

**FIELD LOG –**

***Weeks of April 21 and April 28, 2014***

- Flows on the Susquehanna River and tributaries had decreased just enough the week of April 21 to allow staff biologists to deploy continuous in-stream monitors (CIMs) at most core large river sites. CIMs were deployed on the Susquehanna River at Marietta and Harrisburg and on the Juniata River at Newport and the Lewistown Narrows.
- Pre-spawn adult smallmouth bass samples are scheduled to begin the first week in May, but significant rain events the week of April 28 may bring flows up and decrease temperatures and force sampling to be postponed.
- Water quality transect data and water chemistry samples continue to be collected.
