Summary of Review

The applicant has applied for a renewal of an existing NPDES Permit, Permit No. PA0032611, which was previously issued by the Department on June 18, 2013. That permit expired on June 30, 2018.

WQM Permit No. 1171402-A3 authorizes construction of the plant to treat a hydraulic design flow of 2.0 MGD. The STP consists of 2 aerated EQ tanks, a headworks building that provides grit removal, an influent pump station, 2 SBRs, 2 aerobic sludge tanks, and UV disinfection.

The receiving stream, Little Conemaugh River, is classified as a CWF and is located in State Watershed No. 18-E.

The applicant has complied with Act 14 Notifications and no comments were received.

The applicant indicated that there is one storm water outfall at the STP. Part C will contain language titled "Requirements Applicable to Stormwater Outfalls".

Sludge use and disposal description and location(s): A polymer is added to the sludge from the aerobic sludge tanks and a rotary fan press is used for the dewatering of sludge. Solids are disposed of at the Laurel Highlands Landfill, Jackson TWP, Cambria County, DEP Permit # 101534.

Public Participation

DEP will publish notice of the receipt of the NPDES permit application and a tentative decision to issue the individual NPDES permit in the *Pennsylvania Bulletin* in accordance with 25 Pa. Code § 92a.82. Upon publication in the *Pennsylvania Bulletin*, DEP will accept written comments from interested persons for a 30-day period (which may be extended for one additional 15-

day period at DEP's discretion), which will be considered in making a final decision on the application. Any person may request or petition for a public hearing with respect to the application. A public hearing may be held if DEP determines that there is significant public interest in holding a hearing. If a hearing is held, notice of the hearing will be published in the *Pennsylvania Bulletin* at least 30 days prior to the hearing and in at least one newspaper of general circulation within the geographical area of the discharge.

Kiskiminetas-Conemaugh River Watershed TMDL

A TMDL for the Kiskiminetas-Conemaugh River Watershed ("Kiski-Conemaugh TMDL")—of which the Little Conemaugh River is a part—was completed on January 29, 2010 for the control of acid mine drainage pollutants: aluminum, iron, manganese, sediment and pH. In accordance with 40 CFR § 122.44(d)(1)(vii)(B), when developing WQBELs, the permitting authority shall ensure that effluent limits developed to protect a narrative water quality criterion, a numeric water quality criterion, or both, are consistent with the assumptions and requirements of any available wasteload allocation (WLA) for the discharge prepared by the State and approved by EPA pursuant to 40 CFR § 130.7. The Portage Area STP was assigned wasteload allocations (WLAs) for aluminum, iron, and manganese by the Kiski-Conemaugh TMDL. Therefore, pursuant to § 122.44(d)(1)(vii)(B), WQBELs will be imposed at Outfall 001. Only aluminum, iron, and manganese WQBELs are imposed because the TMDL does not establish wasteload allocations for sediment or pH. The TMDL used a surrogate approach for both of those constituents by which reductions of in-stream concentrations of aluminum, iron, and manganese would result in acceptable reductions of sediment and mitigation of acidic pH.

The TMDL's allocated concentrations for aluminum, iron, and manganese are equivalent to the most stringent water quality criteria for those pollutants and those criteria will be imposed as end-of-pipe limits at Outfall 001. The methods used to

implement water quality criteria are described in 25 Pa. Code §§ 96.3 and 96.4. Also, DEP's *Water Quality Toxics Management Strategy* (Doc. No. 361-2000-003) addresses design conditions in detail (Table 1 in that document), including the appropriate durations to assign to water quality criteria. The design duration for Criteria Maximum Concentration (CMC) criteria is 1 hour (acute). The design duration for Criteria Continuous Concentration (CCC) criteria is 4 days (chronic). The design duration for Threshold Human Health (THH) criteria is 30 days (chronic). The design duration for Cancer Risk Level (CRL) criteria is 70 years (chronic).

The 750 μ g/L aluminum criterion in 25 Pa. Code § 93.8c is a CMC (acute) criterion. Therefore, 750 μ g/L is imposed as a maximum daily limit. There is no CCC criterion for aluminum necessitating the imposition of a more stringent average monthly limit. Imposing 750 μ g/L as both a maximum daily and average monthly limit is protective of water quality uses.

The 1.5 mg/L iron criterion is given as a 30-day average in 25 Pa. Code § 93.7(a). Therefore, 1.5 mg/L is imposed as an average monthly limit and the maximum daily effluent limit is calculated using a multiplier of two times the average monthly limit based on DEP's *Technical Guidance for the Development and Specification of Effluent Limitations and Other Permit Conditions in NPDES Permits* (Doc. No. 362-0400-001, Chapter 3, pp. 15 – 16).

The 1 mg/L potable water supply criterion for manganese in 25 Pa. Code § 93.7(a) is a human health criterion (chronic). Per Table 1 of the *Water Quality Toxics Management Strategy*, the duration for a THH criterion is 30 days. Therefore, an average monthly effluent limit of 1 mg/L is imposed, and the maximum daily effluent limit is calculated using a multiplier of two times the average monthly limit consistent with the technical guidance cited above for iron.

Since the allocated concentrations are equivalent to water quality criteria, the Portage Area STP's compliance with concentration limits for aluminum, iron, and manganese will not result in excursions above water quality criteria and the permit will be consistent with the TMDL's WLAs. Consequently, the TMDL's load limits are not required. The TMDL's wasteload allocations and the applicable WQBELs are summarized in the table below.

Table 5. TMDL Effluent Limits for Outfall 001

Pollutant	Average Monthly (mg/L)	Maximum Daily (mg/L)	
Aluminum, Total	0.75	0.75	
Iron, Total	1.5	3.0	
Manganese, Total	1.0	2.0	

Effluent concentrations (as reported in the renewal application) for Aluminum, Iron and Manganese were significantly less than the proposed WQBELs found in Table 5 above. As a result, no schedule of compliance is needed and the new TMDL WQBELs will take effect upon permit issuance. Measurement frequency will be 1/month and the required sample type is 24-Hr. composite.

Changes Since Last Permit Issuance: NONE

Other Comments: Plant expansion to 2.0 MGD, with a peak flow of 6.0 MGD, was part of a Corrective Action Plan, which the Authority was under to eliminate bypassing during wet weather conditions. Act 537 Planning was not required due to the fact that this expansion was only to deal with wet weather flow. Mass Limitations (CBOD5 & TSS) for the facility will be based upon a design flow of 1.0 MGD. The organic design capacity of 1700 lbs BOD₅ per day remained unchanged.

Wastewater De	escription:	Sewage Effluent		

Technology-Based Limitations

The following technology-based limitations apply, subject to water quality analysis and BPJ where applicable:

Pollutant	Limit (mg/l)	SBC	Federal Regulation	State Regulation
CBOD ₅	25	Average Monthly	133.102(a)(4)(i)	92a.47(a)(1)
CBOD5	40	Average Weekly	133.102(a)(4)(ii)	92a.47(a)(2)
Total Suspended	30	Average Monthly	133.102(b)(1)	92a.47(a)(1)
Solids	45	Average Weekly	133.102(b)(2)	92a.47(a)(2)
рН	6.0 – 9.0 S.U.	Min – Max	133.102(c)	95.2(1)
Fecal Coliform				
(5/1 – 9/30)	200 / 100 ml	Geo Mean	-	92a.47(a)(4)
Fecal Coliform				
(5/1 – 9/30)	1,000 / 100 ml	IMAX	-	92a.47(a)(4)
Fecal Coliform				
(10/1 – 4/30)	2,000 / 100 ml	Geo Mean	-	92a.47(a)(5)
Fecal Coliform				
(10/1 – 4/30)	10,000 / 100 ml	IMAX	-	92a.47(a)(5)
Total Residual Chlorine	0.5	Average Monthly	-	92a.48(b)(2)

Comments: The above technology-based limitations will again be imposed under the authority of PA Code, Title 25, Chapter 95.5(a)(1) - Treatment requirements for discharges to waters affected by abandoned mine drainage. For wastes discharged to waters polluted by abandoned coal mine drainage, so that the applicable water quality criteria are not being met and designated water uses are not being achieved to the extent that aquatic communities are essentially excluded, and where the pollution cannot be remedied by controlling known, active discharges, the following degrees of treatment shall be provided: Sewage shall receive secondary treatment.

The attached Cause and Effect Survey, Dated July 13, 2021, gives the following conclusion:

The objective of this survey was to determine if the discharge from the Portage Area Sewage Authority WWTP is affecting the aquatic life, water quality, and/or physical characteristics of the Little Conemaugh River.

Findings from this survey suggest that the river is heavily impacted by the AMD discharge. Therefore, any impacts, if present, from the WWTP discharge were not detected. The IBI scores for both sites could not be calculated with confidence because the individual count was below 180 individuals. The water quality parameters indicate that the river is impacted upstream of the outfall and the quality does not improve very much below the WWTP outfall. While we cannot use the IBI scores, the low abundance of organisms indicates toxic pollution.

The results from this survey indicate that the river is still not attaining its Chapter 93 Aquatic Life Use, with the cause being Metals (Iron and Aluminum) and the Source being AMD discharge.

Water Quality-Based Limitations

A "Reasonable Potential Analysis" (Toxic Management Spreadsheet Version 1.3) was conducted.

The following limitations were determined through water quality modeling (output files attached):

Parameter	Limit (ug/l)	SBC	Model
Total Copper (ug/L)	23.7	Average Monthly	TMS Version 1.3
Total Zinc (ug/L)	199.0	Average Monthly	TMS Version 1.3

Comments: Part C.III. (Titled "WQBELs for Toxic Pollutants) has been added to the permit. The Authority has the opportunity to collect site-specific data and conduct a TRE. The Authority will have 2 years to complete the required studies and submit a Final WQBEL Compliance Report to the Department before having to comply with Final Permit Limits for total zinc. A Pre-Draft Letter/Survey for Toxic Pollutants was mailed to the applicant on December 14, 2020 and Authority's Engineer responded on January 18, 2021.

A WQBEL for total copper (mass & concentration) was previously imposed on this facility based upon output data from PENTOXSD Version 2.0c. Mass limits were incorrectly calculated based upon a design flow rate of 1.0 MGD. eDMR data for total copper was reviewed and the Department's TMS Model, Version 1.3, was used to develop an updated WQBEL (mass & concentration) for total copper based upon a design flow rate of 2.0 MGD. Please see page 16 of the fact sheet for further details concerning this parameter.

The Toxic Management Spreadsheet Version 1.3 modeling results recommends Monitoring for hexavalent chromium.

The NPDES Permit Application indicates that the STP does not receive IW flow from an IU.

Best Professional Judgment (BPJ) Limitations

Comments: Comments: A Dissolved Oxygen minimum limitation of 4.0 mg/L will be implemented based on the standard in 25 PA Code Chapter 93 and best professional judgment.

Anti-Backsliding

Section 402(o) of the Clean Water Act (CWA), enacted in the Water Quality Act of 1987, establishes anti-backsliding rules governing two situations. The first situation occurs when a permittee seeks to revise a Technology-Based effluent limitation based on BPJ to reflect a subsequently promulgated effluent guideline which is less stringent. The second situation addressed by Section 402(o) arises when a permittee seeks relaxation of an effluent limitation which is based upon a State treatment standard of water quality standard.

Previous limits can be used pursuant to EPA's anti-backsliding regulation 40 CFR 122.44 (I) Reissued permits. (1) Except as provided in paragraph (I)(2) of this section when a permit is renewed or reissued. Interim effluent limitations, standards or conditions must be at least as stringent as the final effluent limitations, standards, or conditions in the previous permit (unless the circumstances on which the previous permit was based have materially and substantially changed since the time the permit was issued and would constitute cause for permit modification or revocation and reissuance under §122.62). (2) In the case of effluent limitations established on the basis of Section 402(a)(1)(B) of the CWA, a permit may not be renewed, reissued, or modified on the basis of effluent guidelines promulgated under section 304(b) subsequent to the original issuance of such permit, to contain effluent limitations which are less stringent than the comparable effluent limitations in the previous permit.

The facility is not seeking to revise the previously permitted effluent limits.

Additional Considerations:

Ultraviolet (UV) disinfection is used therefore Total Residual Chlorine (TRC) limits are not applicable. Routine monitoring of UV Transmittance will be at the same monitoring frequency that is used for TRC.

NPDES Permit Fact Sheet Portage Area STP

For pH, Dissolved Oxygen (DO) and UV Transmittance, a monitoring frequency 1/day has been imposed. In general, less frequent monitoring may be established only when the permittee demonstrates that there will be no discharge on days where monitoring is not required.

For existing discharges (NPDES Renewal Applications), if WQM7.0 modeling results for summer indicates that an average monthly warm period limit of 25 mg/L (default in model) is acceptable for ammonia-nitrogen, a year-round monitoring requirement, at a minimum should be established. Since technology-based effluent limitations are applicable for this facility, assume that a monthly warm period limit of 25 mg/L is acceptable for ammonia-nitrogen and impose a year-round monitoring requirement for ammonia-nitrogen that is consistent with Table 6-3 of the Permit Writers Manual. Application data for Outfall # 001 indicates that long-term average ammonia-nitrogen concentration in the discharge is less than 0.185 mg/L.

Sewage discharges will include monitoring, at a minimum, for E. Coli, in new and reissued permits, with a monitoring frequency of 1/month for facilities with a design flows >= 1 MGD per Chapter 92.a.61.

Nutrient monitoring is required to establish the nutrient load from the wastewater treatment facility and the impacts that load may have on the quality of the receiving stream(s). A 1/quarter monitor and report requirement for Total N & Total P has been added to the permit as per Chapter 92.a.61.

Mass loading limits are applicable for publicly owned treatment works. Current policy requires average monthly mass loading limits be established for CBOD5, TSS, and NH₃-N and average weekly mass loading limits be established for CBOD5 and TSS. Average monthly mass loading limits (lbs/day) are based on the formula: design flow (MGD) x concentration limit (mg/L) x conversion factor (8.34).

For POTWs with design flows greater than 2,000 GPD influent BOD₅ and TSS monitoring must be established in the permit, and the monitoring should be consistent with the same frequency and sample type as is used for other effluent parameters.

Monitoring frequency for the proposed effluent limits are based upon Table 6-3, Self-Monitoring Requirements for Sewage Dischargers, from the Departments Technical Guidance for the Development and Specification of Effluent Limitations. Please note that Monitoring Requirements were changed for Flow to 2/week Metered to be consistent with the guidance.

Whole Effluent Toxicity (WET)

For Outfall 001, **Acute Chronic** WET Testing was completed:

For the permit renewal application (4 tests).

- Quarterly throughout the permit term.
- Quarterly throughout the permit term and a TIE/TRE was conducted.

Other:

The dilution series used for the tests was: 100%, 89%, 78%, 39%, and 20%. The Target Instream Waste Concentration (TIWC) to be used for analysis of the results is: 78%.

Summary of Four Most Recent Test Results

TST Data Analysis

(NOTE – In lieu of recording information below, the application manager may attach the DEP WET Analysis Spreadsheet).

	Ceriodaphnia	Results (Pass/Fail)	Pimephales Results (Pass/Fail)		
Test Date	Survival	Reproduction	Survival	Growth	
11/04/2013	PASS	PASS	PASS	PASS	
11/04/2014	PASS	PASS	PASS	PASS	
12/08/2015	PASS	PASS	PASS	PASS	
11/26/2016	PASS	PASS	PASS	PASS	

* A "passing" result is that in which the replicate data for the TIWC is not statistically significant from the control condition. This is exhibited when the calculated t value ("T-Test Result") is greater than the critical t value. A "failing" result is exhibited when the calculated t value ("T-Test Result") is less than the critical t value.

Is there reasonable potential for an excursion above water quality standards based on the results of these tests? (*NOTE* – *In general, reasonable potential is determined anytime there is at least one test failure in the previous four tests*).

Comments: N/A

Evaluation of Test Type, IWC and Dilution Series for Renewed Permit

Acute Partial Mix Factor (PMFa): 1 Chronic Partial Mix Factor (PMFc): 1

1. Determine IWC – Acute (IWCa):

(Q_d x 1.547) / ((Q₇₋₁₀ x PMFa) + (Q_d x 1.547))

[(2.0 MGD x 1.547) / ((3.76 cfs x 1) + (2.0 MGD x 1.547))] x 100 = 45.14%

Is IWCa < 1%? YES X NO (YES - Acute Tests Required OR NO - Chronic Tests Required)

If the discharge is to the tidal portion of the Delaware River, indicate how the type of test was determined:

N/A

Type of Test for Permit Renewal: Chronic Tests

2a. Determine Target IWCa (If Acute Tests Required)

TIWCa = 45.14 / 0.3 = 100%

2b. Determine Target IWCc (If Chronic Tests Required)

(Q_d x 1.547) / (Q₇₋₁₀ x PMFc) + (Q_d x 1.547)

[(2.0 MGD x 1.547) / ((3.76 cfs x 1) + (2.0 MGD x 1.547))] x 100 = **45%**

3. Determine Dilution Series

(NOTE – check Attachment C of WET SOP for dilution series based on TIWCa or TIWCc, whichever applies).

Dilution Series = 100%, 73%, 45%, 23%, and 11%.

WET Limits

Has reasonable potential been determined? YES
NO

Will WET limits be established in the permit? \Box YES \boxtimes NO

If WET limits will be established, identify the species and the limit values for the permit (TU).

N/A

If WET limits will not be established, but reasonable potential was determined, indicate the rationale for not establishing WET limits:

N/A

Proposed Effluent Limitations and Monitoring Requirements

The limitations and monitoring requirements specified below are proposed for the draft permit, and reflect the most stringent limitations amongst technology, water quality and BPJ. Instantaneous Maximum (IMAX) limits are determined using multipliers of 2 (conventional pollutants) or 2.5 (toxic pollutants). Sample frequencies and types are derived from the "NPDES Permit Writer's Manual" (362-0400-001), SOPs and/or BPJ.

Outfall 001, Effective Period: December 1, 2023 through Permit Expiration Date.

	Effluent Limitations					Monitoring Requirements				
Parameter	Barameter Mass Units (Ibs/day) ⁽¹⁾ Concentrations (mg/L)				Concentrations (mg/L)		lass Units (lbs/day) ⁽¹⁾ Concentrations (mg/L)		Minimum ⁽²⁾	Required
Falameter	Average Monthly	Average Weekly	Minimum	Average Monthly	Maximum	Instant. Maximum	Measurement Frequency	Sample Type		
		5.18			310.0			24-Hr		
Total Zinc (ug/L)	3.32	Daily Max	XXX	199.0	Daily Max	497	1/week	Composite		

Compliance Sampling Location: Outfall # 001

Proposed Effluent Limitations and Monitoring Requirements

The limitations and monitoring requirements specified below are proposed for the draft permit, and reflect the most stringent limitations amongst technology, water quality and BPJ. Instantaneous Maximum (IMAX) limits are determined using multipliers of 2 (conventional pollutants) or 2.5 (toxic pollutants). Sample frequencies and types are derived from the "NPDES Permit Writer's Manual" (362-0400-001), SOPs and/or BPJ.

Outfall 001, Effective Period: Permit Effective Date through November 30, 2023.

RE	Cause and Effect Survey Little Conemaugh River State Water Plan: 18E Hydrologic Unit Code: 05010007 Stream Code: 45815 Aquatic Life Use Designation: CWF Portage Area Sewage Authority Waste Water Treatment Plant Cambria Township, Cambria County

INTRODUCTION

On May 17, 2021, at the request of William Mitchell of the Clean Water Program, a cause and effect survey was conducted on Little Conemaugh River, in the vicinity of the Portage Area Sewage Authority Wastewater Treatment Plant (WWTP), located in Portage Township, Cambria County (Figure 1). The previous data collection and assessment efforts demonstrated that this reach of Little Conemaugh River was not attaining its designated aquatic life use as defined by Chapter 93, caused by metals and pH and the source being acid mine drainage (AMD) as listed in the 303(d) list of the Integrated Report. The limits of the previous National Pollutant Discharge Elimination System (NPDES) permit for the plant's discharge had been affected by the stream's non-attainment status. Mr. Mitchell wanted to know if instream conditions may have changed since the previous assessment that had indicted non-attainment.

The Portage Area Sewage Authority Wastewater Treatment Plant outfall (PA 0032611) is located at approximately Latitude: 40.3935198, Longitude: -78.684066. The water discharges to an approximately 20-meter-long open channel that flows into the Little Conemaugh River along the river's left descending bank (Figure 2). Since the WWTP is a batch plant and only discharges certain times of the day, the flow

Southwest Regional Office 500 Waterfront Drive | Pittsburgh, PA 15222 | 412-442-4000 | www.dep.pa.gov - 2 -

in the channel is slow, except when the plant is discharging. Approximately 65 meters upstream from where the discharge reaches the Little Conemaugh River channel, a large AMD discharge enters the river, causing the river to turn orange. The floodplain where the Portage Wastewater Treatment Site is located is forested, except for the area occupied by the WWTP and State Route 53 (Portage Street).

According to Stream Stats, at the location where the outfall is located, the drainage area is approximately 37.2 square miles (Figure 3). Land use throughout the basin is predominantly forested (approximately 78%) and urban (approximately 8%). According to the aerial, the rest of the watershed appears to be agriculture (approximately 10%) and industrial (approximately 4%). Little Conemaugh River is in the Conemaugh River; Stony Creek River State Water Plan (SWP 18E) and the Conemaugh Hydrologic Unit (Hydrologic Unit Code 05010007). Currently, the Little Conemaugh River (Stream Code 45815) is listed as not attaining its designated Aquatic Life Use for Cold Water Fishery (CWF). The stream was previously assessed as not attaining its Chapter 93 designated use due to acid mine drainage, caused by metals and pH.

The Portage Area Sewer Authority Wastewater Treatment Plant is a Sequencing Batch Reactor with Ultraviolet disinfection that serves approximately 5,200 people in Portage Borough and Portage Township. The Average Annual Design flow for the plant is 2.0 Million Gallons per Day. The previous permit was issued on July 1, 2013 and expired on June 30, 2018.

SAMPLING METHODOLOGY

Cause and effect surveys are designed to investigate possible relationships between point or nonpoint sources of conventional pollutants and known or suspected instream water quality problems.

On May 17, 2021, basic water quality (Table 1) and macroinvertebrates (Table 2) were examined at two locations within the Little Conemaugh River (Figure 2). The upstream site was located approximately 5 meters upstream of where the Portage Area Sewage Authority's discharge enters the Little Conemaugh (Figures 4 & 5). The downstream location was approximately 100 meters downstream of the outfall location (Figures 6 & 7).

Basic water quality parameters were examined using a field meter and additional water chemistry and macroinvertebrates were collected and subsampled according to the Department's <u>Water Quality</u> <u>Monitoring Protocols for Streams and Rivers 2018</u> (Monitoring Book), which can be found by following this link:

http://files.dep.state.pa.us/Water/Drinking%20Water%20and%20Facility%20Regulation/WaterQualityP ortalFiles/Technical%20Documentation/MONITORING_BOOK.pdf

The results were analyzed according to the Department's Assessment Methodology for Rivers and Streams 2018 (Assessment Book), which can be found by following this link: <u>http://files.dep.state.pa.us/Water/Drinking%20Water%20and%20Facility%20Regulation/WaterQualityP</u> ortalFiles/Methodology/2015%20Methodology/Assessment_Book.pdf - 3 -

RESULTS

Upstream station

The upstream station was located just upstream of where the WWTP's discharge enters the Little Conemaugh River. Since the entire downstream sample is affected by the aforementioned AMD discharge, care was taken to ensure that the upstream water sample and the entire upstream invertebrate sample was taken downstream of where the AMD enters the Little Conemaugh. At this location, the WWTP was located on the left descending bank and Rt 53 was on the right descending bank. pH taken with the field meter was 6.06, the temperature was 9.8°C, dissolved oxygen was 10.60 mg/L, and specific conductance was 410 unhos/cm. The habitat score was 172, which consisted of mostly optimal and sub optimal scores. The lowest score was due to lack of forested riparian zone.

The macroinvertebrate subsample contained 80.2 individuals that were picked from the entire sample (28 out of 28 possible grids) (Table 3). The dominant taxa were Chironomids, with a total of 16 taxa being identified. Two genera of mayflies, 2 genera of stoneflies, and 4 genera of caddisflies were all found in the sample, and together made up 25.6% of the sample. Because there were less than 160 organisms in the sample, the Assessment Book (2018) states that it may not be appropriate to use the Index of Biotic Integrity (IBI), which was calculated to be 38.1. The book also states that low abundance often indicates toxic pollution or severe habitat alterations, which must be considered in making holistic stream assessments. We found no evidence of severe habitat alterations, but AMD impacts were obvious, indicating that this may be the reason why this section of the Little Conemaugh River is not attaining its aquatic life use. From the water quality results, total aluminum (1170 ug/L) and total iron (3669 ug/L) exceeded Chapter 93 standards and also indicate AMD impacts. While Chapter 93 does not have limits for specific conductance or total dissolved solids, the upstream results for these parameters are considered to be medium stressor (410 mg/L and 254 mg/L. respectively), according to Virginia Department of Environmental Quality's Stressor Analysis in Virginia:Data Collection and Stressor Thresholds (Stressor Analysis in Virginia, 2017), which can be found by following this link: https://www.deq.virginia.gov/water/waterquality/monitoring/probabilistic-monitoring

Downstream Station

The downstream station was approximately 100 meters downstream from the outfall. State Route 53 follows the right descending bank in this area. A wide, forested floodplain is on the left descending bank. The pH as this location was 6.16, the temperature was 10.60°C, the dissolved oxygen was 10.68 mg/L, and the specific conductance was 383.7 unhos/cm. The habitat score within this segment was 193, with all parameters being optimal or suboptimal.

The macroinvertebrate subsample consisted of 71 individuals from the entire sample (28 out of 28 grids) (Table 4). The dominant taxa was Oligochaeta, and 14 taxa were identified. One genera of mayfly, three genera of stonefly, and four genera of caddisflies were found in the sample. In total, they made up 31% of the sample. There were 6 taxa that were found in the upstream sample but not in the downstream

- 4 -

sample. There were 4 taxa that were found in the downstream sample that were not found in the upstream sample. Because there were less than 160 organisms in the sample, the Assessment Book (2018) states that it may not be appropriate to use the Index of Biotic Integrity (IBI), which was calculated to be 38.8. Again, we found no evidence of severe habitat alterations, but obvious AMD impacts, indicating that this section of the Little Conemaugh River is not attaining its aquatic life use. Total aluminum (1300 ug/L) and total iron (4330 ug/L) exceeded Chapter 93 standards and also indicate AMD impacts.

While Chapter 93 does not have limits for specific conductance, the downstream result for this parameter is considered to be medium (383.7 mg/L) by Stressor Analysis in Virginia, 2017.

DISCUSSION AND CONCLUSIONS

The objective of this survey was to determine if the discharge from the Portage Area Sewage Authority WWTP is affecting the aquatic life, water quality, and/or physical characteristics of the Little Conemaugh River.

Findings from this survey suggest that the river is heavily impacted by the AMD discharge. Therefore, any impacts, if present, from the WWTP discharge were not detected. The IBI scores for both sites could not be calculated with confidence because the individual count was below 180 individuals. The water quality parameters indicate that the river is impacted upstream of the outfall and the quality does not improve very much below the WWTP outfall. While we cannot use the IBI scores, the low abundance of organisms indicates toxic pollution.

The results from this survey indicate that the river is still not attaining its Chapter 93 Aquatic Life Use, with the cause being Metals (Iron and Aluminum) and the Source being AMD discharge.

☑ Recommended WQBELs & Monitoring Requirements

No. Samples/Month: 4

	Mass	Limits		Concentra	tion Limits		I		
Pollutants	AML (lbs/day)	MDL (lbs/day)	AML	MDL	IMAX	Units	Governing WQBEL	WQBEL Basis	Comments
Hexavalent Chromium	Report	Report	Report	Report	Report	µg/L	23.0	CFC	Discharge Conc > 10% WQBEL (no RP)
Total Copper	0.39	0.62	23.7	36.9	59.1	µg/L	23.7	AFC	Discharge Conc ≥ 50% WQBEL (RP)
Total Zinc	3.32	5.18	199	310	497	µg/L	199	AFC	Discharge Conc ≥ 50% WQBEL (RP)

☑ Other Pollutants without Limits or Monitoring

The following pollutants do not require effluent limits or monitoring based on water quality because reasonable potential to exceed water quality criteria was not determined and the discharge concentration was less than thresholds for monitoring, or the pollutant was not detected and a sufficiently sensitive analytical method was used (e.g., <= Target QL).

Pollutants	Governing WQBEL	Units	Comments
Total Dissolved Solids (PWS)	N/A	N/A	PWS Not Applicable

Hexachloroethane	0.86	µg/L	Discharge Conc < TQL
Indeno(1,2,3-cd)Pyrene	0.009	µg/L	Discharge Conc < TQL
Isophorone	75.3	µg/L	Discharge Conc < TQL
Naphthalene	95.2	µg/L	Discharge Conc ≤ 25% WQBEL
Nitrobenzene	22.1	µg/L	Discharge Conc < TQL
n-Nitrosodimethylamine	0.006	µg/L	Discharge Conc < TQL
n-Nitrosodi-n-Propylamine	0.043	µg/L	Discharge Conc < TQL
n-Nitrosodiphenylamine	28.5	µg/L	Discharge Conc < TQL
Phenanthrene	2.21	µg/L	Discharge Conc < TQL
Pyrene	44.3	µg/L	Discharge Conc ≤ 25% WQBEL
1.2.4-Trichlorobenzene	0.16	µg/L	Discharge Conc < TQL

Model Results

8/25/2021

PMF - Annual Average Design Flow 2.0 MGD

Applicant:	Portage Area Sewer Authority
Name of plant:	Portage Area STP
Permit Number:	PA0032611
Municipality:	Portage Township
County:	Cambria
Receiving stream:	Little Conemaugh River

The following program will calulate partial mix factors for acute and chronic conditions:

calculated fields

net stream flow (Qs cfs)=	3.76
discharge flow (Qd mgd)=	2
velocity (fps)=	0.273
width (feet) =	6.962
depth (feet) =	0.696
slope (ft/ft) =	0.004

or

complete mix time (min) =

0.54

FOR ACUTE CONDITIONS: IF COMPLETE MIX TIME < 15 MINUTES THEN PMF = 1, IF > 15 MINUTES CALCULATE PMFa

PMFa	=		
------	---	--	--

1.000 100.00 %

FOR CHRONIC CONDITIONS: IF COMPLETE MIX TIME < 720 MINUTES THEN PMF = 1, IF > 720 MINUTES CALCULATE PMFc

PMFc = or	1.000 100.00 %		
IWCc=[Qd * 1.547] / [(Qs*P!	MFc)+(Qd*1.547)]=	0.4514	
Target IWCc=IWCc/1=	0.451		45.14 %
IWCa=[Qd * 1.547] / [(Qs*PI	MFa) + (Qd * 1.547)] =	0.4514	
Target IWCa=IWCa/0.3=	1.000 or		100.00 %
WET tests should pass if per than the target IWCa (acute)	•	•	C50 are greater
Program written by David Po	onchione on April 8, 1999)	
Program run by : W. Mitc	hell on	August 30, 2021	I

For Department use only
