontal drill cuttings for beneficial use, onsite disposal, and future landfill disposal protocols. The Department remains committed to protecting the public from unnecessary exposure to radiation and is actively pursuing the recommendations of the 2015 TENORM study report. Landfill disposal is outside of the scope of this rulemaking.

- 1460.** Comment: According to news articles: “Fracking industry truck drivers have been blowing the whistle for some time, saying that radioactivity alarms are going off “all the time.” Workers report that the radioactivity levels are sky-high, even in empty trucks that have already dumped their load of drill cuttings at landfills. Mac Sawyer, a former fracking truck driver and environmental cleanup worker in the Marcellus Shale industry in Pennsylvania, has stated that sometimes “they just disable the alarm” rather than treating flowback or drill cuttings waste with the special care required of radioactive waste. Uranium and Radium 226 are mobilized by fracking.”

Because Marcellus shale is more radioactive than other shale plays, the drill cuttings can be more radioactive, as evidenced by alarms activated at waste disposal sites and the high measurement of radioactivity in a study downstream from the Josephine Treatment Plant in Indiana County which treats wastewater from oil and gas drilling. Radium levels of sediment samples collected in Blacklick Creek, downstream from the plant, were 200 times greater than background samples. Researcher Vengosh noted that levels exceed thresholds for radioactive waste disposal and pose “potential environmental risks of radium bioaccumulation in localized areas of shale gas wastewater disposal.” (912, 926)

Response: The Department’s 2015 TENORM Study Report (Report) presented several observations and recommendations regarding radioactive material associated with the oil and gas industry. While the study outlines recommendations for further study, it concluded there is little potential for harm to workers or the public from radiation exposure due to oil and gas development. The Report observed that there is little potential for radiological exposure to workers or members of the public from the handling, hauling, and temporary storage of vertical and horizontal drill cuttings on natural gas well sites and recommended that the Department conduct research and investigation of vertical and horizontal drill cuttings for beneficial use, onsite disposal, and future landfill disposal protocols.

The Report also observed that there is little potential for radiological exposure to workers or members of the public from sediment-impacted soil at publically owned treatment works (POTWs) that have received wastewater from the oil and gas industry and at centralized wastewater treatment plants (CWTs) that treat wastewater from the oil and gas industry. The 2015 TENORM Study Report observed that there is a radiological environmental impact to soil from the sediments from these POTWs and CWTs. The Report recommended that the Department 1) conduct additional radiological sampling and analyses and radiological surveys at all POTWs and CWTs accepting wastewater from oil and gas operations to determine if there are areas of contamination that require remediation; 2) determine if it is necessary to establish radiological effluent discharge limitations; and 3) determine if the development and implementation of a spill policy is necessary. The Department remains committed to protecting the public from unnecessary exposure to radiation and is actively pursuing the recommendations of the 2015 TENORM study report.

Landfill disposal is outside of the scope of this rulemaking.

1461. Comment: Include standards for testing drill cuttings for radioactivity. (1106)

Response: The Department's 2015 TENORM Study Report presented several observations and recommendations regarding radioactive material associated with the oil and gas industry. While the study outlines recommendations for further study, it concluded there is little potential for harm to workers or the public from radiation exposure due to oil and gas development. The Report observed that there is little potential for radiological exposure to workers or members of the public from the handling, hauling, and temporary storage of vertical and horizontal drill cuttings on natural gas well sites and recommended that the Department conduct research and investigation of vertical and horizontal drill cuttings for beneficial use, onsite disposal, and future landfill disposal protocols. The Department remains committed to protecting the public from unnecessary exposure to radiation and is actively pursuing the recommendations of the 2015 TENORM study report.

1462. Comment: § 78.61: On-site disposal of drill cuttings without the written permission of the surface landowner must be prohibited. On-site disposal of waste materials of any kind can have serious financial, property, and health implications for the surface landowner. *The surface landowner must be afforded the opportunity to provide informed consent.* This section should include language such as the following:

- Disposal of drill cuttings or residual waste at the well site without permission of the surface landowner is not permitted. The request for permission of the surface landowner for disposal, burial, or containment of drill cuttings shall be by certified mail, and must contain the following notice:
NOTICE: Disposal of waste material on your property may have financial implications for your ability to obtain a mortgage or insurance. Waste materials may potentially have an effect upon human health. By consenting to this disposal, you are indicating that you have informed yourself regarding these risks and consider them acceptable. (869a)

Response: The Department disagrees that the regulations should include a requirement for landowner permission or consent. Prior to entering into a lease agreement with the well operator, the landowner may discuss and agree upon the terms and conditions that relate to the type of operations that will occur on the property. Additionally, the Department believes that the provisions of §§ 78.61 and 78a.61 are sufficiently protective that an operator meeting

those requirements should not be required to obtain prior consent. The Department does believe that transparency and notice are important concerns, however, and has added language to sections 78.61 and 78a.61 requiring operators to provide notice to surface landowners of the location of cuttings disposal or land application.

- 1463.** Comment: The disposal of various wastes through burying on site or spreading via land or road application should not be allowed. There is not adequate testing or oversight to keep hazardous chemicals, residual waste and radioactive material from contaminating our water. At the very least, the landowner should be notified and given the opportunity to stop these practices from being carried out. (1066, 1089, 1229)

Response: See response to comment 1462.

- 1464.** Comment: § 78.61(a) and § 78.62(a) allow certain drill cuttings and residual wastes to be disposed of in pits at the well site. We recommend that the Department require operators who choose to dispose of drill cuttings and residual wastes in onsite pits first obtain surface owner approval. Approval should be expressed in a written expression of informed consent, and presented to the Department. Surface owner consent should not be presumed to imply or assume liability for the pit and its contents unless specifically stated. Landowner consent shall not absolve the operator from compliance with other Department requirements. (997a)

Response: See response to comment 1462.

- 1465.** Comment: § 78.61(a) and § 78.61(b) -These sections on the disposal of drill cuttings talks about “drill cuttings from above the casing seat ...” It is suggested that this be clarified to read “drill cuttings from above the surface casing seat ...” (861a)

Response: See response to comment 1453.

- 1466.** Comment: 78.61(a)(3) - The definition of watercourse is very broad, “a channel or conveyance of surface water having defined bed and banks, whether natural or artificial, with perennial or intermittent flow.” Every channel and diversion ditch around a farmer’s field, along every farm road can be considered a watercourse. This broad definition places substantial limitations on disposal areas. (1174)

Response: Use of this definition is appropriate to protect waters of the Commonwealth.

- 1467.** Comment: **78.61(a)(6)** – The term “waste” should not be used in reference to uncontaminated drill cuttings from above the casing seat. These materials are not residual wastes.

Suggested Regulatory Language:

(6) The free liquid fraction of the uncontaminated drill cuttings shall be removed and disposed under § 78.60 (relating to discharge requirements). (1153)

Response: The Department acknowledges that uncontaminated drill cuttings from above the casing seat do not meet the definition of “residual waste” under the Solid Waste Management Act but believes that use of the term “waste” is appropriate.

- 1468.** Comment: Section 78.61(a)(7) requires that a pit holding drill cuttings from above the casing seat be “backfilled to the ground surface” 78.62(a)(15) provides that a pit containing residual wastes

“shall be backfilled to at least 18 inches over the top of the liner.” Both 78.61 and 78.62 contemplate revegetation of the backfilled pit. A minimum depth of fill should be required between ground surface and drill cuttings or residual waste. This minimum depth should be greater than the rooting zone for expected groundcover. Minimum depth is critical where agriculture is the expected land use. (997a)

Response: The cover depth requirements are minimum requirements. If necessary to support land uses or establish vegetation, additional cover depth will be required.

- 1469.** Comment: The setbacks for land spreading of drill cuttings in § 78.61(b) for water supplies and water bodies and wetlands are so limited as to be meaningless, particularly in the absence of testing or studies showing that such setback are effective. One indication that they are not is Oklahoma’s regulation in place since 2003 that land application of waste is prohibited within 300 feet of private water wells and within ¼ mile from municipal wells. (853a)

Response: The Department has determined that the setback requirements for land spreading of drill cuttings from above the casing seat are appropriate.

- 1470.** Comment: Drill cuttings that are radioactive should not be disposed of, spread on, nor incorporated into the soil § 78.61(b) nor in pits § 78.62, 78.63. (609, 944, 938, 938a)

Response: The Report observed that there is little potential for radiological exposure to workers or members of the public from the handling, hauling, and temporary storage of vertical and horizontal drill cuttings on natural gas well sites and recommended that the Department conduct research and investigation of vertical and horizontal drill cuttings for beneficial use, onsite disposal, and future landfill disposal protocols. The Department remains committed to protecting the public from unnecessary exposure to radiation and is actively pursuing the recommendations of the 2015 TENORM study report.

- 1471.** Comment: § 78.61(b)(4) does not allow land application of drill cuttings and residual wastes within 200 feet of a water supply. This protective buffer should explicitly include active water wells for domestic, irrigation and stock uses. (997a)

Response: The Department disagrees that amending this section is necessary. Water supply is defined in 78.1 as *a supply of water for human consumption or use, or for agricultural, commercial, industrial or other legitimate beneficial uses.*

- 1472.** Comment: It is imperative that the Department continued use of solidifiers, dusting, unlined pits, attenuation or other “alternative practices for the onsite storage or disposal of drill cuttings allowed under § 78.61(d). Statements in the proposed revisions that the DEP will provide a list of approved solidifiers and has to approve the material and the installation procedure to be used are simply too vague to be effective. The proposed regulations do not contain an information, procedures, protocols and analytical data on which the Department would base its determinations and issuance of permits. It is impossible to know whether the alternative practices and materials provide equivalent or superior protection as is required in §§ 78.56(b), 78.59(o), 78.58 and 78.61(d). As currently written, there is no reason to presume that the standards would be met – leaving unanswered question of whether operator convenience or preference for particular products would become the determining factor for DEP in allowing numerous “exceptions to the rules”. (853a)

Response: The Department disagrees that the standards to be used to evaluate solidifiers should be clarified directly in the regulation. Standards that will be used to evaluate solidifiers are more appropriately developed in technical guidance or other similar means.

1473. Comment: Section 78.61 – Every day, sites in Ohio and New York are taking thousands of tons of drill cuttings from gas wells drilled in Pennsylvania. Instead of having other states collect enormous amounts of money for disposal of drill cuttings, the PA DEP should make it easier for gas companies working in Pennsylvania to dispose of drill cuttings in our state. Pennsylvania has thousands of acres of abandoned coal strip mines that should be reclaimed using drill cuttings. No agency has indicated that drill cuttings contain any pollutants of concern that would make drill cuttings unsuitable for filling of abandoned mines. PA DEP should, at least, allow the use of drill cuttings which are mixed with coal ash from Coal refuse power plants to be used to fill abandoned mines.(92a)

Response: Disposal of drill cuttings outside of the well site is beyond the scope of this rulemaking.

1474. Comment: 78.61 (b), 78.61 (c) (2), and 78.63 (a) – I don't think any surface rights owner should have land application of anything forced on them. The regulations should require a specific written agreement from the surface rights owner to permit land applications. The land application agreement should tell what is going to be applied, how much and exactly where. (167)

Response: See response to comment 1462

1475. Comment: 78.61 (b), 78.61 (c) (2), and 78.63 (a) Before any land application, the operator should be required to have the material to be applied tested for undesirable components, including such things as arsenic which can be naturally occurring above the casing seat level. The material composition information should be supplied to the surface rights owner as part of the written agreement so they can see it before agreeing to a land application on their property. The material composition results should also be sent to DEP for review before the department allows them to proceed with land application. (167)

Response: See response to comment 1462. Under §§ 78.62 and 78.63, operators must demonstrate that the residual waste meets the regulatory criteria and handle the residual waste in accordance with the regulation in order to dispose of or land apply the residual waste at the well site. Under §§ 78a.62 and 78a.63, the owner or operator of an unconventional well may not dispose of residual waste, including contaminated drill cuttings, at the well site by land application or in a pit unless the land application or the pit is authorized by a permit or other approval is obtained from the Department.

1476. Comment: §78.61(a) – These proposed regulations merit further clarification and further instructions to the oil and gas operators as well as the public. By definition, Drill Cuttings, “Lifted continually to surface during drilling by a circulating-fluid system driven by a pump. To facilitate removal of cuttings, mud is constantly circulated down through drill pipe, out through nozzles in drill bit, and then up to surface through space between drill pipe and well bore through earth (diameter of bit is somewhat greater than that of pipe).” Further clarification is warranted to describe what measures, processes, and equipment is deemed adequate to separate the drilling fluid from the drill cuttings as well as the radio nuclides from the drill cuttings. The clarification should not be submitted by the oil and gas industry and instead be determined by independent researchers including but not limited to: geologists, nuclear engineers, nuclear physicists, and biochemical engineers. The gas and oil industry shall pay the Commonwealth for the data obtained by these

professionals.

Also, in addition to my above statement and/or if the Department chooses to ignore that request, the Agricultural Department must be notified as well as every lease holder and potential lease holder must be informed of research regarding the pros and cons of drill cuttings on land application. “Experiments conducted in France showed that after spreading oil-based mud cuttings on farmland, followed by plowing, tilling, and fertilizing, approximately 10% of the initial quantity of the oil remained in the soil. Phytotoxic effects on seed germination and sprouting were not observed, but corn and wheat crop yields decreased by 10% (6)” Potential concerns include the need for large land areas; the relatively slow degradation process (the rate of biodegradation is controlled by the inherent biodegradation properties of the waste constituents, soil temperature, soil-water content, and contact between the microorganisms and the wastes); and the need for analyses, tests, and demonstrations. Also, high concentrations of soluble salts or metals can limit the use of land spreading (6)” When evaluating land spreading as a drilling waste management option, several items should be considered. These include area-wide topographical and geological features; current and likely future activities around the disposal site; hydro-geologic data (location, size, and direction of flow for existing surface water bodies and fresh or useable aquifers); natural or existing drainage patterns; nearby environmentally sensitive features such as wetlands, urban areas, historical or archeological sites, and protected habitats; the presence of endangered species; and potential air quality impacts. In addition, historical rainfall distribution data should be reviewed to establish moisture requirements for land spreading and predict net evaporation rates. Devices needed to control water flow into, onto, or from facility systems should be identified. Wastes should be characterized during the evaluation; drilling wastes with high levels of hydrocarbons and salts may not be appropriate for land spreading. (189)

Response: Section 78.61 and section 78a.61 allow only uncontaminated drill cuttings to be buried or land applied at the well site while contaminated drill cuttings from a conventional well may be buried on site in accordance with Section 78.62(a)(5)-(16) and (b) (relating to disposal of residual waste – pits) or land applied at the site in accordance with Section 78.63(a)(5)-(20) and (b) (relating to disposal of residual waste – land application). Under §§ 78a.62 and 78a.63, the owner or operator of an unconventional well may not dispose of residual waste, including contaminated drill cuttings, at the well site by land application or in a pit unless the land application or the pit is authorized by a permit or other approval is obtained from the Department. The Department has allowed the disposal of residual wastes including contaminated drill cuttings in a pit at conventional well sites for decades without significant harm to public health and safety or the environment and consequently has not banned the use of pits for temporary waste storage at conventional well sites in this rulemaking.

1477. Comment: 78.61 – The Department is encouraged to conduct a thorough and timely evaluation of the comparative environmental risks associated with available disposal options for drill cuttings. The results of this analysis should be made available for public review and comment. (997a)

Response: The environmental risks associated with the available disposal options for drill cuttings vary from site to site based on site characteristics. If a permit is required for disposal from the Bureau of Waste Management, the environmental risks have been reviewed and addressed in accordance with the permit conditions.

1478. Comment: 78.61(d) – The approved list of solidifiers should be posted to the Department’s website prior to the establishment of this section. (411)

Response: Solidifiers will be posted to the website as they are approved. See response to comment 1479.

- 1479.** Comment: 78.61(f) – Have the necessary electronic reporting setup in GreenPort prior to the implementation of this section. (411)

Response: The Department will ensure that all electronic notification and reporting systems required by the Chapter 78 and Chapter 78a are operational prior to finalizing this rulemaking.

- 1480.** Comment: The proposed amendments to this section would specify the loading and application rate for the land application of drill cuttings. Additionally, this section provides that the Department will maintain a list of approved solidifiers for the disposal of uncontaminated drill cuttings in pits.

Further, this section specifies that the operator shall notify the Department prior to disposing drill cuttings under this section. (566)

Response: The Department acknowledges the comment.

- 1481.** Comment: Contaminated drill cuttings must only be disposed of at landfills properly permitted for such substances. We are favorable to beneficial use of non-contaminated drill cuttings. But, we do not want to see random, non-monitored locations throughout rural Pennsylvania filled with contaminated drill cuttings. The proper burial place for contaminated drill cuttings is a permitted landfill authorized for such residual waste. (1035)

Response: Section 78.61 and section 78a.61 allows only uncontaminated drill cuttings to be buried or land applied at the well site while contaminated drill cuttings may be buried on site in accordance with Section 78.62(a)(5)-(16) and (b) (relating to disposal of residual waste – pits) or land applied at the site in accordance with Section 78.63(a)(5)-(20) and (b) (relating to disposal of residual waste – land application). Under §§ 78a.62 and 78a.63, the owner or operator of an unconventional well may not dispose of residual waste, including contaminated drill cuttings, at the well site by land application or in a pit unless the land application or the pit is authorized by a permit or other approval is obtained from the Department. The Department has allowed the disposal of residual wastes including contaminated drill cuttings in a pit at conventional well sites for decades without significant harm to public health and safety or the environment and consequently has not banned the use of pits for temporary waste storage at conventional well sites in this rulemaking.

- 1482.** Comment: § 78.61 – To provide additional environmental protections to adjacent lands and waters, such as areas owned or managed by the National Park Service, we recommend the following text in bold italics be added to the rest of the text:

“The disposal area is not within 300 feet, of a watercourse or body of water unless approved as part of a waiver granted by the Department under section 3215(b) of the act (58 Pa.C.S. § 3215(b)).”

The 100’ buffer distance (an arbitrary one-size-fits-all figure) described is not considered adequate for keeping floodwaters from nearby streams from impacting the disposal area. The additional distance we recommend would serve to account for more recent periods of increased precipitation and flooding due to increasingly erratic weather events. (1062, 1133)

Response: In accordance with § 3215(f)(1) of the 2012 Oil and Gas Act, no well site may be prepared or well drilled within any flood plain if the well will have a pit or impoundment containing drill cuttings, flowback water, produced water or hazardous materials, chemicals or wastes within the floodplain; or a tank containing hazardous materials, chemicals, condensate, wastes, flowback or produced water within the floodway. The provision has been modified to prohibit disposal of cuttings within the flood plain or 100 feet of a body of water.

1483. Comment: A requirement for the use of native vegetation is recommended:

“The surface of the backfilled pit area shall be revegetated to stabilize the soil surface and comply with § 78.53 (relating to erosion and sediment **[ation]** control). The revegetation shall establish a diverse, effective, permanent, *native* vegetative cover which is capable of self-regeneration and plant succession to help limit the potential introduction and spread of non-native or other invasive species to adjacent private or public lands. Where vegetation would interfere with the intended use of the surface of the landowner, the surface shall be stabilized against erosion.

Revegetating these areas with native vegetation will help to ensure that the objectives for these plantings are achieved, and that other potential economic and ecological impacts associated with the introduction of new non-native, invasive plant species and spread of existing populations are avoided. (1062, 1133)

Response: The Department encourages use of native vegetative cover when possible but it is not appropriate to require use of native vegetation in all circumstances.

1484. Comment: Section 78.61 should contain a statement that “disposal of drill cuttings must comply with the requirements found at Section 78.53, Erosion and Sediment Control.” (1062, 1133)

Response: All activities regulated under Chapter 78 and Chapter 78a must comply with all of Chapter 78 and Chapter 78a.

1485. Comment: 78.61 – The Department should cease the practice of allowing companies to dispose of residual waste, including drill cuttings from below the casing seat, in on-site pits.

Commentator supports the prohibition for on-site disposal of residual waste from hydraulic fracturing. However, the Department’s proposed regulations continue to authorize the creation of mini residual waste landfills across the Commonwealth. The Department does not require companies to publicize the location of these landfills. There is no long-term groundwater monitoring associated with the landfills, and the Department requires no sampling that characterizes what waste before it is disposed at these landfills. These landfills are allowed to be located less than two feet above the seasonal high groundwater table for fresh groundwater on which Pennsylvanians depend for drinking water, even though the Department has evidence that these landfills leak. The Department does not regularly inspect and sample these landfills to ensure there is no environmental harm being caused. The practice is archaic and makes little common sense. The Department should require that the oil and gas industry bear the full financial costs of protecting Pennsylvania’s land and water resources by eliminating this practice and requiring that any residual waste generated at well sites be disposed at facilities with double liners, leak detection, long term groundwater monitoring, and bonding. (852a)

Response: To the extent that this section regulates uncontaminated drill cuttings from above the surface casing seat, the requirements ensure protection of waters of the Commonwealth. For disposal of contaminated drill cuttings or drill cuttings from below the surface casing

seat, section 78.61 provides a reference to §§ 78.62 and 78.63, which require testing of contaminated drill cuttings and drill cuttings from below the casing seat prior to disposal and section 78a.61 provides a reference to §§ 78a.62(a) and 78a.63(a) which require a permit or other approval from the Department. The Department believes that these provisions are adequate to ensure protection of waters of the Commonwealth.

- 1486.** Comment: 78.61 – The DEP Analysis understates costs or in many instances fails to state any cost at all for the proposed changes. One such area of concern is the revised regulations in 78.61 and 78.62. Among other things these sections impose a new notice requirement of three business days. Under conventional well practice extra time will create significant cost. Conventional wells are completed rapidly and the equipment is moved on to the next location. For example, under current practices the pit is often closed the next day following well completion thus freeing the equipment to move on. A waiting period of three days will add the costs of both lost labor and idle equipment. (1123, 1125, 4683 - 4686, 5707 – 5709, 5741 – 5760, 5761 – 5762)

Response: Appropriate planning will allow operators to comply with the notification requirement without delays and additional operational costs.

- 1487.** Comment: The proposed regulations will introduce the new requirement of hiring a soil scientist to provide a certification. This new requirement would be imposed even though the underlying law has been in existence for 30 years without the certification being required. The DEP has not cited any compelling need or estimated cost for these new regulatory burdens, but we estimate that the costs for a soil scientist and lost labor and equipment will be approximately \$3,000 - \$10,000 per well. (1123, 1125, 4683 - 4686, 5707 – 5709, 5741 – 5760, 5761 – 5762)

Response: The revised provision does not add any new requirements because the existing regulation implies that an accurate seasonal high groundwater determination is made. The Department also notes that the rulemaking allows “other similarly trained persons” to make the determination as well, which may represent a substantial cost savings to the operator.

- 1488.** Comment: Virtually all residual waste approved for beneficial use contains regulated substances. However, the “concentrations” are often low, either below Clean Fill or Regulated Fill levels. The mere existence of a regulated substance in drill cuttings or other waste is not a concern and should not trigger any absolute prohibition on placement reuse – whether the drill cuttings are from conventional or unconventional formations. The Department has no factual, scientific or legal basis for distinguishing between conventional and unconventional drill cuttings or prohibiting the land application of drill cuttings from unconventional formations.

The Department has issued General Permits allowing the direct land application of drill cuttings at Act 2 sites as capping or fill material even though they contain regulated substances. On January 2013, DEP approved drill cuttings for fill material at the Palmerton, Carbon County Act 2 site. On March 2013, it approved drill cuttings and stabilized drilling fluids as a coproduct as a replacement for soil in capping at the Palmerton site. On September 2013, DEP approved the beneficial use of drill cuttings as fill material under Act 2 at the Hazleton, Luzerne County mine reclamation/remediation site. In November 2011 DEP approved a General Permit from Clean Earth Inc. for a 3-year demonstration project to beneficially use drill cuttings on a statewide basis at Act 2 brownfield sites as capping material on a site in Bucks County and any subsequent brownfield site subject to public notice. In August 2013, DEP approved the beneficial use of drill cuttings as a substitute for fine aggregate in the production of asphalt.

These uses were approved because the concentrations of the contaminants are low and do not pose

a threat of pollution or harm. Accordingly, Chapter 78 cannot arbitrarily prohibit land application merely because of the existence of “regulated substances.”

Suggested Regulatory Language:

Remove/delete any language defining drill cuttings managed or placed at the well site as a “residual waste.” Remove any language defining on-site management or placement of drill cuttings as “disposal.” (1153)

Response: The terms “residual waste” and “disposal” are used properly in this section. The regulation distinguishes between drill cuttings and residual waste.

- 1489.** Comment: 78.61(f) – Commentator recommends that the Department clarify or explain any additional obligations placed on the operator as a result of this new Section. For example, can an operator proceed without any acknowledgement from the Department? (1174)

Response: The Department requires 3 business days notification prior to planned disposal of drill cuttings to schedule Department personnel to observe the disposal operation. The regulations do not stipulate that the Department has to acknowledge the notification in order for the disposal to proceed.

- 1490.** Comment: We would like to see on-site burial of drill cuttings prohibited. We would like to see the prohibition of open-air pits with liners as well. (862)

Response: Drill cuttings from above the casing seat do not create a significant threat to the environment if the requirements in §78.61 or §78a.61 are met. The requirements include that the drill cuttings are not contaminated with a regulated substance, including brines, drilling muds, stimulation fluids, well servicing fluids, oil, production fluids or drilling fluids other than top hole water, fresh water or gases.

Section 78.61 only allows uncontaminated drill cuttings to be buried or land applied at the well site while contaminated drill cuttings may be buried on site in accordance with section 78.62(a)(5)-(16) and (b) (relating to disposal of residual waste – pits) or land applied at the site in accordance with Section 78.63(a)(5)-(20) and (b) (relating to disposal of residual waste – land application). Burial or land application of cuttings at an unconventional well site may only occur with a permit or other approval obtained from the Department.

§ 78.62 Disposal of residual waste – pits

- 1491.** Comment: The practice of drillers burying waste at the drilling site, without even the consent of a landowner, must be prohibited. (1055)

Response: See response to comment 1462 regarding landowner consent.

- 1492.** Comment: If, against better advice, the Department continues to allow residual wastes to be buried on well sites under sections 78.62 and 78.63, the Department should include mandatory testing requirements in those sections to make them consistent with section 78.65(f).

Section 78.65(f) would require restoration reports to include “[t]he test results required by §§ 78.62 [Disposal of residual waste - pits] and 78.63 [Disposal of residual waste – land application].” Unfortunately, neither of these two subsections appears to *require* test results.

Section 78.62, both in its current form and its proposed revised form, prohibits operators from disposing of residual waste in pits if the concentration of contaminants in the leachate exceed certain limitations. Similarly, both current and proposed 78.63 prohibit the disposal of residual waste by land application if the concentration and contaminants in the leachate exceed certain limitations. Under section 78.63(a)(19), the Department “may” require the well operator to conduct a chemical analysis to determine leachate characteristics – but unless the Department exercises this discretionary power, operators have no duty to do such an analysis. Subsection 78.65(f) is problematic, then, because it assumes the existence of testing requirements that do not exist. We strongly object to the disposal of any residual wastes on well sites. However, assuming that the Department continues to allow such disposal, the Department should require testing of all residual wastes that are to be disposed of. In other words, sections 78.62 and 78.63 should be revised to be consistent with 78.65(f). (852a)

Response: Operators may not dispose of residual wastes including contaminated drill cuttings at the well site unless the waste meets the specified requirements in §§ 78.62(b) and 78.63(b). Chemical analysis must be conducted in order to demonstrate compliance with these requirements.

- 1493.** Comment: Shouldn’t operators be required to remove all the waste from drilling sites instead of leaving these ‘toxic teabags’ scattered across the state? (939)

Response: The Department has amended the final rulemaking to ban the use of pits for temporary waste storage at unconventional well sites. The Department has determined that it is appropriate to remove this practice because it is not commonly used by unconventional operators. Additionally, the typical type and scope of use by unconventional operators is generally incompatible with technical standards for temporary pits prescribed under § 78.56. As a result, unconventional operators will no longer be permitted to dispose of residual waste including contaminated drill cuttings in a pit at the well, unless the pit is authorized by an individual permit, as any other person proposing to dispose of residual waste could obtain. Conversely, the typical type and scope of use by conventional operators is generally compatible with the technical standards for temporary pits prescribed under § 78.56. The Department has allowed the disposal of residual wastes including contaminated drill cuttings in a pit at conventional well sites for decades without significant harm to public health and safety or the environment and consequently has not banned the use of pits for temporary waste storage at conventional well sites in this rulemaking. Additionally, the Department has not banned the disposal of residual waste including contaminated drill cuttings in a pit at the well site. As long as the requirements in § 78.62 are met, the disposal of residual wastes including contaminated drill cuttings at conventional well sites will not result in significant harm to public health and safety or the environment.

- 1494.** Comment: Waste Disposal: No drilling waste should be allowed to be buried onsite. We do not need to create thousands of mini landfills across the state. Ban the use of drilling pits to store drilling wastewater for any period or in any location. These pits threaten water resources and can produce air emissions. It is past time to ban them. (140, 1055)

Response: See response to comment 1493.

- 1495.** Comment: No burial in pits or land application of drill cuttings. Allowing waste to be left at well sites may be convenient for operators, but it risks water resources and creates a toxic legacy for the public to deal with. I don’t want this hidden pollution buried in my community or on my land and near my drinking water. (5936-6089)

Response: See response to comment 1493.

1496. Comment: Underground tanks for managing waste should be prohibited. (140, 1055)

Response: See response to comment 1016 regarding underground tanks.

1497. Comment: 78.62 – We oppose long-term onsite burial of any residual waste contaminated with chemicals, oil, grease, pollutional materials, regulated substances, water-based drilling muds that contain chemical additives, oil-based drilling muds, polymer-based drilling muds containing mineral oil lubricants, NORM, TENORM, mercury, heavy metals, and other chemical additives or toxins.(1143)

Response: See response to comment 1493.

1498. Comment: 78.57(e) – The requirements that operators provide to DEP a list of locations of buried tanks and remove them within three years at least offers an opportunity – albeit limited and insufficient – to prevent or remediate environmental impacts. That aspect of DEPs mandate is completely ignored when it comes to buried pits containing drill cuttings and residual waste. (853a)

Response: See response to comment 1016 regarding underground tanks. Encapsulated pit locations are recorded on the Well Site Restoration Report.

1499. Comment: 78.62 – Contaminated drill cuttings should not be buried onsite or applied to the land surface. Drilling waste should be removed from the drilling location and properly disposed of at an approved waste disposal facility capable of handling the quantity and type of waste generated.

Alternative best practices for waste handling are described in comment 1442, above.

We recommend the following changes to the discharge requirements at § 78.62.

§ 78.62. Disposal of residual waste—pits.

Closed-loop tank systems shall be used to handle and store residual waste. All residual waste must be disposed of at an offsite approved waste disposal facility. (1143)

Response: See response to comment 1493.

1500. Comment: Anything going into or coming out of an industry well should be controlled in a closed containment system and disposed of as a potentially hazardous material with appropriate analysis and treatment for long term disposal or purification off site. None of this material should be surface applied or buried on site. Much of the industry already acknowledges that on site pits are no good for in or out materials and never were.(114)

Response: See response to comment 1493.

1501. Comment: Open pits should not be permitted under any circumstances. (10, 16, 46, 1086)

Response: See response to comment 1493.

1502. Comment: Prohibit the onsite burial of waste pits. Buried pits can leak and pollute groundwater over time, yet burial allows operators to walk away from any responsibility after completing operations.(17, 18, 19a, 67, 72, 73, 79, 125, 148, 160, 161, 168, 169, 195, 402, 475, 477, 492a, 564, 565, 626, 632, 787, 808, 842, 843, 853a, 884, 947, 1000, 1039, 1058, 1068, 1086, 1102, 1161, 1168, 4582 – 4584, 4584 - 4650)

Response: See response to comment 1493.

1503. Comment: The DEP should stop promoting the disposal of residual waste at well sites. (Section 78.62) (19, 21, 23, 55, 90, 113, 142, 165, 189, 391, 429a, 851, 946, 958, 1005, 1152, 1210)

Response: The Department acknowledges the comment. The Department disagrees that section 78.62 promotes the disposal of residual waste at well sites.

1504. Comment: 78.62(a)(1) – Commentator questions the legality and scientific basis for the blanket prohibition of on-site disposal of waste generated by hydraulic fracturing of unconventional wells and solid waste generated by processing of fluids pursuant to § 78.58. On-site disposal should be permitted if the waste meets the requirements of § 78.62(b). Benefits would include conservation of landfill space and reduced heavy traffic on local communities.

Suggested Regulatory Language:

The residual waste is generated by the drilling, or stimulation of an oil or gas well that is located on the well site where the residual waste is disposed. Solid residual waste generated by hydraulic fracturing of unconventional wells and solid residual waste generated by processing of fluids pursuant to § 78.58, may not be disposed of on the well site unless it meets the requirements of § 78.62(b). (1153)

Response: Solid waste generated by hydraulic fracturing of unconventional wells and solid waste generated by processing of fluids pursuant § 78.58 are concentrated waste streams which are not appropriate for disposal in accordance with §§ 78.62 and 78.63.

1505. Comment: 78.62(a)(5) – Allow registered Small Businesses to submit hard copy notification. (1135)

Response: Regarding electronic submission of reports and notifications, see response to comment 219.

1506. Comment: The 3 business day notification period to DEP should be extended to 10 to allow for appropriate monitoring of any disposal process[78.62(a)(5)]. (1093, 1098)

Response: The Department believes that the notification timeframe established in the regulations is sufficient to allow Department field staff to plan inspection schedules.

1507. Comment: 78.62(a)(7) – Delete this subsection per *Robinson Twp. et al. v. Commonwealth of Pennsylvania et al.* (1135)

Response: The setback restriction is appropriate and is unrelated to § 3215(b) of the 2012 Oil and Gas Act.

1508. Comment: Conventional operators should not be required to retain soil scientists for certification of pit bottoms, which would add significant costs to operations. We recommend the adoption of a

performance standard that pit bottoms do not penetrate the seasonable groundwater table, which achieves the same environmental benefit without the significant costs associated with certifications.

Suggested amendatory language:

(9) The bottom of the pit shall not penetrate the seasonal high groundwater table at the time of installation. (1135)

Response: The Department disagrees with the proposed changes to subsection (a)(9) because the 20 inch separation requirement allows for a physical barrier between the seasonal high groundwater table and the bottom of the pit to prevent mixing of impounded materials and groundwater and to ensure structural integrity of the pit.

1509. Comment: 78.62(a)(9) – The term “seasonal high groundwater table” should be defined as provided in Comment 902, above. (1153)

Response: The Department maintains that the seasonal high water table definition is adequate.

1510. Comment: Section 78.62 addresses pits and their contained wastes “generated by the drilling, or stimulation, or production of an oil or gas well.” From time to time in the course of production, a pit will be required in order to responsibly accommodate the maintenance activities related to a service rig. It is unreasonable to require an operator to contract “a soil scientist or other similarly trained person using accepted and documented scientific method s” to verify that the pit bottom is “20 inches above the seasonal high groundwater table” every time they decide it is necessary to put a rig over a well. This requisite should be limited to the drilling and completion phases of a well and not to production. These proposed revisions should be tabled in favor of further consideration. (12, 623)

Response: The 20 inch separation requirement allows for a physical barrier between the seasonal high groundwater table and the bottom of the pit to prevent mixing of impounded materials and groundwater and to ensure structural integrity of the pit. It is necessary to ensure that the 20 inch separation is met every time a pit is used.

1511. Comment: To truly safeguard the groundwater and reduce the risk of a pit liner floating, all pits and impoundments should be required to have a professional determine the seasonal high groundwater table. This is not mentioned under all of the potential pit applications. The 2’ freeboard is also not mentioned under freshwater or centralized impoundments. It is important that some space is provided for all pits and impoundments. Fencing should also be required for all pits and impoundments for human and wildlife safety. (1149)

Response: See responses to comments 1197, 1198 and 1199.

1512. Comment: The draft regulations would allow well operators to dispose of residual waste in pits. Or essentially mini landfills, on well sites as long as they comply with certain minimum requirements. Because oil and gas site waste is exempt from hazardous waste regulations, the result is that this hazardous waste can be managed as residual waste and disposed of onsite with a single synthetic liner and no long-term groundwater monitoring. These minimal protections are inadequate. Given the high risk posed by these many landfills, DEP should prohibit well site disposal waste entirely. (1210)

Response: See response to comment 1493.

1513. Comment: The proposed amendments to this section clarify that solid waste generated by hydraulic fracturing of unconventional wells or processing wastewater under § 78.58 (relating to onsite processing) may not be disposed of in a pit on the well site. However, residual waste, including contaminated drill cuttings, can be disposed of in a pit on the well site. Additionally, the proposed amendments require the operator to notify the Department prior to disposing residual waste. This section also proposes a requirement that operators determine that the pit bottom is 20 inches above the seasonal high groundwater table prior to using the pit and that the determination be certified by a soil scientist or other similarly trained person using accepted and documented scientific methods. Compliance with this section shall be documented and made available to the Department upon request, as well as submitted in the well site restoration report. (566)

Response: The Department acknowledges the comment.

1514. Comment: Disposal of residual waste at well sites should not be allowed (78.82). Instead, operators should be required to provide and comply with plans for off-site residual waste disposal.(153)

Response: See response to comment 1493.

1515. Comment: No burial of fracking waste on-site. All fracking waste should be removed to another location and chemically neutralized before dumping. When transported it should be treated as a toxic chemical.(156)

Response: Section 78a.62(a)(1) disallows solid waste generated by hydraulic fracturing of unconventional wells and solid waste generated by processing of fluids pursuant to §78.58 from being disposed on the well site without an individual permit from the Department.

1516. Comment: There should be no burial or land application of drill cuttings or other residual waste. The ability of liners to last indefinitely and prevent pollution of soil and ground water is not proven. In effect, the burial of any waste from operations represents an unacceptable risk to our water supplies and, as one critic stated, also creates an untold number of “brown fields” for future generations. (148, 182, 402)

Response: See response to comment 1493.

1517. Comment: After the liquid fraction of the drill cuttings is removed, residual waste, including contaminated drill cuttings may be disposed of in pits providing the drill cuttings were generated on that specific site. Excluded from this disposal method is solid waste generated by hydraulically fractured unconventional wells and also, fluids processed in accordance to 78.58. The volume and contaminants make it very impractical to even consider onsite disposal for hydraulically fractured unconventional wells generated solid waste and fluids processed in accordance with 78.58. We therefore, fully support and recommend prohibiting site disposal of solid waste generated by hydraulically fractured unconventional wells and also, fluids processed in accordance to 78.58 as written. (660a)

Response: The Department acknowledges the comment.

1518. Comment: The Penn Future comments address § 78.62, and state that the Proposed Regulations should ban the disposal of residual waste at well sites. I support the Penn Future comments in this regard. However, the Proposed Regulations should also ban both the on-site disposal of drill cuttings

from above the casing seat, and the land application of drill cuttings from below the casing seat. (1070)

Response: The Department acknowledges the comment. See response to comment 1493.

1519. Comment: Long-term storage pits and on-site burial of solid waste should be prohibited, with no waivers issued.(1078)

Response: See response to comment 1493.

1520. Comment: The draft regulations would allow well operators to dispose of residual waste in pits on well sites as long as they comply with certain minimal requirements. Because waste generated at oil and gas sites is exempt from the hazardous waste regulations, the result is that hazardous waste can be managed as residual waste and disposed at well sites with a single synthetic liner and no long-term groundwater monitoring. These minimal protections are inadequate. As the DEP knows, many well-site disposal pits have leaked in recent years, contaminating surface and groundwater and dotting the Pennsylvania countryside with brownfield sites. Given the high risks of these mini-landfills, and the fact that their one and only advantage is fewer truck trips to landfills (and reduced cost for operators), the DEP should prohibit well site disposal of residual waste entirely. To the extent that the DEP continues to allow this method of waste disposal it should, at a minimum, require long-term groundwater monitoring and public notice of existing and future disposal sites. (23, 24, 26, 55, 90, 113, 142, 165, 189, 192, 391, 843, 946, 958, 1005, 1152)

Response: See response to comment 1493. Additionally, under § 78.62(b)(1) the concentration of the contaminants in the leachate from the residual wastes cannot exceed 50 percent of the maximum concentration in 40 CFR § 261.24 as well as 50 times the primary maximum contaminant level in effect under 25 Pa. Code § 109.202. This conservative specification provides assurance that the waste is not hazardous.

1521. Comment: Pit liners are non-exempt waste under the U.S. Resource Recovery and Conservation Act (RCRA) and must be disposed accordingly. Therefore, the proposed regulations cannot allow that these liners be buried on site. (853a)

Response: The exclusion outlined at 40 CFR § 261.4(b)(5) does not apply to pit liners. EPA has determined that “synthetic pit liners used in [gas exploration and production] activities are not covered by the RCRA exemption because they are not intrinsically derived from, or uniquely associated with the exploration, development, or production of crude oil and natural gas.” The liners are not “intrinsic” to drilling operations because they are used for a variety of other operations such as municipal solid waste landfills and industrial waste landfills and impoundments. The material does not meet the exemption criteria under 40 CFR § 261.4(b)(5) and is accordingly subject to regulation under RCRA. The pit liners would be subject to the applicable requirements of the Resource Conservation and Recovery Act, including 40 CFR Part 261 concerning the identification and listing of hazardous waste, which has been incorporated by reference in accordance with 25 Pa. Code § 261a.1. If the materials are not hazardous waste, they would be regulated as residual waste. Residual waste is defined in the Solid Waste Management Act, 35 P.S. §§ 6018.101 *et seq.*, to include wastes from industrial activities. Section 3273.1(a) of the Oil and Gas Act exempts an operator from the obligation to obtain a permit and post a bond under SWMA. Section 3273.1(c) recognizes that the duties or obligations of an owner or operator of a well site under SWMA are not diminished or otherwise affected by Section 3273.1. The substantive requirements in § 78.62 are as equally protective as those in the residual waste regulations.

1522. Comment: DEP is not taking measures to prevent the environmental risks of pit burial to water and soil, nor even keeping track of where these risks might arise. DEP does not require operators to map or list the location and volume of buried pits, maintain a database of buried pits or follow any protocols to monitor whether or not they remain solidified and impermeable over time. The only clear documentation of whether a pit has been buried is well restoration records, which are kept in individual paper well files at the regional DEP offices. But operators are not required to file these reports until after the last well of the site is completed and can request a restoration extension of up to 2 years. As a result it can take years for the Department and the public to have access information about whether pits have been buried on a site even though they may be close to a wetland, stream backyard or farm field.

pennsylvania

DEPARTMENT OF ENVIRONMENTAL PROTECTION

Bureau of Oil and Gas Management

August 20, 2010

Dear well operator:

DEP has recently investigated several significant incidents resulting from leaking pits adjacent to well sites. Due to the frequency of these events and the potentially severe impacts to the environment, I am writing this letter to remind all operators that produce gas from unconventional shale formations such as the Marcellus, Utica, Burket, Mandata, Rhinestreet and other similar formations, of the regulatory requirements governing the use of pits to temporarily store or ultimately dispose of residual wastes generated by well drilling or production.

Pit Construction

Rocks or other debris can tear pit liners. 25 Pa. Code § 78.56 requires pits to be constructed so that the liner subbase is smooth, uniform and free from debris, rock and other material that may puncture, tear, cut or otherwise cause the liner to fail. The liner subbase and subgrade shall be capable of bearing the weight of the material above the liner without settling that may affect the integrity of the liner. If the pit bottom or sides consist of rock, shale or other materials that may cause the liner to fail, a subbase of at least 6 inches of soil, sand or smooth gravel, or sufficient amount of an equivalent material, shall be installed over the area as the subbase for the liner.

Hay or other similar organic material is not a suitable alternative to soil, sand or smooth gravel.

In addition to building a proper subbase, the bottom of the pit must be 20 inches above the seasonal groundwater table. This provision applies to pits used for temporary storage of waste only. Pits may not be used to dispose of residual waste if the bottom of the pit will be within 20 inches of the seasonal groundwater table during any part of the year. 25 Pa. Code 78.62.

Finally, pits used by operators that produce gas from unconventional shale formations to dispose of residual waste must be lined with an impervious liner that is at least 30 millimeters thick. 25 Pa. Code 78.62(a)(10). DEP will be rescinding its approval to use 20 millimeter liners at these sites through a notice in the *Pennsylvania Bulletin*. The volume of material, the length of time the pits are in use, and the potential impacts to the environment from leaking pits necessitate this action.

Disposal of Waste

Only residual waste that is generated by well drilling or production may be disposed of on-site.

Trash, land clearing waste, or other waste that was not generated by well drilling or production may not be disposed of in pits on-site. In addition, only residual waste that meets the

requirements of 25 Pa. Code 78.62(b) may be disposed of on-site. DEP requests that prior to disposing of waste on-site, a chemical analysis of a representative sample of the waste be

performed to demonstrate compliance with this section. Failure to do so may result in an enforcement action by DEP. A list of parameters that must be tested is enclosed with this letter. Because shale formations have the potential to produce an acid discharge, the shale should be analyzed and handled according to the enclosed fact sheet.

The regulations governing the use of pits to store and dispose of waste generated by well drilling or production are minimum standards that, if strictly followed, will protect the environment. Well operators should instruct contractors on proper pit construction and routinely inspect pits prior to liner installation and while the pit is in use to detect and repair any defects. DEP also urges operators to consider using superior waste containment facilities.

Thank you for your attention to this important matter. Please contact me at (717) 772-2199 if you have any questions.

Sincerely,

Scott Perry
Director

enclosures

(853a)

Response: The Department believes that transparency and notice are important concerns and has added language to sections 78.61 and 78a.61 requiring operators to provide notice to surface landowners of the location of cuttings disposal or land application. Additionally, §§ 78.62 and 78.63 require operators to provide 3 days' notice to the Department prior to disposing of residual waste including contaminated drill cuttings on the well site.

1523. Comment: All waste that is produced by the on-site operation must be transported to a secure storage/processing facility that guarantees that no toxic chemicals are released into the environment. They must be forced to adhere to all the current clean water and clean air standards that other industries are held to. No special deals, no special treatment.(52, 1055)

Response: See response to comment 1493.

1524. Comment: It is recommended that the scope of § 78.62 be clarified. It is unclear if or what type of residual waste generated from hydraulic fracturing of unconventional wells might be considered under this section for disposal in on-site pits. Depending on its application, additional safeguards and requirements may be needed. (997a)

Response: Subsection (a)(1) describes the types of residual wastes that may be considered under this section.

1525. Comment: When it comes to waste disposal, drilling company operators should follow the federal regulation of hazardous substances that other industries have to follow. (46, 51, 70, 135, 200-385, 1088)

Response: The US Environmental Protection Agency(EPA) is evaluating this issue. To the extent that the EPA determines that these wastes are hazardous, then the Department will revisit these requirements. Until that time, the Department believes that the proposed regulations are appropriate.

1526. Comments: Operators currently escape the federal regulation of hazardous substances that other industries must follow. To protect water supplies as well as air quality, land, public health, and wildlife, I call on DEP to apply U.S. Resource Recovery and Conservation Act standards to regulate all aspects of the storage, transport, and use of the hazardous materials generated by shale gas extraction activities. (402, 631)

Response: See response to comment 1525.

1527. Comment: Disposal of brine, drill cuttings, and residual waste (Sections 78.60, 78.61, 78.62, and 78.63, and 78.70). Operators currently escape the strict federal regulation of hazardous substances that other industries have to follow. Yet drilling and fracking generate large amounts of solid and liquid waste that can harm water supplies, air quality, land, health, and wildlife. Pennsylvania should apply U.S. Resource Recovery and Conservation Act standards to regulate all aspects of the storage, transport, and use of hazardous materials contained in pits, centralized impoundments, and tanks. In addition, DEP's proposed Chapter 78 changes don't address the risks posed by hazardous waste and do little to improve current regulations or ensure safe disposal. (17, 18, 72, 73, 79, 102, 125, 148, 160, 161, 168, 195, 399, 402, 492a, 564, 565, 626, 632, 808, 843, 947, 1039, 1058, 1102, 4582 – 4584)

Response: See response to comment 1525.

1528. Comment: The planned regulations would allow well operators to dispose of waste in pits on well sites if they follow minimal requirements. Since waste from oil and gas sites is exempt from the hazardous waste regulations, hazardous waste can be disposed at well sites with a single synthetic liner and no long-term groundwater monitoring. This is far from being good enough. Everything corrodes or deteriorates eventually. Please think about what will happen to our water and our health when these facilities leak.

Many disposal pits have leaked, contaminating water. Due to the high risks of these mini landfills, the DEP should prohibit well site disposal of residual waste. If it continues there should be long-term groundwater monitoring and public notice of the locations of these disposal sites. The DEP should strengthen its regulatory mechanisms for ensuring that pits and impoundments are constructed in a structurally sound manner and according to regulation. Any falsification must be prosecuted criminally. (180)

Response: See response to comment 1493. Additionally, under § 78.62(b)(1) the concentration of the contaminants in the leachate from the residual wastes cannot exceed 50 percent of the maximum concentration in 40 CFR § 261.24 as well as 50 times the primary maximum contaminant level in effect under 25 Pa. Code § 109.202. This conservative specification provides assurance that the waste is not hazardous.

1529. Comment: Section 78.62 draft regulations allow well operators to dispose of residual waste including drill cuttings in pits at the well site as long as they comply with certain requirements. As waste generated at oil and gas drill sites is exempt from hazardous waste regulations, the result is hazardous waste can be managed as residual waste and disposed at well sites with a single synthetic liner and no long-term groundwater monitoring. These minimal protections are inadequate. (846, 1109)

Response: See response to comment 1493. Additionally, under § 78.62(b)(1) the concentration of the contaminants in the leachate from the residual wastes cannot exceed 50 percent of the maximum concentration in 40 CFR § 261.24 as well as 50 times the primary maximum

contaminant level in effect under § 109.202. This conservative specification provides assurance that the waste is not hazardous.

1530. Comment: Section 78.62 allows the operator to store residual waste at the drill site. Considering the increasing number of brownfields that have been created by leaking disposal pits, this practice should be disallowed entirely.(108)

Response: See response to comment 1493.

1531. Comment: § 78.62: On-site disposal of “residual waste” without the written permission of the surface landowner must be prohibited. On-site disposal of waste materials of any kind can have serious financial, property, and health implications for the surface landowner. *The surface landowner must be afforded the opportunity to provide informed consent.* This section should include language such as the following:

- Disposal of drill cuttings or residual waste at the well site without permission of the surface landowner is not permitted. The request for permission of the surface landowner for disposal, burial, or containment of drill cuttings shall be by certified mail, and must contain the following notice:

NOTICE: Disposal of waste material on your property may have financial implications for your ability to obtain a mortgage or insurance. Waste materials may potentially have an effect upon human health. By consenting to this disposal, you are indicating that you have informed yourself regarding these risks and consider them acceptable. (869a)

Response: See response to comment 1462 regarding landowner consent.

1532. Comment: § 78.62: No disposal of “residual waste” containing any amount of radioactivity above background levels should be permitted. On-site disposal of waste materials of any kind can have serious financial, property, and health implications for the surface landowner. *The surface landowner must be afforded the opportunity to provide informed consent.* This section should include language such as the following:

- Disposal of drill cuttings or residual waste at the well site without permission of the surface landowner is not permitted. The request for permission of the surface landowner for disposal, burial, or containment of drill cuttings shall be by certified mail, and must contain the following notice:

NOTICE: Disposal of waste material on your property may have financial implications for your ability to obtain a mortgage or insurance. Waste materials may potentially have an effect upon human health. By consenting to this disposal, you are indicating that you have informed yourself regarding these risks and consider them acceptable. (869a)

Response: See response to comment 1462 regarding landowner consent.

1533. Comment: “(a) After the removal and disposal of the free liquid fraction of the waste under § 78.60(a) (relating to discharge requirements), the owner or operator may dispose of residual waste, including contaminated drill cuttings, in a pit at the well site if the owner or operator satisfies the following requirements”

Contaminated drill cuttings should not be disposed of on any land, nor near any type water supply. Please refer back to Pages 3-5 of these comments under “Temporary Storage” and comments pertaining to the “Seasonal High Water Table” as most, if not all, of the suggestions there also apply to what comments should be made here. (189)

Response: See response to 2080.

1534. Comment: 78.62(a)(1)-The operator should be allowed to dispose of unconventional solid waste at the well site. What is the scientific basis for not allowing the disposal of this material? Why prohibit on-site disposal from unconventional wells without data and tests to support the prohibition? The costs associated with disposing this material at a landfill (which would be the only option if this section is implemented) would make it uneconomic to develop the resource with our company's business plan. (411)

Response: See response to comment 1504.

1535. Comment: we support the ban on disposal of residual waste generated during the fracking of unconventional gas wells (Section 78.62(a)(1)). The draft regulations would allow well operators to continue disposing of drill cuttings and residual waste in pits on well sites as long as they comply with certain minimal environmental protection standards. And while the Department has tightened and increased some regulations around this on-site disposal practice, the agency has provided no testimony or evidence to demonstrate that these regulations will adequately protect the environment. (852)

Response: See response to comment 1493.

1536. Comment; § 78.62 Disposal of Residual Waste – Pits :As we noted above (at § 78.1), neither waste, nor residual waste, are defined in these proposed regulations or in the current version of the regulations. The lack of definition has made it difficult to understand what is allowed in this section. We recommend these definitions be addressed at § 78.1 given the attention to these topics in these regulations.

The language in this section is unclear leading to a range of questions that we hope can be addressed through additional definition and clarifications to existing and proposed text. As noted above (at § 78.1), definitions for “residual waste” and “waste” have not been provided. The proposed language in this section introduces the additional term “solid waste” and reads, “Solid waste generated by hydraulic fracturing of unconventional wells and solid waste generated by processing of fluids pursuant to § 78.58 [Onsite Processing] may not be disposed of on the well site.” Without providing definitions it is unclear if the Commonwealth is making a distinction between “waste”, “residual waste” and “solid waste”. A range of questions is raised by the existing language including: Is solid waste included in or covered under the term “residual waste” and/or are they considered one and the same thing? Is there some portion of residual waste that is not solid waste? Residual waste can be generated by well drilling or stimulation - can solid waste be generated by the same means? If solid waste from hydraulic fracturing of unconventional wells can't be disposed of on the well site, what solid and/or residual waste is there left to dispose of onsite? We request clarification of this section so that we can understand what materials may be buried near National Park System lands. (1062, 1133)

Response: The Department agrees that clarification is needed and has revised the subsection to refer to the solid fraction of the residual waste generated by hydraulic fracturing of unconventional wells and the solid fraction of the residual waste generated by processing of fluids pursuant to § 78.58.

1537. Comment: 78.62(a)(1) has been amended to prohibit solid waste generated by hydraulic fracturing of unconventional wells and solid waste generated by processing of fluids to be disposed of on the

well site. What is the need for this prohibition? We raise a similar concern with § 78.63(a)(1), relating to disposal of residual waste via land application. We ask EQB to explain in the Preamble and RAF of the final-form regulation the reasonableness of the requirements in these subsections. (1099)

Response: Solid waste generated by hydraulic fracturing of unconventional wells and solid waste generated by processing of fluids pursuant § 78.58 are concentrated waste streams which are not appropriate for disposal in accordance with §§ 78.62 and 78.63.

1538. Comment: 78.62(a)(1-4,6-8,10) The changes here reflect the addition of residual, stimulation and references to Act 13, all which are needful. We therefore, recommend their adoption at the minimum as is written. (660a)

Response: The Department acknowledges the comment.

1539. Comment: 78.62(a)(5) - Have the necessary electronic reporting setup in Greenport prior to the implementation of this section. The end of this statement should read ‘the operator shall re- notify the Department of the new proposed date of disposal. (411)

Response: The Department will ensure that all electronic notification and reporting systems required by the Chapter 78 and Chapter 78a are operational prior to finalizing this rulemaking.

1540. Comment: 78.62(a)(5): PADEP is proposing to require 72 hour notification for disposal of residual waste. Operators currently have to abide by drilling, notching, and fracking notifications. An additional notification for closing in of a drill pit will add to the confusion currently being experienced by conventional operators who drill and frac different wells every day. Something as simple as a rainstorm would cause a chain reaction: a pit can’t be encapsulated in the rain, so the state would need to be re-notified and operators would be forced to wait an additional 72 hours to meet notification requirements. No notification should be required for a process as simple as encapsulating a drill pit. I recommend an exemption for pits less than 1,000 bbl.(450)

Response: The Department disagrees that no notification should be required. The Department believes that the notification timeframe established in the regulations is the minimum time sufficient to allow Department field staff to plan inspection schedules. See response to comment 1522.

1541. Comment: 78.62(a)(5) The proposal also provides for a three day advanced notification prior to pit disposal which may allow for adequate planning for the Department’s staff to be onsite and perform an inspection of the work. Therefore, we do recommend both provisions for adoption. (660a)

Response: The Department acknowledges the comment.

1542. Comment: § 78.62(a)(7) – We recommend that residual waste burial in pits not take place in floodplains. As in other sections of our comments we recommend “300 feet” replace “100 feet” in this subsection. This would serve to account for more recent periods of increased precipitation and flooding due to increasingly erratic weather events. (1062, 1133)

Response: In accordance with § 3215(f)(1) of the 2012 Oil and Gas Act, no well site may be prepared or well drilled within any flood plain if the well will have a pit or impoundment containing drill cuttings, flowback water, produced water or hazardous materials, chemicals

or wastes within the floodplain; or a tank containing hazardous materials, chemicals, condensate, wastes, flowback or produced water within the floodway. The provision has been modified to prohibit disposal of cuttings within the flood plain or 100 feet of a body of water.

1543. Comment: 78.62(a)(9), who qualifies as an “other similarly trained person”? We ask EQB to clarify what is meant by this term or delete it. (1099)

Response: The term is defined through its use in the regulation. A similarly trained person is someone who has the ability to identify redoxymorphic features (mottling) in soil and accurately determine the elevation of the seasonal high groundwater table.

1544. Comment: § 78.62(9): Determination of Seasonal High Groundwater Table should be done by an independent 3rd party. A requirement that waste protection infrastructure should be located at a “safe distance” above SHGT is fitting and proper, though many have questioned whether 20 inches is sufficient distance to be “safe”. Just as important as the actual measure of distance is the issue of who determines what the SHGT actually is. It is quite simply a conflict of interest for a well operator to be the party that determines this. The Environmental Quality Board must require that SHGT be determined by an independent certified professional, similar to the requirement that pre-drilling water tests be done by an independent certified laboratory (§ 78.52). (869a)

Response: See response to comment 899.

1545. Comment: 78.62(a)(9): The proposed regulation stating that a certified scientist or engineer must evaluate the seasonal high groundwater table comes at extreme cost with little environmental benefit. Conventional operators can have dozens of small pits within a few acres. A pit cannot be utilized for drilling or fracking if it is below the groundwater table simply because it fills up with water. Therefore, the DEP is attempting to further regulate a situation that does not exist. I propose adding a pit exemption for pits less than 1,000 bbl. (450)

Response: The subsection requires the determination to be made by a qualified person. Operators will be held responsible to ensure that the requirements are met and to address and issues that may arise as a result of an improper determination. Elevated water tables within 20 inches of the bottom of the pit may impact structural integrity of the pit or cause intermingling of groundwater and the regulated substances contained within the pit.

1546. Comment: 78.62(a)(9) - While this provision is less detailed than a similar provision, 78.59b.(e) the required certification statement ideally will ascertain that the environment and specifically our water resources will be adequately protected. However, we suggest that just as in 78.59b.(e) this statement be part of this provision as well: In no case shall the regional groundwater table be affected. With this additional consideration we recommend this provision for adoption. (660a)

Response: Section 78.59b(e) contemplates artificial manipulation of the groundwater to maintain the 20 inch separation for centralized freshwater impoundments. Section 78.62 does not allow artificial manipulation of the groundwater to maintain the 20 in separation and therefore the suggested language is not needed.

1547. Comment: 78.62(a)(9): The proposed language related to a certified minimum 20” pit depth above the seasonal high groundwater table should be revised to remove the certification requirement. (1113, 1118, 1120, 1115a, 1176-1188)

Response: The Department disagrees with the proposed changes to subsection (a)(9) because

the 20 inch separation requirement allows for a physical barrier between the seasonal high groundwater table and the bottom of the pit to prevent mixing of impounded materials and groundwater and to ensure structural integrity of the pit. It is critical to ensure that the mandatory 20 inch separation is not compromised and therefore a certification by an adequately trained individual is appropriate.

- 1548.** Comment: Issuance of waivers for “alternative waste management practices” should be prohibited by the Chapter 78 revisions. The Department routinely issues alternative waste management waivers allowing the use of 20 mil pit liners to contain drilling, exploration and productions wastes rather than the thicker 30 mil which is required in § 78.62. Not long after DEP approved the use of thin HDPE liners, Scott Perry, Director of the Bureau of Oil and Gas Management stated in an August 20, 2010 letter to well operators that “...pits used by operators that produce gas from unconventional shale formations to dispose of residual waste must be lined with an impervious liner that it at least 30 mil thick. 25 Pa. Code 78.62(a)(10). DEP will be rescinding its approval to use 20 mil liners at these sites through a notice in the Pennsylvania Bulletin. The volume of material, the length of time the pits are in use and the potential impacts to the environment from leaking pits necessitate this action.” However, it does not appear that the allowance of the thinner pit liner was in fact rescinded. This leaves in place, the option for drillers to apply for and obtain a waiver for this “alternative” waste management practice – one that DEP has itself acknowledged to be risky and inappropriate for current drilling operations. (853a)

Response: Subsection 78.62(a)(11) requires liners to meet the requirements in §§ 78.56(a)(8)-(10) which requires the liner to be 30 mils thick at a minimum unless approved by the Department upon a demonstration that the alternative thickness is at least as protective as 30 mils. The Department has approved several such liners and will keep an updated list of approved alternatives on its website.

- 1549.** Comment: It is imperative that the EQB prohibit the continued use of alternate liner or natural materials for pits as allowed under § 78.62(a)(11). (853a)

Response: See response to comment 1548.

- 1550.** Comment: 78.62(a)(11-18) The codification of pit construction standards that mirror those for temporary storage creates standard regulations for all pits, temporary and permanent. All pits, whether temporary or permanent need to be constructed to the most rigorous and modern standards in order to adequately protect our water resources. We support that standardization for adoption. (660a)

Response: The Department acknowledges the comment.

- 1551.** Comment: In constructing waste pits 78.62 (a)(15), it only requires 18 inches of soil fill over the top of the pit. It would be better to require at least 30 to 36 inches of fill. Otherwise if someone is plowing or digging fence post holes, they could easily ruin the integrity of the top liner for the pit. (167)

Response: See response to comment 1462 regarding landowner consent and notice provided to landowner regarding the location of waste disposed on the well site.

- 1552.** Comment: § 78.62(b)(2)-(3) (Current Rule): Allowing leachate at 50 times the safe drinking water standard is unacceptable. How exactly is leaching at 50 times the safe drinking water standard to be abated? We are not talking here about disposal at a landfill or other central facility: We are talking

about someone's property. Why 50? Why should any amount of contamination of leachate at all be allowed? The number 50 should be changed to 1. (That is assuming that pits are accepted at all for storing anything but potable water.) (869a)

Response: Section 78.62 only applies to conventional wells, which typically generate a smaller volume of waste than unconventional wells. The drinking water standard requirements in these paragraphs must be understood in context with the pit construction standards in subsection (a) and the leachate standards established in paragraph (b)(1), relating to the hazardous waste toxicity characteristic standard. The pit construction standards in § 78.62(a) provide significant protection from the waste entering the environment and the bottom of the pit cannot be closer than 20 inches from the seasonal high groundwater table. These requirements should prevent significant leaching from the encapsulated pit. In addition, the drinking water standard test provides additional health-based protection to the requirements in subsection (b)(1), which are already conservative at 50% of the toxicity standards in 40 CFR Part 261.

1553. Comment: 78.62(b). This provision provides that residual waste not exceeding certain contaminate concentration levels may, while still contaminated be disposed of in an onsite pit. This pit of course meets these better construction standards, but nevertheless, we are considering the burial of contaminated residual waste. It is perhaps important to consider a few items. As noted on the Drilling Waste Information Management System, "Onsite pit burial may not be a good choice for wastes that contain high concentrations of oil, salt, biologically available metals, industrial chemicals, and other materials with harmful components that could migrate from the pit and contaminate usable water resources." [<http://web.ead.anl.gov/dwm/techdesc/burial/index.cfm>]

In regards to those contaminated residual wastes that do qualify for onsite disposal, we do have some concerns. Our concerns pertain to potentially larger volumes of cuttings per site relative to the upcoming technology change to conventional horizontal wells, and in the rare event, to those unconventional wells where such wells are not hydraulically fractured. The Department needs to view this with an eye to the future of a possible increase of conventional drilling. The renaissance of exploration may extend in a greater way to conventional drillers in the future. The price of oil is higher than in many years and a new operator, IMG Midstream is offering a new opportunity in the unconventional fields which they are now interested in applying to the conventional gas fields. "In planning the projects, IMG found that the same constraints that stifle conventional gas producers' getting their product to market also apply to Marcellus companies. So, now, the company plans to source from both conventional and shale producers."

[<http://www.post-gazette.com/news/state/2014/01/08/IMG-Midstream-plans-small-plants-to-generate-electricity-from-gas/stories/201401080079>]

This new opportunity, distributed energy, is one whereby field gas is transported to a facility and through CHP electricity is generated and via the nearest substation enters the electric grid. So, we are considering this with two viewpoints, one that conventional horizontal drilling may create per site a greater quantity of residual waste and distributed energy may increase drilling in the conventional gas fields. Thus, we are considering the possibility of an increasing load of contaminated residual wastes and whether it is appropriate to continue with onsite disposal.

PA Code 288 Residual Waste Landfills creates application and operating requirements for three specific kinds of landfills, Class I, Class II, and Class III. Application requirements include site analysis, cover and re-vegetation, water protection and monitoring, and closure provisions. Granted, oil and gas residual waste disposal pits are significantly smaller, but in consideration of small landfilling of contaminated residual wastes, it is appropriate to review what if any oversight may be

missing as compared to a regulated residual waste landfill. For example, as part of the site analysis, the applicant is required to sample and describe certain characteristics of the aquifer for at least two quarters, including concentrations of arsenic, barium and lead. The applicant also has to provide a water quality monitoring plan. Upon closure of the facility, the applicant is required to provide a schedule of ongoing post-closure water quality monitoring, leachate collection and treatment, along with a description of the manner in which funds will be available to cover these and other required conditions.

We are concerned about the manner in which materials leaching may not be monitored in so many well site pit locations. We are concerned with the lack of oversight as compared to a regulated residual waste landfill, how likely it is that rural private water supplies may be impacted, and if so, the seriousness of such impacts and how the impacted homeowner's water supply will be remediated. In addition, it is important to note that in general, conventional drillers are much smaller operators than unconventional. Many notable conventional drillers of years gone by such as Pennzoil Prod. Co. has not spud a well in Pennsylvania since 2007. Many other less known operators have also ceased their activity in Pennsylvania. Thus, our concern lies with what happens in the long-term obligation when a contaminated residual waste pit has unnecessarily impacted a water supply, whose obligation/liability does it then become? Again, we are really focused on the disposal of contaminated residual wastes and what that means in regards to onsite well disposal methods.

Clean Earth of Williamsport currently has a Beneficial Use R&D permit [WMGR097R017] to demonstrate that drill cuttings and drilling mud generated during Marcellus Shale operations can be successfully processed and beneficial used as engineered fill at brownfield or Act 2 sites, as a construction material at other sites, and in construction of drill pads.
[\[http://www.pabulletin.com/secure/data/vol41/41-21/853.html\]](http://www.pabulletin.com/secure/data/vol41/41-21/853.html)

On December 19, 2013 Penn State Extension hosted a webinar "Drilling and Pipeline Cuttings Reclamation" which provided an update regarding the progress made with the Beneficial Use Permit.

This is a very informative webinar, just full of interesting facts. One item that is mentioned is that "The 10% not suitable for reuse exhibited the following characteristics: 1) Naturally occurring radioactive material, norm above background and 2) Inorganic constituents such as Arsenic, Lead and Barium." Because these cuttings are not suitable for reuse, their destination becomes a landfill that is properly authorized to accept contaminated drill cuttings. To be clear, we do understand that these are cuttings from both vertical and horizontal bores and strictly unconventional drilling. Thus, while these cuttings may be from deeper depths than the conventional residual waste contaminated cuttings referenced in this section, still, some of the contaminated cuttings may essentially come from shallower formations. Other contaminated substances that may be disposed of in the onsite pit are items other than the cuttings such as drilling muds and thus a soil component. Thus, there is good information here that we can at least compare to 40 C.F.R. 261.24 Table I (relating to the characteristic of toxicity). Arsenic, Lead and barium are all constituents of unconventional drill cuttings and noted contaminants on Table I. These same contaminants may be common to conventional drilling and are contaminants that are of concern regarding residual waste landfills in PA Code 288.123.

It is worthwhile to consider the presence of these same contaminants in conventional drilling onsite disposal. Here follows a discussion regarding arsenic as an example.

Arsenic –

- Water samples collected indicated a presence of arsenic. *“Arsenic is a relatively new concern in drinking water with serious health effects at very low concentrations. It is thought to most often occur naturally from certain types of rocks but it can also come from treated lumber and pesticides.”*
- Only 2 percent of the wells exceeded the health-based drinking water standard of 10 mg/L for arsenic. The maximum concentration observed was 35 mg/L but the majority of wells (89 percent) had arsenic concentrations below 6 mg/L. Wells with high arsenic occurred mostly in northern Pennsylvania regions, presumably due to the geology of these areas. The three northern regions of the state had significantly higher arsenic concentrations than the southern regions with the highest occurring in the northwest region. These results are similar to results reported by the U.S. Geological Survey (2000) for 578 private wells that were sampled in southeast and extreme western Pennsylvania. Arsenic is thought to originate primarily from natural geologic sources, thus, it would not be expected to vary significantly over time.
- Contamination of private wells can occur through the interaction of both natural and human causes. Leaching of arsenic from bedrock is an example of a natural source. Leaching from an oil and gas waste pit is an example of human causes.
- The well owners that participated in this study were made aware of problems that occurred in their water supply. Note that the percent avoiding water quality problems increased dramatically in each case. Pollutants with more severe or better documented impacts on human health, like lead, arsenic and E. coli bacteria, had the highest avoidance rates at the end of the study. Since relative risk information was given to each well owner in the Penn State Cooperative Extension fact sheets included with each water test report, it is not surprising that well owners responded with greater actions for pollutants with greater risks.
- Arsenic is also a human health concern because it can contribute to skin, bladder and other cancers (National Research Council, 1999).
- The National Research Council (1999) recommended lowering the current maximum contaminant level (MCL) allowed for arsenic in drinking water of 50 µg/L (micrograms per liter), citing risks for developing bladder and other cancers. The U.S. Environmental Protection Agency (USEPA) will propose new and likely lower, arsenic MCL during 2000 (U.S. Environmental Protection Agency, 2000). This fact sheet provides information on where and to what extent natural concentrations of arsenic in ground water exceed possible new standards.
- As the concentration for a possible new MCL decreases, the likelihood of exceeding that standard increases. Although homeowners with private wells are not regulated, a lower drinking-water standard would mean that more homeowners will be consuming water with concentrations that exceed a standard.
- Reported arsenic concentrations in Pennsylvania groundwater are noted not only in the Northern Tier Region, but also across the vast Marcellus Play including, areas that are also locations prone to conventional/shallow oil and gas drilling. These are same areas where folks rely on private water sources, wells and springs. These are the same locations where contaminated drilling cuttings may be disposed in pits.

- *“This research is not intended to predict arsenic levels for individual wells; its purpose is to predict the probability of elevated levels of arsenic in groundwater to help public health efforts in Pennsylvania,” said USGS scientist Eliza Gross, who led the study. “The study results and associated probability maps provide water-resource managers and health officials with useful data as they consider management actions in areas where groundwater is most likely to contain elevated levels of arsenic.”*

The Pennsylvania Department of Health plans to use the maps as an educational tool to inform health professionals and citizens of the Commonwealth about the possibility of elevated arsenic in drinking water wells and to help improve the health of residents, particularly in rural communities.

Arsenic occurs naturally and, in Pennsylvania, is most common in shallow glacial and shale/sandstone type aquifers, particularly those containing pyrite minerals. Arsenic can also result from human activities. Geologic conditions, such as fractures, and chemical factors in groundwater, such as low oxygen, extreme pH, and salinity, can cause arsenic to leach from rocks, become mobile, and contaminate wells distant from the source. Groundwater with elevated arsenic levels – more than 4 micrograms per liter -- can be found in scattered locations throughout Pennsylvania.

Arsenic in drinking water has been linked to several types of cancer, reproductive problems, diabetes, a weakened immune system, and developmental delays in children.

Here is an example from Kanawha County, West Virginia that indicates the amount of Arsenic and other contaminant levels which may leach into soil from improperly buried contaminated pit waste. There is not an easy way to obtain such information from Pennsylvania pit waste lacking the investigation through many file reviews. We just wanted to provide an example of what soil tests may reveal in regards to Arsenic leaching. We are quite aware of the disparity between PA and WV regulations. Again, we are more interested in what a soil sample may reveal regarding contaminated pit waste and nearby private water supplies, especially in view that water supplies within the Northern Tier Region at times have indicated existing pre-drill sample results have indicated a presence of arsenic. We are concerned about such water supplies and the risk of a further increase of arsenic levels. This report is attached in a separate attachment labeled *Arsenic – example of pit soil screening level 5714_EA*. It is relevant to note that this particular operator, Cabot Oil and Gas also operates in Pennsylvania’s Northern Tier Region; attached please find the corresponding completion report. The contaminated soil in this case reveals an arsenic concentration of 16mg/kg. According to this report, the EPA Soil to Groundwater screening level reveals .292 mg/kg as compared to this particular Soil to Groundwater screening calculated to 5.8 mg/kg. Please refer to the attached report for further details regarding this environmental assessment.

- As per 40 C.F.R. 261.24 Table I (As of July 1, 2011): Arsenic’s Regulatory Level is 5 mg/L (Maximum Concentration of Contaminants for the Toxicity Characteristic). According to the regulation, which is only revised for “residual” the thresholds for Arsenic, for concentration of contaminants in the leachate from the residual waste are as follows.
 - Does not exceed 50% of Table I - or 2.5 mg/L
 - Does not exceed 50x the primary maximum contaminant level under § 109.202; which for arsenic is .010 mg/L or 50x - .5 mg/L
 - As per the previous map, Arsenic concentrations are shown as elevated if greater than or equal to 4.0 micrograms per liter.

Our concern here lies with the fact that there is a greater risk here due to the fact that arsenic is already present in water supplies and that the addition of onsite contaminated residual waste pits may create an unnecessary risk to nearby water supplies. Pits also lack onsite monitoring. Certainly there are options here. Requiring monitoring is one option. Reducing the acceptable contamination level is another. Better yet, we recommend that onsite contaminated residual waste pit burial be eliminated in favor of centralized disposal where such contaminants are more easily, properly and adequately monitored.

Since the Department has access to information regarding residual waste contaminants that are common to onsite residual waste pit burial, we recommend that the Department review such information along with the enormous amount of water sampling that has been done in areas prone to drilling in order to determine based on present water quality whether there are sufficient safeguards in place to adequately protect water supplies in the event of water resource impacts. This is new information that the Commonwealth has been gathering since the unconventional development began and this is a relevant and necessary review. We recommend centralized landfilling of all contaminated residual waste and request the Department consider this information and eliminate onsite contaminated residual waste pit burial. (660a)

Response: See response to comment 1552.

1554. Comment: No burial of waste pit liners nor drill cuttings.(400, 401, 1030, 1030a, 1073-1077, 1079-1082, 1084, 1086, 1158)

Response: See response to comment 1493.

1555. Comment: The regulation of a conventional shallow oil drilling pit that is often less than 1/10 of an acre in size in the same manner as a holding pond at an unconventional site that often exceeds several acres in size is inappropriate. This section alone demonstrates the overwhelming need for separating the regulatory requirements of conventional and unconventional operations. In addition, for small pits it is recommended that the rule simply state that pits be installed above the water table as determined by water entering (or not entering) the pit hole at the time of installation. (606, 606a)

Response: As part of this rulemaking, in response to comments and recent legislation (the Act of July 10, 2014 (P.L. 1053, No. 126)), the Department split Chapter 78 into two separate Chapters – one for conventional oil and gas wells (Chapter 78) and the other for unconventional wells (Chapter 78a). The purpose of this amendment to the final rulemaking was to clarify the different requirements for conventional and unconventional wells. The Department believes that having two completely separate regulatory Chapters should serve to eliminate any confusion about what requirements apply to conventional and unconventional wells. In addition, having separate Chapters allows the Department to craft regulations to match the environmental risks posed by each segment of the industry (compare, for example, section 78.56 and section 78a.56, which contain significantly different requirements for temporary storage at conventional and unconventional well sites, respectively).

The Department disagrees with the proposed changes because the 20 inch separation requirement allows for a physical barrier between the seasonal high groundwater table and the bottom of the pit to prevent mixing of impounded materials and groundwater and to ensure structural integrity of the pit.

- 1556.** Comment: Within a 10 mile radius of my unleased land, my best estimate is that there are now over 30 gas wells, with more to come. It no longer feels like a safe place to live. In reading over the details of these proposed Chapter 78 regulations, I do not feel any less vulnerable.

I have a Master's Degree in Special Education and 30 years of daily study and experience in the field of human health.

In both molecular biology and pharmacology, "small molecule" is the term used for a molecule with a low molecular weight, 10 to the minus 9th. At this size, minute beyond what you can imagine, a substance is able to activate a receptor site on a human cell membrane, and in so doing – alter gene expression, which can then signal the cell to die, multiply, or mutate. Thus, the central dogma of receptor pharmacology is that the effect of any substance is directly proportional to the number of receptors occupied, and the smaller the molecule, the greater the capacity to occupy and affect receptor sites. On the membranes of your cells, toxins wreak havoc and dilution DOES NOT count. Less is truly more.

It is my understanding of these principles of orthomolecular biology that cause my fear and trepidation when reading the proposed Chapter 78 regulations, for there is an inherent flaw that can be found throughout: the classification and therefore the regulation of potentially highly toxic material as "residual waste".

The meaning of residual is: that which is left over. Kind of like the meatloaf in your refrigerator; it's what remains after the main event. Residual waste is an enormous challenge to the gas industry, and one they will do everything in their power to minimize. The industry would like permission to dispose of this waste in the most inexpensive, unregulated, and unobserved way possible. And therein lies my worst fears.

Section 78.62 outlines the conditions under which waste, that when generated by other industries IS classified as toxic, can be left behind at the site for perpetuity, as long as operators follow very minimal requirements.

I propose that NO residual waste should ever be stored in pits or permitted to remain behind when the well site is abandoned. (644)

Response: See response to comment 1493.

- 1557.** Comment: Before I finish I want to read this beautiful passage under the section 78.62 on the disposal of residual waste, or pits.

Section 78.62: "Disposal of residual waste-pits. The proposed amendments to this section clarify that solid waste generated by hydraulic fracturing of unconventional wells or processing wastewater under § 78.58 (relating to onsite processing) may not be disposed of in a pit on the well site. However, residual waste, including contaminated drill cuttings, can be disposed of in a pit on the well site.

I repeat for all the homeowners in the room with well pads on their property or for wells on public lands, "residual waste, including contaminated drill cuttings, can be disposed of in a pit on the well site." a.k.a. it's buried; it's buried without your permission or you knowing about it. But it's fine since it's required to be buried 20" above the Seasonal High Water Table. So, what is "it?" What are these contaminants? Lets look at Triple Divide and fast forward to Judy Eckerfs chapter. Okay, we see the contaminants are iron (that's fine nothing wrong with more iron behind the swingset),

manganese (I think that's in toothpaste, no big deal), Barium, Benzene, Strontium, Arsenic, Thorium, Uranium or radium 226 and 228, or in other words radioactive elements that produce radon. Okay ... but, these are naturally occurring contaminants. Like the good radon! So, everything is fine ... right? It's not like we have cases where a pit was buried above a seasonal high water table and someone found these contaminants in a person's water supply. What? This whole chapter in Triple Divide is about Judy Eckerfs water supply being contaminated after drilling, and the company illegally buried the waste pit, and DEP found out two years later, and they didn't issue a fine, and they found the same contaminants in the water supply that would be in the waste pit. AND they had a predrill test that showed Judy had clean water uncontaminated water before drilling. So what happened? DEP's investigation concluded that the gas industry wasn't liable for the contamination to Judy's water, because Judy filed her complaint more than six months after drilling.

Look, this is American soil, American resources and American citizens who require that agencies who are provided with the duty to protect the air, land, soil and water do better than sniff test regulations. (849a)

Response: The Department acknowledges the comment.

- 1558.** Comment: The regulations related to residual waste are unlawfully inadequate. The DEP's own studies have shown extensive and significant environmental pollution and harm resulting from faulty pits. Some companies have already started using a closed loop system to better contain these harmful wastes. For some reason, despite all this, the DEP has proposed allowing onsite burial of pits. In fact, the DEP only requires the pits to be 20 inches above the seasonal high groundwater table. Other states are more protective, New Mexico requires 25 ft. Also, the DEP is only proposing setback requirements for pits in regards to streams flowing year round, rather than protecting intermittent streams, which is contrary to the Clean Streams law. Why the DEP would fail to recognize the persistent threat that pits pose to the environment and human health is difficult to comprehend. Clearly, all pits must be prohibited. (887)

Response: See response to comment 1493. The Department disagrees that the setbacks do not apply to intermittent streams. The rulemaking only allows for disposal pits for conventional operators where the disposal area is not within 100 feet of a watercourse or body of water or within a flood plain.

- 1559.** Comment: I've now attended three of these sessions, and I think that several general conclusions can be drawn from the comments thus far. The first conclusion would be that many folks believe that there is a substantial risk of ground water pollution due to the use of pits for drill cuttings or completion fluid storage. The second conclusion can be drawn from the number of comments insisting that the conventional and unconventional wells are two altogether different animals, and cannot and should not be lumped together as one entity.

In regard to the first issue I would like to explain a little about how those of us in the shallow well, conventional industry utilize pits. First of all, in the early days of shallow oil well drilling with cable tools, the drill cuttings were mixed into a slurry by the drilling tools themselves, and then removed from the well bore with a tool known as a bailer; a laborious and time-consuming process. Over the course of the several weeks that it would normally take to drill the well to bottom, the drill cutting slurry would be discharged to the ground, normally on the downhill side of the well. Today, if you take a shovel and dig around the downhill side of one of these old wells, you may find evidence of these cuttings, otherwise known in the industry as sand pumpings. They will usually be found under years of ground and leaf cover, with tree and shrub roots growing all through them. My

reason for mentioning this is so that you might understand that the drill cuttings removed from our shallow conventional wells are a pretty benign substance, mostly consisting of shale and sandstone. Dry, uncontaminated drill cuttings are harmless enough that many operators apply for a waiver that allows them to discharge them by a method called dusting, and then land farming them into the surrounding surface. Prior to the fracturing phase of the well development, a small pit is excavated, which would probably average about 10' wide by 25' long by 8' deep. It is then lined with a 20 mil plastic liner. For those who may not understand that terminology, suffice it to say that a 20 mil liner is a pretty tough piece of plastic. Typically a frac job on a shallow well takes from five to ten hours to complete and during this time, frac return water will be discharged into this pit, and recycled by means of a water pump back into steel tanks on the wellsite. Once the frac operation is completed, the liquid fraction in the pit is vacuumed off. The remaining solids mostly consist of frac sand. The liner is then folded in on itself, encapsulating those frac sand returns. The pit is then reclaimed using the dirt that was excavated from it.

The point of this explanation is to emphasize the difference between large scale pits constructed for shale gas wells versus small scale pits used by the shallow well folks. This, of course, ties into the point that has been made by so many at these hearings. Small pits vs. large pits. Small locations vs. large locations. Small number of trucks vs. large numbers of trucks. Small amounts of drill cuttings vs. large amounts of drill cuttings. Small amounts of waste fluids vs. large amounts of waste fluids. Wells costing thousands vs. wells costing millions.

We're comparing apples to oranges here, and one size does not fit all. Common sense must prevail. (902)

Response: As part of this rulemaking, in response to comments and recent legislation (the Act of July 10, 2014 (P.L. 1053, No. 126)), the Department split Chapter 78 into two separate Chapters – one for conventional oil and gas wells (Chapter 78) and the other for unconventional wells (Chapter 78a). The purpose of this amendment to the final rulemaking was to clarify the different requirements for conventional and unconventional wells. The Department believes that having two completely separate regulatory Chapters should serve to eliminate any confusion about what requirements apply to conventional and unconventional wells. In addition, having separate Chapters allows the Department to craft regulations to match the environmental risks posed by each segment of the industry (compare, for example, section 78.56 and section 78a.56, which contain significantly different requirements for temporary storage at conventional and unconventional well sites, respectively).

- 1560.** Comment: An additional concern has to be the radioactive waste as generated from oil and gas operation. This is radon country and radon gas will be released in the drilling process as well as contamination in the shale waste. As I recall several years ago, the interstate 99 portion of that road between Altoona and Penn State was held up for years because no one wanted to take the sulfur - pyrite contaminated shale fill that was being produced in the road cuts because of their acidic waste content, As a concerned citizen, This unwanted material needs to be disposed of properly not haphazardly and not permitted to blow around as an air pollutant (916)

Response: Air emissions from oil and gas operations are regulated by the Department under Article III of Title 25. Changes to Article III are beyond the scope of this rulemaking. The Department's 2015 TENORM Study Report presented several observations and recommendations regarding radioactive material associated with the oil and gas industry. While the study outlines recommendations for further study, it concluded there is little potential for harm to workers or the public from radiation exposure due to oil and gas development. The Report observed that there is little potential for radiological exposure to

workers or members of the public from the handling, hauling, and temporary storage of vertical and horizontal drill cuttings on natural gas well sites and recommended that the Department conduct research and investigation of vertical and horizontal drill cuttings for beneficial use, onsite disposal, and future landfill disposal protocols. The Department remains committed to protecting the public from unnecessary exposure to radiation and is actively pursuing the recommendations of the 2015 TENORM study report. Landfill disposal is outside of the scope of this rulemaking.

1561. Comment: Under section 78.62(b), pits containing residual waste are allowed to be constructed on-site if the leachate analysis from the residual being applied to the pit does not exceed 50 times the respective drinking water MCL level or if the leachate does not exceed 50 times any established health level established by the Department. We recommend that any pits containing material up to 50 times the MCL or advisory level be lined and monitored. We also recommend that some type of groundwater monitoring be required at least quarterly surrounding the pits in order to detect if the liner has failed. It is also recommended that any pits or impoundments be permitted under the Pennsylvania Residual Waste regulations. (1138)

Response: See responses to comments 1493 and 1552.

1562. Comment: § 78.62(b)(2) and (3) – We believe this may merely be a typo: subsection (1) reads “does not exceed 50% of the maximum concentration”. Subsections (2) and (3) read, “does not exceed 50 times” the primary maximum contaminant level and safe drinking water level respectively. (1062, 1133)

Response: The language referenced by the commenter does not contain any typos.

1563. Comment: Radiation should be specifically addressed in the new regulations. Other regulations are not sufficient to guide the current oil and shale gas industry because of the uncertain status of various regulations and the use of varied terms. For example, the Solid Waste Management Act (35 P.S. §§ 6018.101-1003), referred to § 78.58(d) has limited provisions for radiation. Also, the Guidance on Radioactivity Monitoring at Solid Waste Processing and Disposal Facilities (Document 250-3100-001) was offered only as a best management practice in the absence of regulation. This Guidance has many deficiencies:

- a. It carries no regulatory authority.
- b. It is dated written in 2004,
- c. It handles only small quantities of TENORM,
- d. It did not anticipate the nature and volume of tracking waste disposed in landfills.

Waste Disposal” (para 2) is among the topics included in this Act, yet omits two items. The Act omits 1) the handling, monitoring and storage of radioactive waste and 2) waste disposal in landfills an industry-accepted method of disposal of the waste of the hydraulic fracking process, tracking fluid and drill cuttings.

Current language of the Act calls this waste “contaminated” (e.g. § 78.62), yet classifies it as “residual waste.” Fracking fluid and drill cuttings in Pennsylvania are known to contain at least Radium-226, a radioactive material. Therefore provisions should be made for measuring radiation and handling waste appropriately. Radium-226 has a half-life of 1601 years and will forever remain to impact the health of residents and the environment.

The ACT fails to mention Radium-226, TENORM or the radioactive nature of this waste. In fact,

“radioactive” is found once in the document in § 78.123 regarding logs maintained on the well. (938, 938a)

Response: The Department’s 2015 TENORM Study Report presented several observations and recommendations regarding radioactive material associated with the oil and gas industry. While the study outlines recommendations for further study, it concluded there is little potential for harm to workers or the public from radiation exposure due to oil and gas development. The Department remains committed to protecting the public from unnecessary exposure to radiation and is actively pursuing the recommendations of the 2015 TENORM study report. Subsection 78.58(d) requires an operator processing fluids onsite to develop a radiation protection action plan which specifies procedures for monitoring and responding to radioactive material produced by the treatment process. This section also requires procedures for training, notification, recordkeeping, and reporting to be implemented.

1564. Comment: even if the new regulations preclude the use of pits or impoundments to manage chemicals and other waste materials, there are thousands of sites across the Commonwealth that were permitted before the new Chapter 78 rules will take effect that used pits or impoundments to manage well construction and development and production waste. At the vast majority of these sites, the Pennsylvania Department of Environmental Protection (PADEP) allowed the owner/operator to bury the residual materials and wastes in the pits or impoundments by pushing in the sides and covering the top with soil to complete the burial.

The Earthjustice comments explain our concerns about the environmental contamination incidents related to waste management in pits and impoundments and the potential for wastes buried in these pits and impoundments to leach into adjacent soil, groundwater, or surface waters. This contamination potential does not go away once the wastes are buried. Instead, each of these burial sites becomes an environmental legacy that may cause considerable damage from release and migration of contaminants in the future.

To mitigate the environmental risks from these burial sites, we propose that a program be added to the proposed Chapter 78 regulations to specifically address these risks. This program would have several components, including: 1) identifying the location of each waste burial site; 2) determining the type and volume of waste in each burial site; 3) determining the waste site design and burial method used; 4) testing the waste to determine whether any constituent exceeds applicable or relevant and appropriate federal, state or local environmental quality criteria; 5) testing soils, groundwater and surface waters in the vicinity of the burial site to determine whether waste constituents have already migrated from the burial site; 6) removal of all waste materials from the burial site, all soils contaminated from contaminant migration, and remediation of impacted groundwater and surface waters; 7) transportation with a manifest system for tracking shipments of wastes and contaminated soil to waste handling, treatment and disposal facilities licensed to accept such wastes; 8) establishing a record keeping and reporting system for the owner/operator to provide PADEP with the information identified above; 9) making all of this information available to the public on a real time basis (i.e. as soon as it is submitted) through the PADEP website using a system such as eFACTS or a prominently identified portion of the PADEP website; and 10) payment by permit applicants of a fee to establish a fund to address orphan burial sites. Outlined below are some preliminary aspects of each of these components.

Identification, location and information about waste burial sites (items 1-3 above): Within 90 days of the effective date of the revised Chapter 78 regulations all oil & gas owners/operators that have previously held a permit to drill an oil or gas well or operate an oil or gas production facility in Pennsylvania shall submit to PADEP a list of all sites where waste materials have been buried. This

list shall include a map showing the burial site location, global positioning system (GPS) coordinates for each burial site, the site design and burial method used (including whether a liner was installed and the type used), a description of the type of waste material buried, an estimate of the amount of waste material buried, information about any known leakage or contamination from the burial site, results of any prior monitoring or testing to identify or verify leakage or contamination, information on any removal of waste or remediation that has occurred, the date on which the burial was completed, the name and address of the owner/operator or contractor who generated the waste material, and, if the burial was performed by an entity that did not participate in activities that generated the waste material, the name and address of the entity which performed the burial. If an owner/operator does not submit this information within the 90 day period, any application it submits for a new oil or gas well or production facility shall not be deemed administratively complete and the permit shall not be issued until the owner/operator has provided the information described above. An owner/operator seeking a permit or approval from PADEP must identify all current and former entities which held an oil & gas well or production facility permit or approval from PADEP and in which the current owner/operator held any legal interest, directly or indirectly through any other entity.

Burial site testing (items 4 - 5 above): Within 180 days of receipt of the information described above, PADEP shall conduct testing of the burial site to determine whether any constituent of the buried material exceeds an applicable or relevant and appropriate environmental criteria or parameter established under federal, state, or local laws or regulations, including water quality criteria, maximum contaminate levels (MCL), or MCL goals established under federal, state or local laws or regulations, and the additional parameters identified in the Earthjustice comments. If the waste material in a burial site does exceed any of these criteria or standards, PADEP shall test soils, groundwater and surface waters to determine whether any contamination from the buried material has already occurred. If no contamination is found, PADEP will retest a year later for two years. The cost of such testing shall be reimbursed to PADEP by the owner/operator of the site that includes the burial site. Until such testing is completed no application for a new oil or gas well or production facility permit by the owner/operator of the site may be approved by PADEP.

Waste and Contaminated Soil Removal and Remediation (items 6-9 above): For any burial site where initial or subsequent annual testing has determined that one or more of the environmental criteria described above is exceeded, within 90 days the owner/operator shall excavate and transport offsite, using a manifest system established by PADEP, all waste material and soils exceeding the environmental criteria. If groundwater or surface water contamination is found by the testing, within 30 days the owner/operator shall begin remediation approved by PADEP. The removed material must be transported to a facility authorized to accept such materials. If the owner/operator of the site that includes the burial site does not perform the excavation and offsite transport and disposal of the waste and contaminated soil or initiate PADEP-approved remediation, PADEP will use funds from the orphan sites remediation fund described below to perform the excavation and transport offsite, including the manifesting of these materials, and the remediation of soil, groundwater, and/or surface water contamination. Any owner/operator that does not perform the excavation and offsite transport and/or remediation described above shall not be eligible to apply for or obtain any permit for an oil or gas well or production facility.

Orphan Sites Remediation Fund (item 10 above): As part of any application for an oil or gas well or production facility permit under Chapter 78, the applicant will pay a fee that PADEP shall use to establish a fund to perform waste burial site identification, testing and remediation at sites where no owner/operator is known or where the owner/operator has not performed the identification, testing, removal, remediation and offsite transport obligations described above. PADEP may also use the funds to investigate and respond to burial sites identified by written, email, or telephone

notification by the public to PADEP. When PADEP establishes this fund, it shall include information that clearly informs the public of its right to request investigation and response for specific burial sites. For any site where PADEP used monies from the fund to perform the functions described above, the fund shall have a claim against any owner/operator who does not comply with the described requirements and the non-compliant owner/operator shall not be eligible to obtain any permit or other authorization from PADEP.

Establishing and using a system as described above is the only way we can minimize the creation of a legacy of potentially thousands of contaminated sites spread across Pennsylvania. The federal Superfund and the state's Act 2 programs are already being stretched to their limits and do not need the addition of these oil or gas waste burial sites to that burden. (1151)

Response: See response to comment 1493.

- 1565.** Comment: The Department should eliminate waiver provisions or establish standards for when waivers may be granted. Section 78.61 contains setback provisions for the location of disposal areas from streams and watercourses that may be waived by the Department, with no standard for when the Department may waive the setback requirement. The Department should remove the waiver provisions or establish standards for when setback requirements may be waived. (852a)

Response: The Department has removed the waiver provisions from the subsection.

- 1566.** Comment: Geologists should certify groundwater level. Section 78.62(a)(9) only requires a soil scientist rather than a professional geologist to determine separation between pit bottom and seasonal high groundwater. Considering this is a rule for burying residual waste, the judgment should be made by a professional geologist. (852a)

Response: A soil scientist or other appropriately trained person can accurately determine the elevation of the seasonal high groundwater table.

- 1567.** Comment: Setback distances should be enlarged. The setback distance from a burial pits to buildings under section 78.62(a) and water wells under section 78.62(a)(8) (should be greater than 200 feet and should reflect the risk to public health associated with the use of the building. (852a)

Response: The setbacks are consistent with the setbacks in the 2012 Oil and Gas Act.

- 1568.** Comment: Temporary pit requirements should not be stricter than disposal pits. 78.62(a)(11) replaces liner language (coefficient of permeability of 1×10^{-7} cm/sec and thickness of 30 mil) with the requirements in 78.56(a)(8-10). Unfortunately, those paragraphs do not provide specific permeability or liner thickness, just "structurally sound and impermeable". The requirements for disposal pits should certainly be as strict as the requirements for temporary storage pits. (852a)

Response: Subsections 78.56(a)(8-10) do provide specific permeability and liner thickness specifications. The requirements for disposal pits are appropriate.

- 1569.** Comment: Landfills should not be located within 20 inches of a drinking water supply. It is somewhat ironic that Act 13 establishes setback requirements of hundreds of feet between a well that has multiple liners of steel and concrete between pollutional materials in the well and surface waters, and at the same time the Department allows residual waste to be disposed 20 inches above seasonal high groundwater on which Pennsylvanians depend for drinking water. The Department should end this practice, but if it does not, then it should either increase the distance protecting fresh drinking

water or explain in the preamble to its regulations the scientific basis for assuming that twenty inches of soil will protect groundwater. (852a)

Response: The 20 inch separation requirement allows for a physical barrier between the seasonal high groundwater table and the bottom of the impoundment to prevent intermingling of encapsulated pit and groundwater. Remediation of potential leaks from encapsulated pits by the soil is not expected due to the nature of the waste generally contained in encapsulated pits.

1570. Comment: Pit specifications for drill cuttings from below the casing seat must be clarified. Section 78.61(c)(1) refers to the original requirements of section 78.62(a)(5) - (18), some parts of which have been changed or do not exist with respect to liner requirements. The rule does not provide direction to appropriate liner requirements in the remaining proposed language. (852a)

Response: The final rulemaking contains the correct cross-references.

1571. Comment: Burying of frac waste on site or of drill cuttings should end completely and carry a fine of no less than \$ 500,000. (806)

Response: The burial of drill cuttings from unconventional operations is prohibited. Burial of drill cuttings from conventional operations has been conducted for many years without reported impacts on health and safety or the environment.

1572. Comment: There is no public notice of where these sites are located, no transparency about what is disposed in these sites, the sites are allowed to be located 20 inches above fresh drinking water, and there is no long term monitoring to ensure that the sites are not leaking. These protections are inadequate.

It is true that the Department establishes limits for the concentration of various pollutants that can be in this waste. For example, the waste cannot contain pollutants in concentrations that exceed 50% of what would make the waste hazardous for toxicity. But these limits miss the mark. First, the limits are only as good as the testing protocols, and these regulations contain no requirements that the test be representative and performed according to accepted protocols. Second, there is no oversight requirement associated with the testing. The operators are free to ignore the regulations, and the burden would be on the agency to dig up these sites after the fact, sample them, and prove that the operator engaged in unlawful activity to enforce the standards. In other words, the requirements look nice, but as a practical matter the Department is not capable of enforcing the requirement.

I no other person, and few other industries are offered this convenience. Even the power industry must dispose of its fly ash in double-lined landfills with long-term monitoring and closure plans. I have seen the state prosecute individuals for dumping or burying household trash, or construction and demolition debris, and yet it officially sanctions this industry disposing of its residual waste at its construction site. This would be similar to the agency enacting a regulation allowing steel mills or dry cleaners to dig holes and bury their residual waste on their back forty.

What is worse, the DEP knows that many well-site disposal pits have leaked in recent years, contaminating surface and groundwater across Pennsylvania. When events in West Virginia recently reminded us of the importance and value of our clean water supplies, why would we promote this risky behavior? It is time that the Department cease allowing this method of waste

disposal to continue. They would not allow you to do it. They would not allow mom-and-pop businesses to do it. They should not allow it at oil and gas well sites.

At the very least, the DEP should (1) require DEP, and landowner and the public be notified where these sites will be located; (2) require that sampling of the waste be representative and results submitted to the agency before disposal occurs; and (3) require long-term groundwater monitoring. (852)

Response: See response to comment 1493.

§ 78.63 Disposal of residual waste – land application

1573. Comment: 78.63(a)(1) – Commentator questions the legality and scientific basis for the blanket prohibition of land application of residual waste generated by hydraulic fracturing of unconventional wells and solid waste generated by processing of fluids pursuant to § 78.58. Land application should be permitted if the waste meets the requirements of Section 78.63(b). Benefits would include conservation of landfill space and reduced heavy traffic on local communities.

Suggested Regulatory Language:

(1) The residual waste is generated by the drilling or stimulation of an oil or gas well that is located on the well site. Residual waste generated by hydraulic fracturing of unconventional wells and residual waste generated by processing pursuant to § 78.58, may not be disposed of on the well site unless it meets the requirements of § 78.63(b). (1153)

Response: See response to comment 1504.

1574. Comment: 78.63 – We support the EQB’s proposal to prohibit land disposal of solid waste generated by hydraulic fracturing of unconventional wells or processing of fluids under § 78.58. (1143)

Response: The Department acknowledges the comment.

1575. Comment: We oppose the land application of any other oil and gas waste, and we do not support the EQB’s proposal to allow the land application of residual waste (including contaminated drill cuttings).

We also do not support the distinction made here between unconventional and other oil and gas wells; this rule should apply to all wells in Pennsylvania.

We oppose the long-term onsite burial of any waste contaminated with chemicals, oil, grease, pollutorial materials, regulated substances, water based drilling muds that contain chemical additives, oil-based drilling muds, polymer-based drilling muds containing mineral oil lubricants, NORM, TENORM, mercury, heavy metals, or any other chemical additives or toxins.

We recommend that § 78.63 be revised as follows:

§ 78.63. Disposal of residual waste prohibited—land application.

The owner or operator is prohibited from disposing of any waste from Oil and Gas Operations by land application. (1143)

Response: This section of the Chapter 78 has remained largely unchanged since 1989 and the Department has allowed the disposal of residual wastes including land application of contaminated drill cuttings at conventional well sites since that time without significant harm to public health and safety or the environment. As long as the requirements in § 78.63 are met, including the leachate analysis requirements in § 78.63(b), the disposal of residual wastes including contaminated drill cuttings via land application at conventional well sites is reasonable and appropriate to ensure adequate protection of public health and safety and the environment. Conversely, the Department does not believe that the regulatory requirements originally promulgated in § 78.63 are sufficiently protective when applied to unconventional wells and well sites and the wastes generated thereby. Consequently, the Department has revised § 78a.63 to require operators of unconventional wells to obtain a permit from the Department prior to disposing of residual wastes including contaminated drill cuttings via land application at unconventional well sites.

1576. Comment: Amend subsection (a)(5) to allow Registered Small Businesses to submit notice via the telephone. (1135)

Response: The Department does not believe that the requirement to notify the Department electronically through its website poses an undue hardship on small business. Regarding electronic submission of reports and notifications, see response to comment 891.

1577. Comment: Collection and analysis of chemical waste samples that are intended to be disposed of onsite needs to be a mandatory requirement. The draft regulations leave this to the discretion of the operator, which should not be permitted. This is particularly important where a disposal site does not need to be inspected by the agency prior to closure, and there is no provision for long term monitoring of ground water. (19, 21, 26, 90, 142, 165, 180, 181, 189, 192, 391, 843, 851, 868, 946, 958, 1005)

Response: The Department disagrees and believes that disposal of residual wastes including contaminated drill cuttings at the well site that meet the requirements specified in §§ 78.62(b) and 78.63(b) do not present a health and safety or environmental concern. Chemical analysis must be conducted in order to demonstrate compliance with these requirements.

1578. Comment: 78.63(a)(1) – There is no scientific reason for PA DEP to not allow land application of drill cuttings from Unconventional wells. The PA DEP should be encouraging the use of drill cuttings to reclaim abandoned strip mines. (92a)

Response: Unconventional well drilling requires the addition of various chemicals to the drilling mud that contaminates the drill cuttings and renders the cuttings unacceptable for land application. Additionally, the volume of drill cuttings produced by drilling unconventional wells makes land application difficult due to the amount of land disturbance necessary to meet the regulatory 1:1 mixing requirement. The use of drill cuttings on abandoned mine lands is beyond the scope of this rulemaking.

1579. Comment: Ban road or land application of drilling waste, whether brine for de-icing, buried drill cuttings, or other such activities. (99, 649)

Response: With regard to drilling waste from unconventional wells, the Department acknowledges the comment. The rulemaking provides provisions that protect health and

safety as well as the environment and encourages the beneficial use of certain drilling wastes, as well as requirements to ensure the safe disposal of certain residual wastes on well sites.

- 1580.** Comment: The Board should deny the Department's proposed revisions to the Chapter 78 oil and gas regulations relating to the disposal and beneficial use of residual waste to the extent that they are contrary to the Solid Waste Management Act and associated regulations. As to the disposal of residual waste at the well site, the commentator urges the Board to act quickly to adopt more protective regulations that are consistent with the Department's solid waste management program, and that are adequate to protect the public and the environment. As to the beneficial use of brine for dust suppression and road stabilization, the Board should deny this proposed revision. The Board has already promulgated regulations that establish a process whereby residual wastes can be approved for beneficial uses. 25 Pa. Code Chapter 287. The Department must utilize this process if it wants to approve the beneficial use of gas well brine for dust control and road stabilization. (1152)

Response: The rulemaking is consistent with section 3273.1 of the 2012 Oil and Gas Act and the Solid Waste Management Act and regulations promulgated thereunder. Section 3273.1(a) exempts an operator from the obligation to obtain a permit and post a bond under the Solid Waste Management Act. Section 3273.1(c) recognizes that the duties or obligations of an owner or operator of a well site under the Solid Waste Management Act are not diminished or otherwise affected by Section 3273.1 The substantive requirements in Sections 78.61-63 and 78a.61-63 are as equally protective as those in the residual waste regulations.

With respect to the beneficial use of brine for dust suppression and road stabilization, the Board is not constrained by the residual waste beneficial use regulations. Chapters 78 and 78a are being promulgated under the authority of the Solid Waste Management Act as well as several other environmental statutes, and therefore additional regulations related specifically to the beneficial use of brine may be included within these Chapters. Section 105(a) of SWMA provides the Environmental Quality Board with the authority to adopt rules, regulations, criteria and standards of the Department to carry out the provisions of SWMA, including those relating to the protection of safety, health, welfare and property of the public and the air, water and other natural resources of the Commonwealth.

- 1581.** Comment: Prohibit the land application of all wastes including topsoil water, pit water, fill, or dredged material. These substances can contain chemicals and sediments bound with pollutants that pose risks to water, air and soil. (17, 18, 19a, 72, 73, 79, 102, 104, 125, 148, 169, 402, 492a, 475, 626, 787, 808, 843, 853a, 884, 909, 926, 938, 939, 947, 1030, 1030a, 1039, 1058, 1064, 1073-1077, 1079-1082, 1084, 1101, 1102, 1148, 1158, 1161, 1168, 4582 – 4584, 4584 – 4650)

Response: See response to comment 1575.

- 1582.** Comment: 78.63(a)(l) - The operator should be allowed to dispose of unconventional solid waste at the well site. What is the scientific basis for not allowing the disposal of this material? Why prohibit on-site disposal from unconventional wells without data and tests to support the prohibition?

78.63(a)(5) - Have the necessary electronic reporting setup in GreenPort prior to the implementation of this section.(411)

Response: Unconventional well drilling requires the addition of various chemicals to the drilling mud that contaminates the drill cuttings and renders the cuttings unacceptable for land application. Additionally, the volume of drill cuttings produced by drilling unconventional wells makes land application difficult due to the amount of land disturbance

necessary to meet the regulatory 1:1 mixing requirement.

The Department will ensure that all electronic notification and reporting systems required by the Chapter 78 and Chapter 78a are operational prior to finalizing this rulemaking.

- 1583.** Comment: 78.63(a)(1): The option of land application at the well site is available providing the operator satisfies the requirements. The waste must be generated at that well site. Residual waste generated by hydraulic fracturing of unconventional wells and generated by processing pursuant to § 78.58 may not be disposed of by land application. We support this provision for adoption as written. (660a)

Response: The Department acknowledges the comment.

- 1584.** Comment: The proposed amendments to this section clarify that solid waste generated by hydraulic fracturing of unconventional wells or processing fluids under § 78.58 may not be disposed of by land application at the well site. However, residual waste, including contaminated drill cuttings, can be disposed of on the well site by land application. The amendments to this section include a new provision that requires the operator to notify the Department 3 business days prior to land application. This notice shall be submitted electronically to the Department through its web site and include the date the residual waste will be disposed. Compliance with this section shall be documented and made available to the Department upon request as well as submitted in the well site restoration report. (566)

Response: The Department acknowledges the comment.

- 1585.** Comment: The commentators do not approve of the use of land application and or disposal of drilling waste at well sites. PA DEP neglected to allow the surface owner to reject this practice on property that is only being leased. Land application should only be allowed if the surface property owner fully agrees with the practice. Please include landowner agreements as part of this practice. It is our understanding that many different constituents are found within each step of gas well development and that all waste should be handled according to contaminated conditions. Landowners are not allowed to contaminate their property in fear of health reasons, nor should the oil and gas industry be allowed to do the same. These practices lead to diminished land values and use. (566)

Response: The rule making provides standards under which the waste can be safely disposed of at the well site. The Department encourages property owners who have concerns with the disposal of residual waste at the well site to negotiate lease restrictions with the operator. The final-form rulemaking contains a requirement that the well operator notify the surface landowner of the waste disposal and the location of land application.

- 1586.** Comment. No wastewater, drill cuttings, or other substances produced on the well site should be applied to land areas. (609, 926, 938a)

Response: See response to comment 1575.

- 1587.** Comment: No burial or land application of drill cuttings. We are creating the opportunity for thousands upon thousands of future “superfund” sites if we allow this toxic and often radioactive waste to be buried on well sites. I don’t want this hidden pollution buried in my community or my backyard or farm field and not near my water supplies! (787, 1030, 1030a, 1064, 1073-1077, 1079-1082, 1084, 1101, 1158, 4584 – 4650)

Response: See response to comment 1575.

1588. Comment: Residual waste/ brine trucks should be marked with hazardous waste signs, numbered and tracked from point to point to ensure delivery to proper facilities. (843)

Response: “Drilling fluids, produced waters and other wastes associated with the exploration, development, or production of crude oil, natural gas or geothermal energy” are solid wastes but not hazardous wastes by definition. Therefore, application of hazardous waste transportation requirements to such wastes is not appropriate. Residual waste transportation is subject to regulation under the Solid Waste Management Act, 35 P.S. § § 6018.101 et seq., the Waste Transportation Safety Act, 27 Pa.C.S. § § 6201 et seq., and Chapter 299 of the Department’s residual waste regulations.

1589. Comment: The use of production fluids and reuse of flowback and produced water should be strictly regulated under RCRA and not be allowed to be used for things like dust suppression on roads. (845)

Response: The rulemaking provides provisions that protect health and safety as well as the environment and encourages the beneficial use of certain drilling wastes.

1590. Comment: As with other regulatory programs (e.g. RCRA), the regulations should provide language that allows the operators to rely on generator knowledge for disposal purposes in lieu of continued chemical analysis of material generated on site. (908)

Response: After a waste stream from a specific source has be characterized, continuous chemical analysis is not required, however, the waste stream must be monitored to ensure it has not changed.

1591. Comment: The DEP should be responsible for testing of the chemical content and radioactivity of all frack waste. No wastewater or drill cuttings should be applied to land areas. (912)

Response: The Department does not have the financial resources available to conduct testing of all hydraulic fracturing wastes. When testing is required the operator is responsible for the cost of testing through an accredited independent third party laboratory. See response to comment 1575.

1592. Comment: Residual waste disposal on roads and land is not a beneficial use and common sense says that this is what happened at Times Beach, MO years ago and the disposal of residual waste from gas and oil development has many of the same problems. It spreads the waste far afield but byproduct wastes can pollute waterways and landscapes in a more significant manner than other residual wastes. DEP regulations must ensure that land spreading does not result in contamination of soil, vegetation, and groundwater, particularly near drinking water supplies, streams, and rivers. (916)

Response: See response to comment 1575. Brine spread on roads must meet specific chemical parameters and be applied at appropriate rates and in appropriate locations to ensure protection of public health and safety and the environment.

1593. Comment: Disposal of liquid and solid waste is of major concern. First, the application of brine on roads is a public health issue for those living near where this occurs. Transfer of toxic materials

into areas where children and the elderly are exposed will increase their risk of developing illness associated with chemical exposure. The addition of compounds such as barium, strontium, radium 226 and unidentified chemicals used in the gas drilling process only increase the negative impact this runoff has on our rivers and streams. Disposal of brine, drill cuttings and residual waste exclusively in hazardous waste approved facilities is critical to protect public health. DEP's current "beneficial use" policy allowing drill cuttings and residual waste to be solidified and used as odor cover in municipal landfills is an unsafe practice. Allowing toxic materials admittance to a municipal landfill will most certainly lead to negative health impacts for residents on adjacent properties who are breathing the now contaminated air. Additionally, there is potential for contamination of public water from landfill leachate lines which are attached to municipal water authorities and or waste treatment facilities. These authorities do not have the proper equipment to filter out contaminants should they enter the leachate. If a landfill liner becomes compromised there is also the potential for private water supplies to become polluted through groundwater contamination. Land application or burial in a location other than a hazardous waste facility should not be allowed for these toxic materials. (919, 943)

Response: The rulemaking provides provisions that protect health and safety as well as the environment and encourages the beneficial use of certain drilling wastes. Sections 78a.62(a) and 78a.63(a) prohibits the disposal of residual wastes generated by hydraulic fracturing of unconventional wells and residual waste generated by processing residual waste from hydraulic fracturing of unconventional operations. Land application or burial on the well site is not allowed unless established contaminant parameters are met. See response to comment 1575. The issues raised by the commentator regarding off-site management of residual wastes are beyond the scope of this rulemaking.

- 1594.** Comment: The US EPA is aware of the risks involved with fracking wastes. A confidential Environmental Protection Agency draft document on the environmental impacts of the oil, gas and coal industries was obtained by the New York Times. It shows that federal authorities are concerned about public drinking water supplies especially in the regions of the Marcellus Shale. According to the E PA, "As oil and gas development encroaches on suburban and urban areas, human health and environmental impacts are expected to escalate." The document cites waste disposal as the main "bottleneck for the industry." The study was provided to The Times by an EPA official who said it shows that dilution of drilling waste does not always succeed in eliminating the health risks posed by that waste. The study is marked confidential and was conducted on behalf of the American Petroleum Institute in 1990. It found a potential increased risk of cancer among people who often eat fish from waters where drilling waste is discharged. The study is relevant because state regulators in Pennsylvania have said that dilution is effectively removing the risks posed by drilling waste that is discharged into rivers. Importantly, this study found an increased risk of cancer when drilling waste was dumped into a body of water that was larger than Pennsylvania Rivers. Furthermore, state records indicate that the radium levels found in Pennsylvania wastewater are much higher than those used in this study.

In a study by the Pennsylvania Department of Environmental Protection on Marcellus Shale wastewater discharge to the South Fork Tenmile Creek in Southwest Pennsylvania, state regulators concluded that even after treatment plants reduced the amount of hydro fracking wastewater that they were accepting, the water discharged from these treatment plants still had a negative impact on aquatic life in the streams that received the discharge." (926)

Response: Chapter 78 does not authorize discharges to surface waters. The issues raised by the commentator are beyond the scope of this rulemaking. The events in South Fork Tenmile Creek as described in the comment occurred in 2008-2009. The Department has since taken

action to rectify this situation and others like it.

- 1595.** Comment: The regulations should include a comprehensive waste management system such as that adopted under Subtitle C of the federal Resource Conservation and Recovery Act. Although the RCRA program now has limited application to the oil & gas industry at the federal level, there is no restriction in federal law that precludes a state from applying more stringent waste management requirements. It is essential that there be a true “cradle to grave” waste management program applicable to oil & gas development. (930)

Response: The comment is beyond the scope of this rulemaking.

- 1596.** Comment: The standards state that residual waste including contaminated drill cuttings may be disposed of on site. This is unacceptable for this or any industry. The storage of contaminated (to any degree) including radioactive drill cutting should be prohibited

Presently, the tracking industry is exempt from the regulation of hazardous substances that other industries must abide by. Those standards should be applied to all aspects of the storage, transport, and use of hazardous materials contained in pits, centralized impoundments, and tanks. Because Marcellus shale is more radioactive than other shale plays, the drill cuttings can be more radioactive, as evidenced by alarms activated at waste disposal sites and the high measurement of radioactivity in a study downstream from the Josephine Treatment Plant in Indiana County which treats wastewater from oil and gas drilling. Radium levels of sediment samples collected in Blacklick Creek, downstream from the plant, were 200 times greater than background samples. Researcher Vengosh noted that levels exceed thresholds for radioactive waste disposal and pose “potential environmental risks of radium bioaccumulation in localized areas of shale gas wastewater disposal.” There is no mention that evidence of positive radioactivity or chemical toxicity tests precludes the storage of drill cuttings in a pit or on-site burial. (938)

Response: The Department’s 2015 TENORM Study Report presented several observations and recommendations regarding radioactive material associated with the oil and gas industry. While the study outlines recommendations for further study, it concluded there is little potential for harm to workers or the public from radiation exposure due to oil and gas development. The Report also observed that there is little potential for radiological exposure to workers or members of the public from the handling, hauling, and temporary storage of vertical and horizontal drill cuttings on natural gas well sites. In addition, the 2015 TENORM Study Report concluded that there is little potential for radiological exposure to workers or members of the public from sediment-impacted soil at publically owned treatment works (POTWs) that have received wastewater from the oil and gas industry and at centralized wastewater treatment plants (CWTs) that treat wastewater from the oil and gas industry. The 2015 TENORM Study Report also observed that there is a radiological environmental impact to soil from the sediments from these POTWs and CWTs. The Report recommended that the Department: 1) conduct additional radiological sampling and analyses and radiological surveys at all POTWs and CTWs accepting wastewater from oil and gas operations to determine if there are areas of contamination that require remediation; 2) determine if it is necessary to establish radiological effluent discharge limitations; and 3) determine if the development and implementation of a spill policy is necessary. The Department remains committed to protecting the public from unnecessary exposure to radiation and is actively pursuing the recommendations of the 2015 TENORM study report. Section 78.58(d) requires an operator processing fluids onsite to develop a radiation protection action plan which specifies procedures for monitoring and responding to radioactive material produced by the

treatment process. This section also requires procedures for training, notification, recordkeeping, and reporting to be implemented.

1597. Comment: Residual contaminated waste is only properly disposed of at centralized permitted landfills. We need to have our environment protected from multiple mini contaminated landfills. Contaminated wastes need to be properly monitored for leaching and affecting private rural water supplies. That is best done at centralized landfill locations. (1035)

Response: See response to comment 1575.

1598. Comment: § 78.63 Disposal of Residual Waste – Land Application § 78.63(a)(1) – We have similar concerns as those described above under § 78.62(a)(1). There are, however, some differences we note. In § 78.62(a)(1), “residual waste is generated by the drilling or stimulation of an oil or gas well.” (emphasis added) In § 78.63(a)(1), “residual waste is generated by the drilling of an oil or gas well.” Absent a definition for residual waste, we don’t understand how these two sections can be different. In § 78.62(a)(1), “solid waste generated by hydraulic fracturing of unconventional wells and solid waste generated by processing of fluids pursuant to § 78.58, may not be disposed of on the well site.” In § 78.63(a)(1), “residual waste generated by hydraulic fracturing of unconventional wells and residual waste generated by processing pursuant to § 78.58, may not be disposed of by land application.” Please clarify the reasons for the differences in these comparable sections. As we note elsewhere, definitions for waste, solid waste and residual waste would aid greatly in our understanding of the Commonwealth’s intent. (1062, 1133)

Response: See response to comment 1536.

1599. Comment: The Proposed Regulations should also ban the disposal of residual waste by land application at the well site. *See* § 78.63.

Certain oil and gas exploration and production wastes, including drilling fluids and drill cuttings, are exempt from the United States Environmental Protection Agency (the “EPA”) hazardous waste regulations, promulgated under the authority of Resource Conservation and Recovery Act (the “RCRA”), Subtitle C. Otherwise, the waste disposal methods provided for under §§ 78.61-78.63 of the Proposed Regulations would be prohibited by federal law. The decision in *Robinson Township* established that under the ERA, the Commonwealth is a trustee of Pennsylvania’s public natural resources. The court reasoned that, “[a]s a fiduciary, the Commonwealth has a duty to act toward the corpus of the trust – the public natural resources – with prudence, loyalty, and *impartiality*.” *Robinson Township* at 38 [emphasis added]. The *impartiality* element of this duty should preclude the Commonwealth from promulgating regulations which enable oil and gas operators to take advantage of the aforementioned federal hazardous waste exceptions. The Commonwealth cannot be said to act impartially toward Pennsylvania’s public natural resources by permitting an oil or gas well operator to dispose of the hazardous waste it generates by methods that are prohibited for other industries operating in Pennsylvania. (1070)

Response: Pursuant to federal law, 40 CFR § 261.4(b)(5), drilling fluids, produced waters, and other wastes associated with the exploration, development, or production of crude oil, natural gas or geothermal energy are excluded from being managed as hazardous waste. However, although the Department has incorporated that exclusion into its hazardous waste regulation by reference, under Pennsylvania law, these materials are still considered a solid waste. Despite the federal exemption, these materials are regulated as residual waste in the Commonwealth.

Residual waste is defined in the Solid Waste Management Act, 35 P.S. Sections 6018.101 et seq. and residual waste regulations, 25 Pa. Code Chapter 287, to include wastes from industrial activities. The activities authorized in § 78.63 are in compliance with the SWMA. This section of the Chapter 78 has remained largely unchanged since 1989 and the Department has allowed the disposal of residual wastes including land application of contaminated drill cuttings at conventional well sites since that time without significant harm to public health and safety or the environment. As long as the requirements in § 78.63 are met, including the leachate analysis requirements in § 78.63(b), the disposal of residual wastes including contaminated drill cuttings via land application at conventional well sites is reasonable and appropriate to ensure adequate protection of public health and safety and the environment consistent with Article I, Section 27 of the Pennsylvania Constitution. Conversely, the Department does not believe that the regulatory requirements originally promulgated in § 78.63 are sufficiently protective when applied to unconventional wells and well sites and the wastes generated thereby. Consequently, the Department has revised § 78a.63 to require operators of unconventional wells to obtain a permit from the Department prior to disposing of residual wastes including contaminated drill cuttings via land application at unconventional well sites. Amended § 78.63 is reasonable and appropriate and effectively implements Article I, Section 27.

- 1600.** Comment: 78.63(a)(21) requires the owner or operator to remediate the land application area until compliance is demonstrated, if the additional analysis, including soil surveys, monitoring and chemical analysis, fails to show compliance with the loading and application rate of waste consistent with DEP guidelines. However, there is no explicit timeframe by which the additional analysis must take place, or when the owner and operator must come into compliance. Leaving the remediation of contaminated soils for an unknown period of time will increase the risk of pollution to streams and impacts on aquatic life. (1157)

Response: The time needed for remediation of contaminated soils may vary from site to site. The Department will require remediation of contaminated soils as expeditiously as possible and establish a site specific timeframe for compliance for each instance. Establishing a generalized timeframe for compliance that is not site specific may result in contamination being in place longer than necessary.

- 1601.** Comment: Commentator opposes the disposal of residual waste, including contaminated drill cuttings, by land application. Before disposing of residual waste by land application, an operator or owner should be required to test the waste material, above and beyond the testing requirements of § 78.63(b), for naturally occurring radioactive material (NORM) levels. If NORM is found, then the residual waste materials should not be permitted to be disposed of by land application. (1157)

Response: See response to comment 1575. The testing requirements in subsection (b) include testing for TENORM and establish criteria for several TENORM constituents. The Department's 2015 TENORM Study Report presented several observations and recommendations regarding radioactive material associated with the oil and gas industry. While the study outlines recommendations for further study, it concluded there is little potential for harm to workers or the public from radiation exposure due to oil and gas development. The Report observed that there is little potential for radiological exposure to workers or members of the public from the handling, hauling, and temporary storage of vertical and horizontal drill cuttings on natural gas well sites and recommended that the Department conduct research and investigation of vertical and horizontal drill cuttings for beneficial use, onsite disposal, and future landfill disposal protocols. The Department remains committed to protecting the public from unnecessary exposure to radiation and is actively

pursuing the recommendations of the 2015 TENORM study report. Landfill disposal is regulated under the Solid Waste Management Act and is outside of the scope of this rulemaking. .

- 1602.** Comment: All liquid and solid waste must be monitored for all relevant forms of radiation and readings must appear clearly on current labels in at least the following conditions:
- (1). All temporary and permanent impoundments, storage tanks, pits, that collect discharges from wells must be tested at least quarterly.
 - (2) All liquid and solid materials transported to permanent sites such as landfills and injection wells, must be tested and clearly labeled, regardless of whether the destination state requires such labeling. (609, 938, 938a)

Response: Regarding (1), § 78.58(d) requires an operator processing fluids onsite to develop a radiation protection action plan which specifies procedures for monitoring and responding to radioactive material produced by the treatment process. This section also requires procedures for training, notification, recordkeeping, and reporting to be implemented.

Regarding (2), testing and labeling requirements for transportation of radioactive materials are outside of the scope of this rulemaking.

- 1603.** Comment: DEP should set standards for radiation monitor alarm set points. Trucks carrying above a certain limit must go to sites designated for radioactive waste.
Trucks below a certain radiation limit and volume might be allowed at a landfill site if the landfill meets at least the following features:

- i. The intensity and volume of radioactive substances in the landfill has not already reached a pre-determined limit set by the DEP, and verified by a third independent party.
- ii. The amounts of radioactivity and volumes are publically disclosed on a quarterly basis.
- iii. Residents within a 5 mile radius of the landfill are informed annually of the radioactivity status
- iv. The landfill monitors radiation on landfill perimeters and in storm run-off and streams nearby on at least a quarterly basis.
- v. The landfill leachate does not move the radioactivity to sites other than those designed for radioactivity. For example, the landfill cannot send radioactive leachate to municipal waste water treatment plants. (609, 938, 938a, 944)

Response: The issues raised by the commentator regarding offsite management of wastes are beyond the scope of this rulemaking.

- 1604.** Comment: Section 78.63 proposes allowance of residual waste using land application techniques if the toxicity requirements of 40 CFR § 261.24 are met. No reference is made to any MCL or health advisory limits for the material itself or for its leachate component. We recommend requiring testing for base material and leachate components prior to allowing land application of any drilling cuttings or byproducts of the operation. We recommend that the Department use land application of generally innocuous materials, but to require used of lined pits for storage of drilling waste materials that could pollute water sources. (1138)

Response: See response to comment 1575.

- 1605.** Comment: There should be strict regulation regarding the disposal of brine, drill cuttings and other residual waste from drilling. Fracking operators should have to follow the regulations imposed on

other industries regarding hazardous waste. After all, returned fracking fluid contains radioactive elements, benzene and other toxic chemicals, and brine. Brine should not be used for dust suppression or road de-icing due to the possibility the chemicals it contains will be dispersed into the air. Nor should residual waste be used as fill material for any purpose. (1146)

Response: See response to comment 1575.

- 1606.** Comment: 78.63(a)(2)-(3) – The changes here reflect the references to Act 13 which are needful. We therefore, recommend their adoption at the minimum as is written. (660a)

Response: The Department acknowledges the comment.

- 1607.** Comment: 78.63(a)(5) – The proposal also provides for a three day advanced notification prior to pit disposal which may allow for adequate planning for the Department’s staff to be onsite and perform an inspection of the work. Therefore, we do recommend both provisions for adoption. (660a)

Response: The Department acknowledges the comment.

- 1608.** Comment: 78.63(a)(20) – The proposal incorporates 25 Pa. Chapter 102. We support consistency across the code and recommend this provision for adoption. (660a)

Response: The Department acknowledges the comment.

- 1609.** Comment: 78.63(19)-(21) – To determine compliance with this section, the Department may require the owner or operator to conduct soil surveys, monitoring or chemical analysis.

We support appropriate and reasonable oversight that ensures that the land application is in compliance. We recommend this provision for adoption at a minimum as is written. (660a)

Response: The Department acknowledges the comment.

- 1610.** Comment: 78.63(a)(21) – We are recommending the same language as is noted in 78.62(b)(1-4) as a point of consistency with disposal of contaminated residual waste including drill cuttings. Additionally, we request that our previous comment above for 78.62 regarding contaminated residual waste and arsenic be also considered in response to this provision. (660a)

Response: See response to comment 1604.

- 1611.** Comment: 78.63(21)(c) – The owner or operator may request to dispose of residual waste, including contaminated drill cuttings, in an alternate manner from that required in subsection (a) by submitting a request to the Department for approval. The request shall be made on forms provided by the Department and shall demonstrate that the practice provides equivalent or superior protection to the requirements of this section.

We want to be clear that in absence of oversight that would normally occur in a landfill situation related to contaminated residual waste disposal including drill cuttings, that we prefer regulated landfill disposal and strongly discourage the Department from approving alternate disposal requests for contaminated residual wastes including drill cuttings. Our concerns lie with protecting our water resources and a variance of oversight in the manner in which landfilled contaminated residual waste is handled as compared to contaminated residual wastes, including drill cuttings as generated by the

oil and gas industry. There needs to be a consistency of not only regulations, but also, oversight and on-going monitoring of contaminated residual waste regardless of the disposal locations. More consistency and ease of monitoring is available at centralized locations and we advocate to that end. (660a)

Response: The Department acknowledges the comment.

§ 78.64 Containment around oil and condensate tanks

- 1612.** Comment: § 78.64 and § 78.64a – These sections require secondary containment “sufficient to hold the volume of the largest tank, plus an additional 10% of volume for precipitation.” Considering the likelihood of extreme weather events coupled with the possibility of events resulting in the rupture of more than one tank in any given secondary containment area, we suggest the Department adopt a standard of requiring a secondary containment “with the sufficient perimeter and height to hold 1.5 times the volume of the largest tank.” This enhanced requirement will better protect lands and waters of the Commonwealth and adjacent areas and has long been employed by the National Park Service for nonfederal oil and gas operations conducted under our regulations found at 36CFR Part 9B. (1062, 1133)

Response: If secondary containment is properly designed, constructed, maintained and operated in compliance with these regulations, the Department believes the volume of the largest tank plus an additional 10% of volume for precipitation secondary containment capacity requirement is adequate to protect the environment.

- 1613.** Comment: § 78.64: We request clarification on whether the listed requirement applies to all existing operations or only new operations? We suggest this more protective standard be required of both existing and new drilling operations. (1062, 1133)

Response: The subsections apply to all new, refurbished or replaced tanks or other above ground containment structures approved by the Department. Section 78.64 has applied to oil tanks since 1994. This section expands those requirements to also address condensate tanks. The Department has added a phase-in period for existing condensate tanks to meet the new standards.

- 1614.** Comment: Regulations for containment around oil and condensate tanks must be strengthened based on recent experiences in West Virginia. (1093, 1098)

Response: The Department acknowledges the comment.

- 1615.** Comment: Recent Marcellus Shale history has provided reason to extend this provision to include condensate tanks. Appropriate secondary containment is reasonable and an excellent precautionary measure to adequately protect our water resources. The results of what happens when inadequate containment is relied upon around condensate tanks is detailed in the attached occurrence from one site operated by Cabot in West Virginia. This is relevant as we have seen, corporate personalities are not state specific; they do cross lines especially when regulations prove to be less than a floor and insufficient to effectively address environmental impacts or adequately protect water resources. Please refer to attached – Condensate Spill – lacking secondary containment 2026EA. In this case, lacking adequate secondary containment, the soil, nearby ditch became contaminated by brine and petroleum. Please refer to the attached environmental assessment for further details. We recommend this provision be adopted as written. (660a)

Response: The Department acknowledges the comment.

- 1616.** Comment: **78.64(a)** – The commentator contends that the 660 reference is an antiquated number which was changed in the Federal Spill Prevention and Counter Control regulations several years ago. To maintain consistency between federal and state, Commentator recommends the language read “If an owner or operator uses a tank with a combined capacity of at least 1320 gallons...” (1071)

Response: The Department agrees changes should be made to reflect the current regulatory language. The Department has deleted “a tank with a capacity of at least 660 gallons” from the subsection.

§ 78.64a Containment systems and practices at unconventional well sites

- 1617.** Comment: 78.64a -There should be a clear definition of what the term “stored” means for clarification of Act 13. It had been discussed during Department training for Act 13 implementation webinars that individual fuel tanks on equipment were not considered “stored”; however, the way this section is worded, individual fuel tanks would need to be contained. (411)

Response: The section is very specific as to when secondary containment systems must be used.

- 1618.** Comment: § 78.64a: We also request clarification on whether the listed requirement applies to all existing operations or only new operations? We suggest this more protective standard be required of both existing and new drilling operations. (1062, 1133)

Response: Section 78a.64a pertains to the provisions required under section 3218.2 of the 2012 Oil and Gas Act. Secondary containment is required to be installed on the well site during both drilling and hydraulic fracturing operations, regardless if the operation is existing or new.

- 1619.** Comment: 78.64a – We support proposals to improve containment systems and practices. Overall, this new section provides a number of positive spill prevention requirements. We do, however, have some recommendations for improvement.

Foremost, we recommend that containment systems and practices should be improved at all oil and gas operations, not just unconventional well sites, and the containment systems should be impervious and impermeable. The proposed regulation would allow some permeability through the containment liner, albeit a small coefficient of permeability is proposed. However, we request that no amount of leakage be allowed. Containment systems should be “leak proof.”

When a containment system is damaged, the operator should be required to immediately remove regulated substances from that damaged containment system.

We recommend that § 78.64a be revised as follows:

§ 78.64a. Containment systems and practices at Oil and Gas Operations.

(a) This section applies to all Oil and Gas Operations.

(b) All Oil and Gas Operations shall be designed and constructed using containment systems and practices that prevent spills of regulated substances to the ground surface and to prevent spills

from leaving the Oil and Gas Operation.

(c) All regulated substances, including solid wastes and other regulated substances in equipment or vehicles, shall be managed within a containment system. This subsection does not apply to fuel stored in equipment or vehicle fuel tanks unless the equipment or vehicle is being refueled at the well site.

(d) Pits and centralized impoundments that comply with this chapter are deemed to meet the requirements of this section.

(e) Containment systems must meet all of the following:

(1) A containment system must be used at the Oil and Gas Operation when any equipment that will be used for any phase of drilling, casing, cementing, hydraulic fracturing or flowback operations is brought onto a well site and when regulated substances including drilling mud, drilling mud additives, hydraulic oil, diesel fuel, hydraulic fracturing additives, chemicals, or flowback are brought onto or generated at the Oil and Gas Operation.

(2) A containment system must be impervious and impermeable.

(3) The physical and chemical characteristics of all liners, coatings or other materials used as part of the containment system, that could potentially come into direct contact with regulated substances being stored, must be compatible with the regulated substance and be resistant to physical, chemical and other failure during handling, installation and use. Liner compatibility shall satisfy ASTM Method D5747, Compatibility Test for Wastes and Membrane Liners, or other more stringent standards as approved by the Department.

(f) An operator shall utilize secondary containment when storing additives, chemicals, oils or fuels, or regulated substances. The secondary containment must have sufficient containment capacity to hold the volume of the largest container within the secondary containment area plus 10% to allow for precipitation, unless the container is equipped with individual secondary containment such as a double walled tank. Where double-walled tanks are used, a secondary containment liner must be placed under all valves, flanges, and connection points to capture potential leaks. Tanks that are manifolded together shall be designed in a manner to prevent the uncontrolled discharge of multiple manifolded tanks. A well site liner that is not used in conjunction with other containment systems does not constitute secondary containment for the purpose of this subsection.

(g) Subsurface secondary containment systems may be employed at the Oil and Gas Operation. Subsurface secondary containment must meet the following requirements:

(1) Subsurface secondary containment systems must be impervious, impermeable and have sufficient strength and thickness to maintain the integrity of the containment system. The thickness of a subsurface containment system must be at least 30 mils. Adjoining sections of the subsurface containment system must be sealed together, in accordance with the manufacturer's directions, to prevent leakage. All seams of the adjoining sections shall have their integrity tested prior to being covered.

(2) Subsurface secondary containment systems must be designed to allow for the management or removal of stormwater.

(3) Subsurface secondary containment systems must be designed and installed in a manner that prevents damage to the system by the sub-base or the movement of equipment or other activities on the surface.

(4) Subsurface secondary containment systems may not be used to store regulated substances.

(5) A written standard of operational procedure for the inspection, maintenance and repair of the subsurface secondary containment system shall be included in the preparedness, prevention and

contingency plan.

(h) The operator shall submit a report to the Department documenting compliance with § 78.64 within 30 days of installation of the containment system and at least 14 days prior to operation. The Department shall make the report available to the public on the Department's website within 7 days. All surface containment systems shall be inspected weekly to ensure integrity. If the containment system is damaged or compromised, the well operator shall immediately repair the containment system. If the containment system cannot be immediately repaired, all regulated substances must be removed from the containment system and removed from the site, or placed in another on-site containment system that has not been damaged. The operator shall maintain records of any repairs until the containment system is restored. Stormwater shall be removed as soon as possible and prior to the capacity of secondary containment being reduced by 10% or more.

(i) Regulated substances that escape from primary containment or are otherwise spilled onto a containment system shall be cleaned up and removed within 24 hours. After removal of the regulated substances the operator shall inspect the containment system. A Department approved leak detection system capable of rapidly detecting a leak shall satisfy the requirement to inspect the integrity of a subsurface containment system. Groundwater monitoring wells do not constitute a leak detection system for the purpose of this subsection. If the containment system did not completely contain the material, the operator shall notify the Department, all regulated substances shall be removed from the containment system and removed from the site, or placed in another on-site containment system that has not been damaged, and the operator shall immediately remediate the affected area in accordance with § 78.66 (relating to reporting and remediating releases).

(j) Stormwater that comes into contact with regulated substances stored within the secondary containment area shall be managed as residual waste.

(k) Inspection reports and maintenance records shall be available at the well site for review by the Department, shall be submitted to the Department annually, and shall be made available to the public on the Department's website within 7 days.

(l) Documentation of chemical compatibility of containment systems with material stored within the system shall be provided to the Department upon request. (1143)

Response: Section 78a.64a pertains to the provisions required under section 3218.2 of the 2012 Oil and Gas Act, which was written specifically for secondary containment at unconventional well sites.

1620. Comment: 78.64a: The requirement with respect to "regulated substances" is overly broad. Act 13, specifies a list of six materials that must be in containment systems when stored on unconventional well sites. See Section 3218.2(c).

Suggested amendatory language:

(b) Well sites shall be designed and constructed using containment systems and practices that prevent spills of regulated substances to the ground surface and to prevent spills from leaving the well site during drilling and hydraulic fracturing operations.

(c) Containment systems shall be used when drilling mud, hydraulic oil, diesel fuel, drilling mud

additives, hydraulic fracturing additives, or hydraulic fracturing flowback is stored on an unconventional well site. This subsection does not apply to fuel stored in equipment or vehicle fuel tanks unless the equipment or vehicle is being refueled at the well site. (1071, 1137, 1147, 1153, 1174)

Response: The Department acknowledges that §3218.2(c) does list six materials that require use of containment systems when stored on an unconventional well site but disagrees with the comment. Section 402(a) of the Clean Streams Law (35 P.S. §691.402(a)) states that whenever the Department finds that any activity creates a danger of pollution of the waters of the Commonwealth or that regulation of the activity is necessary to avoid such pollution, the Department may, by rule or regulation, establish the conditions under which such activity shall be conducted.

1621. Comment: § 78.64a improperly allows an operator to install a leak detection system in lieu of inspection or repair, even after regulated substances are known to escape containment. Whether or not leak detection systems are required, both repairs and cleanup should be mandatory after a discovered leak. (997a)

Response: The Department agrees that both repairs and cleanup are necessary after a discovered leak. Section 78a.64a(e) requires that the well operator repair the containment system if it is found to be damaged or compromised. Section 78a.64a(f) requires the removal of regulated substances and then an inspection of the secondary containment to ensure its integrity. The language allowing a leak detection system in lieu of the inspection requirement has been removed from the rulemaking language.

1622. Comment: 78.64a – (a) This section shall only apply to unconventional well sites. (1057)

Response: The Department acknowledges the comment. This section is only included in the unconventional Chapter of the final-form rulemaking.

1623. Comment: 78.64a(c) - This subsection should only apply to regulated substances and solid wastes in equipment or vehicles used directly for the phases of drilling, casing, cementing, hydraulic fracturing, or flowback. The operator should not have to contain individual fuel or hydraulic oil tanks on individual equipment or vehicles (in order to operate) regardless of whether they are refueled or not. An example is an individual pump truck should not need to be contained but an acid transport truck would since the acid is used in the actual hydraulic fracturing process. (869a)

Response: Secondary containment is necessary to help prevent spills of regulated substances to the ground surface and escaping the well site. See response to comment 1620.

1624. Comment: We recognize the need to regulate unconventional wells differently and more stringently than conventional ones [78.64a]. All pits and centralized impoundments should be prohibited. Only closed tanks should be used for all polluttional materials – including fuel [78.64a (c)] and non-regulated wastes of unknown composition. Our comments concerning containment and practices for conventional wells are also applicable to unconventional wells. Greater expectations are placed on operators to provide written standards of operational procedures, but they are not site specific. (1093, 1098)

Response: The Department acknowledges the comment.

1625. Comment: 78.64a(c): Section 3218.2(c) of Act 13 lists six specific substances that must be stored

in containment systems. This subsection broadens the scope of that statutory list to include “all regulated substances, including solid wastes and other regulated substances in equipment or vehicles.” How is this expansion consistent with the intent of the General Assembly and Act 13? What is the need for this requirement? We ask EQB to explain in the Preamble and RAF of the final-form regulation how the list in the final-form regulation reasonably and adequately balances protection of the public health and natural resources against the fiscal impact on the oil and gas industry. (1099)

Response: The Department acknowledges that §3218.2(c) does list 6 materials that require use of containment systems when stored on an unconventional well site but disagrees with the comment. Section 402(a) of the Clean Streams Law (35 P.S. §691.402(a)) states that whenever the Department finds that any activity creates a danger of pollution of the waters of the Commonwealth or that regulation of the activity is necessary to avoid such pollution, the Department may, by rule or regulation, establish the conditions under which such activity shall be conducted.

- 1626.** Comment: § 78.64a(d): This section must simply be stricken. Pits and centralized impoundments should only be used to store potable water. (869a)

Response: This section has been deleted because pits are addressed in other sections of the regulation.

- 1627.** Comment: 78.64a(e) establishes the standards for containment systems. Do secondary containment systems referenced in 78.64a(f) have to meet the same standards as containment systems? This should be clarified in the final-form regulation.(1099)

Response: The Department has changed the language in the rulemaking to provide clarity for the meaning of secondary containment.

- 1628.** Comment: 78.64a (e) - The requirements of subsection 78.64a(e) are too prescriptive, and would not allow the Department to approve alternate methods where appropriate. Suggested Language: (e) Unless otherwise approved by the Department, containment systems must meet all of the following : (1137, 1147, 1174)

Response: The requirements in the section are appropriate. Deviation from the minimum standards prescribed in the section would not provide adequate protection to the environment.

- 1629.** Comment: 78.64a(e)(1) - This proposed subsection is overly broad (e.g. it would apply to cement in cement trucks) and conflicts with Act 13 Section 3218.2, which provides a specified list of materials that require storage in containment systems. The subsection is unnecessary because it is redundant with revised subsection (b) and (c) above. Suggested Language: Delete subsection (e) (1). (1137,1147,1153, 1174)

Response: The requirement to contain regulated substances is appropriate to ensure protection of public health and safety and the environment. The Department considers cement as a regulated substance.

- 1630.** Comment: As previously referenced in our general comments about the drawbacks of overly prescriptive language, it is our suggestion that the language be modified to allow for flexibility. As such, We support the MSC suggested language which reads “(e) Unless otherwise approved by the

Department, containment systems shall meet all of the following:”

78.64a(e)(1): This proposed subsection is overly broad, would apply to cement in cement trucks, and conflicts with Act 13, which provides a specified list of materials that require storage in containment systems which are addressed in a previous subsection. Subsection (e)(l) should be deleted. (1071)

Response: The requirements in the section are appropriate. Deviation from the minimum standards prescribed in the section would not provide adequate protection to the environment. The requirement to contain regulated substances is appropriate to ensure protection of public health and safety and the environment. The Department considers cement as a regulated substance.

- 1631.** Comment: § 78.64a(e)(3) -This section requires the liner compatibility to satisfy ASTM Method 5747 Compatibility Test for Wastes and Membrane Liners. § 78.6(a)(12) requires liners to satisfy EPA Method 9090 - Compatibility Test for Wastes and Membrane Liners. Here again it is suggested that either method would be applicable for either section, so either both methods should be referenced in both sections (recommended) or one should be selected as the standard. (1147)

Response: The rulemaking language has been changed and the Department allows for the use of test methods if approved by the Department.

- 1632.** Comment: 78.64a(e)(3) – ASTM D5747 is a test for landfill liners and pits where the liner is submerged in diluted chemicals for extended periods of time. It is extremely expensive (\$5000) to run on each chemical type found at a site. We propose ASTM D543 as an alternate test for surface liners. It contains a wet patch method that simulates a concentrated surface spill, which ASTM D5747 does not. We recommend testing for 72 hours at 140 F to account for response time and summer surface temperatures. Suggested Language: (3) The physical and chemical characteristics of all liners, coatings or other materials used as part of the containment system, that could potentially come into direct contact with regulated substance being stored, must be compatible with the regulated substance and be resistant to physical, chemical and other failure during handling, installation and use. Liner compatibility shall satisfy ASTM Method D5747, ASTM D543, or other standards as approved by the Department. (1137, 1147, 1153, 1174)

Response: The rulemaking language has been changed and the Department allows for the use of test methods if approved by the Department.

- 1633.** Comment: § 78.64a (f) Per 3218.2(d) of Act 13, there is no mandatory secondary containment requirement when storing additives, chemicals, oils or fuels. We recommend striking the first sentence because it is unnecessary and redundant with revised subsection(c) above.

§ 78.64a (f) Suggested amendatory language: Areas where additives, chemicals, oils or fuels are to be stored must have sufficient containment capacity to hold the volume of the largest container stored in the area plus 10% to allow for precipitation, unless the container is equipped with individual secondary containment such as a double walled tank. Tanks that are manifolded together shall be designed in a manner to prevent the uncontrolled discharge of multiple manifolded tanks. A well site liner that is not used in conjunction with an impervious berm does not constitute secondary containment for the purpose of this subsection. (1071, 1137, 1147, 1153, 1174)

Response: The Department interprets Section 3218.2(d) of Act 13 to mean that the container that additives, chemicals, oils or fuels are stored in is considered to be primary containment.

Therefore, the containment capacity referred to that must be able to hold the contents of the largest container plus 10% for precipitation is secondary containment.

1634. Comment: 78.64a(f) -The requirement of secondary containment is confusing. If an additive is already in a tote, is that considered containment and a liner system under the tote is secondary containment? This is going beyond the scope of Act 13 which merely requires a single containment system. (411)

Response: See response to comment 1633.

1635. Comment: 78.64a(f): Section 3218.2(d) of Act 13 does not require secondary containment systems. However, 78.64a(f) does require secondary containment when storing additives, chemicals, oils or fuels. Why does EQB believe this provision is consistent with the intent of the General Assembly and Act 13? (1099)

Response: The Department interprets Section 3218.2(d) of Act 13 to mean that the container that additives, chemicals, oils or fuels are stored in is considered to be primary containment. Therefore, the containment capacity referred to that must be able to hold the contents of the largest container plus 10% for precipitation is secondary containment. Any other interpretation of section 3218.2(d) would render the final phrase of the subsection (“...unless the container is equipped with individual secondary containment.”) irrelevant.

1636. Comment: The last sentence of § 78.64a(f) is vague. EQB should clarify the intent of this sentence in the final-form regulation. (1099)

Response: The Department has evaluated the language and determined that it is appropriate to convey that well site liners may not be used as secondary containment and as a result has stricken the last sentence of subsection (f) as well as all other references to subsurface liners serving as secondary containment.

1637. Comment: 78.64a(f): The final sentence of this subsection is vague and potentially contrary to Act 13 which has no such prohibition. As we understand, the Department’s concern is that an impervious berm be used with the liner to provide sump capacity. As such, we suggest stating this directly as in the following suggested amendatory language:

“(f) The secondary containment shall have sufficient containment capacity to hold the volume of the largest container within the secondary containment area plus 10% to allow for precipitation, unless the container is equipped with individual secondary containment such as a double walled tank. Tanks that are manifolded together shall be designed in a manner to prevent the uncontrolled discharge of multiple manifolded tanks. A well site liner that is not used in conjunction with an impervious berm does not constitute secondary containment for the purpose of this subsection.” (1071, 1137, 1174)

Response: The Department has evaluated the language and determined that it is appropriate to convey that well site liners may not be used as secondary containment and as a result has stricken the last sentence of subsection (f) as well as all other references to subsurface liners serving as secondary containment.

1638. Comment: Section 78.64a(f) states that secondary containment must be based on the largest container in the secondary containment system, but it does not restrict the number of containers or total volume of chemicals stored per containment system. This assumes that the system may only be

adequate to handle the failure of a single primary container. The Department should amend the language to ensure that the secondary containment system is designed with an adequate margin of safety to handle the failure of multiple primary containers. (852a)

Response: The language is consistent with § 3218.2(d) regarding capacity of secondary containment systems. The volume of the largest tank plus an additional 10% of volume for precipitation capacity requirement is reasonably adequate to protect public health and safety the environment.

- 1639.** Comment: Section 78.64a (f) states “a well site liner that is not used in conjunction with other containment systems does not constitute secondary containment for the purpose of this subsection.” This wording is confusing in its implications that a well site liner would be a secondary containment for a raw material or waste material that is in another containment system, such as a tank. If that is intended, then the regulation should provide standards for materials used to construct a ‘well site liner’ so that the liner would be appropriate for secondary containment, and possibly establish chemicals and wastes that would not be eligible for this type of large scale ‘well site liner’ method of secondary containment. (852a)

Response: The Department has evaluated the language and determined that it is appropriate to convey that well site liners may not be used as secondary containment and as a result has stricken the last sentence of the section being commented on. The Department interprets Section 3218.2(d) of Act 13 to mean that the container that additives, chemicals, oils or fuels are stored in is primary containment. Tanks or other primary containers do not meet the requirements for secondary containment, unless they are equipped with individual secondary containment such as a double walled tank.

- 1640.** Comment: 78.64a(g) – This language is too prescriptive and does not provide flexibility to the Department to approve alternate methods. Suggested Language: (g) Subsurface secondary containment systems may be employed at the well site. Unless otherwise approved by the Department, subsurface secondary containment shall meet the following requirements.(1071, 1137, 1147, 1174)

Response: Subsurface systems by their very nature cannot be easily inspected or repaired nor do they prevent soil contamination and therefore are not considered as viable secondary containment by the Department.

- 1641.** Comment: 78.64a(g)(1) – What constitutes an integrity test? Is the integrity test protocol provided by the manufacturer? (411)

Response: Language referring to subsurface containment has been stricken from the rulemaking language because the Department deems subsurface containment systems as too impractical to be employed as a secondary containment system.

- 1642.** Comment: Section 78.64a(g)(2) requires a subsurface containment system to ‘be designed to allow for the management or removal of stormwater’. The regulation should require an above grade berm that prevents stormwater run on for shallow below grade containment systems, and a drainage system that collects stormwater that infiltrates and collects in subsurface buried liner systems. (852a)

Response: Language referring to subsurface containment has been stricken from the rulemaking language because the Department deems subsurface containment systems as too impractical to be employed as a secondary containment system.

- 1643.** Comment: 78.64a(g)(4) – The use of the term “regulated substance” and the reference to “storage” make this subsection unclear and unnecessary. Subsurface secondary containment is not used for storage. Delete subsection (g)(4).(1137, 1147, 1174)
