EXECUTIVE SUMMARY

OBG | Baker Environmental Solutions Joint Venture (OBG | Baker) has prepared this Supplemental Site Investigation Report to present the supplemental investigation activities and associated findings. The scope of work for the supplemental investigation was based on the results from the Phase II Site Investigation completed in early 2024, as well as information obtained during a recent review of historical files by the Department.

To complete the supplemental investigation field activities in an efficient and timely manner, site preparation activities were completed both at project onset and prior to the comprehensive groundwater sampling activities. The initial site preparation activities included using heavy equipment to clear pathways through the dense weeds to the wells and borings and again to clear pathways to the wells after a historic snowfall in December 2024.

The focus of the supplemental investigation included three areas, Lampe Marina Area, Industrial North Area, and the Industrial South Area – East Region. A series of 16 soil borings were advanced in the Lampe Marina parking lot and campground areas to evaluate potential off-site contamination documented nearby on site. Four soil borings were advanced in the Industrial North Area to evaluate reported historical contamination along the rail lines coming/leaving the site with two additional borings also advanced to evaluate data gaps between wells MW-13 and MW-37. Five soil borings were advanced in the Industrial South Area - East Region where a recent review of historical documents by the Department illuded that there may have been waste disposed in this area.

Lampe Marina Area Soil Investigation

A total of 21 soil samples were collected from 16 soil borings in the Lampe Marina Area with 15 of the samples exhibiting benzene detections and six of the borings exhibiting concentrations above criteria. All Volatile Organic Compound (VOC) criteria exceedances were observed in soils in the northern half of the Lampe Marina investigation area. Several Semivolatile VOCs (SVOCs) were detected in all but one sample with PAHs (Polycyclic Aromatic Hydrocarbons, a common contaminant artifact of coke production) being the most detected subgroup of SVOCs to exceed criteria in the soil samples. Consistent with benzene, PAHs exceeded criteria in most of the soil samples from the northern half of the Lampe Marina investigation area. Several metals also were detected in the soil samples with limited criteria exceedances including thallium, arsenic, manganese, and chromium.

The identification of manmade material at depth (e.g., waste cloth) in the on-site and off-site Lampe Marina Area soils supports the conclusion that the geographic limits of the former Erie Coke facility were continually and methodically expanded outward toward, and at, the lakeshore with fill material, operational wastes, and other wastes during its more than one hundred years of operation. It is likely that this same practice took place with previous property owners to Erie Coke.

Industrial North Area Soil Investigation

A total of nine soil samples were collected from six soil borings and one well boring in Industrial North Area. Several soil samples exhibited VOC (primarily benzene) and SVOC (primarily PAHs) concentrations above criteria. Although several metals also were detected in soil from this area, there were limited metals criteria exceedances including arsenic, chromium, lead, manganese, selenium, and thallium. The elevated VOC and SVOC soil concentrations with varying identified subsurface wastes (e.g., white fibers, white powder, wood) indicates that there are multiple waste streams contributing to the overall detrimental effects of groundwater quality in this area.

The contamination observed in soil in the vicinity of wells MW-13 and MW-45 in the Industrial North Area is believed to have two sources at a minimum. One source being the wastes and fill material used to continually fill in low areas and extend the shoreline to expand Erie Coke's historical operational area. The other source is believed to be from poor housekeeping of railcars, equipment, and/or trucks along the various rail spurs in this, and other areas, on site.

Industrial South Area – East Region Soil Investigation

Five soil borings were advanced, and seven soil samples were collected from this area. VOC detections were sporadic with only two samples exhibiting a VOC (benzene) concentration above criteria. Several SVOCs were detected in most of the soil samples from this area with only three samples exhibiting SVOC criteria exceedances. Most SVOC criteria exceedances were limited to PAHs (primarily naphthalene). Several metals also were detected in this area with limited criteria exceedances including manganese, arsenic and thallium.

Consistent with the Lampe Marina and Industrial North Areas, the contaminant impact observed in this area does not appear to have one contaminant source. Contaminant impact and depth in one boring (primarily PAHs) was not consistent with the impact and depth observed in another boring from this area (primarily benzene).

Groundwater Investigation

A meeting between the Department and OBG | Baker took place after completing the soil boring activities to discuss the appropriate number of supplemental investigation monitoring wells. It was agreed that seven shallow overburden groundwater monitoring wells would be installed during this phase of the investigation with six of the wells (MW-39 through MW-44) installed in the Lampe Marina area and one well (MW-45) installed in the Industrial North Area.

A comprehensive groundwater sampling event of all 58 wells on and off site was completed in December 2024. VOCs were detected in approximately 65% of the groundwater monitoring wells with VOC criteria exceedances in over 50% of the wells. It should be noted that the high percentage of impacted wells is expected as wells were located based on a biased approach

toward contaminated areas. Benzene was the most prevalent VOC to exceed criteria (over 50% of the wells) with many well samples being several orders of magnitude over criteria. This was anticipated as benzene is typically the primary VOC in concentrated byproducts, air emissions, and wastewater from the coke production process. The areas with the most elevated benzene concentrations include Lampe Marina Area, Industrial North Area, and the generalized Tank Farm Area and appear to be independent of each other. Benzene concentrations in these areas ranged from over one to five orders of magnitude above criteria.

At least one SVOC analyte was detected in approximately 75% of the groundwater monitoring wells with SVOC criteria exceedances (primarily PAHs) in approximately 45% of the wells. Notable SVOC criteria exceedances included naphthalene in 24 wells and biphenyl in 23 wells and also can be attributed to the coke production process.

The strategic placement and sampling of soil borings and groundwater monitoring wells from this investigation were successful in delineating the contaminant impact in the Lampe Marina parking lot. Wells MW-39, MW-40, and MW-41 are impacted with VOCs (primarily benzene) and SVOCs (primarily PAHs) above criteria. This is to be expected as associated soil borings have shown that waste material has crossed the property boundary. Soil borings closer to the campground area are clean of waste.

MW-13 in the Industrial North Area is the most contaminated well on site with respect to VOCs and is also the most concerning. Documented manmade contamination at depths above and below the water table (continual source), its close proximity to the lakeshore, and consecutive increases in benzene levels throughout 2024 (60% from January to December 2024; 374,000 ug/L to 629,000 ug/L) are the foundation of the concern. A flat hydraulic gradient indicates minimal groundwater flow towards Lake Erie through the area of MW-13. However, due to the contaminant proximity to the lake, it is one of the areas that should be addressed first in a remediation plan.

Isoconcentration mapping of VOCs and SVOCs conveyed that each of the most impacted areas on site are independent of each other and are not a result of an expanding plume migration (excluding within the Tank Farm Area itself). Each of these larger impacted areas are a composite of a number of smaller individual source areas contributing to the overall poor groundwater quality beneath the site that could potentially migrate toward the Lake Erie shoreline.

Recommendations for further investigation work at the site include continued quarterly monitoring of select groundwater wells (including Dense Non-Aqueous Phase Liquid [DNAPL] monitoring), installation of a new deep well (MW-13D) nested with MW-13 in the Industrial North Area, installation of a shallow well adjacent to both SB-224 and SB-225 in the Industrial South Area – East Region, and biannual sediment sampling along the shoreline of Lake Erie adjacent to MW-13 and also in the Tank Farm Area.

1.0 INTRODUCTION

OBG | Baker Environmental Solutions Joint Venture (OBG | Baker) has prepared this Supplemental Site Investigation Report for the Pennsylvania Department of Environmental Protection (PADEP or Department) as authorized by PADEP Work Requisition, Number 7-6-181, Contract Number SAP4000023226 (GTAC-7), pursuant to the Pennsylvania Hazardous Sites Cleanup Act (HSCA), Act 108, October 18, 1988.

This report presents the strategies and methodologies used to implement the Scope of Work at the Erie Coke Site (site) located in Erie, Pennsylvania that were presented in the Supplemental Site Investigation Work Plan (OBG | Baker, October 2024). The Work Plan was prepared based on the findings from the Phase II Site Investigation completed in early 2024, as well as information obtained during a recent review of historical files by the Department. The Supplemental Site Investigation Report included herein also presents the findings from the investigation activities and the associated conclusions and recommendations moving forward.

It should be noted that because the supplemental investigation was essentially an extension of the recently completed Phase II investigation, some of the detailed discussions of investigation and sampling protocols and methodologies may not be presented herein. Rather, these detailed discussions, as well as a comprehensive presentation of the site history and environmental investigations, can be located in the Phase II Site Investigation Report (OBG | Baker, September 2024).

2.0 SITE LOCATION AND SETTING

The Erie Coke Site is located at 925 East Bay Drive in the City of Erie, Erie County, Pennsylvania at 42° 08’ 40.6602” N latitude and -80° 04’ 3.5976” W longitude on the USGS Erie North Quadrangle map (Figure 1). Erie Coke Corporation (Erie Coke) owns several parcels of land totaling approximately 186 acres of which approximately 96 acres is land, and an additional 90 acres is considered ‘submerged lands’ (beyond the Lake Erie shoreline into the lake). The site is bordered to the north by Lake Erie and Lampe Marina, to the east by East Avenue Boat Ramp (East Ave. Boat Launch) and Lake Erie, to the south by a residential area and the Barber National Institute, and to the west by the City of Erie wastewater treatment plant and a wooded area (Figure 2). A sitewide presentation of figure numbers and their proximity to each other is presented on Figure 3. The three primary areas where intrusive investigation activities were performed were in the Lampe Marina Area (Figure 4), Industrial North Area (Figure 5), and the Industrial South Area - East Region (Figure 6).

The site is located within a state designated Environmental Justice Area. The site is sparsely vegetated and not in use. The site is generally flat, except for steep banks above the Lake Erie shoreline and the area west and south of the main operational plant area. The northern / eastern bank separates the site from Lake Erie and the western / southern bank separates the site from East Bay Drive. Access to the site for vehicles is restricted to the East Avenue gate entrance where a new locking gate and fencing were recently installed by the Department to partially restrict access.

General land uses proximate to the site include commercial, industrial, and residential areas. The population within a three-mile radius relies exclusively on a public water supply operated by Erie Water Works.

3.0 SITE PREPARATION ACTIVITIES

3.1 Site Clearing

To complete the supplemental investigation field activities in an efficient and timely manner, site preparation activities were completed both at project onset and prior to the comprehensive groundwater sampling activities. The initial site preparation activities were completed on August 5, 2024, using the drilling subcontractor (Allprobe Environmental, Inc. [Allprobe]) with OBG | Baker providing oversight and direction.

An excavator and skid steer with a brush hog attachment were used by Allprobe to complete most of the site preparation activities (e.g., vegetation clearing and vehicle/personnel access pathways). Wastewater storage drums and a rolloff box also were mobilized during the site preparation activities by the waste disposal subcontractor (American Waste Management Systems, Inc. [AWMSI]) for use during the investigation activities. A field office was also mobilized for the field activities.

To accomplish the supplemental investigation field activities, clearing of pathways to select boring locations was warranted. Unfortunately, phragmites and other invasive weeds grow back quickly each year on site. For this scope of work, limited tree cutting (saplings) and grading work were necessary to clear the pathways to the test boring locations. A track mounted skid steer with brush hog and excavator were utilized to clear the pathways to the boring locations.

In some areas, only the skid steer with brush hog was needed to clear the pathways. In others, the excavator was used to cut the pathway with the skid steer following behind to 'clean up' the cut pathway. On site OBG | Baker personnel directed the subcontractor where to clear using a handheld GPS unit and surveyed mapping. Test borings that warranted development of access pathways for clearing are shown on Figure 5 (SB-219 and SB-221) and Figure 6 (SB-222 through SB-226).

3.2 Snow Plowing

After completing the test boring and well installation activities (see later sections of report) but prior to the comprehensive groundwater sampling event, a historic snow event covered the site in early December 2024. Snow accumulations and drifts in the site area approached five feet. Due to the extraordinary snowfall, the comprehensive groundwater sampling event was postponed one week to address the snowfall.

At the approval of the Department, OBG | Baker contracted Allprobe to perform the snow plowing activities. The subcontactor utilized two track mounted skid steers with buckets to complete the work. The snow plowing scope included general clearing around the field office and laydown areas and clearing pathways to, and around, all on-site groundwater monitoring wells. The snow plowing and clearing activities were completed on December 9th and 10th, 2024.

4.0 SOIL INVESTIGATION ACTIVITIES

The supplemental investigation was performed to further determine the nature and extent of hazardous substances, pollutants, or contaminants that have been released into the environment from specifically focused areas on and off site. This evaluation was completed through soil sampling, Non-Aqueous Phase Liquid (NAPL) monitoring, and subsequent installation and sampling of additional groundwater monitoring wells to the existing well network. The drilling activities were initiated on November 11, 2024, and were completed on November 22, 2024. A photographic log of investigation activities is provided in Attachment G.

4.1 Soil Boring Locations

A series of 16 soil borings (SB-200 through SB-215 shown on Figure 4) were advanced in the Lampe Marina parking lot and campground areas to evaluate potential off-site contamination documented nearby on site. Further south on Figure 5, four soil borings (SB-216, SB-217, SB-218, and SB-220) were advanced in the Industrial North Area to evaluate reported historical contamination along the rail lines coming/leaving the site, and two borings (SB-219 and SB-221) were advanced to evaluate data gaps between wells MW-13 and MW-37.

On Figure 6 (Industrial South Area – East Region), five soil borings (SB-222 through SB-226) were advanced in an area where a recent review of historical documents by the Department illuded that there may have been waste disposed in this area.

As shown on the figures, soil borings were placed in locations that aided in the identification and delineation of contaminant impact at each area. All borings were advanced to native material with one exception. At the request of the Department, soil boring SB-200 in the Lampe Marina campground area was advanced to bedrock to document the bedrock depth in the area (approximately 54 feet). All soil boring logs for this supplemental investigation are provided in Attachment A.

4.2 Soil Boring Advancement and Sample Collection

Rotasonic drilling method were used for soil sampling and included a combination of rotary power, hydraulic pull-down pressure, and mechanically generated oscillations to advance a dual line of drill pipe. Continuous four-inch diameter soil core samples were collected for lithologic identification and field screening during boring advancement. As each boring was advanced, the inner casing collected a continuous four-inch nominal diameter soil core in five- or ten-foot-long increments.

Once the soil core was extracted, it was placed directly into a clear polyethylene liner using a vibration technique of the rotasonic rig. Housing the sample in a clear plastic liner allowed the OBG | Baker geologist to log the core and field screen the continuous soil sample while minimizing potential volatilization. With significant fill and non-cohesive soils, an outer six-inch diameter

casing was needed to advance the borings deeper than ten feet to achieve the desired boring depths.

Field screening of surface (0 to 1-foot depth interval) and subsurface soil samples consisted of placing the tip of the Photoionization Detector (PID) through small slits cut in the polyethylene liner at approximately one-foot intervals to measure the total concentration of Volatile Organic Compounds (VOCs) in parts per million (ppm). The PID responses were recorded on the associated boring logs. In addition to the PID results, other items that were documented on the boring logs include geologic descriptions of the soil type, odor, discoloration, recovery amount, sample depth, moisture content, grain size, and any other features observed in the soil sample. The soil boring logs are provided in Attachment A.

4.3 Soil Sample Selection Methodology

With the exception of boring SB-200 discussed above, all soil borings were terminated once native material was encountered. Retrieved soil cores were field-screened and up two soil samples were collected from each boring for laboratory analysis described below.

Identified Areas with Contaminant Impact:

- One 'worst-case' soil sample above the water table based on PID readings and/or visual evidence of staining/odor. No 'worst-case' soil samples were collected for analysis below the water table.

- One 'clean' soil sample collected below the 'worst-case' soil sample, above the soil/groundwater interface. No 'clean' soil samples were collected for analysis below the water table.

Areas with No Obvious Contaminant Impact:

- One soil sample was collected above the water table at the environmental scientist's discretion to document subsurface conditions and potentially delineate contaminant impact not obvious through screening (e.g., metals).

The site history has documented releases from tanks and other operational issues throughout the site's history causing environmental concerns across the various Areas of Concern (AOC). For consistency, delineation, and overall site characterization, OBG | Baker and the Department agreed that all soil samples discussed below would be analyzed for VOCs, Semi-Volatile Organic Compounds (SVOCs), and metals (including mercury). All laboratory analyses were completed by a state certified laboratory (ALS Global Environmental Laboratory in Middletown, Pennsylvania).

5.0 LABORATORY ANALYTICAL RESULTS – SOIL INVESTIGATION

The laboratory analytical results discussed below are focused on the soil samples collected as part of the supplemental site investigation to better understand the environmental impact on and off site from historical site operations. Soil sample nomenclature was based on the example below:

SB-220-10-DUP
SB: Soil Boring
220: Boring number
10: Soil sample collected at depth of approximately 9 to 10 feet below grade
DUP: Duplicate soil sample

The criteria used for comparison to all soil analytical results were the Pennsylvania Residential and Non-Residential Medium-Specific Concentrations (MSCs). The detailed laboratory analytical reports for the supplemental investigation soil samples are provided in Attachment B.

As summarized on Tables 1 through 3, and shown on Figures 4 through 6, 33 soil samples (and four quality control duplicate samples) were collected for laboratory analysis from the supplemental investigation. Soil sampling in each boring followed the methodologies described above with either one or two investigative (not quality control) soil samples submitted for laboratory analysis from each boring for characterization and/or potential delineation. Soil samples for analysis were not only collected from the soil borings but were also collected from the well borings used to install the supplemental investigation monitoring wells.

A notable number of select analyte detections and criteria exceedances were exhibited for VOCs, SVOCs and metals in the 37 investigative soil samples. To better covey the distribution of contaminant impact, the development of 'Hits Box' figures showing select VOC and SVOC criteria exceedances were developed. With some soil samples exhibiting over a dozen criteria exceedances, the incorporation of all exceedances would clutter the associated figure and reduce the purpose of the figure. Benzene, naphthalene, and biphenyl historically have been used as markers to represent the overall level of impact (e.g., if there is an elevated biphenyl detection, there are likely other elevated PAHs in the same sample). With extensive historical data supporting this assessment, only the criteria exceedances for these three analytes were included in the three figures associated with the discussions below. It should be noted that sample exceedances occurred in clusters across the site and not evenly distributed as evident by current and historical criteria exceedance mapping in this and previous reports.

5.1 Soil Analytical Results - Lampe Marina Area

Soil borings and sample locations for this area are shown on Figure 4 and the laboratory analytical results are summarized on Table 1. A series of 16 soil borings (SB-200 through SB-215) were advanced in the Lampe Marina parking lot and campground areas to evaluate potential off-site contamination documented nearby on site. At the SB-200 boring location in the campground, no

concerning evidence of contamination (i.e., no VOC or SVOC criteria exceedances) was present as soil impact became less prominent as soil borings approached the campground. Dredged material as the foundation of the campground consists primarily of sand, silt, rock, and shells. An overview of the development of the campground through dredgings can be found in Attachment H.

A total of 19 investigative soil samples (and two duplicates) were collected from the soil borings in this area between the depths of seven and 14 feet below ground surface (bgs). Of the six new groundwater monitoring wells installed in this area (discussed later in report), two soil samples (MW-40-9 and MW-41-8) also were collected from the well borings.

Of the 21 soil samples from this area, 15 of the samples exhibited benzene detections with six of them exhibiting concentrations above criteria (Residential/Non-Residential MSC of 500 micrograms per kilogram [ug/kg]). Concentrations above criteria ranged from 1,190 ug/kg in SB-208-9.5 to 186,000 ug/kg in MW-41-8. The only other VOC criteria exceedance was 1,3,5-trimethylbenzene in MW-41-8 at a concentration of 33,500 ug/kg. All of the VOC criteria exceedances were observed in soils in the northern half of the Lampe Marina investigation area (see Figure 7 for associated benzene exceedances).

Several SVOCs were detected in all but one of the 21 soil samples (SB-209-8.5). Consistent with historical investigation findings, PAHs were the most detected subgroup of SVOCs to exceed criteria in the soil samples and did so for several analytes.

SVOC criteria exceedances ranged from one analyte (SB-205-11) to 13 analytes (MW-41-8 and SB-204-10). A majority of the SVOC criteria exceedances were limited to PAHs, which are a common contaminant artifact of coke production. Historically, the most common PAHs exceeding criteria on site included benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene. Consistent with benzene, these and other PAH analytes exceeded criteria in most of the soil samples from the northern half of the Lampe Marina investigation area (see Figure 7 for associated biphenyl and naphthalene criteria exceedances).

Although several metals also were detected in all 21 samples within this collective area, there were limited metals criteria exceedances. Metals criteria exceedances were limited primarily to thallium, arsenic, manganese, and chromium. Thallium exceeded criteria in 15 samples, arsenic in 12 samples, manganese in six samples, and chromium in four samples. The most metal criteria exceedances were exhibited in SB-204-10 with four metal exceedances including arsenic, chromium, manganese, and thallium. Other than the metals above, lead was the only other metal to exceed criteria and did so in only one sample (MW-40-9).

5.2 Soil Analytical Results – Industrial North Area

Soil borings and sample locations for this area are shown on Figure 5 and the laboratory analytical results are summarized on Table 2. Four soil borings (SB-216, SB-217, SB-218, and SB-220) were advanced in the Industrial North Area to evaluate reported historical contamination along the rail lines and spurs coming/leaving the site, and two borings (SB-219 and SB-221) were advanced to evaluate data gaps between wells MW-13 and MW-37. One well boring (MW-45) also was advanced in this area.

A total of nine soil samples (including one duplicate) were collected from the soil and well borings in this area between the depths of three and ten feet bgs. Of the nine soil samples collected from this area, four of the samples exhibited VOC concentrations above criteria. Benzene exceeded criteria (Residential/Non-Residential MSC of 500 ug/kg) with concentrations ranging from 539 (J) ug/kg in SB-217-3 to 976,000 ug/kg in MW-45-10 (see Figure 8 for associated benzene exceedances). The only other VOC criteria exceedances in soil from this area included toluene (493,000 ug/kg) and 1,3,5-trimethylbenzene (25,300 ug/kg) in the MW-45-10 soil sample.

Several SVOCs were detected in all nine of the soil samples within this collective area with limited criteria exceedances. Five of the nine samples exhibited at least one SVOC analyte exceeding criteria. SVOC criteria exceedances ranged from two analytes (MW-45-10, SB-217-6, and SB-218-7) to five analytes (SB-221-9). SVOC criteria exceedances were primarily limited to PAHs including benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, biphenyl, and naphthalene (see Figure 8 for associated biphenyl and naphthalene criteria exceedances).

Although several metals also were detected in all nine soil samples within this collective area, there were limited metals criteria exceedances. Metals criteria exceedances were limited to arsenic, chromium, lead, manganese, selenium, and thallium. Arsenic exceeded criteria in six samples, thallium in four samples, chromium in three samples, manganese in two samples, and silver and lead in one sample each. The most metal criteria exceedances were exhibited in SB-220-10-DUP with four metal exceedances.

5.3 Soil Analytical Results – Industrial South Area – East Region

Soil borings and sample locations for this area are shown on Figure 6 and the laboratory analytical results are summarized on Table 3. On Figure 6 (Industrial South Area – East Region), five soil borings (SB-222 through SB-226) were advanced in an area where a recent review of historical documents by the Department illuded that there may have been waste disposed in this area.

A total of seven soil samples (including one duplicate) were collected from the soil borings in this area between the depths of four and 16 feet bgs. Of the seven soil samples collected from this area, VOC detections were sporadic. All seven samples exhibited at least one detectable VOC, with methyl acetate, a common laboratory contaminant, being the most detected (present in six of the seven samples), followed by carbon disulfide and toluene (five samples each). Only two of

the seven samples exhibited VOC concentrations above criteria. The lone VOC to exceed criteria was benzene in soil samples SB-224-4 (1,030 ug/kg) and SB-224-6 (1,320 ug/kg) - (see Figure 9 for associated benzene exceedances).

Several SVOCs were detected in six of the seven soil samples within this area. Four of the seven samples exhibited no SVOC criteria exceedances. The exceedances ranged from one analyte (naphthalene at 15,500 ug/kg in SB-224-4) to twelve analytes in sample SB-225-12.

A majority of the SVOC criteria exceedances were limited to PAHs. Naphthalene led with three criteria exceedances, followed by several other PAHs with two exceedances (see Figure 9 for associated biphenyl and naphthalene criteria exceedances).

Although several metals also were detected in all seven samples within this collective area, there were limited metals criteria exceedances. Six of the seven samples exhibited at least one metal analyte with a concentration above criteria. Metals criteria exceedances were limited to manganese, arsenic and thallium. Manganese exceeded criteria in six samples and arsenic and thallium in two samples each. The highest manganese concentration in the area was 5,500 ug/kg in SB-226-16.

The most metal criteria exceedances were exhibited in soil sample SB-225-12 and its duplicate with three each (arsenic, manganese, and thallium). All other samples exhibited no more than one metal criteria exceedance.

6.0 GROUNDWATER INVESTIGATION ACTIVITIES

The supplemental investigation was performed to further determine the nature and extent of hazardous substances, pollutants, or contaminants that have been released into the environment from specifically focused areas on and off site. A segment of this evaluation was completed through the installation and sampling of additional groundwater monitoring wells. The monitoring well installation and development activities were initiated on November 18, 2024, and were completed on November 22, 2024.

6.1 Groundwater Monitoring Well Locations

The draft test boring logs from the 27 soil borings (SB-200 through SB-226) advanced as part of the supplemental investigation were presented to the Department for review. A subsequent meeting between the Department and OBG | Baker took place to discuss the findings from the boring logs. The meeting was to determine the appropriate number and construction specifications of the supplemental investigation groundwater monitoring wells.

It was agreed in the meeting that an additional seven shallow overburden groundwater monitoring wells would be installed during this phase of the investigation. Six of the wells (MW-39 through MW-44) were installed in the Lampe Marina area and one well (MW-45) was installed in the Industrial North Area of the site. The wells proposed and the considerations for their finalized installation locations are summarized below and are shown on Figures 4 and 5.

MW-39

A well was proposed and installed adjacent to the SB-203 soil boring location due to nearby on-site well MW-12 exhibiting the highest benzene concentrations in the Lampe Marina area. A well at this location would aid in determining the magnitude and extent to the off-site marina from the potential on-site contaminant migration.

MW-40

A well was proposed and installed adjacent to the SB-204 soil boring location due to the elevated field screening detections (approximately 89 ppm) and the presence of tarry material above the water table. The location also was chosen to monitor potential off-site migration from on-site well MW-15 that exhibited coal tar in the boring and benzene concentrations orders of magnitude above criteria.

MW-41

A well was proposed and installed adjacent to the SB-206 soil boring location due to elevated field screening readings (309 ppm at 12 feet bgs) in the boring and also to allow for off-site monitoring and possible delineation of contaminant impact in MW-15 and MW-40.

MW-42

A well was proposed and installed adjacent to the SB-215 soil boring location due to elevated field screening readings and the presence of coke and coal breeze above the water table conveying possible contaminant impact. Further, a well at this location would allow for possible delineation of contaminant impact (potentially) migrating off site from on-site well MW-2.

MW-43

A well was proposed and installed adjacent to the SB-211 soil boring location to potentially delineate elevated contamination exhibited historically in wells MW-16 and MW-2. This well would also be used as a sentinel well for monitoring potential contaminant plume movement toward the lake and marina.

MW-44

A well was proposed and installed adjacent to the SB-205 soil boring location to potentially delineate the elevated contaminant impact anticipated to be present in newly installed monitoring wells MW-40 and MW-41. This well would also be used as a sentinel well for monitoring potential contaminant plume movement toward the Lampe Marina campgrounds and Lake Erie.

MW-45

A well was proposed and installed adjacent to the SB-217 soil boring location in the Industrial North Area of the site (Figure 5). This location was chosen to evaluate the impact and extent of the white waste encountered during drilling SB-217 (field screening readings of 1,072 ppm) and connection to further east well MW-13.

6.2 Groundwater Monitoring Well Installation Activities

The groundwater monitoring well installation activities were completed by Cascade Drilling of Marietta, OH with the OBG | Baker on-site environmental scientist providing oversight and direction.

The well borings (20 feet deep or less) were drilled using the same rotasonic drilling methods used for the soil boring activities. Rotasonic methods were ideally suited for the monitoring well installations because the methods minimized generation of waste, reduced difficulties with heaving sands, provided for more controlled well installations, and reduced development time due to the ability to vibrate the outer casing in or out of the borehole.

As was earlier described for the soil sampling drilling, continuous soil core samples were collected for lithologic identification during well boring advancement. One soil sample was proposed to be submitted for laboratory analysis from the most impacted zone above the water table following the same methodologies described above for the soil boring sampling activities. However, if no evidence of contamination, the soil sample was collected at the environmental scientist's discretion.

A total of three soil samples were collected from the well installation activities including MW-40-9, MW-41-8, and MW-45-10 collected from well borings MW-40, MW-41, and MW-45, respectively. No soil samples were collected from the other four well boring advancements (MW-39, MW-42, MW-43, and MW-44) as there was no evidence of notable contamination in the retrieved soil cores. The analytical results of these three samples were discussed previously in Sections 5.1 and 5.2 of this report and are summarized on Tables 1 and 2.

As directed by OBG | Baker's on-site environmental scientist, the wells were constructed using two-inch diameter, Schedule 40, PVC well casing and screen materials. Screens (0.010-inch slot) for all wells were ten feet in length as summarized on the well survey table (Table 4). All seven wells were installed at depths between approximately 16 and 19 feet deep.

Notable hydrostatic pressure (head) from the overburden aquifer's heaving sands (a.k.a., running sands) was encountered during the drilling activities across the site and proved to be more challenging during well drilling and installation. To address this issue, instead of using large quantities of potable water to offset the head, the borings were instead drilled modestly further for deeper placement of the temporary casing.

Once the desired depth of the well was achieved, the well construction activities were initiated. Unfortunately, heaving sands still proved to be an issue, even with the over drilling. As shown on the associated well boring logs (Attachment C), heaving sands forced the wells to be installed slightly shallower than originally planned.

At each well location, after placement of the well screen and riser, sand pack was placed between the well screen and drill casing up to a level approximately two feet above the top of the well screen. Above the well screen and sand pack, bentonite chips were installed between the PVC riser and the drill casing to near grade. As the construction materials were installed, the outer drill casing was slowly removed from the borehole annulus to allow the construction materials to fill the annulus void. The bentonite was hydrated after placement, if needed.

At the ground surface, each of the six wells in the Lampe Marina area was constructed with a flush mounted steel casing set in a two-foot square concrete pad. For MW-45 installed in the Industrial North Area, a 'stick up' well was constructed fitted with an outer steel protective casing and two protective bollards, consistent with the construction of other on-site wells. The well was fitted with a keyed-alike lock.

The Test Boring and Well Construction Records for the seven supplemental investigation monitoring wells are provided in Attachment C.

6.2.1 Groundwater Monitoring Well Development

Monitoring well development activities were performed no sooner than 24 hours after completing the installation of the monitoring wells. Before development, groundwater level and total well depth measurements were collected to calculate the volume of groundwater present within the well casing and determine the appropriate volume to be evacuated for development.

A disposable submersible pump (e.g., Monsoon pump) with dedicated, disposable tubing or a dedicated disposable bailer were used to develop the wells to remove fine sediments and residual drill cuttings from the well casing and the borehole annulus and allow for collection of representative samples for analysis. The pump and bailer were raised and lowered during development to agitate (i.e., stir up) the water within the well to remove additional suspended solids. Development continued at each well until at least the calculated five well volumes were removed. After the pump motor failed, disposable bailers were used for development of the remaining wells.

Water generated from the well development activities was containerized in buckets and transferred to drums in the centralized staging area near the former facility office. The management of Investigation-Derived Waste (IDW) is discussed further in Section 10.0 (IDW Management) of this report.

6.3 Groundwater Monitoring Well Sampling Activities

The comprehensive groundwater sampling event of all 58 wells on and off site was completed from December 9th to 18th, 2024. A complete round of groundwater levels was collected from the wells and recorded in the field notebook and are summarized on Table 4. The monitoring wells were purged prior to sampling to collect a representative groundwater sample from the overburden aquifer.

A majority of the 58 monitoring wells were purged and sampled using low flow purging and sampling methods to minimize sampling-induced turbidity problems and provide samples more representative of ambient groundwater quality. A peristaltic pump with dedicated, disposable polyethylene tubing was used for a majority of the well purging and sampling activities to mitigate cross contamination between wells. A dedicated, disposable field filter was used in line to collect the groundwater sample aliquot designated for dissolved metals analysis. In wells that purging and sampling were problematic due to the presence of NAPL, the wells were purged with a dedicated, disposable polyethylene bailer and retrieval line.

The groundwater samples were analyzed for VOCs, SVOCs, metals (total and dissolved, including mercury), and general chemistry. After collection of the samples for laboratory analysis, field parameter samples were collected and measured for pH, conductivity, temperature, dissolved oxygen, Oxidation-Reduction Potential (ORP), and turbidity. The December 2024 field parameters were recorded in the field notebook and are summarized on Table 5.

6.4 Non-Aqueous Phase Liquid Monitoring

An Interface Probe (IFP) was previously used to measure NAPL in applicable monitoring wells, but the viscosity and 'sticky' properties of the NAPL would not allow for accurate NAPL measurements, and cleaning the IFP afterwards proved time consuming and problematic. A weighted measurement tape and string subsequently were used to measure NAPL but also proved problematic with the inability to penetrate down through the standing NAPL in the bottom of the applicable well.

The latest measurement tool used to measure the NAPL was a 30-foot long, one-inch diameter rigid PVC pipe with attached cotton string secured along the outside of the pipe. The length of the pipe allowed for lowering through the well casing and firmly seating the one-inch pipe at the base of the well bottom cap. Once confirmed at the bottom (through minor tapping of the one-inch pipe on the well bottom cap), the pipe (and attached string) was immediately removed from the well casing and laid on the ground. The white cotton string appeared to show the accurate thickness of the NAPL by measuring the length of black, NAPL-coated string below the white groundwater saturated string.

During implementation of the recent field activities, measurements of both Light NAPL (LNAPL) and Dense NAPL (DNAPL) were completed in the Tank Farm Area. The individual or multiple sources of the NAPL were not identified in the Tank Farm Area as it could be from multiple tanks and/or transmission lines beneath the ground surface. Throughout the previous site investigations, coal tar, creosote, and other byproducts of coke production were encountered in various soil and well borings.

Measurable thicknesses of DNAPL were observed in seven of the groundwater wells in the Tank Farm Area in November 2024 (Table 6). Measurements were collected in November, prior to the comprehensive sampling event in early December, to allow any agitated DNAPL to equilibrate prior to the well purging and sampling activities. LNAPL was not observed in any of the monitoring wells. MW-34D exhibited the greatest thickness of DNAPL with two feet in November followed by MW-9D (1.8 feet), MW-26S and MW-27D (1.5 feet each), MW-10S (0.79 feet), MW-26D (0.21 feet), and MW-36D (0.17 feet).

DNAPL thicknesses varied significantly between November 2024 and previous measurements. This could be due to several factors including, but not limited to, the method of measurement (discussed above), NAPL flowing into the open borehole from pockets in the subsurface soil collecting in the annulus, NAPL clogging the well screen slots mitigating stabilization with surrounding aquifer/NAPL, and delayed flow into the well due to DNAPL characteristics.

6.5 Groundwater Monitoring Well Survey

A total of seven new groundwater monitoring wells (MW-39 through MW-45) were installed as part of the supplemental investigation. To provide accurate placement on scaled site figures and representative groundwater flow mapping, the seven wells were surveyed by the OBG | Baker surveyor on December 23, 2024, after completion of the December 2024 groundwater monitoring well sampling activities.

The monitoring well survey activities included locating the horizontal position and establishing elevations of the newly installed monitoring wells. Elevations of the top of steel protective casing (stick up or flush mounted), top of inner PVC casing, and adjacent concrete pad (acting as ground surface) were surveyed.

The horizontal survey data were measured to the nearest 0.1-foot and referenced to the Pennsylvania State Plane Coordinate System, North American Datum (NAD) 1983. The vertical survey data were measured to the nearest 0.01-foot and referenced to the North American Vertical Datum (NAVD) 1988.

The surveying activities were conducted under the direction of a professional land surveyor licensed to practice surveying in the Commonwealth of Pennsylvania. The data collected from the December 2024 well survey are incorporated into Table 4 and their respective well construction logs in Attachment C.

7.0 HYDROGEOLOGY

Detailed discussions of site geology and hydrogeology were presented previously in the Phase II Site Investigation Report (OBG | Baker, September 2024). The hydrogeology discussions below are an update to previous reporting using the data collected from the most recent December 2024 groundwater sampling event.

The water table in the unconfined, overburden aquifer was generally encountered at a depth of approximately eight feet bgs and provided sufficient production for groundwater sampling in all but one well (MW-27S). To collect representative groundwater elevation measurements, the water levels in each of the 58 wells shown on Figure 10 were measured before the well purging and sampling activities.

As summarized on Table 4, the depth to groundwater in the 58 wells in December 2024 varied from approximately five to 16 feet bgs. All 58 of the wells were installed in the unconfined aquifer to either straddle the water table (shallow wells) or be installed at the overburden/bedrock interface (deep wells).

Based on the December 2024 groundwater elevation measurements, a groundwater elevation contour map was developed (Figure 11). It should be noted that only the shallow monitoring well measurements on Table 4 were used for the map development as the use of the nested deep well measurements would provide an inaccurate map of groundwater flow. As shown on the figure, the groundwater flow direction was generally to the north toward Lake Erie with an approximate hydraulic gradient of 3.8×10^{-3} feet per foot. The hydraulic gradient is essentially the slope of the water table across the site. The groundwater flow and associated mapping is relatively consistent with previously developed groundwater elevation contour maps for the site.

Three standpipes (SP-1 through SP-3) were installed during the site preparation activities. The purpose of the standpipes was an attempt to collect accurate measurements of the Lake Erie water level for comparison to the groundwater elevations in nearby wells on the land portion of the site. At the time of sampling in December 2024, the Lake Erie water level was lower than the installation locations of standpipes SP-1 and SP-2, and therefore, no water level readings were able to be collected. However, the water level in SP-3 was able to be recorded (5.64 feet below top of casing).

Based on the groundwater elevations in December 2024, the water level in standpipe SP-3 was lower than the nearest monitoring wells on land conveying and corroborating the most recent groundwater flow mapping. This same assumption can be translated to SP-1 and SP-2 whose water levels were lower than the depth of the standpipe installation.

It should be noted that only limited data is available for interpretation of the hydraulic interconnection between on-site wells and the three standpipes. The relatively flat hydraulic

gradient of site groundwater and the dynamic continually fluctuating water levels within the standpipes along the rocky shoreline convey a difficult interpretation of the interaction between the overburden aquifer and Lake Erie. This, along with the complexity of the aquifer due to intermixing of deposited materials, indicates that the groundwater flow towards Lake Erie may be retarded by multiple factors.

8.0 LABORATORY ANALYTICAL RESULTS – GROUNDWATER MONITORING WELLS

Because of the unknown future use of the site and the mixture of commercial, industrial, and residential areas near the site, the groundwater analytical results continue to be compared to both the Residential and Non-Residential MSCs for Used Aquifers. A summary of the groundwater analytical result detections is provided on Table 7, and a summary of quality control analytical results is provided on Table 8 for the December 2024 comprehensive groundwater sampling event. The detailed laboratory analytical reports from the sampling event are provided in Attachment D.

It should be noted that common laboratory artifacts including, but not limited to, acetone, chloroform, and chloromethane that are shown as detected on the tables are not discussed or tallied in the report sections below. They are not believed to actually be present in the respective groundwater sample and are a remnant of the laboratory analytical testing process.

8.1 Volatile Organic Compounds

VOCs were detected in approximately 65% of the groundwater monitoring wells with VOC criteria exceedances in over 50% of the wells. All five of the quality control duplicate samples exhibited criteria exceedances.

As expected from the previous groundwater monitoring well results in August, benzene was the most prevalent VOC to exceed criteria in the monitoring wells in December 2024. Benzene criteria (5 ug/L) was exceeded in over 50% of the wells with concentrations in many samples being several orders of magnitude over criteria. Notable elevated benzene concentrations that were a minimum of three orders of magnitude above criteria (5 ug/L) included:

- MW-10D (10,400 ug/L)
- MW-13 (629,000 ug/L – over five orders of magnitude above criteria)
- MW-15 (23,200 ug/L)
- MW-15-DUP (23,100 ug/L)
- MW-16 (13,100 ug/L)
- MW-26S (14,400 ug/L)
- MW-27D (5,090 ug/L)
- MW-29 (13,400 ug/L)
- MW-31 (19,100 ug/L)
- MW-36S (7,910 ug/L)
- MW-36D (6,260 ug/L)
- MW-41 (27,100 ug/L)
- MW-45 (27,600 ug/L)

Most of the remaining benzene exceedances were over two orders of magnitude above the Residential MSC with 27 wells exhibited criteria exceedances greater than 500 ug/L.

In addition to benzene, several other VOCs were detected in the groundwater monitoring wells with the most prominent being toluene (25 wells), all forms of xylene (25 wells), ethylbenzene (21 wells), 1,2,4-trimethylbenzene (24 wells), and 1,3,5-trimethylbenzene (21 wells).

After benzene, 1,2,4-trimethylbenzene was the most prominent VOC to exceed criteria (130 ug/L) in December 2024 with exceedances in twelve of the 58 wells. The 1,2,4-trimethylbenzene criteria exceedances generally were exhibited in the same wells that also had benzene criteria exceedances with the highest concentration (969 ug/L) in MW-29.

Toluene also was prominent in December 2024 with criteria (1,000 ug/L) exceedances in nine of the 58 wells with the highest toluene concentrations in wells MW-13 (72,900 ug/L) and MW-29 (25,300 ug/L). Other notable toluene concentrations included MW-31 (2,740 ug/L), MW-45 (2,510 ug/L), MW-15 (2,480 ug/L), and MW-36D (2,260 ug/L), as these four wells exhibited toluene concentrations twice the Residential MSC. Every well that exhibited a toluene criteria exceedance also exhibited a benzene criteria exceedance.

Other more limited VOCs were detected and exceeded criteria in December 2024 including 1,3,5-trimethylbenzene (four wells), styrene (three wells), bromomethane (two wells), and ethylbenzene and all forms of xylenes (one well each). All of these analytes exceeded criteria in well MW-29 with the well exhibiting more criteria exceedances (seven) than any other well during the December 2024 sampling event.

8.2 Semivolatile Organic Compounds

At least one SVOC analyte was detected in approximately 75% of the 58 groundwater monitoring wells with SVOC criteria exceedances exhibited in approximately 45% of the wells.

As expected from historical groundwater analytical results, PAHs were the most common of the SVOCs to be detected and exceed criteria in the monitoring wells during the December 2024 sampling event.

Notable SVOC detections included naphthalene (42 wells), acenaphthylene (33 wells), carbazole (32 wells), fluorene (31 wells), anthracene (28 wells), and fluoranthene (28 wells).

Notable SVOC criteria exceedances included naphthalene (24 wells), biphenyl (23 wells), 2-methylnaphthalene (20 wells), carbazole (19 wells), dibenzofuran (13 wells), and benzo(a)anthracene (11 wells).

Notable naphthalene concentrations over three orders of magnitude above criteria (100 ug/L) included:

- MW-26S (12,900 ug/L)
- MW-27D (12,500 ug/L)
- MW-10D (11,900 ug/L)
- MW-41 (11,300 ug/L)
- MW-36D (11,200 ug/L)

Including the five wells above, approximately 30% of the wells exhibited naphthalene concentrations greater than one order of magnitude above criteria (100 ug/L).

Biphenyl concentrations in approximately 25% of the wells were over one order of magnitude above criteria (0.84 ug/L) with the five highest included:

- MW-36S (64.8 ug/L)
- MW-36D (61.4 ug/L)
- MW-34D (53.1 ug/L)
- MW-26S (42.9 ug/L)
- MW-27D (40.1 ug/L)

With the exception of MW-1, all wells that exhibited at least one SVOC analyte above criteria also exhibited at least one VOC analyte (typically benzene) above criteria.

Notable multiple SVOC exceedances were exhibited in wells MW-9D (13 exceedances), MW-36S (12 exceedances), MW-27S (10 exceedances), and MW-15, MW-10D, MW-26S, and MW-27D (all with eight criteria exceedances each).

8.3 Metals

Although both a total and dissolved metals analysis sample were collected from each well, the discussion below is focuses solely on the dissolved component of the groundwater samples as these data provide a better understanding of groundwater quality without interference.

As expected, several dissolved metals were detected in all 58 of the wells and the five duplicate samples. At least one dissolved metal detection exceeded criteria in approximately 80% of the wells. Only wells MW-10S/D, MW-11S, MW-19S/D, MW-21, MW-22S/D, MW-26S, MW-34D, and MW-42 exhibited no metals criteria exceedances during the December 2024 sampling event.

Potassium, sodium, manganese, magnesium, iron, calcium, and barium were the most detected of the dissolved metal constituents with detections in greater than 95% of the groundwater samples.

With respect to criteria exceedances, iron was the most prevalent dissolved metal to exceed criteria with exceedances in 39 of the wells, followed by manganese in 32 wells, and arsenic in eight wells. The remaining dissolved metals exceeded criteria in four or less wells during the December 2024 sampling event.

Notable manganese concentrations included:

- MW-13 (10.1 milligrams per liter [mg/L])
- MW-4 (1.7 mg/L)
- MW-16 (1.7 mg/L)
- MW-36S (1.6 mg/L)
- MW-39 (1.6 mg/L)
- MW-25 (1.5 mg/L)
- MW-2 (1.5 mg/L)

Well MW-13 exhibited the most dissolved metals criteria exceedances with seven (aluminum, beryllium, chromium, cobalt, iron, lead, and manganese). The seven exceedances in MW-13 were also the highest concentrations for those respective analytes exhibited in any of the December 2024 groundwater samples.

After MW-13, all other wells exhibited three or less dissolved metals analyte concentrations above their respective criteria.

8.4 General Chemistry

General chemistry also was analyzed in the groundwater well samples and included total acidity, total alkalinity, chloride, nitrate, pH, conductivity, sulfate, total dissolved solids, and turbidity. As summarized on Table 7, sulfate was the most prevalent of the general chemistry parameters to exceed criteria (250 mg/L) with exceedances in over 70% of the wells and exhibiting an average concentration of over 500 mg/L. The elevated sulfate levels were anticipated in groundwater as ammonium sulfate is produced as a by-product during removal of ammonia from raw coke oven gas.

In addition, nitrate exceeded criteria (10 mg/L) in eleven wells, chloride criteria (250 mg/L) in four wells, and pH (6 to 8.5 acceptable range) in four wells. The general chemistry criteria exceedances were similar to historical sampling data. Consistent with the elevated VOC and SVOC concentrations in well MW-13, the sulfate concentration (2,310 mg/L) in MW-13 was the highest of all the groundwater samples, and the pH (2.44) in MW-13 was the lowest of all the groundwater samples collected in December 2024.

9.0 QUALITY ASSURANCE / QUALITY CONTROL

In addition to the investigative soil and groundwater monitoring well samples, Quality Assurance/Quality Control (QA/QC) samples also were collected as part of the supplemental investigation. A presentation of the QA/QC samples collected with their associated analytical results is provided below. The analytical results of the duplicate samples are spread across their respective investigative results tables. The trip blank, field blank, and equipment rinsate blank analytical results are tabulated on Table 8 and the detailed laboratory analytical reports provided in Attachments B and D.

9.1 Duplicate Samples

Duplicate samples were collected at a rate of approximately 10% of the associated investigative samples. Using this criterion, a total of four soil duplicate samples (SB-202-11 DUP, SB-210-9 DUP, SB-220-10 DUP, and SB-225-12 DUP) were collected in November 2024 during the drilling activities, and five groundwater duplicate samples (MW-11D DUP, MW-15 DUP, MW-24 DUP, MW-34S DUP, and MW-40 DUP) were collected in December 2024 during the comprehensive groundwater sampling event.

As presented in the Quality Assurance Plan (OBG | Baker, October 2024), the Data Quality Objectives (DQOs) for the Relative Percent Difference (RPD) between investigative samples and the associated duplicate samples is 35% for non-aqueous samples and 20% for aqueous samples.

For the soil samples, analyte detections between the four investigative and duplicate samples were fairly consistent. Exceptions primarily being a detection of an analyte in the investigative sample but not in the duplicate sample due to an elevated detection limit in the duplicate caused by laboratory sample dilution. Several analytes detected in the investigative and duplicate samples were not within the targeted 35% RPD and was understandable. The often ‘sticky’ and hydrophobic nature of the streaking and pockets of coal tar-impacted soil in the retrieved soil cores wasn’t always conducive to collection of a homogeneous investigative and quality control duplicate sample.

For the December 2024 groundwater monitoring well sampling event, a majority of all analyte detections in all five of the duplicate samples exhibited VOC, SVOC, metals, and general chemistry concentrations/values within the acceptable RPD of the associated investigative groundwater sample.

9.2 Trip Blanks

Trip blanks were analyzed to document VOC sample integrity during shipment of investigative samples from the site to the laboratory for analytical testing. Trip blanks were supplied by the laboratory before the beginning of the investigative field activities. They were stored in the field office trailer during the duration of the field activities.

One trip blank accompanied each cooler housing VOC samples that was shipped to the laboratory during the investigation. A total of 14 trip blanks were submitted for laboratory analysis. Seven of the trip blanks were used for sample shipment during the soil boring and well installation activities (TB-1 through TB-7). The remaining seven trip blanks (TB-40 through TB-46) were used for sample shipment during the comprehensive groundwater sampling event.

As summarized on Table 8, trivial analyte detections were observed across the 14 trip blanks. Chloromethane was detected in three samples, methyl acetate in two samples, and trans 1,3-dichloropropene in one sample. All detections were low level and estimated ('J flag'). These low-level ancillary analyte detections covey that sample integrity was not compromised between collection and delivery to the laboratory.

9.3 Field Blanks

To document the background/ambient site conditions, one field blank (FB-1) was collected during the drilling activities in November 2024. The field blank was collected by pouring laboratory-grade, organic-free, deionized water (provided by the laboratory) into the appropriate sample containers for laboratory analyses. The analysis of the field blank documented the integrity/quality of the water supplied by the laboratory in case erroneous detections are observed from the laboratory analytical results and also document ambient site conditions during sample collection.

As summarized on Table 8, a low-level detection of chloroform (20.3 ug/L) was present in field blank FB-1. This low-level detection is not a concern to the overall focus of the supplemental investigation.

9.4 Equipment Rinsate Blanks

Two equipment rinsate blanks (EB-1 and EB-2) were collected during the monitoring well installation activities. The field blanks were collected by pouring laboratory-grade, organic-free, deionized water (provided by the laboratory) over the decontaminated drilling head of the rotasonic drilling rig and collecting the rinsate into the appropriate sample containers for laboratory analyses. The analyses of the field blanks were used to document the effectiveness of the decontamination activities performed by the drillers.

Low-level detections of chloroform (19.6 ug/L and 18.1 ug/L, respectively) were present in the two rinsate blanks. Total calcium was detected in both samples and total sodium in EB-1, with all metal detections being low-level and not a concern with impact to sample integrity.

10.0 INVESTIGATION-DERIVED WASTE MANAGEMENT

Investigation-Derived Waste (IDW) was generated and managed accordingly during the supplemental investigation and associated sampling activities. Ancillary wastes that were not believed to pose a potential threat to the environment (e.g., soil core liners, disposable gloves, tubing, disposable bailers, rope, paper towels, etc.) were temporarily staged on site in a Construction and Demolition (C&D) rolloff box. One load of C&D waste totaling less than one half of a ton was transported off site to the nearby Waste Management Lake View Landfill on December 30, 2024.

For the drummed aqueous and non-aqueous wastes, new waste profile samples were collected for analysis (IDW-W and IDW-S, respectively) for an extensive analytical suite required by the disposal facilities. The laboratory analytical reports for the two waste profile samples are provided in Attachment E. Once the results were received, they were presented to the waste disposal subcontractor (AWMSI) for dissemination to the disposal facilities. Once approved, coordination for removal of the drums was completed.

From the soil boring and well installation activities, only two soil drums were generated. If soil was believed to not be hazardous, it was spread on site, consistent with previous waste management activities. If deemed hazardous (through field screening and visual observations), the soil was drummed for later off-site disposal. The two hazardous soil drums were transported on December 30, 2024, for treatment and disposal to Ross Incineration Services Inc. in Grafton, OH.

The only other wastes generated were decontamination fluids from the soil boring and well installation activities and purged groundwater from the subsequent well sampling activities. A total of eight drums of non-hazardous water were generated from the supplemental investigation. The eight drums of non-hazardous aqueous waste were transported and disposed at The PennOhio Corporation in Ashtabula, Ohio on December 30, 2024.

Copies of the waste disposal manifests for all materials described above are presented in Attachment F.

11.0 NATURE AND EXTENT OF CONTAMINANT IMPACT

This section was developed to evaluate the various physical and chemical properties of the contaminants detected in soil and groundwater and provide a discussion of the relationship these properties have on influencing the fate and transport of the constituents of concern in the environment.

11.1 Soil

A total of 37 soil samples were collected during the supplemental site investigation from the Lampe Marina Area (21 soil samples), Industrial North Area (nine soil samples), and the Industrial South Area - East Region (seven soil samples).

11.1.1 Lampe Marina Area Soil

Soil borings and sample locations for this area are shown on Figure 4 and the laboratory analytical results are summarized on Table 1. From the 16 soil borings (SB-200 through SB-215) and 21 soil samples collected from this area, 15 of the samples from 11 borings exhibited benzene detections with six of them exhibiting concentrations above criteria (500 ug/kg). Concentrations above criteria ranged from 1,190 ug/kg to 186,000 ug/kg. The only other VOC criteria exceedance was 1,3,5-trimethylbenzene in MW-41-8 at a concentration of 33,500 ug/kg.

Several SVOCs were detected in all but one of the 21 soil samples. Consistent with historical investigation findings, PAHs were the most detected subgroup of SVOCs to exceed criteria in the soil samples and did so for several analytes. SVOC criteria exceedances ranged from one analyte to 13 analytes in the area. A majority of the SVOC criteria exceedances were limited to PAHs, which are a common contaminant artifact of coke production. The analytical results were not surprising, as historically, soils sampled with the presence of coal tar and elevated PID readings translated to elevated VOC and/or SVOC concentrations.

Although several metals also were detected in all 21 samples within this collective area, there were limited metals criteria exceedances. Metals criteria exceedances were limited primarily to thallium, arsenic, and manganese. Thallium exceeded criteria in 15 samples, arsenic in 12 samples, and manganese in six samples.

VOC and SVOC criteria exceedances were exhibited only in soils from the northern half of the Lampe Marina investigation area (see Figure 7 for associated benzene, biphenyl and naphthalene criteria exceedances).

Further evaluation of the analytical data against the associated test boring and well construction logs (Attachments A and C, respectively) conveys similar findings from the previous phases of the investigation in this and other areas on site. Most of the vadose zone soils consist of reworked soil (varying amounts of sand, silt, and clay) and coke/coal breeze intermixed with limited

amounts of manmade/natural materials (e.g., waste cloth, wood, brick, and metal). The presence of these materials at depths ranging from seven to twelve feet below grade and near the water table supports the theory that soil, fill, and waste process materials were systematically and methodically deposited at the historical shoreline of Lake Erie to build up land, dispose of waste, and extend their operational acreage.

At the SB-200 boring location in the campground, no concerning evidence of contamination (i.e., no VOC or SVOC criteria exceedances) was present as soil impact became less prominent as soil borings approached the campground. Dredged material as the foundation of the campground consists primarily of sand, silt, rock, and shells. An overview of the development of the campground through dredgings can be found in Attachment H.

11.1.2 Industrial North Area Soil

Soil borings and sample locations for this area are shown on Figure 5 and the laboratory analytical results are summarized on Table 2. Four soil borings (SB-216, SB-217, SB-218, and SB-220) were advanced in the Industrial North Area to evaluate reported historical contamination along the rail lines coming/leaving the site, and two borings (SB-219 and SB-221) were advanced to evaluate data gaps between wells MW-13 and MW-37. One well boring (MW-45) also was advanced in this area.

Of the nine soil samples collected from this area, four of the samples exhibited VOC concentrations above criteria. Benzene exceeded criteria (500 ug/kg) with concentrations ranging from 539 (J) ug/kg to 976,000 ug/kg. The only other VOC criteria exceedances were toluene (493,000 ug/kg) and 1,3,5-trimethylbenzene (25,300 ug/kg). Both of these exceedances were in the MW-45 soil sample.

Several SVOCs were detected in all nine of the soil samples within this collective area with limited criteria exceedances. Five of the nine samples exhibited at least one SVOC analyte exceeding criteria. SVOC criteria exceedances ranged from two to five analytes and were primarily limited to PAHs (see Figure 8 for associated biphenyl and naphthalene criteria exceedances). As presented above for the Lampe Marina soils, the analytical results from this area also were not surprising, as historically, soils sampled with the presence of coal tar and elevated PID readings translated to elevated VOC and/or SVOC concentrations.

Although several metals also were detected in all nine soil samples within this collective area, there were limited metals criteria exceedances. Metals criteria exceedances were limited to arsenic, chromium, lead, manganese, selenium, and thallium. Arsenic exceeded criteria in six samples, thallium in four samples, chromium in three samples, manganese in two samples, and silver and lead in one sample each.

After review of the associated tables and figures from this area, it appears that the contaminant impact in the Industrial North Area from the supplemental investigation may be a function of historical shoreline extension (see Lampe Marina discussion above) and also poor loading/offloading management and spills at sporadic locations along the rail lines coming/leaving the site from the north. The sporadic impact can be traced along the lines with significant contamination (benzene, naphthalene, and/or other PAHs) in the Industrial North and Lampe Marina areas at/near borings SB-03, SB-101, SB-102, SB-105, SB-107, SB-110, SB-111, SB-05, SB-218, and SB-217 (north to south). Conversely, limited or no contaminant impacted in soils at/near the rail lines were exhibited in soil borings SB-01, SB-02, SB-118, SB-06, SB-220, SB-216, SB-130, and SB-128 (north to south).

Further evaluation of the analytical data against the associated test boring and well construction logs (Attachments A and C, respectively) conveyed similar findings from the previous investigation phases in this area. Most of the vadose zone soils consist of reworked soil and coke/coal breeze intermixed with limited amounts of manmade/natural materials (e.g., wood, unknown white powder). The presence of these materials at depths up to ten feet supports the theory that soil, fill, and waste process materials were systematically and methodically deposited at the historical shoreline of Lake Erie to build up land, dispose of waste, and extend their operational acreage.

This theory is supported by the impact exhibited in soils between the supplemental investigation borings and those further northeast near the shoreline. Further support of this theory was documented in historical photographs and videos along the Lake Erie shoreline during the site survey (Site Investigation Report, July 2023) where waste, fill, and equipment have been dumped at the lake's shoreline.

The lack of consistency in documented contaminant impact in this area supports the sporadic dumping of various waste materials along the continually expanding lake edge. As an example, the white powder (and wood) encountered in soils in MW-45 is not the same as the white fibrous material encountered at depth in nearby MW-13 soils near the shoreline during the previous phase of the investigation.

11.1.3 Industrial South Area – East Region Soil

Soil borings and sample locations for this area are shown on Figure 6 (Industrial South Area – East Region) and the laboratory analytical results are summarized on Table 3. Five soil borings (SB-222 through SB-226) were advanced in an area where a recent review of historical documents by the Department illuded that there may have been waste disposed in this area.

A total of seven soil samples were collected from the soil borings in this area between the depths of four and 16 feet bgs with limited VOC detections and criteria exceedances. Benzene exceeded soil criteria in two samples from one boring (SB-224) with concentrations of 1,030 ug/kg and 1,320 ug/kg (see Figure 9).

Several SVOCs were detected in six of the seven soil samples within this collective area. Three of the seven soil samples exhibited SVOC criteria exceedances limited primarily to PAHs with biphenyl and naphthalene being the most detected to exceed criteria (see Figure 9 for associated biphenyl and naphthalene criteria exceedances).

Although several metals also were detected in all seven samples within this collective area, there were limited metals criteria exceedances. Six of the seven samples exhibited at least one metal analyte with a concentration above criteria. Metals criteria exceedances were limited primarily to manganese, arsenic and thallium.

Consistent with the Lampe Marina and Industrial North Area discussions above, the contaminant impact observed in this area does not appear to be consistent with one source. As shown on Table 3 and Figure 9), the contaminant impact in SB-225 (primarily PAHs) is not consistent with the impact observed in SB-224 (primarily benzene and naphthalene). The soil samples that exhibited contaminant impact above criteria also were collected from different depths.

11.2 Groundwater

From the extensive groundwater investigations and subsequent rounds of groundwater sampling from the 58 monitoring wells, some reasonable observations can be made regarding the nature and extent of contaminant impact in the overburden aquifer. However, it has been well documented that there may be other unknown areas on site where vadose zone contamination may have impacted groundwater quality on a more localized scale.

Extensive pockets of fill and waste buried on a 96-acre (land parcels only) site approaching two hundred years of operational activity between the coke and prior industrial production has blended waste streams into one or more contaminant plumes in the overburden aquifer.

11.2.1 Volatile Organic Compounds

VOCs were detected in approximately 65% of the groundwater monitoring wells with VOC criteria exceedances in over 50% of the wells. Benzene was the most prevalent VOC to exceed criteria in groundwater (over 50% of the wells) with concentrations in many wells being several orders of magnitude over criteria (MW-10D, MW-13, MW-15, MW-16, MW-26S, MW-27D, MW-29, MW-31, MW-36S/D, MW-41, and MW-45). The highest benzene concentration in December 2024 was 629,000 ug/L in MW-13 in the Industrial North Area. Most of the remaining benzene exceedances were approximately two orders of magnitude above the Residential MSC (see Table 7).

Similar to the discussion above for the nature of soil impact sitewide, although benzene impact in groundwater is extensive, it is not believed to be indicative of one source area plume. Rather, the benzene (and other analyte) impact in site groundwater is believed to be a comingling of multiple contaminant plumes from multiple source areas at varying depths (above and below water table).

In order to provide a better understanding of the extent of benzene impact in the overburden aquifer, a benzene isoconcentration map was developed for the December 2024 groundwater sampling event (Figure 12). As shown on the figure, there appears to be five primary well areas with the most elevated benzene concentrations in groundwater including:

- Lampe Marina Area (MW-15, MW-41 and MW-16 areas),
- Industrial North Area (MW-13 and MW-45 areas),
- Industrial South Area – West Region (MW-24 area),
- Industrial South Area – Central Region (MW-29 area), and
- Tank Farm Area (multiple shallow/deep wells).

Benzene concentrations in these areas ranged from over one to five orders of magnitude above criteria (5 ug/L). Although benzene impact is documented in each of these areas, other analyte detections (and visual observations from well borings) support the comingling of multiple plumes theory (e.g., MW-29 near the tank farm exhibited more aggregate benzene, toluene, and xylenes concentrations than any other well on site; MW-13 groundwater was notably more acidic than any other well on site [pH = 2.44]).

Based on the groundwater elevation contour map (Figure 11), and the distribution of benzene in groundwater (Figure 12), it is evident that each of these five benzene impacted areas are independent of each other and are not a result of an expanding plume migration (excluding migration within the Tank Farm Area itself). Rather, the resulting mapping of benzene depicts the site as a function of a number of smaller individual known and unknown source areas contributing to the overall poor groundwater quality beneath the site. The unknown areas are potentially impacted areas yet to be discovered.

Regardless of the number of independent or comingling contaminant plumes across the site, contamination in the overburden aquifer is migrating toward Lake Erie along a majority of the more than 2,000 feet of shoreline that abuts the site. The only exceptions would be in the area near well MW-33, between MW-13 and MW-19S, and between MW-13 and the Lampe Marina area.

In all other wells near the Lake Erie shoreline, VOCs (primarily benzene) exceeded criteria with many detections being orders of magnitude above criteria. The VOC migration off site was not limited to the lakeshore. As evident on the benzene isoconcentration map (Figure 12), VOC impact in groundwater also is present beneath the Lampe Marina parking lot (see MW-40 and MW-41 on Table 7).

After benzene, 1,2,4-trimethylbenzene was the most prominent VOC to exceed criteria (130 ug/L) in December 2024 with exceedances in twelve of the 58 wells. The 1,2,4-trimethylbenzene criteria exceedances generally were exhibited in the same wells that also had benzene criteria

exceedances and were expected as it is also product associated with the carbonization of coal process.

Toluene also was prominent with criteria (1,000 ug/L) exceedances in nine of the 58 wells with the highest toluene concentrations in wells MW-13 (72,900 ug/L) and MW-29 (25,300 ug/L). Every well that exhibited a toluene criteria exceedance also exhibited a benzene criteria exceedance. This was expected as both benzene and toluene are present in high concentrations in coke production (carbonization) byproducts and wastes.

11.2.2 Semi-Volatile Organic Compounds

At least one SVOC analyte was detected in approximately 75% of the 58 groundwater monitoring wells with SVOC criteria exceedances exhibited in approximately 45% of the wells. As expected from historical groundwater analytical results, PAHs were the most common of the SVOCs to be detected and exceed criteria in the monitoring wells during the December 2024 sampling event.

Notable SVOC detections included naphthalene (42 wells), acenaphthylene (33 wells), carbazole (32 wells), fluorene (31 wells), anthracene (28 wells), and fluoranthene (28 wells). Notable SVOC criteria exceedances included naphthalene (24 wells), biphenyl (23 wells), 2-methylnaphthalene (20 wells), carbazole (19 wells), dibenzofuran (13 wells), benzo(a)anthracene (11 wells).

Naphthalene concentrations were over three orders of magnitude above criteria (100 ug/L) in wells MW-26S, MW-27D, MW-10D, MW-41, and MW-36D. Including these five wells, approximately 30% of the wells exhibited naphthalene concentrations greater than one order of magnitude above criteria.

Biphenyl concentrations in approximately 25% of the wells were over one order of magnitude above criteria (0.84 ug/L) with the five highest concentrations being in wells MW-36S, MW-36D, MW-34D, MW-26S, and MW-27D with concentrations ranging from 40.1 ug/L to 64.8 ug/L.

Notable multiple SVOC exceedances were exhibited in wells MW-9D (13 exceedances), MW-36S (12 exceedances), MW-27S (10 exceedances), and MW-15, MW-10D, MW-26S, and MW-27D (all with eight criteria exceedances each). Most of the SVOC criteria exceedances were exhibited in the same wells that also exhibited VOC criteria exceedances.

In order to provide a better understanding of the extent of SVOC impact in the overburden aquifer, two additional isoconcentration maps were developed. The naphthalene (Figure 13) and biphenyl (Figure 14) maps were developed as these two PAHs exhibited a notable number of criteria exceedances during historical groundwater sampling events.

With respect to the naphthalene distribution (Figure 13), the areas with the most elevated naphthalene concentrations in groundwater were similar to the biphenyl distribution (Figure 14).

The most elevated naphthalene levels in groundwater included Lampe Marina Area (MW-15, MW-16, and MW-41 areas), northwest of the Tank Farm (MW-11D area), and the Tank Farm Area (multiple shallow/deep wells). Naphthalene concentrations in some of these areas exceeded two orders of magnitude over criteria (100 ug/L).

Based on the latest groundwater elevation contour map (Figure 11), and the distribution of naphthalene in groundwater (Figure 13), it is believed that each of these more impacted areas are independent of each other and are not a result of an expanding plume migration (excluding within the Tank Farm Area itself). Similar to benzene, the resulting mapping of naphthalene depicts the site as a function of a number of smaller individual source areas contributing to the overall poor groundwater quality beneath the site.

As shown on Figure 14, the areas with the most elevated biphenyl concentrations in groundwater included Lampe Marina Area (MW-15, MW-16, and MW-41 areas), northwest of the Tank Farm (MW-11D area), and the Tank Farm Area (multiple shallow/deep wells). Biphenyl concentrations in these areas were not more than one order of magnitude above criteria.

Based on the latest groundwater elevation contour map (Figure 11), and the distribution of biphenyl in groundwater (Figure 14), it is believed that each of these biphenyl-impacted areas are independent of each other and are not a result of an expanding plume migration (excluding within the Tank Farm itself). Similar to benzene and naphthalene, the resulting mapping of biphenyl depicts the site as a function of a number of smaller individual source areas contributing to the overall poor groundwater quality beneath the site that is ultimately migrating toward the Lake Erie shoreline.

The SVOC migration off site was not limited to the lakeshore. As evident on the naphthalene and biphenyl isoconcentration maps, SVOC impact in groundwater is present beneath part of the Lampe Marina parking lot (see MW-40 and MW-41 on Table 7).

11.2.3 Metals

Although both a total and dissolved metals analysis sample were collected from each well, the discussion below is focuses solely on the dissolved component of the groundwater samples as these data provide a better understanding of groundwater quality without interference.

As expected, several dissolved metals were detected in all 58 of the wells. At least one dissolved metal detection exceeded criteria in approximately 80% of the wells. Wells MW-10S/D, MW-11S, MW-19S/D, MW-21, MW-22S/D, MW-26S, MW-34D, and MW-42 exhibited no metal criteria exceedances during the December 2024 sampling event.

Potassium, sodium, manganese, magnesium, iron, calcium, and barium were the most detected of the dissolved metal constituents with detections in at least 95% of the groundwater samples.

With respect to criteria exceedances, iron and manganese were the most prevalent dissolved metals to exceed criteria with exceedances in over half of the wells, followed by arsenic in 14% wells. The remaining dissolved metals exceeded criteria in four or less wells during the December 2024 sampling event.

Notable manganese concentrations over an order of magnitude above criteria (0.3 mg/L) included MW-16, MW-13, MW-4, MW-36S, MW-39, MW-25, and MW-2. MW-13 exhibited the most dissolved metals criteria exceedances with seven (aluminum, beryllium, chromium, cobalt, iron, lead, and manganese). The seven exceedances in MW-13 were also the highest concentrations for those respective analytes exhibited in any of the December 2024 groundwater samples. After MW-13, all other wells exhibited three or less dissolved metals analyte concentrations above their respective criteria. With metal criteria exceedances in most wells, the extent of select metals impact above criteria in groundwater is across a majority of the site.

11.2.4 General Chemistry

General chemistry also was analyzed in the groundwater well samples and included total acidity, total alkalinity, chloride, nitrate, pH, conductivity, sulfate, total dissolved solids, and turbidity. The general chemistry criteria exceedances were similar to historical sampling data.

As summarized on Table 7, sulfate was the most prevalent of the general chemistry parameters to exceed criteria (250 mg/L) with exceedances in over 70% of the 58 wells and exhibiting an average concentration of over 500 mg/L. The elevated sulfate levels were anticipated in groundwater as ammonium sulfate is produced as a by-product during removal of ammonia from raw coke oven gas. Consistent with the elevated VOC and SVOC concentrations in well MW-13, the sulfate concentration (2,310 mg/L) in MW-13 was the highest of all the groundwater samples, and the pH (2.44) in MW-13 was the lowest of all the groundwater samples collected in December 2024.

11.3 Non-Aqueous Phase Liquid

During implementation of the recent field activities, measurements of both LNAPL and DNAPL were completed in the Tank Farm Area. The individual or multiple sources of the NAPL were not identified in the Tank Farm Area as it could be from multiple tanks and/or transmission lines beneath the ground surface.

Measurable thicknesses of DNAPL were observed in seven of the groundwater wells in the Tank Farm Area in November 2024 (Table 6). LNAPL was not observed in any of the monitoring wells. MW-34D exhibited the greatest thickness of DNAPL with two feet in November, followed by MW-9D (1.8 feet), MW-26S and MW-27D (1.5 feet each), MW-10S (0.79 feet), MW-26D (0.21 feet), and MW-36D (0.17 feet).

DNAPL thicknesses varied significantly between November 2024 and previous measurements. This could be due to several factors including, but not limited to, the method of measurement (discussed previously), NAPL flowing into the open borehole from pockets in the subsurface soil collecting in the annulus, NAPL clogging the well screen slots mitigating stabilization with the surrounding aquifer/NAPL, and delayed flow into the well due to DNAPL characteristics.

After review of the latest NAPL measurements on Table 6 and their locations, it appears that there may be a preferential pathway for DNAPL. The wells with the greatest DNAPL thicknesses are in a fairly straight line through the middle of the Tank Farm Area with the greatest thicknesses being at the western (1.8 feet in MW-9D) and eastern (2.0 feet in MW-34D) limits of the Tank Farm in November 2024. The preferential pathway could be attributed to utility or transfer piping serving as a conduit beneath the Tank Farm. No subsurface historical mapping plans of the Tank Farm Area have been located for review.

One thing of note when measuring the DNAPL across the site is the different physical properties of the DNAPL. In some borings, the nature of the encountered DNAPL was more viscous and 'sticky' whereas other encountered DNAPL was less viscous and appeared more mobile. Unfortunately, there is no documentation of where these DNAPL characteristics were encountered as the differences in the DNAPLs were not observed until near the end of the previous investigation activities.

Although there is a limited amount of accurate DNAPL data available, a DNAPL location map was developed for this report to provide a better understanding of the current limits of DNAPL in the Tank Farm area (Figure 15). Periodic monitoring in the future of the DNAPL in the Tank Farm Area will provide a better understanding of the movement and direction of the DNAPL toward the lakeshore.

Regardless of the chemical and physical properties of the DNAPL, the inferred DNAPL limit on Figure 15 conveys that measurable DNAPL is limited to the Tank Farm Area of the site and does not appear to be a threat to Lake Erie at the present time (discounting the dissolved phase migration discussed previously). The lack of DNAPL in groundwater down gradient wells MW-38D, MW-22S, MW-22D, MW-21, and MW-23 support this conclusion.

12.0 DATA TRENDS

With completion of the December 2024 groundwater sampling event, an attempt was made to identify any data trends that may be present in site groundwater. A multi-phase investigation of the site included installation and sampling of numerous monitoring wells between 2022 and 2024. Because of this, some wells (MW-1, MW-2, MW-3, MW-4, MW-5S/5D, MW-6S/6D, MW-7, MW-8S/8D, MW-9D, MW-10, and MW-11S/D) have up to six groundwater sampling events to identify possible data trends whereas others (MW-39 through MW-45) have only one groundwater sampling event as shown on Table 9.

For purposes of this data trend evaluation, only wells that had a minimum of four sampling events and a minimum of three consecutive upward or downward concentrations through the most recent sampling event were evaluated for possible data trends. The data summary table shown on Table 9 is not all inclusive with respect to the extensive analytical suite analyzed since project inception. Rather, the analytes shown on the table have been selected as they are believed to be representative of the overall groundwater quality at the site and not clutter the function of the table with unnecessary data that has not driven historical investigations to date.

There was difficulty in identifying trends in many samples due to elevated and inconsistent detection limits from the laboratory. In some instances where an analyte was not detected at an elevated detection limit, other analytes in that same sample were still evaluated for possible data trends. If the other analytes exhibited a trend, that same trend was inferred to the other analyte in the sample that exhibited the elevated detection limit. As an example, MW-9D exhibited a downward trend in multiple SVOCs including anthracene from January through December 2024. Similarly, benzo(g,h,i)perylene also exhibited a downward trend in MW-9D with the inference that the lack of detection in April 2024 (at 6 ug/L detection limit) was likely between 6 ug/L and 1.9 ug/L (August 2024 concentration). This inference is supported by similar trends in biphenyl, fluoranthene, fluorene, and phenanthrene in MW-9D.

With 58 wells having between one and six sampling events since 2022, there are numerous upward and downward data trends that have been identified. Obviously, future sampling events would provide additional data to further corroborate (or contradict) the identified data trends. However, it should be noted that some of the trends are not significant and are within the error of sampling and instrument uncertainty. Future monitoring may corroborate minor increasing/decreasing trends or reveal itself as stable results with minor fluctuations over time. A summary of identified data trends through December 2024 is summarized below.

Downward Data Trends:

- MW-5D (Benzene)
- MW-8S (Benzene, Ethylbenzene, O-Xylene, Toluene, Fluoranthene, Naphthalene, Phenanthrene)

- MW-9S (Benzene, Acenaphthylene)
- MW-9D (Ethylbenzene, Acenaphthylene, Anthracene, Benzo(g,h,i)perylene, Biphenyl, Fluoranthene, Fluorene, Phenanthrene)
- MW-10S (Benzene, O-Xylene, Toluene, Acenaphthylene)
- MW-11D (Benzene, Ethylbenzene, O-Xylene)
- MW-12 (M&P Xylenes)
- MW-13 (M&P Xylenes, O-Xylene, Total Xylenes)
- MW-17 (Fluoranthene, Phenanthrene)
- MW-18 (Toluene)
- MW-19D (Benzene, M&P Xylene, O-Xylene, Toluene, Total Xylenes)
- MW-22S (O-Xylene, Styrene, Total Xylenes)
- MW-24 (Benzene, M&P Xylene, Toluene, Total Xylenes)
- MW-27S (Fluorene, Phenanthrene)
- MW-31 (Benzene, Toluene)
- MW-34S (Benzene, Fluoranthene, Fluorene, Naphthalene, Phenanthrene)
- MW-36D (Acenaphthylene)
- MW-37 (Acenaphthene, Fluorene, Naphthalene, Phenanthrene, Pyrene)

Upward Data Trends:

- MW-8D (Acenaphthylene, Anthracene)
- MW-9S (Anthracene)
- MW-10D (Acenaphthene, Biphenyl, Fluorene)
- MW-11D (Naphthalene)
- MW-12 (Ethylbenzene, Fluoranthene)
- MW-13 (Benzene)
- MW-15 (Ethylbenzene, M&P Xylene, O-Xylene, Total Xylenes)
- MW-19D (Ethylbenzene, Isopropylbenzene, Acenaphthene, Anthracene, Fluoranthene, Phenanthrene)
- MW-21 (Acenaphthene)
- MW-22S (Biphenyl, Fluorene, Phenanthrene)
- MW-26S (Benzene)
- MW-27D (Acenaphthene, Anthracene, Fluorene, Naphthalene, Phenanthrene)
- MW-34D (Ethylbenzene, Biphenyl, Fluorene)
- MW-36S (Benzene, Ethylbenzene, M&P Xylene, O-Xylene, Styrene, Toluene, Total Xylenes, Acenaphthene, Anthracene, Biphenyl, Fluoranthene, Fluorene, Phenanthrene)
- MW-36D (M&P Xylene, O-Xylene, Total Xylenes, Biphenyl, Fluorene)

Although most of the data trends identified above bring some value from an investigation perspective, they are strategic when evaluating future remedial alternatives (if any). Identified

trends become validated with additional groundwater data and can be used to formulate more refined preliminary remedial alternatives.

Obviously, the wells and analytes listed in the upward trend are more concerning than those listed with decreasing analytical concentration trends. However, it should be noted that some wells exhibited both a downward trend and an upward trend for different analytes including wells MW-11D, MW-13, MW-19D, MW-22S, and MW-36D. Although the reason for some of the wells that exhibited both increasing and decreasing data trends is unclear, some others may be a function of having multiple and variable sources of contaminant impact. It has been well documented since the initial investigation activities in 2022 that there is an extensive network of smaller and larger individual contaminant source areas throughout the site at varying depths and thicknesses. The remobilization into the groundwater of a small pocket or layer of contamination during intrusive soil boring and/or well installation activities could cause an increase in a particular contaminant concentration. Conversely, this same pocket or layer of contamination may have been cut off from the overburden aquifer during drilling activities causing a methodical decrease in contaminant levels.

The primary focus to trending groundwater analyte concentrations is in wells near the lakeshore, with MW-13 in the Industrial North Area providing the greatest concern. The high level of contamination in soil and groundwater in the general well area has been well documented. Although the well has exhibited a downward trend in all forms of xylene concentrations, the benzene levels, which are the highest on site, have continued to increase for each sampling event in 2024. Benzene levels in MW-13 have increased approximately 60% from January to December 2024 (374,000 ug/L to 629,000 ug/L). With groundwater flow documented to be toward Lake Erie through MW-13, additional sampling of MW-13 should be completed to monitor contaminant concentrations.

Other upward concentration trends were exhibited in wells near the lakeshore but were generally low-level concentrations significantly below criteria (e.g., acenaphthene in MW-21). For wells generally located between the Tank Farm Area and the lakeshore (MW-19S/D, MW-21, MW-22S/D, MW-23, and MW-33), only limited analyte detections exhibited an increasing trend, albeit at generally low-level concentrations. Increasing trends included ethylbenzene, isopropylbenzene, acenaphthene, and anthracene in MW-19D, biphenyl, fluorene, and phenanthrene in MW-22S, and acenaphthene in MW-21. Future monitoring of these wells will better establish if these increasing concentration trends are viable and are a concern to the lakeshore.

13.0 CONCLUSIONS

The conclusions below are provided in a bulletized format for ease of review and discussion. In general, and consistent with previous OBG | Baker investigative reports, it has been concluded that the site is still considered a potential threat to human health and the environment. This previous conclusion has been expanded off site to the northern portions of the Lampe Marina parking lot after completion of the supplemental site investigation.

- The strategic placement and sampling of soil borings and groundwater monitoring wells from the supplemental site investigation were successful in delineating the contaminant impact in the Lampe Marina parking lot.

- Subsurface soils in the northern portions of the Lampe Marina parking lot are impacted with essentially the same VOC (primarily benzene) and SVOC (primarily PAHs) contamination exhibited elsewhere on site. The identification of manmade material at depth (e.g., waste cloth) in the Lampe Marina Area supports the conclusion that the geographic limits of the former Erie Coke facility were continually expanded outward toward, and at, the lakeshore with fill material, operational wastes, and other wastes during its more than one hundred years of operation. It is likely that this same practice took place with previous property owners to Erie Coke.

- The soil contamination in Lampe Marina Area wells MW-15 (on site), MW-40 (off site), and MW-41 (off site) was likely deposited in the same general timeframe to dispose of wastes and extend the operational shoreline of Erie Coke. This conclusion is supported with all three well borings having exhibited the same fill material (e.g., wood and waste cloth) and tarry material near/below the water table.

- Supplemental investigation wells MW-39, MW-40, and MW-41 impacted with VOCs (primarily benzene) and SVOCs (primarily PAHs) above criteria conveys that the groundwater is impacted off site in the Lampe Marina parking lot. While there was no obvious waste material or elevated PID readings to indicate contamination in MW-39 well boring soils, the direct proximity to SB-203, which encountered slag, coke, and coke breeze, may be the source of benzene impact in MW-39 seen in December 2024.

- With no obvious contamination in the MW-39 well boring soils, the benzene impact in MW-39 in December 2024 may be indicative of the contaminant plume migrating further north toward portions of the campground and Lake Erie. However, there is no evidence that the soil or groundwater beneath the campground is currently impacted from site contaminants as no extensive investigation was completed in that area.

- The elevated VOC and SVOC soil concentrations with varying identified subsurface wastes (e.g., white fibers, white powder, wood) in the Industrial North Area indicates that there are multiple waste streams contributing to the overall detrimental effects of groundwater

quality in this area.

- The contamination observed in soil and groundwater in the vicinity of wells MW-13 and MW-45 in the Industrial North Area is believed to have two sources at a minimum. One source being the wastes and fill material used to continually fill in low areas and extend the shoreline to expand Erie Coke's historical operational area. The other source is believed to be from poor housekeeping of railcars, equipment, and/or trucks along the various rail spurs in this, and other areas, on site. With MW-13 being the most contaminated well on site (with respect to VOCs), having manmade contamination at depths above and below the water table, its presence near the lakeshore, and the identification of wastes nearby along the lakeshore bluff/edge, corroborates the conclusion of potentially multiple contaminant sources. MW-13 is the most concerning well on site for the reasons above and that is also has exhibited consecutive increases in benzene levels throughout 2024 that are already five orders of magnitude above criteria (Table 7).

- Consistent with the Lampe Marina and Industrial North Area, the contaminant impact observed in the Industrial South Area – East Region does not appear to have one contaminant source. Contaminant impact and depth in one boring (primarily PAHs) was not consistent with the impact and depth observed in another boring from this area (primarily benzene).

- VOCs were detected in approximately 65% of the groundwater monitoring wells with VOC criteria exceedances in over 50% of the wells. Benzene was the most prevalent VOC to exceed criteria (over 50% of the wells) with many well samples being several orders of magnitude over criteria. This was anticipated as benzene is typically the primary VOC in concentrated byproducts, air emissions, and wastewater from the coke production process. The areas with the most elevated benzene concentrations include Lampe Marina Area, Industrial North Area, and the generalized Tank Farm Area and appear to be independent of each other. Benzene concentrations in these areas ranged from over one to five orders of magnitude above criteria (5 ug/L).

- In addition to benzene, several other VOCs were detected in the groundwater monitoring wells with the most prominent being toluene (25 wells), all forms of xylene (26 wells), ethylbenzene (21 wells), 1,2,4-trimethylbenzene (24 wells), and 1,3,5-trimethylbenzene (21 wells). Toluene generally exceeded criteria only in wells that also exhibited benzene concentrations above criteria. This was expected as both benzene and toluene are present in high concentrations in coke production byproducts and wastes.

- At least one SVOC analyte was detected in approximately 75% of the groundwater monitoring wells with SVOC criteria exceedances in approximately 45% of the wells. PAHs were the most common of the SVOCs to be detected and exceed criteria in the monitoring

wells. Notable SVOC criteria exceedances included naphthalene (24 wells), biphenyl (23 wells), 2-methylnaphthalene (20 wells), carbazole (19 wells), dibenzofuran (13 wells), benzo(a)anthracene (10 wells). These extensive detection and criteria exceedances can all be attributed to the coke production process.

- Isoconcentration mapping of VOCs and SVOCs conveyed that each of the most impacted areas on site are independent of each other and are not a result of an expanding plume migration (excluding within the Tank Farm Area itself). Each of these larger impacted areas are a composite of a number of smaller individual source areas contributing to the overall poor groundwater quality beneath the site that is potentially migrating toward the Lake Erie shoreline.

- There is more than 2,000 feet of shoreline that abuts the site. With a number of independent and comingling contaminant plumes across the site, Lake Erie should be evaluated as a potential receptor of site contamination.

- Several dissolved metals were detected in all groundwater monitoring wells with criteria exceedances of at least one metal exhibited in approximately 80% of the wells. Iron, manganese, and arsenic were the most abundant metals to exceed criteria in the wells. MW-13 exhibited the most metal criteria exceedances (seven) and the highest associated concentrations of those metals in December 2024.

- The measurable DNAPL appears to be limited to the Tank Farm Area and does not appear to be a threat to Lake Erie at the present time as a separate phase layer. The dissolved phase of the contaminant plume in this area is ahead (down gradient) of the DNAPL migration due to many variables including, but not limited to, the viscosity of the DNAPL.

14.0 RECOMMENDATIONS

An extensive volume of analytical, geological, and hydrogeological data from multiple investigations has been generated from project inception in 2022 to completion of the supplemental investigation activities in December 2024. From this extensive database and observations made during all facets of the investigations, recommendations for further investigation work at the site are as follows:

- Continued periodic (quarterly) monitoring of select groundwater wells on and off site. Wells that do not have a history of contaminant impact, or bring little value to future monitoring, would not be included in the proposed sampling network. The primary focus will be on wells in the Lampe Marina Area, Industrial North Area, and the Tank Farm Area where independent groundwater contaminant plumes are migrating toward Lake Erie.

- Although groundwater monitoring is recommended for only select wells on and off site, it still is recommended that water levels continue to be collected from all 58 wells on and off site to provide more precise groundwater flow mapping.

- Continued periodic (quarterly) monitoring of DNAPL in the Tank Farm Area and associated wells is recommended and is proposed to be completed using the same methodology used in November 2024 (rigid piping and string method).

- Because metal detections are ubiquitous throughout the site and are not the primary focus of the previous multiple investigations, it is recommended that total and dissolved metals analyses be eliminated from future monitoring on site. This same recommendation is also proposed for the general chemistry analysis except for pH.

- It is recommended that a new deep well (MW-13D) be nested with MW-13 in the Industrial North Area. The well is exhibiting a concerning trend of significantly increasing benzene concentrations in 2024 (approximately 60% increase). With the MW-13/SB-121 well log having exhibited significant PID readings (2,107 ppm at 17 feet bgs and 867 ppm at 18 feet bgs) at boring terminus during construction in October 2023, it is believed these concerns are sufficient to warrant the additional deeper monitoring well to nest with the shallower MW-13 (approximately 16 feet deep). The well is proposed to be installed at the soil/bedrock interface to be consistent with other deep wells on site.

- With documented SVOC impact above criteria for numerous analytes in sediments near MW-13 (SED-02, SED-03, and SED-09 from September 2022 investigation), it is recommended that additional supplemental sampling be completed of the sediments along the shoreline of Lake Erie, adjacent to MW-13. It is recommended that the sediment sampling be completed at a minimum of twice per year for a minimum of two years to evaluate the continuing impact (if any) to sediments from on-site contaminants.

- Only one sediment sample (SED-07) was collected during the 2022 investigation that is considered down gradient of the Tank Farm Area with several SVOC detections that did not exceed criteria. With the documented groundwater impact to the Tank Farm Area wells and in wells between it and the lakeshore, it is recommended that additional sediment samples also be collected from this area of the lakeshore. Consistent with recommendation above, it is recommended that the sediment sampling be completed at least twice per year for a minimum of two years to evaluate the contaminant impact (if any) to sediments from on-site contaminants.

- It is recommended that recently installed MW-42 in the Lampe Marina parking lot be retrofitted to be a stick-up well instead of a flush mounted well. At the time of well placement, it was unknown that the well was being installed in a low-lying corner of the parking lot causing the well to be submerged with standing water after snow melt or a rain event. Two protective bollards are recommended to be installed with the new stick-up casing.

- The inconsistent and elevated levels of soil contamination observed in the supplemental investigation borings in the Industrial South Area – East Region are believed to warrant further investigation. To be consistent with other areas investigated on site, it is recommended that one groundwater monitoring well be installed and sampled in the vicinity of borings SB-224 and SB-225. With different analytes of concern (VOCs in SB-224 and SVOCs in SB-225) encountered at different sampling depths, it is believed that a well is warranted at each of these locations. Consistent with other wells on site, each well would be completed with two protective bollards at a minimum.

Notes/Qualifiers:

µg/kg - microgram per kilogram
ft bgs - ft below ground surface
E - result exceeded calibration range
J - result is less than the RL but greater than or equal to the MDL; estimated
MDL - Method Detection Limit
mg/kg - milligram per kilogram
MSC - Medium-Specific Concentration
MW - Monitoring Well
NE - Not Established
PADEP - Pennsylvania Department of Environmental Protection
RL - Reporting Limit
SB - Soil Boring
SVOC - Semi-volatile Organic Compound
TDS - Total Dissolved Solids
U - Not Detected
VOC - Volatile Organic Compound

Bolded - Concentration is detected in the sample
Shaded - Detected concentration exceeds the PADEP Residential Soil MSC
Boxed - Detected concentration exceeds the PADEP Nonresidential Soil MSC

It is noted that several of the non-detect results have reporting limits that exceed the respective screening criteria.

[1] - PADEP Residential MSCs are determined by the lower of the residential Direct Contact and residential Soil-to-Groundwater (Used aquifer; TDS≤2500) values. The Soil-to-Groundwater value is determined by the higher of the 100x Groundwater MSC and Generic Value.
[2] - PADEP Nonresidential MSCs are determined by the lower of the nonresidential Direct Contact and nonresidential Soil-to-Groundwater (Used aquifer; TDS≤2500) values. The Soil-to-Groundwater value is determined by the higher of the 100x Groundwater MSC and Generic Value.
[3] - An additional 38 VOCs were analyzed for, but not detected.
[4] - Not a single chemical but a mixture of the isomers m-xylene and p-xylene.
[5] - Total Xylene used as a surrogate.
[6] - An additional 40 SVOCs were analyzed for, but not detected.
[7] - Not a single chemical but a mixture of the isomers m-cresol and p-cresol.
[8] - p-Cresol used as a surrogate.
[9] - Secondary Maximum Contaminant Level (SMCL)
[10] - Chromium VI used as a surrogate.

Notes/Qualifiers:

µg/kg - microgram per kilogram
ft bgs - ft below ground surface
E - result exceeded calibration range
J - result is less than the RL but greater than or equal to the MDL; estimated
MDL - Method Detection Limit
mg/kg - milligram per kilogram
MSC - Medium-Specific Concentration
MW - Monitoring Well
NE - Not Established
PADEP - Pennsylvania Department of Environmental Protection
RL - Reporting Limit
SB - Soil Boring
SVOC - Semi-volatile Organic Compound
TDS - Total Dissolved Solids
U - Not Detected
VOC - Volatile Organic Compound

Bolded - Concentration is detected in the sample
Shaded - Detected concentration exceeds the PADEP Residential Soil MSC
Boxed - Detected concentration exceeds the PADEP Nonresidential Soil MSC

It is noted that several of the non-detect results have reporting limits that exceed the respective screening criteria.

(1) - PADEP Residential MSCs are determined by the lower of the residential Direct Contact and residential Soil-to-Groundwater (Used aquifer; TDS≤2500) values. The Soil-to-Groundwater value is determined by the higher of the 100x Groundwater MSC and Generic Value.

(2) - PADEP Nonresidential MSCs are determined by the lower of the nonresidential Direct Contact and nonresidential Soil-to-Groundwater (Used aquifer; TDS≤2500) values. The Soil-to-Groundwater value is determined by the higher of the 100x Groundwater MSC and Generic Value.

(3) - An additional 42 VOCs were analyzed for, but not detected.
(4) - Not a single chemical but a mixture of the isomers m-xylene and p-xylene.
(5) - Total Xylene used as a surrogate.
(6) - An additional 40 SVOCs were analyzed for, but not detected.
(7) - Not a single chemical but a mixture of the isomers m-cresol and p-cresol.
(8) - p-Cresol used as a surrogate.
(9) - Secondary Maximum Contaminant Level (SMCL)
(10) - Chromium VI used as a surrogate.

Notes/Qualifiers:

µg/kg - microgram per kilogram
ft bgs - ft below ground surface
J - result is less than the RL but greater than or equal to the MDL; estimated
MDL - Method Detection Limit
mg/kg - milligram per kilogram
MSC - Medium-Specific Concentration
NE - Not Established
PADEP - Pennsylvania Department of Environmental Protection
RL - Reporting Limit
SB - Soil Boring
SVOC - Semi-volatile Organic Compound
TDS - Total Dissolved Solids
U - Not Detected
VOC - Volatile Organic Compound

Bolded - Concentration is detected in the sample
Shaded - Detected concentration exceeds the PADEP Residential Soil MSC
Boxed - Detected concentration exceeds the PADEP Nonresidential Soil MSC

It is noted that several of the non-detect results have reporting limits that exceed the respective screening criteria.

[1] - PADEP Residential MSCs are determined by the lower of the residential Direct Contact and residential Soil-to-Groundwater (Used aquifer; TDS≤2500) values. The Soil-to-Groundwater value is determined by the higher of the 100x Groundwater MSC and Generic Value.

[2] - PADEP Nonresidential MSCs are determined by the lower of the nonresidential Direct Contact and nonresidential Soil-to-Groundwater (Used aquifer; TDS≤2500) values. The Soil-to-Groundwater value is determined by the higher of the 100x Groundwater MSC and Generic Value.

[3] - An additional 44 VOCs were analyzed for, but not detected.

[4] - Not a single chemical but a mixture of the isomers m-xylene and p-xylene.

[5] - Total Xylene used as a surrogate.

[6] - An additional 43 SVOCs were analyzed for, but not detected.

[7] - Not a single chemical but a mixture of the isomers m-cresol and p-cresol.

[8] - p-Cresol used as a surrogate.

[9] - Antimony and silver were also analyzed for, but not detected.

[10] - Secondary Maximum Contaminant Level (SMCL)

[11] - Chromium VI used as a surrogate.

Notes:

µs/cm - micro siemens per centimeter
C° - degrees Celsius
mg/L - milligrams per liter
mV - millivolts
N/A - Not Available; Unable to collect due to Non-Aqueous Phase Liquids (NAPL) in well, high contamination, poor recharge, sensor not working, etc.
NTU - Nephelometric Turbidity Units
S.U. - Standard Units

Notes/Qualifiers:

µg/L - microgram per liter
µhos/cm - Micromhos per centimeter
E - result exceeded calibration range
J - result is less than the RL but greater than or equal to the MDL; estimated
MDL - Method Detection Limit
mg/L - milligram per liter
MSC - Medium-Specific Concentration
MW - Monitoring Well
NE - Not Established
NTU - Nephelometric Turbidity Unit
PADEP - Pennsylvania Department of Environmental Protection
RL - Reporting Limit
SU - Standard Unit
SVOC - Semi-Volatile Organic Compound
TDS - Total Dissolved Solids
U - Not Detected
VOC - Volatile Organic Compound

Bolded - Concentration is detected in the sample
Shaded - Detected concentration exceeds the PADEP Residential Groundwater MSC
Boxed - Detected concentration exceeds the PADEP Nonresidential Groundwater MSC

It is noted that several of the non-detect results have reporting limits that exceed the respective screening criteria.

[1] - An additional 40 VOCs were analyzed for, but not detected.
[2] - Not a single chemical but a mixture of the isomers m-xylene and p-xylene.
[3] - Total Xylene used as a surrogate.
[4] - An additional 33 SVOCs were analyzed for, but not detected.
[5] - Not a single chemical but a mixture of the isomers m-cresol and p-cresol.
[6] - p-Cresol used as a surrogate.
[7] - Total mercury, Total silver, and Total thallium were also analyzed for, but not detected.
[8] - Secondary Maximum Contaminant Level (SMCL)
[9] - Dissolved cadmium, dissolved mercury, and dissolved silver were also analyzed for, but not detected.

Semi-Volatile Organic Comounds (µg/L) [2]																			
None Detected																			
Total Metals (mg/L) [3]																			
Calcium, Total	NE	NE	**0.13**	**0.075** J	0.11 U	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Sodium, Total	NE	NE	**0.2** J	0.56 U	0.56 U	-	-	-	-	-	-	-	-	-	-	-	-	-	-

Notes/Qualifiers:

- - Not Analyzed
µg/L - microgram per liter
EB - Equipment Blank
FB -Field Blank
J - result is less than the RL but greater than or equal to the MDL; estimated
MDL - Method Detection Limit
mg/L - milligram per liter
MSC - Medium-Specific Concentration
NE - Not Established
PADEP - Pennsylvania Department of Environmental Protection
QA/QC - Quality Assurance/Quality Control
RL - Reporting Limit
SVOC - Semi-Volatile Organic Compound
TB - Trip Blank
U - Not Detected
VOC - Volatile Organic Compound

Bolded - Concentration is detected in the sample
Shaded - Detected concentration exceeds the PADEP Residential Groundwater MSC
Boxed - Detected concentration exceeds the PADEP Nonresidential Groundwater MSC

[1] - An additional 51 VOCs were analyzed for, but not detected.
[2] - Sixty eight SVOCs were analyzed for, but not detected.
[3] - An additional 21 total metals were analyzed for, but not detected.

Notes/Qualifiers:

- Analysis not available/not performed; well not installed
^c - CCV recovery is outside acceptance limits
µg/L - microgram per liter
CCV - Continuing Calibration Verification
E - result exceeded calibration range
H - sample was prepped or analyzed beyond specified holding times
J - result is less than the RL but greater than or equal to the MDL; estimated
MDL - Method Detection Limit
RL - Reporting Limit
SVOC - Semi-Volatile Organic Compound
U - Not Detected
VOC - Volatile Organic Compound

Italics - Chemical is not detected
Shaded - Decreasing Trend
Shaded - Increasing Trend

Trends consist of three consecutive concentrations, at a minimum, with extrapolated concentrations where elevated detection limits are believed to mask the actual concentration.

Analytical Results Report For

Michael Baker International

Project Erie Coke Works
Workorder 3387420
Report ID 370143 on 11/27/2024

Certificate of Analysis

Enclosed are the analytical results for samples received by the laboratory on Nov 13, 2024.

The ALS Environmental laboratory in Middletown, Pennsylvania is a National Environmental Laboratory Accreditation Program (NELAP) accredited laboratory and as such, certifies that all applicable test results meet the requirements of NELAP.

If you have any questions regarding this certificate of analysis, please contact Elizabeth Parker (Project Coordinator) at (717) 944-5541.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program and any applicable state requirements. The test results meet requirements of the current NELAP standards or state requirements, where applicable. For a specific list of accredited analytes, refer to the certifications section of the ALS website at www.alsglobal.com/en/Our-Services/Life-Sciences/Environmental/Downloads.

This laboratory report may not be reproduced, except in full, without the written approval of ALS Global.

Reference

Notes

- Samples collected by ALS personnel are done so in accordance with the procedures set forth in the ALS Field Sampling Plan (20 - Field Services Sampling Plan).
- Except as qualified, Clean Water Act sample analyses are consistent with methodology requirements in 40 CFR Part 136, including but not limited to the following EPA Method reference revisions:
  EPA 300.1 Rev. 1.0-1997
  EPA 300.0 Rev. 2.1-1993
  EPA 353.2 Rev. 2.0-1993
  EPA 410.4 Rev. 1.0-1993
  EPA 420.4 Rev. 1.0-1993
  EPA 365.1 Rev. 2.0-1993
  EPA 200.7 Rev. 4.4-1994
  EPA 200.8 Rev. 5.4-1994
  EPA 245.1 Rev. 3.0-1994
- Except as qualified, Safe Drinking Water Act sample analyses are consistent with methodology requirements in 40 CFR Part 141.
- The Chain of Custody document is included as part of this report.
- All Library Search analytes should be regarded as tentative identifications based on the presumptive evidence of the mass spectra. Concentrations reported are estimated values.
- Parameters identified as "analyze immediately" require analysis within 15 minutes of collection. Any "analyze immediately" parameters not listed under the header "Field Parameters" are preformed in the laboratory and are therefore analyzed out of hold time.
- Method references listed on this report beginning with the prefix “S” followed by a method number (such as S2310B-97) refer to methods from “Standard Methods for the Examination of Water and Wastewater”.
- For microbiological analyses, the "Prepared" value is the date/time into the incubator and the "Analyzed" value is the date/time out the incubator.
- An Analysis-Prep Method Cross Reference Table is included after Analytical Results & Qualifiers section in this report.
- Unless otherwise noted, all quantitative results for soils are reported on a dry weight basis.

Standard Acronyms/Flags

J	Indicates an estimated value between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL) for the analyte
U	Indicates that the analyte was Not Detected (ND) above the MDL
N	Indicates presumptive evidence of the presence of a compound
MDL	Method Detection Limit
PQL	Practical Quantitation Limit
RDL	Practical Quantitation Limit for this Project
ND	Not Detected - indicates that the analyte was Not Detected
Cntr	Analysis was performed using this container
RegLmt	Regulatory Limit
LCS	Laboratory Control Sample
MS	Matrix Spike
MSD	Matrix Spike Duplicate
DUP	Sample Duplicate
%Rec	Percent Recovery
RPD	Relative Percent Difference
LOD	DoD Limit of Detection
LOQ	DoD Limit of Quantitation
DL	DoD Detection Limit
I	Indicates reported value is greater than or equal to the Method Detection Limit (MDL) but less than the Report Detection Limit (RDL)
(S)	Surrogate Compound
NC	Not Calculated
*	Result outside of QC limits
#	Please reference the result in the Results Section for analyte-level flags.

Project Notations

Sample Notations

Lab ID	Sample ID		
3387420006	SB-210-9	**S1**	The Internal Standard Fluorobenzene response yielded -97.12%D (limits -50/+200%D) for the EPA method 8260 low level analysis.
		S2	The Internal Standard Chlorobenzene-d5 response yielded -97.21%D (limits -50/ +200%D) for the EPA method 8260 low level analysis.
		S3	The Internal Standard 1,4-Dichlorobenzene-d4 response yielded -97.85%D (limits -50/ +200%D) for the EPA method 8260 low level analysis.

Result Notations

Notation Ref.	
1	The QC sample type MSD for method SW846 8270E was outside the control limits for the analyte Acenaphthene. The % Recovery was reported as 55.9 and the control limits were 61 to 105.
2	The QC sample type MS for method SW846 8270E was outside the control limits for the analyte Acenaphthylene. The % Recovery was reported as 50.5 and the control limits were 63 to 106.
3	The QC sample type MSD for method SW846 8270E was outside the control limits for the analyte Acenaphthylene. The % Recovery was reported as 44.4 and the control limits were 63 to 106.
4	The QC sample type MS for method SW846 8270E was outside the control limits for the analyte Anthracene. The % Recovery was reported as 45.1 and the control limits were 60 to 107.
5	The QC sample type MSD for method SW846 8270E was outside the control limits for the analyte Anthracene. The % Recovery was reported as 8.26 and the control limits were 60 to 107.
6	The QC sample type MS for method SW846 8270E was outside the control limits for the analyte Benzo(a)anthracene. The % Recovery was reported as -84.5 and the control limits were 61 to 113.
7	The QC sample type MSD for method SW846 8270E was outside the control limits for the analyte Benzo(a)anthracene. The % Recovery was reported as -169 and the control limits were 61 to 113.
8	The QC sample type MSD for method SW846 8270E was outside the control limits for the analyte Benzo(a)anthracene. The RPD was reported as 22.9 and the upper control limit is 22.
9	The QC sample type MSD for method SW846 8270E was outside the control limits for the analyte Benzo(a)pyrene. The % Recovery was reported as -171 and the control limits were 68 to 121.
10	The QC sample type MS for method SW846 8270E was outside the control limits for the analyte Benzo(a)pyrene. The % Recovery was reported as -90.2 and the control limits were 68 to 121.
11	The QC sample type MS for method SW846 8270E was outside the control limits for the analyte Benzo(b)fluoranthene. The % Recovery was reported as -56.7 and the control limits were 64 to 115.
12	The QC sample type MSD for method SW846 8270E was outside the control limits for the analyte Benzo(b)fluoranthene. The RPD was reported as 31.3 and the upper control limit is 28.
13	The QC sample type MSD for method SW846 8270E was outside the control limits for the analyte Benzo(b)fluoranthene. The % Recovery was reported as -186 and the control limits were 64 to 115.
14	The QC sample type MSD for method SW846 8270E was outside the control limits for the analyte Benzo(g,h,i)perylene. The % Recovery was reported as -68.3 and the control limits were 57 to 119.
15	The QC sample type MS for method SW846 8270E was outside the control limits for the analyte Benzo(g,h,i)perylene. The % Recovery was reported as -13 and the control limits were 57 to 119.
16	The QC sample type MSD for method SW846 8270E was outside the control limits for the analyte Benzo(k)fluoranthene. The % Recovery was reported as 7.92 and the control limits were 63 to 116.
17	The QC sample type MS for method SW846 8270E was outside the control limits for the analyte Benzo(k)fluoranthene. The % Recovery was reported as 27.8 and the control limits were 63 to 116.
18	The QC sample type MSD for method SW846 8270E was outside the control limits for the analyte Carbazole. The % Recovery was reported as 54.6 and the control limits were 66 to 117.
19	The QC sample type MS for method SW846 8270E was outside the control limits for the analyte Chrysene. The % Recovery was reported as -72.5 and the control limits were 65 to 113.

20	The QC sample type MSD for method SW846 8270E was outside the control limits for the analyte Chrysene. The RPD was reported as 23 and the upper control limit is 20.
21	The QC sample type MSD for method SW846 8270E was outside the control limits for the analyte Chrysene. The % Recovery was reported as -158 and the control limits were 65 to 113.
22	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte Di-n-OCtylphthalate. The % Recovery was reported as 121 and the control limits were 80 to 120.
23	The QC sample type MSD for method SW846 8270E was outside the control limits for the analyte Dibenzo(a,h)anthracene. The % Recovery was reported as 26.8 and the control limits were 59 to 116.
24	The QC sample type MS for method SW846 8270E was outside the control limits for the analyte Dibenzo(a,h)anthracene. The % Recovery was reported as 53.2 and the control limits were 59 to 116.
25	The QC sample type MSD for method SW846 8270E was outside the control limits for the analyte Dibenzofuran. The % Recovery was reported as 58.3 and the control limits were 62 to 106.
26	The QC sample type MS for method SW846 8270E was outside the control limits for the analyte 2,4-Dinitrophenol. The % Recovery was reported as 21 and the control limits were 28 to 135.
27	The QC sample type MSD for method SW846 8270E was outside the control limits for the analyte 2,4-Dinitrophenol. The % Recovery was reported as 16.5 and the control limits were 28 to 135.
28	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte 2,4-Dinitrotoluene. The % Recovery was reported as 121 and the control limits were 80 to 120.
29	The QC sample type MS for method SW846 8270E was outside the control limits for the analyte Fluoranthene. The % Recovery was reported as -366 and the control limits were 61 to 114.
30	The QC sample type MSD for method SW846 8270E was outside the control limits for the analyte Fluoranthene. The % Recovery was reported as -456 and the control limits were 61 to 114.
31	The QC sample type MS for method SW846 8270E was outside the control limits for the analyte Fluorene. The % Recovery was reported as 57 and the control limits were 62 to 107.
32	The QC sample type MSD for method SW846 8270E was outside the control limits for the analyte Fluorene. The % Recovery was reported as 38.6 and the control limits were 62 to 107.
33	The QC sample type MSD for method SW846 8270E was outside the control limits for the analyte Hexachlorocyclopentadiene. The % Recovery was reported as 7.7 and the control limits were 20 to 124.
34	The QC sample type MS for method SW846 8270E was outside the control limits for the analyte Hexachlorocyclopentadiene. The % Recovery was reported as 7.43 and the control limits were 20 to 124.
35	The QC sample type MS for method SW846 8270E was outside the control limits for the analyte Hexachloroethane. The % Recovery was reported as 54.9 and the control limits were 57 to 101.
36	The QC sample type MSD for method SW846 8270E was outside the control limits for the analyte Indeno(1,2,3-cd)pyrene. The % Recovery was reported as -44.4 and the control limits were 53 to 118.
37	The QC sample type MS for method SW846 8270E was outside the control limits for the analyte Indeno(1,2,3-cd)pyrene. The % Recovery was reported as 12.3 and the control limits were 53 to 118.
38	The QC sample type MSD for method SW846 8270E was outside the control limits for the analyte 2-Methyl-4,6-dinitrophenol. The % Recovery was reported as 29 and the control limits were 39 to 113.
39	The QC sample type MS for method SW846 8270E was outside the control limits for the analyte 2-Methyl-4,6-dinitrophenol. The % Recovery was reported as 38.9 and the control limits were 39 to 113.

40	The QC sample type MSD for method SW846 8270E was outside the control limits for the analyte Naphthalene. The % Recovery was reported as 50.8 and the control limits were 60 to 102.
41	The QC sample type MS for method SW846 8270E was outside the control limits for the analyte Naphthalene. The % Recovery was reported as 45.9 and the control limits were 60 to 102.
42	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte 4-Nitroaniline. The % Recovery was reported as 123 and the control limits were 80 to 120.
43	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte 2-Nitrophenol. The % Recovery was reported as 124 and the control limits were 80 to 120.
44	The QC sample type MS for method SW846 8270E was outside the control limits for the analyte Phenanthrene. The % Recovery was reported as -19.1 and the control limits were 61 to 106.
45	The QC sample type MSD for method SW846 8270E was outside the control limits for the analyte Phenanthrene. The RPD was reported as 30.6 and the upper control limit is 20.
46	The QC sample type MSD for method SW846 8270E was outside the control limits for the analyte Phenanthrene. The % Recovery was reported as -129 and the control limits were 61 to 106.
47	The QC sample type MS for method SW846 8270E was outside the control limits for the analyte Pyrene. The % Recovery was reported as -241 and the control limits were 62 to 117.
48	The QC sample type MSD for method SW846 8270E was outside the control limits for the analyte Pyrene. The RPD was reported as 23.9 and the upper control limit is 20.
49	The QC sample type MSD for method SW846 8270E was outside the control limits for the analyte Pyrene. The % Recovery was reported as -374 and the control limits were 62 to 117.
50	The concentration of this analyte was greater than 4 times the concentration of the spike added to the matrix spike. According to protocol, the calculation for percent recovery of the matrix spike is not valid.
51	The QC sample type MS1 for method SW846 6010C was outside the control limits for the analyte Arsenic, Total. The % Recovery was reported as 69.6 and the control limits were 75 to 125.
52	The QC sample type MSD1 for method SW846 6010C was outside the control limits for the analyte Barium, Total. The RPD was reported as 24 and the upper control limit is 20.
53	The QC sample type MSD1 for method SW846 6010C was outside the control limits for the analyte Barium, Total. The % Recovery was reported as 180 and the control limits were 75 to 125.
54	The QC sample type MSD1 for method SW846 6010C was outside the control limits for the analyte Chromium, Total. The % Recovery was reported as 62.9 and the control limits were 75 to 125.
55	The recovery of the Matrix Spike (MS) associated to this analyte was outside of the established control limits. The sample was post-digestion spiked, and this matrix spike was within acceptable recovery limits.
56	The QC sample type MS1 for method SW846 6010C was outside the control limits for the analyte Chromium, Total. The % Recovery was reported as 64.4 and the control limits were 75 to 125.
57	The QC sample type MS1 for method SW846 6010C was outside the control limits for the analyte Lead, Total. The % Recovery was reported as 51.9 and the control limits were 75 to 125.
58	The QC sample type MSD1 for method SW846 6010C was outside the control limits for the analyte Lead, Total. The % Recovery was reported as 37.2 and the control limits were 75 to 125.
59	The QC sample type MS1 for method SW846 6010C was outside the control limits for the analyte Potassium, Total. The % Recovery was reported as 139 and the control limits were 75 to 125.
60	The QC sample type MSD1 for method SW846 6010C was outside the control limits for the analyte Potassium, Total. The % Recovery was reported as 249 and the control limits were 75 to 125.

61	The QC sample type MSD1 for method SW846 6010C was outside the control limits for the analyte Potassium, Total. The RPD was reported as 34.3 and the upper control limit is 20.
62	The QC sample type MSD1 for method SW846 6010C was outside the control limits for the analyte Sodium, Total. The % Recovery was reported as 144 and the control limits were 75 to 125.
63	The QC sample type MSD1 for method SW846 6010C was outside the control limits for the analyte Sodium, Total. The RPD was reported as 25 and the upper control limit is 20.
64	The QC sample type MS1 for method SW846 6010C was outside the control limits for the analyte Vanadium, Total. The % Recovery was reported as 15.7 and the control limits were 75 to 125.
65	The QC sample type MSD1 for method SW846 6010C was outside the control limits for the analyte Vanadium, Total. The % Recovery was reported as 27.5 and the control limits were 75 to 125.
66	The QC sample type MS1 for method SW846 6010C was outside the control limits for the analyte Zinc, Total. The % Recovery was reported as 65.3 and the control limits were 75 to 125.
67	The QC sample type MSD1 for method SW846 6010C was outside the control limits for the analyte Zinc, Total. The % Recovery was reported as 48.3 and the control limits were 75 to 125.
68	The surrogate 1,2-Dichloroethane-d4 for method SW846 8260D was outside of control limits. The % Recovery was reported as 138 and the control limits were 56 to 124. This result was reported at a dilution of 1.
69	The QC sample type LCS for method SW846 8260D was outside the control limits for the analyte Freon 113. The % Recovery was reported as 112 and the control limits were 40 to 109.
70	The QC sample type LCS for method SW846 8260D was outside the control limits for the analyte Methyl t-Butyl Ether. The % Recovery was reported as 122 and the control limits were 70 to 118.
71	The CCV recovery yielded 27.58%D (limits +/-20%D) for method SW846 8260D for the analyte 1,2,3-Trichlorobenzene.
72	The CCV recovery yielded 35.68%D (limits +/-20%D) for method SW846 8260D for the analyte 1,2,4-Trichlorobenzene.
73	The QC sample type LCS for method SW846 8260D was outside the control limits for the analyte 1,2,4-Trichlorobenzene. The % Recovery was reported as 142 and the control limits were 63 to 132.
74	The QC sample type MS for method SW846 8260D was outside the control limits for the analyte Chlorodibromomethane. The % Recovery was reported as 72.9 and the control limits were 75 to 124.
75	The QC sample type MS for method SW846 8260D was outside the control limits for the analyte 1,2-Dichlorobenzene. The % Recovery was reported as 69 and the control limits were 75 to 126.
76	The QC sample type MS for method SW846 8260D was outside the control limits for the analyte 1,4-Dichlorobenzene. The % Recovery was reported as 69.1 and the control limits were 72 to 126.
77	The QC sample type MS for method SW846 8260D was outside the control limits for the analyte Freon 113. The % Recovery was reported as 118 and the control limits were 40 to 109.
78	The QC sample type MS for method SW846 8260D was outside the control limits for the analyte Methyl acetate. The % Recovery was reported as 139 and the control limits were 70 to 130.
79	The QC sample type MS for method SW846 8260D was outside the control limits for the analyte 1,2,3-Trichlorobenzene. The % Recovery was reported as 43.4 and the control limits were 68 to 129.
80	The QC sample type MS for method SW846 8260D was outside the control limits for the analyte 1,2,4-Trichlorobenzene. The % Recovery was reported as 53.1 and the control limits were 63 to 132.

Analytical Results Report For

Michael Baker International

Project Erie Coke 188511-3020
Workorder 3387696
Report ID 372546 on 12/9/2024

Certificate of Analysis

Enclosed are the analytical results for samples received by the laboratory on Nov 14, 2024.

The ALS Environmental laboratory in Middletown, Pennsylvania is a National Environmental Laboratory Accreditation Program (NELAP) accredited laboratory and as such, certifies that all applicable test results meet the requirements of NELAP.

If you have any questions regarding this certificate of analysis, please contact Elizabeth Parker (Project Coordinator) at (717) 944-5541.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program and any applicable state requirements. The test results meet requirements of the current NELAP standards or state requirements, where applicable. For a specific list of accredited analytes, refer to the certifications section of the ALS website at www.alsglobal.com/en/Our-Services/Life-Sciences/Environmental/Downloads.

This laboratory report may not be reproduced, except in full, without the written approval of ALS Global.

Reference

Notes

- Samples collected by ALS personnel are done so in accordance with the procedures set forth in the ALS Field Sampling Plan (20 - Field Services Sampling Plan).
- Except as qualified, Clean Water Act sample analyses are consistent with methodology requirements in 40 CFR Part 136, including but not limited to the following EPA Method reference revisions:
  EPA 300.1 Rev. 1.0-1997
  EPA 300.0 Rev. 2.1-1993
  EPA 353.2 Rev. 2.0-1993
  EPA 410.4 Rev. 1.0-1993
  EPA 420.4 Rev. 1.0-1993
  EPA 365.1 Rev. 2.0-1993
  EPA 200.7 Rev. 4.4-1994
  EPA 200.8 Rev. 5.4-1994
  EPA 245.1 Rev. 3.0-1994
- Except as qualified, Safe Drinking Water Act sample analyses are consistent with methodology requirements in 40 CFR Part 141.
- The Chain of Custody document is included as part of this report.
- All Library Search analytes should be regarded as tentative identifications based on the presumptive evidence of the mass spectra. Concentrations reported are estimated values.
- Parameters identified as "analyze immediately" require analysis within 15 minutes of collection. Any "analyze immediately" parameters not listed under the header "Field Parameters" are preformed in the laboratory and are therefore analyzed out of hold time.
- Method references listed on this report beginning with the prefix “S” followed by a method number (such as S2310B-97) refer to methods from “Standard Methods for the Examination of Water and Wastewater”.
- For microbiological analyses, the "Prepared" value is the date/time into the incubator and the "Analyzed" value is the date/time out the incubator.
- An Analysis-Prep Method Cross Reference Table is included after Analytical Results & Qualifiers section in this report.
- Unless otherwise noted, all quantitative results for soils are reported on a dry weight basis.

Standard Acronyms/Flags

J	Indicates an estimated value between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL) for the analyte
U	Indicates that the analyte was Not Detected (ND) above the MDL
N	Indicates presumptive evidence of the presence of a compound
MDL	Method Detection Limit
PQL	Practical Quantitation Limit
RDL	Practical Quantitation Limit for this Project
ND	Not Detected - indicates that the analyte was Not Detected
Cntr	Analysis was performed using this container
RegLmt	Regulatory Limit
LCS	Laboratory Control Sample
MS	Matrix Spike
MSD	Matrix Spike Duplicate
DUP	Sample Duplicate
%Rec	Percent Recovery
RPD	Relative Percent Difference
LOD	DoD Limit of Detection
LOQ	DoD Limit of Quantitation
DL	DoD Detection Limit
I	Indicates reported value is greater than or equal to the Method Detection Limit (MDL) but less than the Report Detection Limit (RDL)
(S)	Surrogate Compound
NC	Not Calculated
*	Result outside of QC limits
#	Please reference the result in the Results Section for analyte-level flags.

Project Notations

Sample Notations

Lab ID	Sample ID		
3387696002	SB-214-9	**S1**	The Internal Standard 1,4-Dichlorobenzene-d4 response yielded -56.40%D (limits -50/ +200%D) for the EPA method 8260 low level analysis.
3387696004	SB-200-10	**S2**	This sample was analyzed at a dilution in the 8260 volatiles analysis due to matrix. Reporting limits were adjusted accordingly.
3387696007	SB-205-11	**S3**	This sample was analyzed at a dilution in the 8260 volatiles analysis due to matrix. Reporting limits were adjusted accordingly.

Result Notations

Notation Ref.	
1	The QC sample type LCS for method SW846 8260D was outside the control limits for the analyte Freon 113. The % Recovery was reported as 112 and the control limits were 40 to 109.
2	The QC sample type LCS for method SW846 8260D was outside the control limits for the analyte Methyl t-Butyl Ether. The % Recovery was reported as 122 and the control limits were 70 to 118.
3	The CCV recovery yielded 27.58%D (limits +/-20%D) for method SW846 8260D for the analyte 1,2,3-Trichlorobenzene.
4	The CCV recovery yielded 35.68%D (limits +/-20%D) for method SW846 8260D for the analyte 1,2,4-Trichlorobenzene.
5	The QC sample type LCS for method SW846 8260D was outside the control limits for the analyte 1,2,4-Trichlorobenzene. The % Recovery was reported as 142 and the control limits were 63 to 132.
6	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte Di-n-OCtylphthalate. The % Recovery was reported as 121 and the control limits were 80 to 120.
7	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte 2,4-Dinitrotoluene. The % Recovery was reported as 121 and the control limits were 80 to 120.
8	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte 4-Nitroaniline. The % Recovery was reported as 123 and the control limits were 80 to 120.
9	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte 2-Nitrophenol. The % Recovery was reported as 124 and the control limits were 80 to 120.
10	The QC sample type LCS for method SW846 8270E was outside the control limits for the analyte mp-Cresol. The % Recovery was reported as 113 and the control limits were 60 to 109.
11	The QC sample type LCS for method SW846 8270E was outside the control limits for the analyte 4-Nitrophenol. The % Recovery was reported as 127 and the control limits were 53 to 124.

Analytical Results Report For

Michael Baker International

Project Erie Coke Works
Workorder 3387962
Report ID 372552 on 12/9/2024

Certificate of Analysis

Enclosed are the analytical results for samples received by the laboratory on Nov 15, 2024.

The ALS Environmental laboratory in Middletown, Pennsylvania is a National Environmental Laboratory Accreditation Program (NELAP) accredited laboratory and as such, certifies that all applicable test results meet the requirements of NELAP.

If you have any questions regarding this certificate of analysis, please contact Elizabeth Parker (Project Coordinator) at (717) 944-5541.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program and any applicable state requirements. The test results meet requirements of the current NELAP standards or state requirements, where applicable. For a specific list of accredited analytes, refer to the certifications section of the ALS website at www.alsglobal.com/en/Our-Services/Life-Sciences/Environmental/Downloads.

This laboratory report may not be reproduced, except in full, without the written approval of ALS Global.

Reference

Notes

- Samples collected by ALS personnel are done so in accordance with the procedures set forth in the ALS Field Sampling Plan (20 - Field Services Sampling Plan).
- Except as qualified, Clean Water Act sample analyses are consistent with methodology requirements in 40 CFR Part 136, including but not limited to the following EPA Method reference revisions:
  EPA 300.1 Rev. 1.0-1997
  EPA 300.0 Rev. 2.1-1993
  EPA 353.2 Rev. 2.0-1993
  EPA 410.4 Rev. 1.0-1993
  EPA 420.4 Rev. 1.0-1993
  EPA 365.1 Rev. 2.0-1993
  EPA 200.7 Rev. 4.4-1994
  EPA 200.8 Rev. 5.4-1994
  EPA 245.1 Rev. 3.0-1994
- Except as qualified, Safe Drinking Water Act sample analyses are consistent with methodology requirements in 40 CFR Part 141.
- The Chain of Custody document is included as part of this report.
- All Library Search analytes should be regarded as tentative identifications based on the presumptive evidence of the mass spectra. Concentrations reported are estimated values.
- Parameters identified as "analyze immediately" require analysis within 15 minutes of collection. Any "analyze immediately" parameters not listed under the header "Field Parameters" are preformed in the laboratory and are therefore analyzed out of hold time.
- Method references listed on this report beginning with the prefix “S” followed by a method number (such as S2310B-97) refer to methods from “Standard Methods for the Examination of Water and Wastewater”.
- For microbiological analyses, the "Prepared" value is the date/time into the incubator and the "Analyzed" value is the date/time out the incubator.
- An Analysis-Prep Method Cross Reference Table is included after Analytical Results & Qualifiers section in this report.
- Unless otherwise noted, all quantitative results for soils are reported on a dry weight basis.

Standard Acronyms/Flags

J	Indicates an estimated value between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL) for the analyte
U	Indicates that the analyte was Not Detected (ND) above the MDL
N	Indicates presumptive evidence of the presence of a compound
MDL	Method Detection Limit
PQL	Practical Quantitation Limit
RDL	Practical Quantitation Limit for this Project
ND	Not Detected - indicates that the analyte was Not Detected
Cntr	Analysis was performed using this container
RegLmt	Regulatory Limit
LCS	Laboratory Control Sample
MS	Matrix Spike
MSD	Matrix Spike Duplicate
DUP	Sample Duplicate
%Rec	Percent Recovery
RPD	Relative Percent Difference
LOD	DoD Limit of Detection
LOQ	DoD Limit of Quantitation
DL	DoD Detection Limit
I	Indicates reported value is greater than or equal to the Method Detection Limit (MDL) but less than the Report Detection Limit (RDL)
(S)	Surrogate Compound
NC	Not Calculated
*	Result outside of QC limits
#	Please reference the result in the Results Section for analyte-level flags.

Project Notations

Sample Notations

Lab ID	Sample ID

Result Notations

Notation Ref.	
1	Bromoform was recovered above the 20 percent 8260D criteria in the continuing calibration verification associated with this sample. The % drift was reported at 21.41%. Acceptable limits are +/-20%.
2	2-Butanone was recovered above the 20 percent 8260D criteria in the continuing calibration verification associated with this sample. The % difference was reported at 21.85%. Acceptable limits are +/-20%.
3	Methyl acetate was recovered above the 20 percent 8260D criteria in the continuing calibration verification associated with this sample. The % difference was reported at 33.26%. Acceptable limits are +/-20%.
4	4-Methyl-2-Pentanone (MIBK) was recovered above the 20 percent 8260D criteria in the continuing calibration verification associated with this sample. The % difference was reported at 24.00%. Acceptable limits are +/-20%.
5	1,2,3-Trichlorobenzene was recovered above the 20 percent 8260D criteria in the continuing calibration verification associated with this sample. The % drift was reported at 20.87%. Acceptable limits are +/-20%.
6	The QC sample type LCS for method SW846 8270E was outside the control limits for the analyte mp-Cresol. The % Recovery was reported as 113 and the control limits were 60 to 109.
7	The QC sample type LCS for method SW846 8270E was outside the control limits for the analyte 4-Nitrophenol. The % Recovery was reported as 127 and the control limits were 53 to 124.
8	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte 2,4-Dinitrotoluene. The % Recovery was reported as 121 and the control limits were 80 to 120.
9	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte 2-Methyl-4,6-Dinitrophenol. The % Recovery was reported as 121 and the control limits were 80 to 120.
10	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte 2-Nitrophenol. The % Recovery was reported as 124 and the control limits were 80 to 120.
11	The concentration of this analyte was greater than 4 times the concentration of the spike added to the matrix spike. According to protocol, the calculation for percent recovery of the matrix spike is not valid.
12	The QC sample type MS1 for method SW846 6010C was outside the control limits for the analyte Calcium, Total. The % Recovery was reported as 274 and the control limits were 75 to 125.
13	The QC sample type MSD1 for method SW846 6010C was outside the control limits for the analyte Calcium, Total. The % Recovery was reported as 418 and the control limits were 75 to 125.
14	The recovery of the Matrix Spike (MS) associated to this analyte was outside of the established control limits. The sample was post-digestion spiked, and this matrix spike was within acceptable recovery limits.
15	The QC sample type MSD1 for method SW846 6010C was outside the control limits for the analyte Magnesium, Total. The % Recovery was reported as 362 and the control limits were 75 to 125.
16	The QC sample type MS1 for method SW846 6010C was outside the control limits for the analyte Magnesium, Total. The % Recovery was reported as 166 and the control limits were 75 to 125.
17	The QC sample type MSD1 for method SW846 6010C was outside the control limits for the analyte Manganese, Total. The % Recovery was reported as 435 and the control limits were 75 to 125.
18	The QC sample type MS1 for method SW846 6010C was outside the control limits for the analyte Manganese, Total. The % Recovery was reported as 217 and the control limits were 75 to 125.
19	The QC sample type MS1 for method SW846 6010C was outside the control limits for the analyte Potassium, Total. The % Recovery was reported as 73.8 and the control limits were 75 to 125.

20	The QC sample type MS for method SW846 7471B was outside the control limits for the analyte Mercury, Total. The % Recovery was reported as 77.4 and the control limits were 80 to 120.
21	The QC sample type MSD for method SW846 7471B was outside the control limits for the analyte Mercury, Total. The % Recovery was reported as -40.2 and the control limits were 80 to 120.
22	The QC sample type MSD for method SW846 7471B was outside the control limits for the analyte Mercury, Total. The RPD was reported as 152 and the upper control limit is 20.
23	The QC sample type LCS for method SW846 8260D was outside the control limits for the analyte Trichlorofluoromethane. The % Recovery was reported as 124 and the control limits were 38 to 123.

Analytical Results Report For

Michael Baker International

Project Erie Coke Works
Workorder 3388148
Report ID 371821 on 12/4/2024

Certificate of Analysis

Enclosed are the analytical results for samples received by the laboratory on Nov 16, 2024.

The ALS Environmental laboratory in Middletown, Pennsylvania is a National Environmental Laboratory Accreditation Program (NELAP) accredited laboratory and as such, certifies that all applicable test results meet the requirements of NELAP.

If you have any questions regarding this certificate of analysis, please contact Elizabeth Parker (Project Coordinator) at (717) 944-5541.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program and any applicable state requirements. The test results meet requirements of the current NELAP standards or state requirements, where applicable. For a specific list of accredited analytes, refer to the certifications section of the ALS website at www.alsglobal.com/en/Our-Services/Life-Sciences/Environmental/Downloads.

This laboratory report may not be reproduced, except in full, without the written approval of ALS Global.

Reference

Notes

- Samples collected by ALS personnel are done so in accordance with the procedures set forth in the ALS Field Sampling Plan (20 - Field Services Sampling Plan).
- Except as qualified, Clean Water Act sample analyses are consistent with methodology requirements in 40 CFR Part 136, including but not limited to the following EPA Method reference revisions:
  EPA 300.1 Rev. 1.0-1997
  EPA 300.0 Rev. 2.1-1993
  EPA 353.2 Rev. 2.0-1993
  EPA 410.4 Rev. 1.0-1993
  EPA 420.4 Rev. 1.0-1993
  EPA 365.1 Rev. 2.0-1993
  EPA 200.7 Rev. 4.4-1994
  EPA 200.8 Rev. 5.4-1994
  EPA 245.1 Rev. 3.0-1994
- Except as qualified, Safe Drinking Water Act sample analyses are consistent with methodology requirements in 40 CFR Part 141.
- The Chain of Custody document is included as part of this report.
- All Library Search analytes should be regarded as tentative identifications based on the presumptive evidence of the mass spectra. Concentrations reported are estimated values.
- Parameters identified as "analyze immediately" require analysis within 15 minutes of collection. Any "analyze immediately" parameters not listed under the header "Field Parameters" are preformed in the laboratory and are therefore analyzed out of hold time.
- Method references listed on this report beginning with the prefix “S” followed by a method number (such as S2310B-97) refer to methods from “Standard Methods for the Examination of Water and Wastewater”.
- For microbiological analyses, the "Prepared" value is the date/time into the incubator and the "Analyzed" value is the date/time out the incubator.
- An Analysis-Prep Method Cross Reference Table is included after Analytical Results & Qualifiers section in this report.
- Unless otherwise noted, all quantitative results for soils are reported on a dry weight basis.

Standard Acronyms/Flags

J	Indicates an estimated value between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL) for the analyte
U	Indicates that the analyte was Not Detected (ND) above the MDL
N	Indicates presumptive evidence of the presence of a compound
MDL	Method Detection Limit
PQL	Practical Quantitation Limit
RDL	Practical Quantitation Limit for this Project
ND	Not Detected - indicates that the analyte was Not Detected
Cntr	Analysis was performed using this container
RegLmt	Regulatory Limit
LCS	Laboratory Control Sample
MS	Matrix Spike
MSD	Matrix Spike Duplicate
DUP	Sample Duplicate
%Rec	Percent Recovery
RPD	Relative Percent Difference
LOD	DoD Limit of Detection
LOQ	DoD Limit of Quantitation
DL	DoD Detection Limit
I	Indicates reported value is greater than or equal to the Method Detection Limit (MDL) but less than the Report Detection Limit (RDL)
(S)	Surrogate Compound
NC	Not Calculated
*	Result outside of QC limits
#	Please reference the result in the Results Section for analyte-level flags.

Project Notations

Sample Notations

Lab ID	Sample ID		
3388148002	SB-217-3	**S1**	The 8260 GCMS volatiles analysis was performed at a dilution due to the level of non-target compounds. Reporting limits were adjusted accordingly.

Result Notations

Notation Ref.	
1	4-Methyl-2-Pentanone(MIBK) was recovered above the 20 percent 8260D criteria in the continuing calibration verification associated with this sample. The %difference was reported at 29.33%. Acceptable limits are +/-20%.
2	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte 2,4-Dinitrotoluene. The % Recovery was reported as 121 and the control limits were 80 to 120.
3	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte 2-Methyl-4,6-Dinitrophenol. The % Recovery was reported as 121 and the control limits were 80 to 120.
4	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte 2-Nitrophenol. The % Recovery was reported as 124 and the control limits were 80 to 120.
5	The concentration of this analyte was greater than 4 times the concentration of the spike added to the matrix spike. According to protocol, the calculation for percent recovery of the matrix spike is not valid.
6	The QC sample type MS1 for method SW846 6010C was outside the control limits for the analyte Lead, Total. The % Recovery was reported as 61.4 and the control limits were 75 to 125.
7	The recovery of the Matrix Spike (MS) associated to this analyte was outside of the established control limits. The sample was post-digestion spiked, and this matrix spike was within acceptable recovery limits.
8	The QC sample type MS1 for method SW846 6010C was outside the control limits for the analyte Potassium, Total. The % Recovery was reported as 160 and the control limits were 75 to 125.
9	The QC sample type MSD1 for method SW846 6010C was outside the control limits for the analyte Potassium, Total. The % Recovery was reported as 130 and the control limits were 75 to 125.
10	The QC sample type MS1 for method SW846 6010C was outside the control limits for the analyte Zinc, Total. The % Recovery was reported as 74.8 and the control limits were 75 to 125.
11	The QC sample type DUP for method S2540G-15 was outside the control limits for the analyte Moisture. The RPD was reported as 13.9 and the upper control limit is 10.
12	The method blank associated with this sample was positive for Calcium, at 11.1 mg/kg. The Calcium analyte concentration in the sample was greater than ten times the concentration of the blank. According to the method, the sample was commented and reported. MSY 11/25/24
13	Bromoform was recovered above the 20 percent 8260D criteria in the continuing calibration verification associated with this sample. The % drift was reported at 21.41%. Acceptable limits are +/-20%.
14	2-Butanone was recovered above the 20 percent 8260D criteria in the continuing calibration verification associated with this sample. The % difference was reported at 21.85%. Acceptable limits are +/-20%.
15	Methyl acetate was recovered above the 20 percent 8260D criteria in the continuing calibration verification associated with this sample. The % difference was reported at 33.26%. Acceptable limits are +/-20%.
16	4-Methyl-2-Pentanone (MIBK) was recovered above the 20 percent 8260D criteria in the continuing calibration verification associated with this sample. The % difference was reported at 24.00%. Acceptable limits are +/-20%.
17	1,2,3-Trichlorobenzene was recovered above the 20 percent 8260D criteria in the continuing calibration verification associated with this sample. The % drift was reported at 20.87%. Acceptable limits are +/-20%.
18	Bromomethane was recovered below the 20 percent 8260D criteria in the continuing calibration verification associated with this sample. The % drift was reported at -21.37%. Acceptable limits are +/-20%.

Analytical Results Report For

Michael Baker International

Project Erie Coke Works
Workorder 3388338
Report ID 373102 on 12/10/2024

Certificate of Analysis

Enclosed are the analytical results for samples received by the laboratory on Nov 19, 2024.

The ALS Environmental laboratory in Middletown, Pennsylvania is a National Environmental Laboratory Accreditation Program (NELAP) accredited laboratory and as such, certifies that all applicable test results meet the requirements of NELAP.

If you have any questions regarding this certificate of analysis, please contact Elizabeth Parker (Project Coordinator) at (717) 944-5541.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program and any applicable state requirements. The test results meet requirements of the current NELAP standards or state requirements, where applicable. For a specific list of accredited analytes, refer to the certifications section of the ALS website at www.alsglobal.com/en/Our-Services/Life-Sciences/Environmental/Downloads.

This laboratory report may not be reproduced, except in full, without the written approval of ALS Global.

Reference

Notes

- Samples collected by ALS personnel are done so in accordance with the procedures set forth in the ALS Field Sampling Plan (20 - Field Services Sampling Plan).
- Except as qualified, Clean Water Act sample analyses are consistent with methodology requirements in 40 CFR Part 136, including but not limited to the following EPA Method reference revisions:
  EPA 300.1 Rev. 1.0-1997
  EPA 300.0 Rev. 2.1-1993
  EPA 353.2 Rev. 2.0-1993
  EPA 410.4 Rev. 1.0-1993
  EPA 420.4 Rev. 1.0-1993
  EPA 365.1 Rev. 2.0-1993
  EPA 200.7 Rev. 4.4-1994
  EPA 200.8 Rev. 5.4-1994
  EPA 245.1 Rev. 3.0-1994
- Except as qualified, Safe Drinking Water Act sample analyses are consistent with methodology requirements in 40 CFR Part 141.
- The Chain of Custody document is included as part of this report.
- All Library Search analytes should be regarded as tentative identifications based on the presumptive evidence of the mass spectra. Concentrations reported are estimated values.
- Parameters identified as "analyze immediately" require analysis within 15 minutes of collection. Any "analyze immediately" parameters not listed under the header "Field Parameters" are preformed in the laboratory and are therefore analyzed out of hold time.
- Method references listed on this report beginning with the prefix “S” followed by a method number (such as S2310B-97) refer to methods from “Standard Methods for the Examination of Water and Wastewater”.
- For microbiological analyses, the "Prepared" value is the date/time into the incubator and the "Analyzed" value is the date/time out the incubator.
- An Analysis-Prep Method Cross Reference Table is included after Analytical Results & Qualifiers section in this report.
- Unless otherwise noted, all quantitative results for soils are reported on a dry weight basis.

Standard Acronyms/Flags

J	Indicates an estimated value between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL) for the analyte
U	Indicates that the analyte was Not Detected (ND) above the MDL
N	Indicates presumptive evidence of the presence of a compound
MDL	Method Detection Limit
PQL	Practical Quantitation Limit
RDL	Practical Quantitation Limit for this Project
ND	Not Detected - indicates that the analyte was Not Detected
Cntr	Analysis was performed using this container
RegLmt	Regulatory Limit
LCS	Laboratory Control Sample
MS	Matrix Spike
MSD	Matrix Spike Duplicate
DUP	Sample Duplicate
%Rec	Percent Recovery
RPD	Relative Percent Difference
LOD	DoD Limit of Detection
LOQ	DoD Limit of Quantitation
DL	DoD Detection Limit
I	Indicates reported value is greater than or equal to the Method Detection Limit (MDL) but less than the Report Detection Limit (RDL)
(S)	Surrogate Compound
NC	Not Calculated
*	Result outside of QC limits
#	Please reference the result in the Results Section for analyte-level flags.

Project Notations

Sample Notations

Lab ID	Sample ID		
3388338001	SB-225-12	**S1**	The 8260 GCMS volatiles analysis was performed at a dilution due to the level of non-target compounds. Reporting limits were adjusted accordingly.
3388338002	SB-225-12D	**S2**	The 8260 GCMS volatiles analysis was performed at a dilution due to the level of non-target compounds. Reporting limits were adjusted accordingly.

Result Notations

Notation Ref.	
1	4-Methyl-2-Pentanone(MIBK) was recovered above the 20 percent 8260D criteria in the continuing calibration verification associated with this sample. The %difference was reported at 29.33%. Acceptable limits are +/-20%.
2	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte Butylbenzylphthalate. The % Recovery was reported as 124 and the control limits were 80 to 120.
3	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte Pentachlorophenol. The % Recovery was reported as 78 and the control limits were 80 to 120.
4	The method blank associated with this sample was positive for Calcium, at 11.1 mg/kg. The Calcium analyte concentration in the sample was greater than ten times the concentration of the blank. According to the method, the sample was commented and reported. MSY 11/25/24
5	The initial analysis of Cobalt had a raw result of 0.0239 mg/L with an RSD of 35.43. The second analysis of Cobalt had a raw result of 0.0376 mg/L with an RSD of 52.80. The RPD between the injections was 9.05%. Since both analyses had RSD > 20 the results were averaged and reported out. AXW 12/10/24
6	Bromoform was recovered above the 20 percent 8260D criteria in the continuing calibration verification associated with this sample. The % drift was reported at 21.41%. Acceptable limits are +/-20%.
7	2-Butanone was recovered above the 20 percent 8260D criteria in the continuing calibration verification associated with this sample. The % difference was reported at 21.85%. Acceptable limits are +/-20%.
8	Methyl acetate was recovered above the 20 percent 8260D criteria in the continuing calibration verification associated with this sample. The % difference was reported at 33.26%. Acceptable limits are +/-20%.
9	The QC sample type MS for method SW846 8260D was outside the control limits for the analyte Methyl cyclohexane. The % Recovery was reported as 136 and the control limits were 70 to 130.
10	The QC sample type MSD for method SW846 8260D was outside the control limits for the analyte Methyl cyclohexane. The % Recovery was reported as 139 and the control limits were 70 to 130.
11	4-Methyl-2-Pentanone (MIBK) was recovered above the 20 percent 8260D criteria in the continuing calibration verification associated with this sample. The % difference was reported at 24.00%. Acceptable limits are +/-20%.
12	1,2,3-Trichlorobenzene was recovered above the 20 percent 8260D criteria in the continuing calibration verification associated with this sample. The % drift was reported at 20.87%. Acceptable limits are +/-20%.
13	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte bis(2-Chloroisopropyl)ether. The % Recovery was reported as 74 and the control limits were 80 to 120.
14	The QC sample type LCS for method SW846 8270E was outside the control limits for the analyte mp-Cresol. The % Recovery was reported as 58.8 and the control limits were 60 to 109.
15	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte 4-Nitrophenol. The % Recovery was reported as 78 and the control limits were 80 to 120.
16	The concentration of this analyte was greater than 4 times the concentration of the spike added to the matrix spike. According to protocol, the calculation for percent recovery of the matrix spike is not valid.
17	The QC sample type MS1 for method SW846 6010C was outside the control limits for the analyte Antimony, Total. The % Recovery was reported as 66 and the control limits were 75 to 125.
18	The recovery of the Matrix Spike (MS) associated to this analyte was outside of the established control limits. The sample was post-digestion spiked, and this matrix spike was within acceptable recovery limits.

19	The QC sample type MSD1 for method SW846 6010C was outside the control limits for the analyte Arsenic, Total. The % Recovery was reported as 74.1 and the control limits were 75 to 125.
20	The QC sample type MS1 for method SW846 6010C was outside the control limits for the analyte Arsenic, Total. The % Recovery was reported as 70.5 and the control limits were 75 to 125.
21	The QC sample type MS1 for method SW846 6010C was outside the control limits for the analyte Barium, Total. The % Recovery was reported as 50.9 and the control limits were 75 to 125.
22	The QC sample type MSD1 for method SW846 6010C was outside the control limits for the analyte Barium, Total. The % Recovery was reported as 74.9 and the control limits were 75 to 125.
23	The QC sample type MSD1 for method SW846 6010C was outside the control limits for the analyte Potassium, Total. The % Recovery was reported as 34.6 and the control limits were 75 to 125.
24	The QC sample type MS1 for method SW846 6010C was outside the control limits for the analyte Potassium, Total. The % Recovery was reported as -41.9 and the control limits were 75 to 125.
25	The QC sample type MS1 for method SW846 6010C was outside the control limits for the analyte Sodium, Total. The % Recovery was reported as 71.1 and the control limits were 75 to 125.
26	The QC sample type MS1 for method SW846 6010C was outside the control limits for the analyte Thallium, Total. The % Recovery was reported as 74.8 and the control limits were 75 to 125.
27	The QC sample type MS1 for method SW846 6010C was outside the control limits for the analyte Zinc, Total. The % Recovery was reported as 72.5 and the control limits were 75 to 125.
28	The QC sample type LCS for method SW846 8260D was outside the control limits for the analyte Trichlorofluoromethane. The % Recovery was reported as 124 and the control limits were 38 to 123.

Analytical Results Report For

Michael Baker International

Project Erie Coke 188511-3020
Workorder 3389084
Report ID 374806 on 12/16/2024

Certificate of Analysis

Enclosed are the analytical results for samples received by the laboratory on Nov 22, 2024.

The ALS Environmental laboratory in Middletown, Pennsylvania is a National Environmental Laboratory Accreditation Program (NELAP) accredited laboratory and as such, certifies that all applicable test results meet the requirements of NELAP.

If you have any questions regarding this certificate of analysis, please contact Elizabeth Parker (Project Coordinator) at (717) 944-5541.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program and any applicable state requirements. The test results meet requirements of the current NELAP standards or state requirements, where applicable. For a specific list of accredited analytes, refer to the certifications section of the ALS website at www.alsglobal.com/en/Our-Services/Life-Sciences/Environmental/Downloads.

This laboratory report may not be reproduced, except in full, without the written approval of ALS Global.

Reference

Notes

- Samples collected by ALS personnel are done so in accordance with the procedures set forth in the ALS Field Sampling Plan (20 - Field Services Sampling Plan).
- Except as qualified, Clean Water Act sample analyses are consistent with methodology requirements in 40 CFR Part 136, including but not limited to the following EPA Method reference revisions:
  EPA 300.1 Rev. 1.0-1997
  EPA 300.0 Rev. 2.1-1993
  EPA 353.2 Rev. 2.0-1993
  EPA 410.4 Rev. 1.0-1993
  EPA 420.4 Rev. 1.0-1993
  EPA 365.1 Rev. 2.0-1993
  EPA 200.7 Rev. 4.4-1994
  EPA 200.8 Rev. 5.4-1994
  EPA 245.1 Rev. 3.0-1994
- Except as qualified, Safe Drinking Water Act sample analyses are consistent with methodology requirements in 40 CFR Part 141.
- The Chain of Custody document is included as part of this report.
- All Library Search analytes should be regarded as tentative identifications based on the presumptive evidence of the mass spectra. Concentrations reported are estimated values.
- Parameters identified as "analyze immediately" require analysis within 15 minutes of collection. Any "analyze immediately" parameters not listed under the header "Field Parameters" are preformed in the laboratory and are therefore analyzed out of hold time.
- Method references listed on this report beginning with the prefix “S” followed by a method number (such as S2310B-97) refer to methods from “Standard Methods for the Examination of Water and Wastewater”.
- For microbiological analyses, the "Prepared" value is the date/time into the incubator and the "Analyzed" value is the date/time out the incubator.
- An Analysis-Prep Method Cross Reference Table is included after Analytical Results & Qualifiers section in this report.
- Unless otherwise noted, all quantitative results for soils are reported on a dry weight basis.

Standard Acronyms/Flags

J	Indicates an estimated value between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL) for the analyte
U	Indicates that the analyte was Not Detected (ND) above the MDL
N	Indicates presumptive evidence of the presence of a compound
MDL	Method Detection Limit
PQL	Practical Quantitation Limit
RDL	Practical Quantitation Limit for this Project
ND	Not Detected - indicates that the analyte was Not Detected
Cntr	Analysis was performed using this container
RegLmt	Regulatory Limit
LCS	Laboratory Control Sample
MS	Matrix Spike
MSD	Matrix Spike Duplicate
DUP	Sample Duplicate
%Rec	Percent Recovery
RPD	Relative Percent Difference
LOD	DoD Limit of Detection
LOQ	DoD Limit of Quantitation
DL	DoD Detection Limit
I	Indicates reported value is greater than or equal to the Method Detection Limit (MDL) but less than the Report Detection Limit (RDL)
(S)	Surrogate Compound
NC	Not Calculated
*	Result outside of QC limits
#	Please reference the result in the Results Section for analyte-level flags.

Project Notations

Sample Notations

Lab ID	Sample ID

Result Notations

Notation Ref.	
E	Result reported exceeds instrument calibration
1	The CCV recovery yielded -25.61%D (limits +/-20%D) for method SW846 8260D for the analyte Bromomethane.
2	The surrogate Nitrobenzene-d5 for method SW846 8270E was outside of control limits. The % Recovery was reported as 0 and the control limits were 38 to 112. This result was reported at a dilution of 100.
3	The surrogate 2-Fluorobiphenyl for method SW846 8270E was outside of control limits. The % Recovery was reported as 0 and the control limits were 40 to 110. This result was reported at a dilution of 100.
4	The surrogate 2,4,6-Tribromophenol for method SW846 8270E was outside of control limits. The % Recovery was reported as 0 and the control limits were 19 to 132. This result was reported at a dilution of 100.
5	The surrogate Terphenyl-d14 for method SW846 8270E was outside of control limits. The % Recovery was reported as 0 and the control limits were 45 to 126. This result was reported at a dilution of 100.
6	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte Di-n-Octylphthalate. The % Recovery was reported as 79 and the control limits were 80 to 120.
7	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte Butylbenzylphthalate. The % Recovery was reported as 78 and the control limits were 80 to 120.
8	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte Hexachlorocyclopentadiene. The % Recovery was reported as 77 and the control limits were 80 to 120.
9	The surrogate 2-Fluorophenol for method SW846 8270E was outside of control limits. The % Recovery was reported as 0 and the control limits were 26 to 116. This result was reported at a dilution of 200.
10	The surrogate Phenol-d5 for method SW846 8270E was outside of control limits. The % Recovery was reported as 0 and the control limits were 35 to 111. This result was reported at a dilution of 200.
11	The surrogate Nitrobenzene-d5 for method SW846 8270E was outside of control limits. The % Recovery was reported as 0 and the control limits were 38 to 112. This result was reported at a dilution of 200.
12	The surrogate 2-Fluorobiphenyl for method SW846 8270E was outside of control limits. The % Recovery was reported as 0 and the control limits were 40 to 110. This result was reported at a dilution of 200.
13	The surrogate 2,4,6-Tribromophenol for method SW846 8270E was outside of control limits. The % Recovery was reported as 0 and the control limits were 19 to 132. This result was reported at a dilution of 200.
14	The surrogate Terphenyl-d14 for method SW846 8270E was outside of control limits. The % Recovery was reported as 0 and the control limits were 45 to 126. This result was reported at a dilution of 200.

Analytical Results Report For

Michael Baker International

Project Erie Coke 188511-3020
Workorder 3389099
Report ID 374247 on 12/13/2024

Certificate of Analysis

Enclosed are the analytical results for samples received by the laboratory on Nov 22, 2024.

The ALS Environmental laboratory in Middletown, Pennsylvania is a National Environmental Laboratory Accreditation Program (NELAP) accredited laboratory and as such, certifies that all applicable test results meet the requirements of NELAP.

If you have any questions regarding this certificate of analysis, please contact Elizabeth Parker (Project Coordinator) at (717) 944-5541.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program and any applicable state requirements. The test results meet requirements of the current NELAP standards or state requirements, where applicable. For a specific list of accredited analytes, refer to the certifications section of the ALS website at www.alsglobal.com/en/Our-Services/Life-Sciences/Environmental/Downloads.

This laboratory report may not be reproduced, except in full, without the written approval of ALS Global.

Reference

Notes

- Samples collected by ALS personnel are done so in accordance with the procedures set forth in the ALS Field Sampling Plan (20 - Field Services Sampling Plan).
- Except as qualified, Clean Water Act sample analyses are consistent with methodology requirements in 40 CFR Part 136, including but not limited to the following EPA Method reference revisions:
  EPA 300.1 Rev. 1.0-1997
  EPA 300.0 Rev. 2.1-1993
  EPA 353.2 Rev. 2.0-1993
  EPA 410.4 Rev. 1.0-1993
  EPA 420.4 Rev. 1.0-1993
  EPA 365.1 Rev. 2.0-1993
  EPA 200.7 Rev. 4.4-1994
  EPA 200.8 Rev. 5.4-1994
  EPA 245.1 Rev. 3.0-1994
- Except as qualified, Safe Drinking Water Act sample analyses are consistent with methodology requirements in 40 CFR Part 141.
- The Chain of Custody document is included as part of this report.
- All Library Search analytes should be regarded as tentative identifications based on the presumptive evidence of the mass spectra. Concentrations reported are estimated values.
- Parameters identified as "analyze immediately" require analysis within 15 minutes of collection. Any "analyze immediately" parameters not listed under the header "Field Parameters" are preformed in the laboratory and are therefore analyzed out of hold time.
- Method references listed on this report beginning with the prefix “S” followed by a method number (such as S2310B-97) refer to methods from “Standard Methods for the Examination of Water and Wastewater”.
- For microbiological analyses, the "Prepared" value is the date/time into the incubator and the "Analyzed" value is the date/time out the incubator.
- An Analysis-Prep Method Cross Reference Table is included after Analytical Results & Qualifiers section in this report.
- Unless otherwise noted, all quantitative results for soils are reported on a dry weight basis.

Standard Acronyms/Flags

J	Indicates an estimated value between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL) for the analyte
U	Indicates that the analyte was Not Detected (ND) above the MDL
N	Indicates presumptive evidence of the presence of a compound
MDL	Method Detection Limit
PQL	Practical Quantitation Limit
RDL	Practical Quantitation Limit for this Project
ND	Not Detected - indicates that the analyte was Not Detected
Cntr	Analysis was performed using this container
RegLmt	Regulatory Limit
LCS	Laboratory Control Sample
MS	Matrix Spike
MSD	Matrix Spike Duplicate
DUP	Sample Duplicate
%Rec	Percent Recovery
RPD	Relative Percent Difference
LOD	DoD Limit of Detection
LOQ	DoD Limit of Quantitation
DL	DoD Detection Limit
I	Indicates reported value is greater than or equal to the Method Detection Limit (MDL) but less than the Report Detection Limit (RDL)
(S)	Surrogate Compound
NC	Not Calculated
*	Result outside of QC limits
#	Please reference the result in the Results Section for analyte-level flags.

Project Notations

Sample Notations

Lab ID	Sample ID

Result Notations

Notation Ref.	
E	Result reported exceeds instrument calibration
1	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte Di-n-Octylphthalate. The % Recovery was reported as 79 and the control limits were 80 to 120.
2	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte Butylbenzylphthalate. The % Recovery was reported as 78 and the control limits were 80 to 120.
3	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte Hexachlorocyclopentadiene. The % Recovery was reported as 77 and the control limits were 80 to 120.
4	The CCV recovery yielded -25.61%D (limits +/-20%D) for method SW846 8260D for the analyte Bromomethane.

Analytical Results Report For

Michael Baker International

Project Erie Coke Works 188511-3020
Workorder 3391293
Report ID 380046 on 1/9/2025 (Revised report. See Project Notations Section.)

Certificate of Analysis

Enclosed are the analytical results for samples received by the laboratory on Dec 10, 2024.

The ALS Environmental laboratory in Middletown, Pennsylvania is a National Environmental Laboratory Accreditation Program (NELAP) accredited laboratory and as such, certifies that all applicable test results meet the requirements of NELAP.

If you have any questions regarding this certificate of analysis, please contact Elizabeth Parker (Project Coordinator) at (717) 944-5541.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program and any applicable state requirements. The test results meet requirements of the current NELAP standards or state requirements, where applicable. For a specific list of accredited analytes, refer to the certifications section of the ALS website at www.alsglobal.com/en/Our-Services/Life-Sciences/Environmental/Downloads.

This laboratory report may not be reproduced, except in full, without the written approval of ALS Global.

Reference

Notes

- Samples collected by ALS personnel are done so in accordance with the procedures set forth in the ALS Field Sampling Plan (20 - Field Services Sampling Plan).
- Except as qualified, Clean Water Act sample analyses are consistent with methodology requirements in 40 CFR Part 136, including but not limited to the following EPA Method reference revisions:
  EPA 300.1 Rev. 1.0-1997
  EPA 300.0 Rev. 2.1-1993
  EPA 353.2 Rev. 2.0-1993
  EPA 410.4 Rev. 1.0-1993
  EPA 420.4 Rev. 1.0-1993
  EPA 365.1 Rev. 2.0-1993
  EPA 200.7 Rev. 4.4-1994
  EPA 200.8 Rev. 5.4-1994
  EPA 245.1 Rev. 3.0-1994
- Except as qualified, Safe Drinking Water Act sample analyses are consistent with methodology requirements in 40 CFR Part 141.
- The Chain of Custody document is included as part of this report.
- All Library Search analytes should be regarded as tentative identifications based on the presumptive evidence of the mass spectra. Concentrations reported are estimated values.
- Parameters identified as "analyze immediately" require analysis within 15 minutes of collection. Any "analyze immediately" parameters not listed under the header "Field Parameters" are preformed in the laboratory and are therefore analyzed out of hold time.
- Method references listed on this report beginning with the prefix “S” followed by a method number (such as S2310B-97) refer to methods from “Standard Methods for the Examination of Water and Wastewater”.
- For microbiological analyses, the "Prepared" value is the date/time into the incubator and the "Analyzed" value is the date/time out the incubator.
- An Analysis-Prep Method Cross Reference Table is included after Analytical Results & Qualifiers section in this report.
- Unless otherwise noted, all quantitative results for soils are reported on a dry weight basis.

Standard Acronyms/Flags

J	Indicates an estimated value between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL) for the analyte
U	Indicates that the analyte was Not Detected (ND) above the MDL
N	Indicates presumptive evidence of the presence of a compound
MDL	Method Detection Limit
PQL	Practical Quantitation Limit
RDL	Practical Quantitation Limit for this Project
ND	Not Detected - indicates that the analyte was Not Detected
Cntr	Analysis was performed using this container
RegLmt	Regulatory Limit
LCS	Laboratory Control Sample
MS	Matrix Spike
MSD	Matrix Spike Duplicate
DUP	Sample Duplicate
%Rec	Percent Recovery
RPD	Relative Percent Difference
LOD	DoD Limit of Detection
LOQ	DoD Limit of Quantitation
DL	DoD Detection Limit
I	Indicates reported value is greater than or equal to the Method Detection Limit (MDL) but less than the Report Detection Limit (RDL)
(S)	Surrogate Compound
NC	Not Calculated
*	Result outside of QC limits
#	Please reference the result in the Results Section for analyte-level flags.

Project Notations

Sample Notations

Lab ID	Sample ID

Result Notations

Notation Ref.	
E	Result reported exceeds instrument calibration
1	The surrogate Terphenyl-d14 for method SW846 8270E was outside of control limits. The % Recovery was reported as 26.2 and the control limits were 41 to 145. This result was reported at a dilution of 1.
2	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte Di-n-Octylphthalate. The % Recovery was reported as 122 and the control limits were 80 to 120.
3	The Total Acidity is titrated to a pH of 8.3 and reported as mg CaCO3/L.
4	The Total Alkalinity is titrated to a pH of 4.5 and reported as mg CaCO3/L.
5	The pH analysis is an "analyze immediately" analysis. Parameters identified as "analyze immediately" require analysis within 15 minutes of collection, and are therefore analyzed outside of the method holding time when analyzed in the laboratory.
6	The surrogate Terphenyl-d14 for method SW846 8270E was outside of control limits. The % Recovery was reported as 35.7 and the control limits were 41 to 145. This result was reported at a dilution of 1.
7	The surrogate 2-Fluorophenol for method SW846 8270E was outside of control limits. The % Recovery was reported as 0 and the control limits were 10 to 85. This result was reported at a dilution of 50.
8	The surrogate Terphenyl-d14 for method SW846 8270E was outside of control limits. The % Recovery was reported as 0 and the control limits were 41 to 145. This result was reported at a dilution of 50.
9	The surrogate Terphenyl-d14 for method SW846 8270E was outside of control limits. The % Recovery was reported as 27.5 and the control limits were 41 to 145. This result was reported at a dilution of 1.
10	The concentration of this analyte was greater than 4 times the concentration of the spike added to the matrix spike. According to protocol, the calculation for percent recovery of the matrix spike is not valid.
11	The surrogate Terphenyl-d14 for method SW846 8270E was outside of control limits. The % Recovery was reported as 32.1 and the control limits were 41 to 145. This result was reported at a dilution of 1.
12	The surrogate Terphenyl-d14 for method SW846 8270E was outside of control limits. The % Recovery was reported as 34.8 and the control limits were 41 to 145. This result was reported at a dilution of 1.

Analytical Results Report For

Michael Baker International

Project Erie Coke 188511-3020
Workorder 3391582
Report ID 386370 on 2/7/2025 (Revised report. See Project Notations Section.)

Certificate of Analysis

Enclosed are the analytical results for samples received by the laboratory on Dec 11, 2024.

The ALS Environmental laboratory in Middletown, Pennsylvania is a National Environmental Laboratory Accreditation Program (NELAP) accredited laboratory and as such, certifies that all applicable test results meet the requirements of NELAP.

If you have any questions regarding this certificate of analysis, please contact Elizabeth Parker (Project Coordinator) at (717) 944-5541.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program and any applicable state requirements. The test results meet requirements of the current NELAP standards or state requirements, where applicable. For a specific list of accredited analytes, refer to the certifications section of the ALS website at www.alsglobal.com/en/Our-Services/Life-Sciences/Environmental/Downloads.

This laboratory report may not be reproduced, except in full, without the written approval of ALS Global.

Reference

Notes

- Samples collected by ALS personnel are done so in accordance with the procedures set forth in the ALS Field Sampling Plan (20 - Field Services Sampling Plan).
- Except as qualified, Clean Water Act sample analyses are consistent with methodology requirements in 40 CFR Part 136, including but not limited to the following EPA Method reference revisions:
  EPA 300.1 Rev. 1.0-1997
  EPA 300.0 Rev. 2.1-1993
  EPA 353.2 Rev. 2.0-1993
  EPA 410.4 Rev. 1.0-1993
  EPA 420.4 Rev. 1.0-1993
  EPA 365.1 Rev. 2.0-1993
  EPA 200.7 Rev. 4.4-1994
  EPA 200.8 Rev. 5.4-1994
  EPA 245.1 Rev. 3.0-1994
- Except as qualified, Safe Drinking Water Act sample analyses are consistent with methodology requirements in 40 CFR Part 141.
- The Chain of Custody document is included as part of this report.
- All Library Search analytes should be regarded as tentative identifications based on the presumptive evidence of the mass spectra. Concentrations reported are estimated values.
- Parameters identified as "analyze immediately" require analysis within 15 minutes of collection. Any "analyze immediately" parameters not listed under the header "Field Parameters" are preformed in the laboratory and are therefore analyzed out of hold time.
- Method references listed on this report beginning with the prefix “S” followed by a method number (such as S2310B-97) refer to methods from “Standard Methods for the Examination of Water and Wastewater”.
- For microbiological analyses, the "Prepared" value is the date/time into the incubator and the "Analyzed" value is the date/time out the incubator.
- An Analysis-Prep Method Cross Reference Table is included after Analytical Results & Qualifiers section in this report.
- Unless otherwise noted, all quantitative results for soils are reported on a dry weight basis.

Standard Acronyms/Flags

J	Indicates an estimated value between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL) for the analyte
U	Indicates that the analyte was Not Detected (ND) above the MDL
N	Indicates presumptive evidence of the presence of a compound
MDL	Method Detection Limit
PQL	Practical Quantitation Limit
RDL	Practical Quantitation Limit for this Project
ND	Not Detected - indicates that the analyte was Not Detected
Cntr	Analysis was performed using this container
RegLmt	Regulatory Limit
LCS	Laboratory Control Sample
MS	Matrix Spike
MSD	Matrix Spike Duplicate
DUP	Sample Duplicate
%Rec	Percent Recovery
RPD	Relative Percent Difference
LOD	DoD Limit of Detection
LOQ	DoD Limit of Quantitation
DL	DoD Detection Limit
I	Indicates reported value is greater than or equal to the Method Detection Limit (MDL) but less than the Report Detection Limit (RDL)
(S)	Surrogate Compound
NC	Not Calculated
*	Result outside of QC limits
#	Please reference the result in the Results Section for analyte-level flags.

Project Notations

P1 This report was revised to include total Zinc results for ALS#3391582007, total Arsenic results for ALS#3391582001, Acenaphthylene for ALS#3391582008 and Carbazole for ALS#3391582009. EXP 2/4/25

Sample Notations

Lab ID	Sample ID

Result Notations

Notation Ref.	
E	Result reported exceeds instrument calibration
1	The QC sample type LCS for method SW846 8270E was outside the control limits for the analyte 3,3-Dichlorobenzidine. The % Recovery was reported as 37.3 and the control limits were 38 to 115.
2	The Total Acidity is titrated to a pH of 8.3 and reported as mg CaCO3/L.
3	The Total Alkalinity is titrated to a pH of 4.5 and reported as mg CaCO3/L.
4	The pH analysis is an "analyze immediately" analysis. Parameters identified as "analyze immediately" require analysis within 15 minutes of collection, and are therefore analyzed outside of the method holding time when analyzed in the laboratory.
5	The concentration of this analyte was greater than 4 times the concentration of the spike added to the matrix spike. According to protocol, the calculation for percent recovery of the matrix spike is not valid.
6	The surrogate Terphenyl-d14 for method SW846 8270E was outside of control limits. The % Recovery was reported as 40.7 and the control limits were 41 to 145. This result was reported at a dilution of 1.
7	The recovery of the Matrix Spike (MS) associated to this analyte was outside of the established control limits. The sample was post-digestion spiked, and this matrix spike was within acceptable recovery limits.
8	The QC sample type MSD for method SW846 6010C was outside the control limits for the analyte Antimony, Dissolved. The % Recovery was reported as 65.3 and the control limits were 75 to 125.
9	The QC sample type MS for method SW846 6010C was outside the control limits for the analyte Antimony, Dissolved. The % Recovery was reported as 62.6 and the control limits were 75 to 125.
10	The QC sample type MSD for method SW846 6010C was outside the control limits for the analyte Calcium, Dissolved. The % Recovery was reported as 21.8 and the control limits were 75 to 125.
11	The QC sample type MS for method SW846 6010C was outside the control limits for the analyte Magnesium, Dissolved. The % Recovery was reported as 130 and the control limits were 75 to 125.
12	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte Butylbenzylphthalate. The % Recovery was reported as 124 and the control limits were 80 to 120.
13	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte Di-n-Octylphthalate. The % Recovery was reported as 125 and the control limits were 80 to 120.
14	The QC sample type CCV for method SW846 8270E was outside the control limits for the analyte bis(2-Ethylhexyl)phthalate. The % Recovery was reported as 124 and the control limits were 80 to 120.
15	The surrogate 2-Fluorophenol for method SW846 8270E was outside of control limits. The % Recovery was reported as 167 and the control limits were 10 to 85. This result was reported at a dilution of 100.
16	The surrogate Phenol-d5 for method SW846 8270E was outside of control limits. The % Recovery was reported as 63 and the control limits were 7 to 56. This result was reported at a dilution of 100.
17	The surrogate Terphenyl-d14 for method SW846 8270E was outside of control limits. The % Recovery was reported as 0 and the control limits were 41 to 145. This result was reported at a dilution of 100.
18	The surrogate Terphenyl-d14 for method SW846 8270E was outside of control limits. The % Recovery was reported as 26.3 and the control limits were 41 to 145. This result was reported at a dilution of 4.
19	The surrogate Terphenyl-d14 for method SW846 8270E was outside of control limits. The % Recovery was reported as 27.8 and the control limits were 41 to 145. This result was reported at a dilution of 1.

20	The surrogate Terphenyl-d14 for method SW846 8270E was outside of control limits. The % Recovery was reported as 37.6 and the control limits were 41 to 145. This result was reported at a dilution of 20.
21	The surrogate 2-Fluorophenol for method SW846 8270E was outside of control limits. The % Recovery was reported as 0 and the control limits were 10 to 85. This result was reported at a dilution of 200.
22	The surrogate Phenol-d5 for method SW846 8270E was outside of control limits. The % Recovery was reported as 0 and the control limits were 7 to 56. This result was reported at a dilution of 200.
23	The surrogate Nitrobenzene-d5 for method SW846 8270E was outside of control limits. The % Recovery was reported as 0 and the control limits were 32 to 125. This result was reported at a dilution of 200.
24	The surrogate 2-Fluorobiphenyl for method SW846 8270E was outside of control limits. The % Recovery was reported as 0 and the control limits were 24 to 116. This result was reported at a dilution of 200.
25	The surrogate 2,4,6-Tribromophenol for method SW846 8270E was outside of control limits. The % Recovery was reported as 0 and the control limits were 23 to 131. This result was reported at a dilution of 200.
26	The surrogate Terphenyl-d14 for method SW846 8270E was outside of control limits. The % Recovery was reported as 37.3 and the control limits were 41 to 145. This result was reported at a dilution of 10.
27	The surrogate Terphenyl-d14 for method SW846 8270E was outside of control limits. The % Recovery was reported as 0 and the control limits were 41 to 145. This result was reported at a dilution of 200.
28	The surrogate Terphenyl-d14 for method SW846 8270E was outside of control limits. The % Recovery was reported as 40.5 and the control limits were 41 to 145. This result was reported at a dilution of 1.
29	The surrogate Terphenyl-d14 for method SW846 8270E was outside of control limits. The % Recovery was reported as 35.4 and the control limits were 41 to 145. This result was reported at a dilution of 20.
30	The surrogate Terphenyl-d14 for method SW846 8270E was outside of control limits. The % Recovery was reported as 36.7 and the control limits were 41 to 145. This result was reported at a dilution of 1.
31	The surrogate Terphenyl-d14 for method SW846 8270E was outside of control limits. The % Recovery was reported as 31.2 and the control limits were 41 to 145. This result was reported at a dilution of 4.
