Internal Review and Recommendations

The draft NPDES permit for BVPV Styrenics, LLC's (BVPV) Beaver Valley Site was transmitted by email to Mr. Timothy Ford of BVPV and Ms. Valentina Miller of Langan Engineering & Environmental Service, LLC (consulting for BVPV) on June 12, 2025. The application was also transmitted to the U.S. Environmental Protection Agency, the U.S. Fish & Wildlife Service, the National Marine Fisheries Service, the Pennsylvania Fish and Boat Commission, and the Ohio River Valley Water Sanitation Commission. The draft NPDES permit was published in the *Pennsylvania Bulletin* on June 28, 2025. By email dated June 25, 2025, Mr. Ford of BVPV requested a 15-day extension of the comment period. By letter dated June 25, 2025, DEP granted a 15-day extension of the comment period (the maximum allowed by 25 Pa. Code § 92a.82(d)) through August 12, 2025.

By email dated August 12, 2025, BVPV submitted comments on the draft NPDES permit. BVPV submitted additional comments on October 15, 2025 pursuant to a conference call between DEP and representatives of BVPV on September 25, 2025. DEP's responses to BVPV's comments are provided below following each comment.

BVPV Comment 1: Outfall 001 Sampling Location: In Part A Section I.A. Footnote 6 indicates that samples collected from Outfall 001 shall be representative of stormwater only. A location to collect a stormwater only sample from Outfall 001 does not currently exist at the site. We request that the sampling point for Outfall 001 remain as the combination of non-contact cooling water, miscellaneous non-process waters, excess river intake, and stormwater runoff.

BVPV Supplemental Comment 1: Outfall 001 Outfall Designation: As part of idling activities at the site, non-contact cooling water, miscellaneous non-process waters, excess river intake are no longer generated at the site and discharged to Outfall 001. BVPV is requesting that Outfall 001 be designated as a stormwater only outfall and the effluent limitations and monitoring requirements be adjusted to reflect this condition. If operation at the site is anticipated to change and discharge of water other than stormwater to Outfall 001 is to resume, a permit modification would be requested.

Internal Review and Recommendations

DEP Response to BVPV Comment 1 and BVPV Supplemental Comment 1: BVPV's supplemental comment from October 15, 2025 supersedes BVPV's August 12, 2025 comment about representative storm water sampling. The identification of Outfall 001 as a storm only outfall means there is no commingling of storm water with other wastewaters and, consequently, samples collected at the outfall will represent storm water only. However, for completeness and future reference, DEP provides the following response to BVPV's August 12, 2025 comment:

The instructions for Module 1 of the application state: **"If stormwater sampling is being conducted at an outfall that receives other wastewaters, the applicant must ensure that only stormwater is sampled.** This may require the applicant to sample stormwater at a location that is different than the normal compliance monitoring location, or otherwise at times when only stormwater discharges are occurring." (emphasis in original)

BVPV reported results for storm water on Module 1, which DEP assumed were sampled consistent with the application instructions that require separate storm water samples and which, in turn, implied that BVPV already identified a location to collect separate samples of storm water.

The purpose of separate storm water sampling is to confirm that storm water BMPs are implemented effectively in the corresponding drainage area. When process wastewaters or non-process wastewaters combine and discharge with storm water, DEP cannot confirm whether storm water controls are being implemented effectively. Therefore, sampling that represents only storm water is required.

As stated above, Outfall 001 will only discharge storm water, so it is not necessary to designate an alternative storm water sampling location. If circumstances change and Outfall 001 becomes a commingled discharge of storm water and process/non-process wastewater, then BVPV should designate a representative storm water sampling location at that time.

Changes in Response to Comments: Effluent limits and/or monitoring requirements at Outfall 001 in the draft permit based on the discharge of non-contact cooling water, miscellaneous non-process wastewaters, and excess intake water will be removed from the permit including: continuous flow monitoring (replaced with semi-annual reporting), pH limits (replaced with semi-annual reporting), TRC limits and reporting, and temperature limits and reporting. The monitoring frequencies for copper and styrene will be changed to 1/6 months. The first draft permit erroneously omitted monitoring and reporting for aluminum at Outfall 001, which DEP intended to require as discussed in the Fact Sheet. Therefore, aluminum will be added to Outfall 001 in the second draft permit with a monitoring frequency of 1/6 months. According to DEP's PFAS policy, monitoring for PFOA, PFOS, PFBS, and HFPO-DA generally is not imposed on storm water discharges, but since PFAS were detected in the application screening and separate storm water samples were not collected, DEP cannot attribute the PFAS detections to the wastewaters that will no longer discharge at Outfall 001. Therefore, monitoring for the four PFAS parameters will remain in the permit. The changes to Outfall 001's effluent limits and monitoring requirements are summarized in the table below.

Outfall 001 Revised Effluent Limitations and Monitoring Requirements

| Parameter | Mass (pounds) | | Concentration (mg/L) | | | Minimum Measurement Frequency | Required Sample Type |

BVPV Comment 2: Outfall 002 Type of Effluent Correction: In Part A, Section I.B, we request the type of effluent be updated to:

Treated process wastewaters from polystyrene and specialty plastics production and treated wastewaters from maintenance activities, facility idling activities, sewer line jetting, condensate, boiler house blowdown, precipitator blowdown, filter plant cooling tower blowdown and gravity filter blowdown filter backwash water from the Potable Water Plant, Belt Filter Press wash water, D2, D3, and D4 cooling tower blowdown, stormwater, and treated sanitary wastewaters monitored at IMP 102.

DEP Response to BVPV Comment 2: Based on BVPV's Supplemental Comment 2 (discussed below), the permit will only authorize discharges during idled production, so treated process wastewaters from polystyrene and specialty plastics production will only be authorized to the extent those wastewaters were generated prior to idling and remain in the treatment lagoons and may be discharged.

Changes in Response to Comments: The "Type of Effluent" for Outfall 002 will be changed to: *Treated process wastewaters from polystyrene and specialty plastics production generated before idling and treated wastewaters from maintenance activities, facility idling activities, sewer line jetting, condensate, boiler house blowdown, precipitator blowdown, filter plant cooling tower blowdown and gravity filter blowdown filter backwash water from the Potable Water Plant, Belt Filter Press wash water, D2, D3, and D4 cooling tower blowdown, stormwater, and treated sanitary wastewaters monitored at IMP 102.*

BVPV Comment 3: Outfall 002 Effluent Limitations - Calculation of Water Quality Based Effluent Limits (WQBELs)

As documented in the Fact Sheet for the draft NPDES permit, DEP developed effluent limits for Outfall 002 consistent with Styropek's request to maintain authorization for process wastewater discharge from Outfall 002. Styropek understands that WQBELs for protection of aquatic life are calculated based on the Q7,10 of the receiving stream. With the facility now idle, and without any process wastewater generated from production operations, discharge through Outfall 002 will not occur at the Q7, 10 stream flow, as the need for discharge will be determined by precipitation.

Considering this condition at the site, and consistent with Styropek's request to maintain authorization for process wastewater discharge, Styropek requests that the renewed NPDES permit be structured with two effluent limit tables for Outfall 002: one table applicable when production operations generating process wastewater discharge to Outfall 002 are in operation, and one table when production operations generating process wastewater discharge to Outfall 002 are idle.

- "Outfall 002A" applicable when production operations generating process wastewater discharge to Outfall 002 are in operation.
- "Outfall 002B" applicable when production operations generating process wastewater discharge to Outfall 002 are idle.

Please see below for the specifics of Styropek's request and comments related to calculation of WQBELs for the Outfall 002 discharge to Racoon Creek.

Internal Review and Recommendations

Outfall 002A: Discharge when production operations generating process wastewater discharge to Outfall 002 are in operation (WQBELs at Q7,10).

Receiving Stream Depth

Based on review of the Fact Sheet, the Department calculated water quality-based effluent limits for the Outfall 002 discharge to Racoon Creek based on acute water quality criteria using the Department's Toxics Management Spreadsheet (TMS). The Department estimated a receiving stream depth of 1.4 feet at a Q7,10 stream flow of 8.28 cfs. The Department based the depth of 1.4 feet on the minimum gage height observed at USGS Gage 03108000. See Fact Sheet page 54. Styropek notes that stream gage height is not the actual stream depth but rather is a height above the gage datum (i.e., the height above the zero-point elevation of the gage).

To provide more accurate stream depth information, Styropek conducted a bathymetric survey of Racoon Creek in the vicinity of Outfall 002 in July 2025. Stream bed elevations and the Racoon Creek water surface elevation at Outfall 002 were recorded.

Attachment 1 contains the survey results and calculation of the Racoon Creek depth on July 30, 2025, based on the stream bed elevations and the stream surface elevation. Attachment 1 also contains calculation of the Racoon Creek depth at Outfall 002 at a Q7,10 stream flow of 8.28 cfs. The calculations are summarized below.

Table 1

| Parameter | Value | Units | Notes |
|---|-------|-------|---|
| Average Racoon Creek Depth at Outfall 002 (7/30/25) | 5.98 | ft | Avg. depth of transect across Racoon Creek at Outfall 002 on 7/30/25 |
| 7/30/25 Racoon Creek Flow, USGS 03108000 | 28.7 | cfs | Flow at time of creek elevation measurement |
| USGS 03108000 Racoon Creek Gage height at 28.7 cfs | 1.65 | ft | At USGS 0310800 7/30/25 at time of creek elevation measurement |
| USGS 03108000 Racoon Creek Gage height at Q7,10 | 1.4 | ft | Average of recorded gage height with stream flow ~ 8 cfs |
| Relative change in elevation at Q7,10 | -0.25 | ft | 1.4 – 1.65 ft |
| Calculated Average Racoon Creek Depth at Outfall 002 at Q7,10 stream flow | 5.76 | ft | Calculated avg depth based on stream bathymetry and 0.25 ft lower stream water surface elevation than 7/30/25 |

Using the more accurate site-specific stream depth of 5.76 ft (at Q7,10) in the Department's TMS spreadsheet results in the following WQBELs based on acute water quality criteria. The WQBELs contained in the draft permit Fact Sheet based on acute criteria are also provided for comparison. The TMS spreadsheet with a stream depth of 5.76 ft is included as Attachment 2.

Table 2: Summary of WQBELs Based on Acute Criteria with Updated Stream Depth

| Parameter | Acute WQBELs with Updated Receiving Stream Depth (5.76 ft) | | Draft Permit Acute WQBELs | | Discharge Conc. (µg/L) |
|------------------------|--|----------------------|---------------------------|------------------|------------------------|
| | M. Avg. (µg/L) | Max Daily (µg/L) | M. Avg. (µg/L) | Max Daily (µg/L) | |
| Chromium, Hexavalent | Report | Report | Report | Report | < 6 |

| 1,2,4-Trichlorobenzene | 268 | 418 | 148 | 230 | 140 † |

† Department used daily max TBEL concentration for reasonable potential determination

Styropek requests that the WQBELs and conditions shown in bold above be included in the Department's determination of final effluent limits for Outfall 002 when the facility is in production (i.e., production operations generating process wastewater

Internal Review and Recommendations

discharge to Outfall 002 are operating). Applying the most stringent of the WQBELs in bold in Table 2, the WQBELs from the Department's chronic assessment, and TBELs that the Department has applied, results in the following final effluent limits for Outfall 002 for the pollutants listed above. The draft permit final Outfall 002 effluent limits are also listed.

**Table 3: Final Outfall 002 Effluent Limits with Updated Stream Depth
(Production Operations Generating Process Wastewater Discharge to Outfall 002)**

| Parameter | Styropek Calculated Final Outfall 002 Effluent Limits with Accurate Stream Depth | | Draft Permit Final outfall 002 Effluent Limits | | Discharge Conc. (µg/L) |
|------------------------|--|------------------------------------|--|------------------|------------------------|
| | M. Avg. (µg/L) | Max Daily (µg/L) | M. Avg. (µg/L) | Max Daily (µg/L) | |

| Phenanthrene | 10.3 (annual avg) | 16.1 | 5.68 | 8.86 | 59 † |
| 1,2,4-Trichlorobenzene | 34.4 (chronic) (annual avg) | 53.7 (chronic) | 34.4 | 53.7 | 140 † |

Outfall 002B: Discharge when production operations generating process wastewater discharge to Outfall 002 are idle (WQBELs at 26 cfs stream flow).

Receiving Stream Depth

As noted above, Styropek conducted a bathymetric survey of Racoon Creek at Outfall 002 to more accurately determine the receiving stream depth. Attachment 3 contains the survey results and calculation of the Racoon Creek depth on July 30, 2025, based on the stream bed elevations and the stream surface elevation (calculated average water depth of 5.98 ft on July 30, 2025, also shown in Attachment 1). Racoon Creek stream flow at the time of the July 30, 2025, stream surface elevation measurement was 28.7 cfs.

Receiving Stream WQBEL Design Flow with Production Operations Idle

As previously documented, all production operations at the facility are currently idled. Without any process wastewater discharge, discharge through Outfall 002 would not occur at the Q7,10 stream flow, as the need for discharge will be determined by precipitation.

Accordingly, Styropek proposes to use a stream design flow for Racoon Creek of 26 cfs for the acute WQBEL calculations with the facility production operations generating process wastewater idle. The stream flow of 26 cfs is the 10th percentile stream flow for the prior 25 years as measured at USGS Gage 03108000 (January 2000 - June 2025). The minimum annual number of days at or above 26 cfs over this time frame was 265 days (2000 - 2024). As the discharge to Outfall 002 will likely be pumped through a filtration device (currently pumped through a Disc Filter as referenced in the Fact Sheet), Styropek will have the technical capability to discharge at any time. Therefore, Styropek is amenable to a permit condition prohibiting discharge through Outfall 002 when the daily stream flow at USGS 03108000 is below 26 cfs when the production operations generating process wastewater discharge to Outfall 002 are idle.

Internal Review and Recommendations

Using the updated stream depth noted above and the updated stream flow of 26 cfs in the Department's TMS spreadsheet results in the following WQBELs based on acute criteria (see Table 4 below and Attachment 4 for the TMS sheets). Note that Attachment 3 contains a minor adjustment to the stream depth to account for the minor difference in stream flow at the time of the survey (28.7 cfs) and the requested stream design flow of 26 cfs (depth adjustment from 5.98 ft to 5.94 ft).

Table 4: WQBELs Based on Acute Criteria with Updated Stream Depth and Stream Design Flow (Production Operations Generating Process Wastewater Discharge to Outfall 002 Idle)

| Parameter | Acute WQBELs with Updated Stream Design Flow and Accurate Stream Depth | | Draft Permit Racoon Creek Acute WQBELs | | Discharge Conc. (µg/L) |
|------------------------|--|----------------------|--|------------------|------------------------|
| | M. Avg. (µg/L) | Max Daily (µg/L) | M. Avg. (µg/L) | Max Daily (µg/L) | |
| Chromium, Hexavalent | Report | Report | Report | Report | < 6 |

Internal Review and Recommendations

Styropek requests that the final effluent limits and conditions shown in bold in Table 5 be included in the renewal NPDES permit when production operations generating process wastewater discharge to Outfall 002 are idle.

Styropek believes the requested limits presented above more accurately reflect the conditions under which discharge would occur when production operations are idle and also utilize more accurate site-specific information.

Proposed Language for NPDES Permit Outfalls 002A and 002B

To incorporate the requested structure of the NPDES permit regarding Outfall 002, Styropek requests the following language for Outfall 002A and Outfall 002B be included in the NPDES along with the limits and conditions requested above.

- Outfall 002A: *Report monitoring results under Outfall 002A when any production operation generating process wastewater discharge to Outfall 002 is in operation. Report "no discharge" under Outfall 002A when results are reported under Outfall 002B.*
- Outfall 002B: *Report monitoring results under Outfall 002B when all production operations generating process wastewater discharge to Outfall 002 are idle. Discharge when all production operations generating process wastewater discharge to Outfall 002 are idle is prohibited when the daily stream flow at USGS Gage No. 03108000 is less than 26 cfs. Report "no discharge" under Outfall 002B when results are reported under Outfall 002A.*

BVPV Supplemental Comment 2: The comments submitted August 5, 2025, provided calculations of Water Quality Based Effluent limits for Outfall 002 based on both production and idled operations. BVPV requests that only discharge when production operations are idled be considered for incorporation into the draft permit for the Outfall 002 discharge. If operation at the site is anticipated to change and processing is to resume, a permit modification would be requested.

DEP Response to BVPV Comment 3 and BVPV Supplemental Comment 2: DEP appreciates BVPV's collection of site-specific data. The site-specific data gathered by BVPV will be used to refine the WQBELs. Pursuant to BVPV Supplemental Comment 2, the permit will only include effluent limits for the idled discharge scenario. BVPV can submit an amendment application to reauthorize the discharge of process wastewaters before manufacturing operations resume.

BVPV proposes that WQBELs for idle conditions be developed using a receiving stream flow rate of 26 cfs (representing the 10th percentile flow of Raccoon Creek) with the additional restriction that BVPV be prohibited from discharging when the flow of Raccoon Creek is less than 26 cfs. There is no precedent for using a 10th percentile stream flow for modeling. DEP is obligated by 25 Pa. Code § 96.4(g) to perform mathematical modeling to develop WQBELs using Q_{7-10} as the steady state design flow for aquatic life and threshold human health criteria and the Harmonic Mean Flow as the steady state design flow for non-threshold (carcinogenic) human health criteria.

The fundamental characteristic of numeric water quality criteria is that they include three components: magnitude, frequency, and duration. This is especially true of water quality criteria designed to protect aquatic life. Each criterion is substantiated based on underlying limitations and conditions specified in the criteria development documentation. Implementation of water quality criteria is invalid unless the underlying limitations and conditions are preserved. The criterion magnitude for many aquatic life criteria is identified on the basis that exposure to concentrations at that magnitude will occur rarely (typically a frequency of no more than once every three years) and for limited periods of time (typically a duration of no more than four days). For the rest of the time, the underlying requirement is that the target organism is not stressed by exposure to the pollutant at any significant level (*i.e.*, that exposure to elevated concentrations is a rare and isolated event). To achieve the underlying frequency and duration components of the water quality criterion, WQBELs must be developed that limit the frequency and duration of instream concentrations of the pollutant of concern.

The Q_{7-10} design flow condition was not arbitrarily selected. It was designed to match the flow profile of natural free-flowing surface waters with the dose-response toxicity profile of pollutants and thereby achieve the underlying frequency and duration components of water quality criteria. Flow management such as that proposed by BVPV is inconsistent with the underlying frequency and duration components of water quality criteria and violates criteria as surely as if instream concentrations exceed the criteria magnitudes.

DEP acknowledges that precipitation-induced discharges during idling conditions are unlikely to occur at Q_{7-10} conditions. However, based on the preceding discussion, the use of Q_{7-10} flow to develop WQBELs is necessitated by DEP's regulatory requirement for steady state modeling and the corresponding need to use a design stream flow that implements the duration

Internal Review and Recommendations

and frequency components of water quality criteria (*i.e.*, Q_{7-10} is used as the design stream flow regardless of whether discharges can or will occur when stream flow is at that level).

Changes in Response to Comments: DEP agrees to the modification of WQBELs based on a revised stream depth and will include limits for idle conditions only. DEP does not agree to the modification of WQBELs based on BVPV's proposal to develop WQBELs using the 10th percentile flow of Raccoon Creek. Outfall 002 effluent limits revised based on site-specific data are summarized in the table below. All other limits at Outfall 002 are unchanged.

Outfall 002 Revised Effluent Limitations and Monitoring Requirements

| Parameter | Revised Mass Limits (pounds/day) | | Revised Concentration Limits (µg/L) | | Outfall 002 Draft Permit Concentration Limits (µg/L) | |
|----------------------|-------------------------------------|-----------|--|-----------------|---|-----------|
| | Mo. Avg. | Max Daily | Mo. Avg. | Max Daily | Mo. Avg. | Max Daily |
| Chromium, Hexavalent | Report | Report | Report | Report | Report | Report |
| Copper, Total | 1.09 | 1.70 | 96.3 | 150.0 | 54.6 | 85.1 |
| Free Cyanide | — | — | No monitoring | No monitoring | Report | Report |
| Lead, Total | 3.63 | 7.83 | 320.0 (TBEL) | 690.0 (TBEL) | 295.0 | 460.0 |
| Mercury, Total | — | — | No monitoring | No monitoring | Report | Report |
| Nickel, Total | 19.1 | 45.1 | 1,690 (TBEL) | 3,980 (TBEL) | 1610.0 | 2512.0 |
| Zinc, Total | 8.28 | 12.9 | 730 | 1,139 | 412.0 | 644.0 |

| Benzo(a)Anthracene | 0.028 | 0.028 | 1.03 (annual avg) | 1.61 | 0.57 | 0.89 |
| 4,6-Dinitro-o-Cresol | 0.885 | 2.92 | 78 (TBEL) (annual avg) | 257 (WQBEL) | 78 | 277 |
| Hexachlorobutadiene | 0.005 | 0.005 | 0.01 (chronic) (annual avg) | 0.016 (chronic) | 11.4 | 17.7 |
| Phenanthrene | 0.116 | 0.182 | 10.3 (annual avg) | 16.1 | 5.68 | 8.86 |

Modeling results to support the limit revisions are attached to this Fact Sheet Addendum.

Effluent data indicate that BVPV will be able to comply with the proposed effluent limits at Outfall 002. To the extent that legacy process wastewater contaminants in the lagoons may be discharged, the precipitation-induced nature of the discharges should facilitate dilution of those contaminants and result in lower effluent concentrations in the effluent during idled conditions.

BVPV Comment 4: Outfall 004 Monitoring

Part A, I.D. of the draft permit incorporates monitoring for Outfall 004. The discharge of river water leaks collected in a sump on the east end of the building to the Ohio River from Outfall 004 have been discontinued. The site would like to remove the monitoring requirements for Outfall 004 at the river pump house from the renewal permit.

DEP Response to BVPV Comment 4: DEP agrees to the removal of effluent limits and monitoring requirements from Outfall 004.

Changes in Response to Comments: The permit's discharge authorization for Outfall 004 will revert to the following:

Discharges shall consist solely of uncontaminated potable/river water leakage.

In addition, the following condition will be added to the permit as Part C, Condition I.K:

When the River Pump House (RPH) is operating, the permittee shall perform weekly inspections of the RPH pumps, tanks, sumps, and related equipment and appurtenances for oil leaks/sheen and shall take necessary measures to prevent the discharge of oil to waters of the Commonwealth.

BVPV Comment 5: Outfall 005 Monitoring

Internal Review and Recommendations

Part A, I.E. of the draft permit incorporates monitoring for Outfall 005. Three samples for oil and grease were collected from Outfall 005 and submitted with the permit renewal application. All results were non-detect values; therefore, the discharge from Outfall 005 represents uncontaminated discharge. The 160 mg/L result for TSS is not believed to be representative of the discharge and the elevated result could have been due to changing condition of the river at the time of sampling. The two TSS results following the 160 mg/L result were orders of magnitude less (6.5 mg/L and 8.3 mg/L) and are more indicative of the typical discharge conditions. Styropek would like to remove the monitoring requirements for Outfall 005 at the river pump house.

DEP Response to BVPV Comment 5: DEP agrees to the removal of effluent limits and monitoring requirements from Outfall 005.

Changes in Response to Comments: The permit's discharge authorization for Outfall 005 will revert to the following:

Discharges shall consist solely of uncontaminated potable/river water leakage.

The condition added to the permit based on DEP's Response to BVPV Comment 4 also will control for Outfall 005.

BVPV Comment 6: Stormwater BMPs

Part C, IV.C.5 of the draft permit, lists Sector-and Site-Specific BMPs, indicated on page 39 of the Fact Sheet to be associated with EPA's "Industrial Stormwater Fact Sheet Series - Sector Y: Rubber, Miscellaneous Plastic Products, and Miscellaneous Manufacturing Industries". To better align the permit language with the idling conditions at the site with potential for restart of processing, we propose that the permit language be adjusted to specify: *During times when production is active and aligns with activities associated with Sector Y: Rubber, Miscellaneous Plastic Products, and Miscellaneous Manufacturing Industries activities, the following sector-specific BMPs shall be implemented to the extent practicable:*

DEP Response to BVPV Comment 6: DEP understands that some BMPs identified in Part C Condition IV.C.5 of the permit do not apply to the facility because the facility is not operating (e.g., BMPs relating to material loading/unloading activities). However, idle conditions at the site do not preclude the discharge of legacy materials (e.g., plastic beads) that remain at the site from when the facility was operating. The introduction to the sector-specific BMPs section of Part C Condition IV.C.5 of the permit already requires sector-specific BMPs to be implemented to the extent practicable. If a BMP related to a specific activity cannot be implemented because that activity is not conducted at the facility when the facility is idle, then it would not be practicable to implement that BMP.

Changes in Response to Comments: None

BVPV Comment 7: Cooling Water Intake Structure Monitoring

Following idling of process activities at the site and discontinuation of operations of the potable water system, Styropek is no longer utilizing the river intake for cooling water. Due to the idling conditions, we request Part C, Section V. of the draft permit be updated to incorporate the following prior to Sections V.A through V.G: *During times when river intake water is associated with cooling water intake at the facility, the following shall be implemented to the extent practicable:*

DEP Response to BVPV Comment 7: DEP agrees to some modification of the Cooling Water Intake Structure requirements in Part C Condition V of the permit to account for idling of the facility and the current lack of use of the intake to supply cooling water.

Changes in Response to Comments: The requirements in Part C Condition V of the draft permit will be prefaced with the following:

When the intake structure on the Ohio River is used to supply cooling water, the permittee shall comply with the following conditions:

BVPV's proposed qualifying language ("to the extent practicable") is too permissive as to the permittee's discretion for implementing cooling water intake structure requirements, so it is not included.

Internal Review and Recommendations

Part C Conditions V.F. and V.G. are modified to remove “throughout the permit term” and “continue to” because the intake will not be used to supply cooling water throughout the permit term.

In addition, the following paragraph is added to the end of Part C Condition V so DEP knows when the cooling water intake structure requirements apply:

The permittee shall notify DEP in writing at least seven (7) days prior to the resumption of use of the intake structure for cooling water withdrawals.

Please note that use of the intake structure for purposes other than the withdrawal of cooling water (e.g., potable water supply) would not trigger the notification requirement. The complete revised condition is shown below.

V. COOLING WATER INTAKE STRUCTURE(S)

When the facility’s intake structure on the Ohio River is used to supply cooling water, the permittee shall comply with the following:

- A. Nothing in this permit authorizes a take of endangered or threatened species under the Endangered Species Act.
- B. Technology and operational measures employed at the cooling water intake structures must be operated in a way that minimizes impingement mortality and entrainment to the smallest amount, extent, or degree reasonably possible.
- C. The location, design, construction or capacity of the intake structure(s) may not be altered without prior approval of DEP.
- D. The permittee must notify DEP before changing its source of cooling water.
- E. The permittee shall retain data and other records for any information developed pursuant to Section 316(b) of the Clean Water Act for a minimum of ten (10) years.
- F. The permittee shall operate and maintain the following technologies or BMPs that constitute Best Technology Available (BTA) for reducing impingement:
 - 0.5 foot per second (fps) through-screen actual velocity. The permittee shall monitor the through-screen actual velocity once per week. In lieu of velocity monitoring, the permittee may calculate the through-screen velocity using water flow, water depth, and the screen open areas. The data shall be submitted on the Cooling Water Intake Monitoring Supplemental Report (3800-FM-BCW0010) as an attachment to monthly Discharge Monitoring Reports (DMRs).
- G. The permittee shall operate and maintain the following technologies or BMPs that constitute Best Technology Available (BTA) for reducing entrainment:
 - Maintenance of actual intake flow of 5% or less of the mean annual flow of the surface waters. The permittee shall monitor intake flows daily. The data shall be submitted on the Cooling Water Intake Monitoring Supplemental Report (3800-FM-BCW0010) as an attachment to monthly Discharge Monitoring Reports (DMRs).

The permittee shall notify DEP in writing at least seven (7) days prior to the resumption of use of the intake structure for cooling water withdrawals.

No other comments were received on the draft permit. Due to the changes made to the draft permit in response to comments, a revised draft permit will be published for a second thirty-day comment period.

Stream / Surface Water Information

BVPV Styrenics, LLC, NPDES Permit No. PA0006254, Outfall 002

Instructions Discharge **Stream**

Receiving Surface Water Name: Raccoon Creek

No. Reaches to Model: 1

☒ **Other Pollutants without Limits or Monitoring**

The following pollutants do not require effluent limits or monitoring based on water quality because reasonable potential to exceed water quality criteria was not determined and the discharge concentration was less than thresholds for monitoring, or the pollutant was not detected and a sufficiently sensitive analytical method was used (e.g., ≤ Target QL).

| Pollutants | Governing WQBEL | Units | Comments |
|---------------------------------|-----------------|-------|----------------------------|
| Total Dissolved Solids (PWS) | N/A | N/A | PWS Not Applicable |
| Chloride (PWS) | N/A | N/A | PWS Not Applicable |
| Bromide | N/A | N/A | No WQS |
| Sulfate (PWS) | N/A | N/A | PWS Not Applicable |
| Fluoride (PWS) | N/A | N/A | PWS Not Applicable |
| Total Aluminum | 1,547 | µg/L | Discharge Conc ≤ 10% WQBEL |
| Total Arsenic | 49.4 | µg/L | Discharge Conc ≤ 10% WQBEL |
| Total Barium | 11,845 | µg/L | Discharge Conc ≤ 10% WQBEL |
| Total Beryllium | N/A | N/A | No WQS |
| Total Boron | 7,897 | µg/L | Discharge Conc < TQL |
| Total Cadmium | 3.41 | µg/L | Discharge Conc ≤ 10% WQBEL |
| Total Cobalt | 93.8 | µg/L | Discharge Conc ≤ 10% WQBEL |
| Total Cyanide | N/A | N/A | No WQS |
| Dissolved Iron | 1,481 | µg/L | Discharge Conc ≤ 10% WQBEL |
| Total Iron | 7,403 | µg/L | Discharge Conc ≤ 10% WQBEL |
| Total Manganese | 4,936 | µg/L | Discharge Conc ≤ 10% WQBEL |
| Total Phenols (Phenolics) (PWS) | | µg/L | PWS Not Applicable |
| Total Selenium | 24.6 | µg/L | Discharge Conc < TQL |
| Total Silver | 70.3 | µg/L | Discharge Conc ≤ 10% WQBEL |
| Total Thallium | 1.18 | µg/L | Discharge Conc < TQL |
| Total Molybdenum | N/A | N/A | No WQS |
| Bromoform | 164 | µg/L | Discharge Conc ≤ 25% WQBEL |
| Chlorobenzene | 494 | µg/L | Discharge Conc ≤ 25% WQBEL |
| Chlorodibromomethane | 18.7 | µg/L | Discharge Conc ≤ 25% WQBEL |
| Chloroethane | N/A | N/A | No WQS |
