

FIELD LOG –

Weeks of June 30 and July 7, 2014

- Unscheduled, semi-quantitative fish samples have been collected at sites in the southeast region of the state since surveys were postponed in the Susquehanna River basin due to severe thunderstorms and subsequent elevated turbidity.
- Additional fish surveys are tentatively scheduled to be collected the week of July 14 in the Susquehanna River West Branch basin.
- Out-of-basin control passive sampler retrieval was completed the week of July 7. Elevated flows had postponed the retrievals.
- Continuous Instream Monitors that collect temperature, specific conductance, pH and dissolved oxygen data continue to be maintained and collect data. Data collected on the Juniata River at Newport and Lewistown Narrows continue to show elevated pH values.
