**PENNSYLVANIA
GAZETTEER
OF STREAMS**

Alphabetical Listing

**Prepared in cooperation with
UNITED STATES DEPARTMENT OF THE INTERIOR
GEOLOGICAL SURVEY**

INTRODUCTION

Following the Legislative Act of July 25, 1913, the Water Supply Commission of Pennsylvania published a Water Resources Inventory Report consisting of a nine parts. Part III, entitled, "Gazetteer of Streams" was published in 1917. "Gazetteer of Streams" contained information related to 4,419 named streams, and one of its four chapters provided drainage tables, that were based upon maps available in 1914. In 1914, the U.S. Geological Survey topographic maps covered 55 percent of the state. J.R. Bien's "Atlas of Pennsylvania" and other maps were used for the remaining 45 percent.

In 1970, to meet the need for drainage areas of streams based upon more current maps, a report entitled, "The Pennsylvania Gazetteer of Streams, Part I" was published cooperatively by the U.S. Geological Survey and the Pa. Department of Forests and Waters. That report contained drainage areas for 6,973 named streams, based upon maps available in November 1968. At that time, U.S. Geological Survey topographical maps covered the entire state, in either 7.5-minute or 15-minute quadrangle maps. The data in that report was presented in 26 lists, each of which was presented in two forms. The first form listed the streams in downstream order and gave the drainage area of each stream, at its mouth, in square miles. The second form listed the streams in alphabetical order and contained the following location information for each stream at its mouth: the site name, county, latitude, longitude, name of the quadrangle map and drainage area.

In 1984, a second volume of the Gazetteer was published, again as a cooperative effort between the U.S. Geological Survey and the Pennsylvania Department of Environmental Resources, successor to the Department of Forest and Waters and predecessor of the current Department of Environmental Protection. The second volume was appropriately titled, "The Pennsylvania Gazetteer of Streams, Part II" and contained detailed descriptions of the named 571 streams with greater than 25 square mile drainage area.

Part II was organized according to the same 26 lists as was Part I. For each of the 571 streams included, Part II provided information on source and mouth of stream locations, stream length, meander ratio, relief ratio, channel slope, physiography, major impoundments, and mean annual precipitation. In 1979, the State Water Plan Division in the Department of Environmental Resources initiated a project to develop a computerized identification file of all streams in Pennsylvania based upon 7.5-minute quadrangle maps. Statewide coverage with 7.5-minute maps had been completed in the 1970's. Every blue line, including intermittent streams, was listed in this compilation. This list was compiled by hierarchical order and was therefore compiled in upstream order, opposite of the order in which the streams were presented in Parts I and II of the Pennsylvania Gazetteer of Streams.

Each stream was identified with a five-digit stream code, and a 26-digit hierarchical number defined its relative hierarchical location. A computer assigned both the stream code and the hierarchical number as the streams were entered in upstream order. Stream codes were provided in "The Pennsylvania Gazetteer of Streams, Part II," for the streams listed in that report. Computerization of the file, including the hierarchical number, enables the preparation of lists in several forms - upstream or downstream order, alphabetical, or numerical according to stream code.

After completion of the computerized StreamFile, the information from "The Pennsylvania Gazetteer of Streams, Part I" was merged with the Stream File information for the named streams. In the Stream File, however, an additional 907 streams were identified as "named" streams. In order to name as many as possible of the nearly 64,000 streams identified in the Stream File, many unnamed streams that flow through named hollows were included as named streams, using the hollow name (e.g. "Dark Hollow").

Pursuant to national mapping standards, the U.S. Geological Survey only permits publication (including publication on quadrangle maps) of names which have been officially approved by the Board on Geographic Names. In this report, all unofficial names are listed in quotation marks to indicate inclusion without approval by the Board on Geographic Names.

While some portions may not be relevant for this report, the following description of the "Method" provided in "The Pennsylvania Gazetteer of Streams, Part I" may be useful to users of this report who do not have access to a copy of the former report. Portions have been deleted to improve relevancy.

The Commonwealth of Pennsylvania is mapped in 7.5 minute quadrangle maps that are published at a scale of 1:24,000 or 1-inch equals 2,000 feet. The drainage area delineations were made on these maps.

The method used for developing drainage areas is the Intra-Agency Coordination of Drainage Area Data, Bulletin No. 4, November 1951. The downstream order is listed in accordance to U.S. Geological Survey Water Supply Paper 1541-A, General Introduction and Hydrologic Definitions, page 19.

The latest maps (as of 1986) were used as the correct source for names, spellings and drainage divides. All drainage area information is at the mouth of a stream unless otherwise noted. For streams entirely within the state, the total drainage areas are given. If a stream flows out of Pennsylvania, only the drainage area for a part within the state is given. The drainage area of a stream having its source in another state and its mouth in Pennsylvania is listed in its entirety. Drainage areas are computed to the locations designated by latitude and longitude. These locations are identified by a site name, using the term "at" if the site is within one mile of a town, or the term "near" if it is more than one mile from the town. The county and quadrangle containing the mouth of the stream are listed. If the stream is the county boundary, both counties are named. When a stream leaves the state, the county and quadrangle names at the point of departure are listed.

Pennsylvania tributaries on the border of New York, Ohio, West Virginia, Maryland, and Delaware have been coordinated to assure agreement of basic data and uniform acceptability of published drainage area figures.

The downstream order of streams is listed by an indenting system. This system is used to indicate the rank of any tributary and the stream to which it is immediately tributary. The main stem is the first rank with each indentation representing one rank less. A stream is tributary to the one listed above it if it is indented one rank less. Storm drains and large built-up areas were delineated according to the topographic features. All quadrangles were matched on a light table to assure continuity of drainage area boundaries.

Determining the drainage areas was done with a rolling planimeter. Each area was planimeted twice to obtain independent vernier readings having no more than one-half of one percent difference. All sub-areas were converted into square miles and checked or adjusted to the area of the quadrangle, as given in the Smithsonian Geographic Tables. Drainage areas were computed to the following significant figures: Two figures for less than one square mile; three figures for one square mile to 1,000 square miles; four figures for more than 1,000 square miles.

This report is different from the format of Parts I and II of the Gazetteer in that both listing orders - upstream (another report) and alphabetical - are presented as statewide lists. Because no maps are included in this report, it is not necessary to retain the 26-list format that was previously used to allow for reasonably scaled mapping of the streams.

This report adds a new element of information, the River Mile, which is included in both listings. The River Mile is the distance, in miles, to the mouth of the listed stream, measured upstream along the stream into which it flows, and measured from the mouth of the stream into which it flows. The River Mile is not the length of the listed stream and should not be interpreted as such.

Questions regarding this report or suggestions for additional stream inclusions are welcomed. They should be directed to:
